include ECU input and output circuit DTCs or individual circuit faults that usually cause single symptoms or failure modes on the vehicle and can be fixed following the proper DTC diagnostic procedure. In general, the technician should think about what DTCs or faults could be caused by another DTC or fault. A failed sensor may set a component DTC and then the system may set a DTC indicating the system cannot operate properly. By correcting the sensor fault, the system may now operate properly and the system level DTC will transition to history. Refer to the examples within each category below to understand the differences between these DTCs. If DTCs of these type are current, the technician is referred to **Diagnostic Trouble Code (DTC) List - Vehicle** to choose the correct DTC diagnostic procedure.

1. Voltage DTCs
    - B1325 Device Power 1 Circuit
    - C0875 Device Voltage Reference Input 2 Circuit
    - C1001 Adaptive Cruise Control Indicators Supply Voltage Circuit
    - P0641 5-Volt Reference Circuit
    - P0787 Downshift Timing Solenoid Control Circuit Low Voltage
2. Programming, Setup, Configuration or Software Performance DTCs
    - B3943 Steering Column Lock has Not Learned Column Integration Module
    - B101E ECU Software Performance
    - B1019 System Configuration Error
    - C0558 Calibration Data Not Programmed
    - P0630 VIN Not Programmed or Mismatched - Powertrain Control Module (PCM)
3. Component related DTCs
    - B0013 Driver Frontal Deployment Loop Stage 2
    - B0163 Passenger Compartment Temp Sensor Circuit
    - C0045 Left Rear Wheel Speed Sensor Circuit
    - P0565 Cruise Control Switch Circuit
    - P0751 1-2 Shift Solenoid (SS) Valve Performance
4. System related DTCs
    - B1010 System Sensors Data Mismatch
    - C0176 System Thermal Error
    - C0561 System Disabled Information Stored
    - P1564 Vehicle Acceleration Too High - Cruise Control Disabled
    - P1625 Transmission Control Module (TCM) System Reset
5. Any other remaining DTCs-The technician should diagnose and correct any other DTCs that are left that were not from the categories above.

12. EMISSION RELATED INSPECTION/MAINTENANCE TESTING CONCERNS-Several regions require that a vehicle pass on-board diagnostic system tests and the inspection/maintenance emission tests in order to renew license plates or vehicle registration. This is accomplished by viewing the Inspection/Maintenance System Status display on a scan tool. Using a scan tool, the technician can observe the Inspection/Maintenance System Status in order to verify that the vehicle meets the criteria that comply with the local area requirements. If inspection and maintenance checks are required in your

region, and the customer concern is related to not passing an Inspection/Maintenance test, a link is provided to **Inspection/Maintenance System Check** where the technician can choose the appropriate Inspection/Maintenance System Check for the actual engine application being used.

13. SYMPTOM DIAGNOSIS-At this step, the diagnostics are assuming that the only information the technician has available to diagnose the customer concern are symptoms of a problem. There are no DTCs set current or history. There may be a Driver Information Center display message or a system indicator to aid in identifying the root cause. The technician should evaluate the symptoms and conditions described by the customer and perform the symptoms diagnostics for the area of customer concern. A link is provided to **Symptoms - Vehicle** which contains a list of all symptoms related to this service manual publication.

DIAGNOSTIC STARTING POINT - VEHICLE

Begin the system diagnosis with **Diagnostic System Check - Vehicle**. The Diagnostic System Check - Vehicle will provide a complete strategy to locate and repair a mechanical or electrical vehicle fault. Not following this strategy may cause additional diagnostic time and/or misdiagnosis.

The Diagnostic System Check - Vehicle will provide the following strategy:

- When to verify the customer concern and identify related bulletins, recalls and preliminary information
- When to identify a control module that is not communicating, a control module that has set a DTC, and the DTC diagnostic priority
- When to address power mode concerns
- When to verify the engine cranks and runs
- When to diagnose symptom related concerns

DIAGNOSTIC SYSTEM CHECK - VEHICLE

Diagnostic Instructions

- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic System Check Instructions** provides an overview of each diagnostic step.
- Continue through the Diagnostic System Check until you are directed to follow a particular diagnostic or repair procedure. Once a repair has been completed, perform the **Diagnostic Repair Verification** and verify the customer concern has been corrected.

The diagnostic procedures within this manual are developed on the assumption that the following areas function as designed:

- The 12 V battery is fully charged and cables are clean and tight. Refer to **Battery Inspection/Test** .
- Fuses are not open. Refer to **Power Distribution Schematics** , and **Electrical Center Identification Views** .
- Ground circuits for the area of customer concern are clean, tight, and in the correct location. Refer to **Ground Distribution Schematics** , and **Harness Routing Views** .
- All connections/connectors for the area of concern are fully seated. Refer to **COMPONENT CONNECTOR END VIEWS - INDEX** .
- There are no aftermarket devices that affect the operation of the system. Refer to **Checking Aftermarket**

Accessories .

- The scan tool powers up. Refer to Scan Tool Does Not Power Up .

Diagnostic System Check

1. VERIFY CUSTOMER CONCERN-Understand and validate the customer concern. Inspect the visible system components for obvious damage or conditions that may cause the concern.
2. BULLETIN SEARCH-Check for related bulletins, recall/field actions and preliminary information.
3. MECHANICAL CONCERNS-Verify the symptom is not exclusively a mechanical concern.
   - **If the symptom is exclusively a mechanical concern**

     Refer to Symptoms - Vehicle.

   - **If the symptom is not a mechanical concern**

   NOTE: **Do not clear any DTCs unless instructed to do so by a diagnostic procedure. If any DTC is Powertrain related, select Capture Info to store DTC and Freeze Frame/Failure Records to the scan tool.**

4. VEHICLE POWER UP VERIFICATION-Ignition ON, verify the vehicle powers up.
   - **If the vehicle does not power up**

     Refer to Power Mode Mismatch .

   - **If the vehicle powers up**
5. CONTROL MODULE COMMUNICATION and DTC CHECK-Using a scan tool, perform the Vehicle DTC Information function and verify at least one control module communicates with the scan tool. Record on the Repair Order the following information:
   - Any control module that is not communicating.
   - Any DTC, including symptom byte, and the control module that has set the DTC.
   - **If the scan tool does not communicate with any control module on the vehicle**

     Refer to Data Link References .

   - **If the scan tool communicates with any control module**
6. CONTROL MODULE INTERNAL PERFORMANCE FAULTS-Verify there are no current control module Internal Hardware Performance DTCs set.
   - **If any DTC of this type is set**

     Refer to Diagnostic Trouble Code (DTC) List - Vehicle.

   - **If no DTC of this type is set**
7. CONTROL MODULE COMMUNICATION VERIFICATION-Verify the vehicle is not built with any control module listed as not communicating with the scan tool, refer to Data Link References .
   - **If the vehicle is built with a control module that is not communicating**

     Refer to Data Link References .

- **If all control modules the vehicle is built with are communicating**

8. COMMUNICATION and POWERMODE FAULTS-Verify there are no current control module Power Mode or Communication DTCs set.
   - **If any DTC of this type is set**

     Refer to **Diagnostic Trouble Code (DTC) List - Vehicle**.

   - **If no DTC of this type is set**

NOTE: **The engine may start during this test. Ensure the vehicle is out of gear and the parking brake is applied. Turn the engine OFF as soon as the crank power mode parameter has been observed.**

9. POWER MODE VERIFICATION-Driver door open, observe the scan tool Power Mode parameter while cycling the ignition switch through all the power modes. Verify the current Power Mode parameter matches the actual ignition switch positions.
   - **If the Power Mode parameter does not match the actual ignition switch positions**

     Refer to **Power Mode Mismatch** .

   - **If the Power Mode parameter matches the actual ignition switch positions**
10. ENGINE CRANK and RUN VERIFICATION-Verify that the engine cranks and runs.
    - **If the engine does not crank**

      Refer to **Engine Does Not Crank**.

    - **If the engine does not run**

      Refer to **Engine Cranks But Does Not Run**.

    - **If the engine cranks and runs**
11. REMAINING DTC REVIEW-Verify there are no other DTCs set.
    - **If other DTCs are set**

      Diagnose them in the order listed below. Refer to **Diagnostic Trouble Code (DTC) List - Vehicle**.

      1. Voltage DTCs
      2. Programming, Setup, Configuration or Software Performance DTCs
      3. Component related DTCs
      4. System related DTCs
      5. Any remaining DTCs

    - **If no other DTCs are set**
12. EMISSION RELATED INSPECTION/MAINTENANCE TESTING CONCERNS-If inspection and maintenance checks are required in your region, verify the customer concern is not related to inspection/maintenance testing.
    - **If the customer concern is related to inspection/maintenance testing**

Refer to **Inspection/Maintenance System Check**.

- **If the customer concern is not related to inspection/maintenance testing**

13. SYMPTOM DIAGNOSIS-Diagnose any remaining customer concern. Refer to **Symptoms - Vehicle**.

POWERTRAIN DIAGNOSTIC TROUBLE CODE (DTC) TYPE DEFINITIONS

Emissions Related DTCs

Action Taken When the DTC Sets - Type A

- The control module illuminates the malfunction indicator lamp (MIL) when the diagnostic runs and fails.
- The control module records the operating conditions at the time the diagnostic fails. The control module stores this information in the Freeze Frame/Failure Records.

Action Taken When the DTC Sets - Type B

- The control module illuminates the MIL on the second consecutive ignition cycle that the diagnostic runs and fails.
- The control module records the operating conditions at the time the diagnostic fails. The first time the diagnostic fails, the control module stores this information in the Failure Records. If the diagnostic reports a failure on the second consecutive ignition cycle, the control module records the operating conditions at the time of the failure. The control module writes the operating conditions to the Freeze Frame and updates the Failure Records.

- The following applies to misfire DTCs:
  - If the control module detects a low level or an emission level misfire condition during 2 consecutive trips, the control module illuminates the MIL.
  - If the control module detects a high level or catalyst damaging misfire, the control module flashes the MIL at a rate of once per second.
  - If the control module detects a misfire during 2 non-consecutive trips, the stored conditions are compared with the current conditions. The control module illuminates the MIL when the following conditions occur:
    - The engine load is within 20 percent of the previous test that failed.
    - The engine speed is within 375 RPM of the previous test that failed.
    - The engine coolant temperature is in the same range of the previous test that failed.
- The following applies to fuel trim DTCs:
  - If the control module detects a fuel trim condition during 2 consecutive trips, the control module illuminates the MIL.
  - If the control module detects a fuel trim condition during 2 non-consecutive trips, the stored conditions are compared with the current conditions. The control module illuminates the MIL when the following conditions occur:
    - The engine load is within 20 percent of the previous test that failed.
    - The engine speed is within 375 RPM of the previous test that failed.
    - The engine coolant temperature is in the same range of the previous test that failed.

Conditions for Clearing the MIL/DTC - Type A or Type B

- The control module turns OFF the MIL after 4 consecutive ignition cycles that the diagnostic runs and does not fail.
- A current DTC, Last Test Failed, clears when the diagnostic runs and passes.
- A history DTC clears after 40 consecutive warm-up cycles, if no failures are reported by this or any other emission related diagnostic.
- Clear the MIL and the DTC with a scan tool.

Non-Emissions Related DTCs

Action Taken When the DTC Sets - Type C

- The control module stores the DTC information into memory when the diagnostic runs and fails.
- The MIL will not illuminate.
- The control module records the operating conditions at the time the diagnostic fails. The control module stores this information in the Failure Records.
- The driver information center, if equipped, may display a message.

Conditions for Clearing the DTC - Type C

- A current DTC Last Test Failed clears when the diagnostic runs and passes.
- A history DTC clears after 40 consecutive warm-up cycles, if no failures are reported by this or any other non-emission related diagnostic.
- Clear the DTC with a scan tool.

DIAGNOSTIC TROUBLE CODE (DTC) LIST - VEHICLE

This master DTC list includes all applicable DTCs in alphanumeric order.

DTC	Diagnostic Procedure
B0005	Wiring Systems and Power Management - **DTC B0005**
B0012	Supplemental Inflatable Restraints - **DTC B0012 or B0013**
B0013	Supplemental Inflatable Restraints - **DTC B0012 or B0013**
B0014	Supplemental Inflatable Restraints - **DTC B0014, B0021, B0031, or B0038**
B0015	Supplemental Inflatable Restraints - **DTC B0015, B001A, B001B, or B0022**
B0016	Supplemental Inflatable Restraints - **DTC B0016, B0018, B0023, or B0025**
B0018	Supplemental Inflatable Restraints - **DTC B0016, B0018, B0023, or B0025**
B0019	Supplemental Inflatable Restraints - **DTC B0019 or B0020**
B001A	Supplemental Inflatable Restraints - **DTC B0015, B001A, B001B, or B0022**
B001B	Supplemental Inflatable Restraints - **DTC B0015, B001A, B001B, or B0022**
B0020	Supplemental Inflatable Restraints - **DTC B0019 or B0020**
B0021	Supplemental Inflatable Restraints - **DTC B0014, B0021, B0031, or B0038**
B0022	Supplemental Inflatable Restraints - **DTC B0015, B001A, B001B, or B0022**
B0023	Supplemental Inflatable Restraints - **DTC B0016, B0018, B0023, or B0025**

DTC	Diagnostic Procedure
B0025	Supplemental Inflatable Restraints - **DTC B0016, B0018, B0023, or B0025**
B0031	Supplemental Inflatable Restraints - **DTC B0014, B0021, B0031, or B0038**
B0038	Supplemental Inflatable Restraints - **DTC B0014, B0021, B0031, or B0038**
B0052	Supplemental Inflatable Restraints - **DTC B0052**
B0055	Supplemental Inflatable Restraints - **DTC B0055**
B0056	Supplemental Inflatable Restraints - **DTC B0056-B0058**
B0057	Supplemental Inflatable Restraints - **DTC B0056-B0058**
B0058	Supplemental Inflatable Restraints - **DTC B0056-B0058**
B0074	Supplemental Inflatable Restraints - **DTC B0074**
B0081	Supplemental Inflatable Restraints - **DTC B0081**
B0083	Supplemental Inflatable Restraints - **DTC B0083-B0088**
B0084	Supplemental Inflatable Restraints - **DTC B0083-B0088**
B0085	Supplemental Inflatable Restraints - **DTC B0083-B0088**
B0086	Supplemental Inflatable Restraints - **DTC B0083-B0088**
B0087	Supplemental Inflatable Restraints - **DTC B0083-B0088**
B0088	Supplemental Inflatable Restraints - **DTC B0083-B0088**
B0158	HVAC - Manual - **DTC B0158**
B0223	HVAC - Manual - **DTC B0223, B0233, B0248, B0268, B0408, B0418, or B0428**
B0233	HVAC - Manual - **DTC B0223, B0233, B0248, B0268, B0408, B0418, or B0428**
B0248	HVAC - Manual - **DTC B0223, B0233, B0248, B0268, B0408, B0418, or B0428**
B0268	HVAC - Manual - **DTC B0223, B0233, B0248, B0268, B0408, B0418, or B0428**
B0283	Fixed and Moveable Windows - **DTC B0283**
B0408	HVAC - Manual - **DTC B0223, B0233, B0248, B0268, B0408, B0418, or B0428**
B0418	HVAC - Manual - **DTC B0223, B0233, B0248, B0268, B0408, B0418, or B0428**
B0428	HVAC - Manual - **DTC B0223, B0233, B0248, B0268, B0408, B0418, or B0428**
B1001	Supplemental Inflatable Restraints - **DTC B1001 (SDM)** **DTC B1001 (PPS)**
B1008	Remote Functions - **DTC B1008**
B1019	Supplemental Inflatable Restraints - **DTC B1019**
B1025	Cellular, Entertainment, and Navigation - **DTC B1025, B1035, B1045, or B1055**
B1035	Cellular, Entertainment, and Navigation - **DTC B1025, B1035, B1045, or B1055**
B1045	Cellular, Entertainment, and Navigation - **DTC B1025, B1035, B1045, or B1055**
B1055	Cellular, Entertainment, and Navigation - **DTC B1025, B1035, B1045, or B1055**
B1259	Cellular, Entertainment, and Navigation - **DTC B1259**
B1287	Cellular, Entertainment, and Navigation - **DTC B1287**
B1325	12 V Starting and Charging - **DTC B1325, B1330, B1420, B1424, B1517, C0800, C0895, C0899, C0900, P0560, P0562, or P0563**
B1330	12 V Starting and Charging - **DTC B1325, B1330, B1420, B1424, B1517, C0800, C0895, C0899, C0900, P0560, P0562, or P0563**
B1370	Wiring Systems and Power Management - **DTC B1370-B1379, B1380-B1389, or B1440-B1443**
B1370	Supplemental Inflatable Restraints - **DTC B1370**

DTC	Diagnostic Procedure
B1371	Wiring Systems and Power Management - **DTC B1370-B1379, B1380-B1389, or B1440-B1443**
B1372	Wiring Systems and Power Management - **DTC B1370-B1379, B1380-B1389, or B1440-B1443**
B1373	Wiring Systems and Power Management - **DTC B1370-B1379, B1380-B1389, or B1440-B1443**
B1374	Wiring Systems and Power Management - **DTC B1370-B1379, B1380-B1389, or B1440-B1443**
B1375	Wiring Systems and Power Management - **DTC B1370-B1379, B1380-B1389, or B1440-B1443**
B1376	Wiring Systems and Power Management - **DTC B1370-B1379, B1380-B1389, or B1440-B1443**
B1377	Wiring Systems and Power Management - **DTC B1370-B1379, B1380-B1389, or B1440-B1443**
B1378	Wiring Systems and Power Management - **DTC B1370-B1379, B1380-B1389, or B1440-B1443**
B1379	Wiring Systems and Power Management - **DTC B1370-B1379, B1380-B1389, or B1440-B1443**
B1380	Wiring Systems and Power Management - **DTC B1370-B1379, B1380-B1389, or B1440-B1443**
B1381	Wiring Systems and Power Management - **DTC B1370-B1379, B1380-B1389, or B1440-B1443**
B1382	Wiring Systems and Power Management - **DTC B1370-B1379, B1380-B1389, or B1440-B1443**
B1383	Wiring Systems and Power Management - **DTC B1370-B1379, B1380-B1389, or B1440-B1443**
B1384	Wiring Systems and Power Management - **DTC B1370-B1379, B1380-B1389, or B1440-B1443**
B1385	Wiring Systems and Power Management - **DTC B1370-B1379, B1380-B1389, or B1440-B1443**
B1386	Wiring Systems and Power Management - **DTC B1370-B1379, B1380-B1389, or B1440-B1443**
B1387	Wiring Systems and Power Management - **DTC B1370-B1379, B1380-B1389, or B1440-B1443**
B1388	Wiring Systems and Power Management - **DTC B1370-B1379, B1380-B1389, or B1440-B1443**
B1389	Wiring Systems and Power Management - **DTC B1370-B1379, B1380-B1389, or B1440-B1443**
B1395	Lighting - **DTC B1395**
B1405	12 V Starting and Charging - **DTC B1405**
B1420	12 V Starting and Charging - **DTC B1325, B1330, B1420, B1424, B1517, C0800, C0895, C0899, C0900, P0560, P0562, or P0563**

DTC	Diagnostic Procedure
B1424	12 V Starting and Charging - **DTC B1325, B1330, B1420, B1424, B1517, C0800, C0895, C0899, C0900, P0560, P0562, or P0563**
B1428	Wiring Systems and Power Management - **DTC B1428**
B1440	Wiring Systems and Power Management - **DTC B1370-B1379, B1380-B1389, or B1440-B1443**
B1441	Wiring Systems and Power Management - **DTC B1370-B1379, B1380-B1389, or B1440-B1443**
B1442	Wiring Systems and Power Management - **DTC B1370-B1379, B1380-B1389, or B1440-B1443**
B1443	Wiring Systems and Power Management - **DTC B1370-B1379, B1380-B1389, or B1440-B1443**
B1446	Cellular, Entertainment, and Navigation - **DTC B1446 or B1447**
B1447	Cellular, Entertainment, and Navigation - **DTC B1446 or B1447**
B1475	Wiring Systems and Power Management - **DTC B1475**
B1516	12 V Starting and Charging - **DTC B1516**
B1517	12 V Starting and Charging - **DTC B1325, B1330, B1420, B1424, B1517, C0800, C0895, C0899, C0900, P0560, P0562, or P0563**
B151A	12 V Starting and Charging - **DTC B151A**
B1527	12 V Starting and Charging - **DTC B1527**
B1529	Secondary and Configurable Customer Controls - **DTC B1529**
B2455	Cellular, Entertainment, and Navigation - **DTC B2455**
B2470	Cellular, Entertainment, and Navigation - **DTC B2470**
B2476	Cellular, Entertainment, and Navigation - **DTC B2476 or B2482**
B2482	Cellular, Entertainment, and Navigation - **DTC B2476 or B2482**
B2485	Cellular, Entertainment, and Navigation - **DTC B2485**
B2530	Lighting - **DTC B2530**
B2545	Lighting - **DTC B2545**
B2575	Lighting - **DTC B2575**
B257A	Lighting - **DTC B257A**
B2580	Lighting - **DTC B2580**
B2585	Lighting - **DTC B2585**
B2600	Lighting - **DTC B2600**
B2610	Lighting - **DTC B2610**
B2615	Lighting - **DTC B2615**
B261A	Lighting - **DTC B261A**
B2625	Lighting - **DTC B2625**
B2645	Lighting - **DTC B2645**
B2652	Lighting - **DTC B2652**
B2705	Shift Lock Control - **DTC B2705**
B2976	Vehicle Access - **DTC B2976**
B3006	Bolted Exterior Body Panels and Closures - **DTC B3006**

DTC	Diagnostic Procedure
B302A	Immobilizer - **DTC B302A**
B3031	Immobilizer - **DTC B3031**
B3055	Immobilizer - **DTC B3055**
B3060	Immobilizer - **DTC B3060**
B3105	Remote Functions - **DTC B3105**
B3109	Remote Functions - **DTC B3109, B3110, B3111, or B3112**
B3110	Remote Functions - **DTC B3109, B3110, B3111, or B3112**
B3111	Remote Functions - **DTC B3109, B3110, B3111, or B3112**
B3112	Remote Functions - **DTC B3109, B3110, B3111, or B3112**
B3125	Vehicle Access - **DTC B3125, B3130, or B3135**
B3130	Vehicle Access - **DTC B3125, B3130, or B3135**
B3135	Vehicle Access - **DTC B3125, B3130, or B3135**
B3265	Vehicle Access - **DTC B3265**
B3445	Lighting - **DTC B3445 or B3884**
B3567	Displays and Gauges - **DTC B3567**
B3600	Lighting - **DTC B3600**
B3622	Secondary and Configurable Customer Controls - **DTC B3622**
B3715	Wipers and Washers - **DTC B3715**
B3794	Cruise Control - **Cruise Control Malfunction - DTC B3794, P0564, P0565, P0567, P0568, P056C, P0580, P0581, P155A-P155C, or P162C**
B3873	Wipers and Washers - **DTC B3873**
B3875	Wipers and Washers - **DTC B3875**
B3884	Lighting - **DTC B3445 or B3884**
B3922	Wipers and Washers - **DTC B3922**
B3933	HVAC - Manual - **DTC B3933**
B3935	Immobilizer - **DTC B3935**
B393B	HVAC - Manual - **DTC B393B**
B3976	Immobilizer - **DTC B3976**
C0035	Antilock Brake System - **DTC C0035-C0050**
C0036	Antilock Brake System - **DTC C0035-C0050**
C0037	Antilock Brake System - **DTC C0035-C0050**
C0038	Antilock Brake System - **DTC C0035-C0050**
C0039	Antilock Brake System - **DTC C0035-C0050**
C0040	Antilock Brake System - **DTC C0035-C0050**
C0041	Antilock Brake System - **DTC C0035-C0050**
C0042	Antilock Brake System - **DTC C0035-C0050**
C0043	Antilock Brake System - **DTC C0035-C0050**
C0044	Antilock Brake System - **DTC C0035-C0050**
C0045	Antilock Brake System - **DTC C0035-C0050**
C0046	Antilock Brake System - **DTC C0035-C0050**
C0047	Antilock Brake System - **DTC C0035-C0050**

DTC	Diagnostic Procedure
C0048	Antilock Brake System - **DTC C0035-C0050**
C0049	Antilock Brake System - **DTC C0035-C0050**
C0050	Antilock Brake System - **DTC C0035-C0050**
C0110	Antilock Brake System - **DTC C0110**
C0131	Antilock Brake System - **DTC C0131**
C0161	Antilock Brake System - **DTC C0161**
C0179	Antilock Brake System - **DTC C0179**
C0186	Antilock Brake System - **DTC C0186**
C0196	Antilock Brake System - **DTC C0196**
C0201	Antilock Brake System - **DTC C0201**
C0242	Antilock Brake System - **DTC C0242 or P0856**
C0245	Antilock Brake System - **DTC C0245**
C0267	Hydraulic Brakes - **DTC C0267**
C0277	Lighting - **DTC C0277 or C0890**
C027B	Hydraulic Brakes - **Auxiliary Brake Booster Pump Malfunction - DTC C027B**
C0292	Antilock Brake System - **DTC C0292**
C0297	Lighting - **DTC C0297**
C0558	Antilock Brake System - **DTC C0558**
C0561	Antilock Brake System - **DTC C0561**
C0563	Antilock Brake System - **DTC C0563**
C0569	Tire Pressure Monitoring - **DTC C0569**
C0710	Antilock Brake System - **DTC C0710**
C0750	Tire Pressure Monitoring - **DTC C0750, C0755, C0760, or C0765**
C0755	Tire Pressure Monitoring - **DTC C0750, C0755, C0760, or C0765**
C0760	Tire Pressure Monitoring - **DTC C0750, C0755, C0760, or C0765**
C0765	Tire Pressure Monitoring - **DTC C0750, C0755, C0760, or C0765**
C0800	12 V Starting and Charging - **DTC B1325, B1330, B1420, B1424, B1517, C0800, C0895, C0899, C0900, P0560, P0562, or P0563**
C0890	Lighting - **DTC C0277 or C0890**
C0895	12 V Starting and Charging - **DTC B1325, B1330, B1420, B1424, B1517, C0800, C0895, C0899, C0900, P0560, P0562, or P0563**
C0899	12 V Starting and Charging - **DTC B1325, B1330, B1420, B1424, B1517, C0800, C0895, C0899, C0900, P0560, P0562, or P0563**
C0900	12 V Starting and Charging - **DTC B1325, B1330, B1420, B1424, B1517, C0800, C0895, C0899, C0900, P0560, P0562, or P0563**
C1100	Hydraulic Brakes - **DTC C1100**
P0010	Engine Controls and Fuel - 3.6L (LFX) - **DTC P0010, P0013, P0020, P0023, P2088, P2089, P2090, P2091, P2092, P2093, P2094, or P2095**
P0011	Engine Controls and Fuel - 3.6L (LFX) - **DTC P0011, P0014, P0021, or P0024**
P0013	Engine Controls and Fuel - 3.6L (LFX) - **DTC P0010, P0013, P0020, P0023, P2088, P2089, P2090, P2091, P2092, P2093, P2094, or P2095**

DTC	Diagnostic Procedure
P0014	Engine Controls and Fuel - 3.6L (LFX) - **DTC P0011, P0014, P0021, or P0024**
P0016	Engine Controls and Fuel - 3.6L (LFX) - **DTC P0016, P0017, P0018, or P0019**
P0017	Engine Controls and Fuel - 3.6L (LFX) - **DTC P0016, P0017, P0018, or P0019**
P0018	Engine Controls and Fuel - 3.6L (LFX) - **DTC P0016, P0017, P0018, or P0019**
P0019	Engine Controls and Fuel - 3.6L (LFX) - **DTC P0016, P0017, P0018, or P0019**
P0020	Engine Controls and Fuel - 3.6L (LFX) - **DTC P0010, P0013, P0020, P0023, P2088, P2089, P2090, P2091, P2092, P2093, P2094, or P2095**
P0021	Engine Controls and Fuel - 3.6L (LFX) - **DTC P0011, P0014, P0021, or P0024**
P0023	Engine Controls and Fuel - 3.6L (LFX) - **DTC P0010, P0013, P0020, P0023, P2088, P2089, P2090, P2091, P2092, P2093, P2094, or P2095**
P0024	Engine Controls and Fuel - 3.6L (LFX) - **DTC P0011, P0014, P0021, or P0024**
P0068	Engine Controls and Fuel - 3.6L (LFX) - **DTC P0068 or P1101**
P0089	Engine Controls and Fuel - 3.6L (LFX) - **DTC P0089, P00C6, P228C, or P228D**
P0090	Engine Controls and Fuel - 3.6L (LFX) - **DTC P0090-P0092, P00C8, P00C9, or P00CA**
P0091	Engine Controls and Fuel - 3.6L (LFX) - **DTC P0090-P0092, P00C8, P00C9, or P00CA**
P0092	Engine Controls and Fuel - 3.6L (LFX) - **DTC P0090-P0092, P00C8, P00C9, or P00CA**
P0096	Engine Controls and Fuel - 3.6L (LFX) - **DTC P0096 or P0111**
P0097	Engine Controls and Fuel - 3.6L (LFX) - **DTC P0097, P0098, or P0099**
P0098	Engine Controls and Fuel - 3.6L (LFX) - **DTC P0097, P0098, or P0099**
P0099	Engine Controls and Fuel - 3.6L (LFX) - **DTC P0097, P0098, or P0099**
P00C6	Engine Controls and Fuel - 3.6L (LFX) - **DTC P0089, P00C6, P228C, or P228D**
P00C8	Engine Controls and Fuel - 3.6L (LFX) - **DTC P0090-P0092, P00C8, P00C9, or P00CA**
P00C9	Engine Controls and Fuel - 3.6L (LFX) - **DTC P0090-P0092, P00C8, P00C9, or P00CA**
P00CA	Engine Controls and Fuel - 3.6L (LFX) - **DTC P0090-P0092, P00C8, P00C9, or P00CA**
P00F4	Engine Controls and Fuel - 3.6L (LFX) - **DTC P00F4-P00F6**
P00F5	Engine Controls and Fuel - 3.6L (LFX) - **DTC P00F4-P00F6**
P00F6	Engine Controls and Fuel - 3.6L (LFX) - **DTC P00F4-P00F6**
P0101	Engine Controls and Fuel - 3.6L (LFX) - **DTC P0101**
P0102	Engine Controls and Fuel - 3.6L (LFX) - **DTC P0102 or P0103**
P0103	Engine Controls and Fuel - 3.6L (LFX) - **DTC P0102 or P0103**
P0106	Engine Controls and Fuel - 3.6L (LFX) - **DTC P0106**
P0107	Engine Controls and Fuel - 3.6L (LFX) - **DTC P0107 or P0108**
P0108	Engine Controls and Fuel - 3.6L (LFX) - **DTC P0107 or P0108**
P0111	Engine Controls and Fuel - 3.6L (LFX) - **DTC P0096 or P0111**
P0112	Engine Controls and Fuel - 3.6L (LFX) - **DTC P0112, P0113, or P0114**
P0113	Engine Controls and Fuel - 3.6L (LFX) - **DTC P0112, P0113, or P0114**
P0114	Engine Controls and Fuel - 3.6L (LFX) - **DTC P0112, P0113, or P0114**
P0116	Engine Controls and Fuel - 3.6L (LFX) - **DTC P0116**
P0117	Engine Controls and Fuel - 3.6L (LFX) - **DTC P0117, P0118, or P0119**
P0118	Engine Controls and Fuel - 3.6L (LFX) - **DTC P0117, P0118, or P0119**
P0119	Engine Controls and Fuel - 3.6L (LFX) - **DTC P0117, P0118, or P0119**

DTC	Diagnostic Procedure
P0121	Engine Controls and Fuel - 3.6L (LFX) - **DTC P0121-P0123, P0222, P0223, P16A0-P16A2, or P2135**
P0122	Engine Controls and Fuel - 3.6L (LFX) - **DTC P0121-P0123, P0222, P0223, P16A0-P16A2, or P2135**
P0123	Engine Controls and Fuel - 3.6L (LFX) - **DTC P0121-P0123, P0222, P0223, P16A0-P16A2, or P2135**
P0128	Engine Controls and Fuel - 3.6L (LFX) - **DTC P0128**
P0171	Engine Controls and Fuel - 3.6L (LFX) - **DTC P0171, P0172, P0174, or P0175**
P0172	Engine Controls and Fuel - 3.6L (LFX) - **DTC P0171, P0172, P0174, or P0175**
P0174	Engine Controls and Fuel - 3.6L (LFX) - **DTC P0171, P0172, P0174, or P0175**
P0175	Engine Controls and Fuel - 3.6L (LFX) - **DTC P0171, P0172, P0174, or P0175**
P0178	Engine Controls and Fuel - 3.6L (LFX) - **DTC P0178**
P0179	Engine Controls and Fuel - 3.6L (LFX) - **DTC P0179**
P018B	Engine Controls and Fuel - 3.6L (LFX) - **DTC P018B-P018D (Chassis Control Module)**
P018C	Engine Controls and Fuel - 3.6L (LFX) - **DTC P018B-P018D (Chassis Control Module)**
P018D	Engine Controls and Fuel - 3.6L (LFX) - **DTC P018B-P018D (Chassis Control Module)**
P0191	Engine Controls and Fuel - 3.6L (LFX) - **DTC P0191**
P0192	Engine Controls and Fuel - 3.6L (LFX) - **DTC P0192 or P0193**
P0193	Engine Controls and Fuel - 3.6L (LFX) - **DTC P0192 or P0193**
P0201	Engine Controls and Fuel - 3.6L (LFX) - **DTC P0201, P0202, P0203, P0204, P0205, P0206, P0261, P0262, P0264, P0265, P0267, P0268, P0270, P0271, P0273, P0274, P0276, or P0277**
P0202	Engine Controls and Fuel - 3.6L (LFX) - **DTC P0201, P0202, P0203, P0204, P0205, P0206, P0261, P0262, P0264, P0265, P0267, P0268, P0270, P0271, P0273, P0274, P0276, or P0277**
P0203	Engine Controls and Fuel - 3.6L (LFX) - **DTC P0201, P0202, P0203, P0204, P0205, P0206, P0261, P0262, P0264, P0265, P0267, P0268, P0270, P0271, P0273, P0274, P0276, or P0277**
P0204	Engine Controls and Fuel - 3.6L (LFX) - **DTC P0201, P0202, P0203, P0204, P0205, P0206, P0261, P0262, P0264, P0265, P0267, P0268, P0270, P0271, P0273, P0274, P0276, or P0277**
P0205	Engine Controls and Fuel - 3.6L (LFX) - **DTC P0201, P0202, P0203, P0204, P0205, P0206, P0261, P0262, P0264, P0265, P0267, P0268, P0270, P0271, P0273, P0274, P0276, or P0277**
P0206	Engine Controls and Fuel - 3.6L (LFX) - **DTC P0201, P0202, P0203, P0204, P0205, P0206, P0261, P0262, P0264, P0265, P0267, P0268, P0270, P0271, P0273, P0274, P0276, or P0277**
P0222	Engine Controls and Fuel - 3.6L (LFX) - **DTC P0121-P0123, P0222, P0223, P16A0-P16A2, or P2135**
P0223	Engine Controls and Fuel - 3.6L (LFX) - **DTC P0121-P0123, P0222, P0223, P16A0-P16A2, or P2135**
P0231	Engine Controls and Fuel - 3.6L (LFX) - **DTC P0231, P0232, or P023F (Chassis Control Module)**

DTC	Diagnostic Procedure
P0232	Engine Controls and Fuel - 3.6L (LFX) - **DTC P0231, P0232, or P023F (Chassis Control Module)**
P023F	Engine Controls and Fuel - 3.6L (LFX) - **DTC P0231, P0232, or P023F (Chassis Control Module)**
P025A	Engine Controls and Fuel - 3.6L (LFX) - **DTC P025A (Chassis Control Module)**
P0261	Engine Controls and Fuel - 3.6L (LFX) - **DTC P0201, P0202, P0203, P0204, P0205, P0206, P0261, P0262, P0264, P0265, P0267, P0268, P0270, P0271, P0273, P0274, P0276, or P0277**
P0262	Engine Controls and Fuel - 3.6L (LFX) - **DTC P0201, P0202, P0203, P0204, P0205, P0206, P0261, P0262, P0264, P0265, P0267, P0268, P0270, P0271, P0273, P0274, P0276, or P0277**
P0264	Engine Controls and Fuel - 3.6L (LFX) - **DTC P0201, P0202, P0203, P0204, P0205, P0206, P0261, P0262, P0264, P0265, P0267, P0268, P0270, P0271, P0273, P0274, P0276, or P0277**
P0265	Engine Controls and Fuel - 3.6L (LFX) - **DTC P0201, P0202, P0203, P0204, P0205, P0206, P0261, P0262, P0264, P0265, P0267, P0268, P0270, P0271, P0273, P0274, P0276, or P0277**
P0267	Engine Controls and Fuel - 3.6L (LFX) - **DTC P0201, P0202, P0203, P0204, P0205, P0206, P0261, P0262, P0264, P0265, P0267, P0268, P0270, P0271, P0273, P0274, P0276, or P0277**
P0268	Engine Controls and Fuel - 3.6L (LFX) - **DTC P0201, P0202, P0203, P0204, P0205, P0206, P0261, P0262, P0264, P0265, P0267, P0268, P0270, P0271, P0273, P0274, P0276, or P0277**
P0270	Engine Controls and Fuel - 3.6L (LFX) - **DTC P0201, P0202, P0203, P0204, P0205, P0206, P0261, P0262, P0264, P0265, P0267, P0268, P0270, P0271, P0273, P0274, P0276, or P0277**
P0271	Engine Controls and Fuel - 3.6L (LFX) - **DTC P0201, P0202, P0203, P0204, P0205, P0206, P0261, P0262, P0264, P0265, P0267, P0268, P0270, P0271, P0273, P0274, P0276, or P0277**
P0273	Engine Controls and Fuel - 3.6L (LFX) - **DTC P0201, P0202, P0203, P0204, P0205, P0206, P0261, P0262, P0264, P0265, P0267, P0268, P0270, P0271, P0273, P0274, P0276, or P0277**
P0274	Engine Controls and Fuel - 3.6L (LFX) - **DTC P0201, P0202, P0203, P0204, P0205, P0206, P0261, P0262, P0264, P0265, P0267, P0268, P0270, P0271, P0273, P0274, P0276, or P0277**
P0276	Engine Controls and Fuel - 3.6L (LFX) - **DTC P0201, P0202, P0203, P0204, P0205, P0206, P0261, P0262, P0264, P0265, P0267, P0268, P0270, P0271, P0273, P0274, P0276, or P0277**
P0277	Engine Controls and Fuel - 3.6L (LFX) - **DTC P0201, P0202, P0203, P0204, P0205, P0206, P0261, P0262, P0264, P0265, P0267, P0268, P0270, P0271, P0273, P0274, P0276, or P0277**
P0300	Engine Controls and Fuel - 3.6L (LFX) - **DTC P0300-P0306**
P0301	Engine Controls and Fuel - 3.6L (LFX) - **DTC P0300-P0306**
P0302	Engine Controls and Fuel - 3.6L (LFX) - **DTC P0300-P0306**

DTC	Diagnostic Procedure
P0303	Engine Controls and Fuel - 3.6L (LFX) - **DTC P0300-P0306**
P0304	Engine Controls and Fuel - 3.6L (LFX) - **DTC P0300-P0306**
P0305	Engine Controls and Fuel - 3.6L (LFX) - **DTC P0300-P0306**
P0306	Engine Controls and Fuel - 3.6L (LFX) - **DTC P0300-P0306**
P0315	Engine Controls and Fuel - 3.6L (LFX) - **DTC P0315**
P0324	Engine Controls and Fuel - 3.6L (LFX) - **DTC P0324, P0326, P0331, P06B6, or P06B7**
P0325	Engine Controls and Fuel - 3.6L (LFX) - **DTC P0325, P0327, P0328, P0330, P0332, or P0333**
P0326	Engine Controls and Fuel - 3.6L (LFX) - **DTC P0324, P0326, P0331, P06B6, or P06B7**
P0327	Engine Controls and Fuel - 3.6L (LFX) - **DTC P0325, P0327, P0328, P0330, P0332, or P0333**
P0328	Engine Controls and Fuel - 3.6L (LFX) - **DTC P0325, P0327, P0328, P0330, P0332, or P0333**
P0330	Engine Controls and Fuel - 3.6L (LFX) - **DTC P0325, P0327, P0328, P0330, P0332, or P0333**
P0331	Engine Controls and Fuel - 3.6L (LFX) - **DTC P0324, P0326, P0331, P06B6, or P06B7**
P0332	Engine Controls and Fuel - 3.6L (LFX) - **DTC P0325, P0327, P0328, P0330, P0332, or P0333**
P0333	Engine Controls and Fuel - 3.6L (LFX) - **DTC P0325, P0327, P0328, P0330, P0332, or P0333**
P0335	Engine Controls and Fuel - 3.6L (LFX) - **DTC P0335 or P0336**
P0336	Engine Controls and Fuel - 3.6L (LFX) - **DTC P0335 or P0336**
P0340	Engine Controls and Fuel - 3.6L (LFX) - **DTC P0340, P0341, P0345, P0346, P0365, P0366, P0390, or P0391**
P0341	Engine Controls and Fuel - 3.6L (LFX) - **DTC P0340, P0341, P0345, P0346, P0365, P0366, P0390, or P0391**
P0345	Engine Controls and Fuel - 3.6L (LFX) - **DTC P0340, P0341, P0345, P0346, P0365, P0366, P0390, or P0391**
P0346	Engine Controls and Fuel - 3.6L (LFX) - **DTC P0340, P0341, P0345, P0346, P0365, P0366, P0390, or P0391**
P0351	Engine Controls and Fuel - 3.6L (LFX) - **DTC P0351-P0356, P2300, P2301, P2303, P2304, P2306, P2307, P2309, P2310, P2312, P2313, P2315, or P2316**
P0352	Engine Controls and Fuel - 3.6L (LFX) - **DTC P0351-P0356, P2300, P2301, P2303, P2304, P2306, P2307, P2309, P2310, P2312, P2313, P2315, or P2316**
P0353	Engine Controls and Fuel - 3.6L (LFX) - **DTC P0351-P0356, P2300, P2301, P2303, P2304, P2306, P2307, P2309, P2310, P2312, P2313, P2315, or P2316**
P0354	Engine Controls and Fuel - 3.6L (LFX) - **DTC P0351-P0356, P2300, P2301, P2303, P2304, P2306, P2307, P2309, P2310, P2312, P2313, P2315, or P2316**
P0355	Engine Controls and Fuel - 3.6L (LFX) - **DTC P0351-P0356, P2300, P2301, P2303, P2304, P2306, P2307, P2309, P2310, P2312, P2313, P2315, or P2316**
P0356	Engine Controls and Fuel - 3.6L (LFX) - **DTC P0351-P0356, P2300, P2301, P2303, P2304, P2306, P2307, P2309, P2310, P2312, P2313, P2315, or P2316**

DTC	Diagnostic Procedure
P0365	Engine Controls and Fuel - 3.6L (LFX) - **DTC P0340, P0341, P0345, P0346, P0365, P0366, P0390, or P0391**
P0366	Engine Controls and Fuel - 3.6L (LFX) - **DTC P0340, P0341, P0345, P0346, P0365, P0366, P0390, or P0391**
P0390	Engine Controls and Fuel - 3.6L (LFX) - **DTC P0340, P0341, P0345, P0346, P0365, P0366, P0390, or P0391**
P0391	Engine Controls and Fuel - 3.6L (LFX) - **DTC P0340, P0341, P0345, P0346, P0365, P0366, P0390, or P0391**
P0442	Engine Controls and Fuel - 3.6L (LFX) - **DTC P0442**
P0443	Engine Controls and Fuel - 3.6L (LFX) - **DTC P0443, P0458, or P0459**
P0446	Engine Controls and Fuel - 3.6L (LFX) - **DTC P0446**
P0449	Engine Controls and Fuel - 3.6L (LFX) - **DTC P0449, P0498, or P0499**
P0451	Engine Controls and Fuel - 3.6L (LFX) - **DTC P0451-P0454**
P0452	Engine Controls and Fuel - 3.6L (LFX) - **DTC P0451-P0454**
P0453	Engine Controls and Fuel - 3.6L (LFX) - **DTC P0451-P0454**
P0454	Engine Controls and Fuel - 3.6L (LFX) - **DTC P0451-P0454**
P0455	Engine Controls and Fuel - 3.6L (LFX) - **DTC P0455**
P0458	Engine Controls and Fuel - 3.6L (LFX) - **DTC P0443, P0458, or P0459**
P0459	Engine Controls and Fuel - 3.6L (LFX) - **DTC P0443, P0458, or P0459**
P0461	Displays and Gauges - **DTC P0461**
P0462	Displays and Gauges - **DTC P0462**
P0463	Displays and Gauges - **DTC P0463**
P0464	Displays and Gauges - **DTC P0464**
P0480	Engine Cooling - **DTC P0480, P0481, P0691, P0692, P0693, or P0694**
P0481	Engine Cooling - **DTC P0480, P0481, P0691, P0692, P0693, or P0694**
P0496	Engine Controls and Fuel - 3.6L (LFX) - **DTC P0496**
P0498	Engine Controls and Fuel - 3.6L (LFX) - **DTC P0449, P0498, or P0499**
P0499	Engine Controls and Fuel - 3.6L (LFX) - **DTC P0449, P0498, or P0499**
P0506	Engine Controls and Fuel - 3.6L (LFX) - **DTC P0506 or P0507**
P0507	Engine Controls and Fuel - 3.6L (LFX) - **DTC P0506 or P0507**
P050D	Engine Controls and Fuel - 3.6L (LFX) - **DTC P050D**
P0513	Immobilizer - **DTC P0513**
P0520	Displays and Gauges - **DTC P0520**
P0532	HVAC - Manual - **DTC P0532 or P0533**
P0533	HVAC - Manual - **DTC P0532 or P0533**
P0560	12 V Starting and Charging - **DTC B1325, B1330, B1420, B1424, B1517, C0800, C0895, C0899, C0900, P0560, P0562, or P0563**
P0562	12 V Starting and Charging - **DTC B1325, B1330, B1420, B1424, B1517, C0800, C0895, C0899, C0900, P0560, P0562, or P0563**
P0563	12 V Starting and Charging - **DTC B1325, B1330, B1420, B1424, B1517, C0800, C0895, C0899, C0900, P0560, P0562, or P0563**

DTC	Diagnostic Procedure
P0564	Cruise Control - **Cruise Control Malfunction - DTC B3794, P0564, P0565, P0567, P0568, P056C, P0580, P0581, P155A-P155C, or P162C**
P0565	Cruise Control - **Cruise Control Malfunction - DTC B3794, P0564, P0565, P0567, P0568, P056C, P0580, P0581, P155A-P155C, or P162C**
P0567	Cruise Control - **Cruise Control Malfunction - DTC B3794, P0564, P0565, P0567, P0568, P056C, P0580, P0581, P155A-P155C, or P162C**
P0568	Cruise Control - **Cruise Control Malfunction - DTC B3794, P0564, P0565, P0567, P0568, P056C, P0580, P0581, P155A-P155C, or P162C**
P056C	Cruise Control - **Cruise Control Malfunction - DTC B3794, P0564, P0565, P0567, P0568, P056C, P0580, P0581, P155A-P155C, or P162C**
P0571	Cruise Control - **DTC P0571**
P0572	Cruise Control - **DTC P0572 or P0573**
P0573	Cruise Control - **DTC P0572 or P0573**
P0575	Cruise Control - **DTC P0575**
P057B	Engine Controls and Fuel - 3.6L (LFX) - **DTC P057B-P057D**
P057C	Engine Controls and Fuel - 3.6L (LFX) - **DTC P057B-P057D**
P057D	Engine Controls and Fuel - 3.6L (LFX) - **DTC P057B-P057D**
P0580	Cruise Control - **Cruise Control Malfunction - DTC B3794, P0564, P0565, P0567, P0568, P056C, P0580, P0581, P155A-P155C, or P162C**
P0581	Cruise Control - **Cruise Control Malfunction - DTC B3794, P0564, P0565, P0567, P0568, P056C, P0580, P0581, P155A-P155C, or P162C**
P05CC	Engine Controls and Fuel - 3.6L (LFX) - **DTC P05CC-P05CF**
P05CD	Engine Controls and Fuel - 3.6L (LFX) - **DTC P05CC-P05CF**
P05CE	Engine Controls and Fuel - 3.6L (LFX) - **DTC P05CC-P05CF**
P05CF	Engine Controls and Fuel - 3.6L (LFX) - **DTC P05CC-P05CF**
P0601	Engine Controls and Fuel - 3.6L (LFX) - **DTC P0601-P0604, P0606, P062B, P062F, P0630, P16F3, or P262B (ECM)**
P0601	Automatic Transmission - 6T70 (MH2) - **DTC P0601-P0604 or P062F**
P0602	Engine Controls and Fuel - 3.6L (LFX) - **DTC P0601-P0604, P0606, P062B, P062F, P0630, P16F3, or P262B (ECM)**
P0602	Automatic Transmission - 6T70 (MH2) - **DTC P0601-P0604 or P062F**
P0603	Engine Controls and Fuel - 3.6L (LFX) - **DTC P0601-P0604, P0606, P062B, P062F, P0630, P16F3, or P262B (ECM)**
P0603	Automatic Transmission - 6T70 (MH2) - **DTC P0601-P0604 or P062F**
P0604	Engine Controls and Fuel - 3.6L (LFX) - **DTC P0601-P0604, P0606, P062B, P062F, P0630, P16F3, or P262B (ECM)**
P0604	Automatic Transmission - 6T70 (MH2) - **DTC P0601-P0604 or P062F**
P0606	Engine Controls and Fuel - 3.6L (LFX) - **DTC P0601-P0604, P0606, P062B, P062F, P0630, P16F3, or P262B (ECM)**
P0615	12 V Starting and Charging - **DTC P0615, P0616, or P0617**
P0616	12 V Starting and Charging - **DTC P0615, P0616, or P0617**
P0617	12 V Starting and Charging - **DTC P0615, P0616, or P0617**

DTC	Diagnostic Procedure
P0621	12 V Starting and Charging - **DTC P0621**
P0622	12 V Starting and Charging - **DTC P0622**
P0628	Engine Controls and Fuel - 3.6L (LFX) - **DTC P0628**
P062B	Engine Controls and Fuel - 3.6L (LFX) - **DTC P0601-P0604, P0606, P062B, P062F, P0630, P16F3, or P262B (ECM)**
P062F	Automatic Transmission - 6T70 (MH2) - **DTC P0601-P0604 or P062F**
P062F	Engine Controls and Fuel - 3.6L (LFX) - **DTC P0601-P0604, P0606, P062B, P062F, P0630, P16F3, or P262B (ECM)**
P0630	Engine Controls and Fuel - 3.6L (LFX) - **DTC P0601-P0604, P0606, P062B, P062F, P0630, P16F3, or P262B (ECM)**
P0633	Immobilizer - **DTC P0633**
P0634	Automatic Transmission - 6T70 (MH2) - **DTC P0634**
P0641	Engine Controls and Fuel - 3.6L (LFX) - Chassis Control Module - **DTC P0641 or P06A6 (Chassis Control Module)**
P0641	Engine Controls and Fuel - 3.6L (LFX) - ECM - **DTC P0641, P0651, P0697, or P06A3 (ECM)**
P0645	HVAC - Manual - **DTC P0645, P0646, or P0647**
P0646	HVAC - Manual - **DTC P0645, P0646, or P0647**
P0647	HVAC - Manual - **DTC P0645, P0646, or P0647**
P064A	Engine Controls and Fuel - 3.6L (LFX) - **DTC P1255 or P064A (Chassis Control Module)**
P0650	Engine Controls and Fuel - 3.6L (LFX) - **DTC P0650, P263A, or P263B**
P0651	Engine Controls and Fuel - 3.6L (LFX) - **DTC P0641, P0651, P0697, or P06A3 (ECM)**
P0658	Automatic Transmission - 6T70 (MH2) - **DTC P0658 or P0659**
P0659	Automatic Transmission - 6T70 (MH2) - **DTC P0658 or P0659**
P0667	Automatic Transmission - 6T70 (MH2) - **DTC P0667, P0668, or P0669**
P0668	Automatic Transmission - 6T70 (MH2) - **DTC P0667, P0668, or P0669**
P0669	Automatic Transmission - 6T70 (MH2) - **DTC P0667, P0668, or P0669**
P0685	Engine Controls and Fuel - 3.6L (LFX) - **DTC P0685-P0687, P0689, P0690, or P1682**
P0686	Engine Controls and Fuel - 3.6L (LFX) - **DTC P0685-P0687, P0689, P0690, or P1682**
P0687	Engine Controls and Fuel - 3.6L (LFX) - **DTC P0685-P0687, P0689, P0690, or P1682**
P0689	Engine Controls and Fuel - 3.6L (LFX) - **DTC P0685-P0687, P0689, P0690, or P1682**
P0690	Engine Controls and Fuel - 3.6L (LFX) - **DTC P0685-P0687, P0689, P0690, or P1682**
P0691	Engine Cooling - **DTC P0480, P0481, P0691, P0692, P0693, or P0694**
P0692	Engine Cooling - **DTC P0480, P0481, P0691, P0692, P0693, or P0694**
P0693	Engine Cooling - **DTC P0480, P0481, P0691, P0692, P0693, or P0694**
P0694	Engine Cooling - **DTC P0480, P0481, P0691, P0692, P0693, or P0694**
P0697	Engine Controls and Fuel - 3.6L (LFX) - **DTC P0641, P0651, P0697, or P06A3 (ECM)**
P069E	Engine Controls and Fuel - 3.6L (LFX) - **DTC P069E**
P06A3	Engine Controls and Fuel - 3.6L (LFX) - **DTC P0641, P0651, P0697, or P06A3 (ECM)**
P06A6	Engine Controls and Fuel - 3.6L (LFX) - **DTC P0641 or P06A6 (Chassis Control Module)**

DTC	Diagnostic Procedure
P06AC	Automatic Transmission - 6T70 (MH2) - **DTC P06AC-P06AE**
P06AD	Automatic Transmission - 6T70 (MH2) - **DTC P06AC-P06AE**
P06AE	Automatic Transmission - 6T70 (MH2) - **DTC P06AC-P06AE**
P06B6	Engine Controls and Fuel - 3.6L (LFX) - **DTC P0324, P0326, P0331, P06B6, or P06B7**
P06B7	Engine Controls and Fuel - 3.6L (LFX) - **DTC P0324, P0326, P0331, P06B6, or P06B7**
P0700	Engine Controls and Fuel - 3.6L (LFX) - **DTC P0700**
P0703	Cruise Control - **DTC P0703**
P0711	Automatic Transmission - 6T70 (MH2) - **DTC P0711-P0713**
P0712	Automatic Transmission - 6T70 (MH2) - **DTC P0711-P0713**
P0713	Automatic Transmission - 6T70 (MH2) - **DTC P0711-P0713**
P0716	Automatic Transmission - 6T70 (MH2) - **DTC P0716 or P0717**
P0717	Automatic Transmission - 6T70 (MH2) - **DTC P0716 or P0717**
P0722	Automatic Transmission - 6T70 (MH2) - **DTC P0722 or P0723**
P0723	Automatic Transmission - 6T70 (MH2) - **DTC P0722 or P0723**
P0741	Automatic Transmission - 6T70 (MH2) - **DTC P0741 or P0742**
P0742	Automatic Transmission - 6T70 (MH2) - **DTC P0741 or P0742**
P0751	Automatic Transmission - 6T70 (MH2) - **DTC P0751 or P0752**
P0752	Automatic Transmission - 6T70 (MH2) - **DTC P0751 or P0752**
P0756	Automatic Transmission - 6T70 (MH2) - **DTC P0756**
P0776	Automatic Transmission - 6T70 (MH2) - **DTC P0776 or P0777**
P0777	Automatic Transmission - 6T70 (MH2) - **DTC P0776 or P0777**
P0796	Automatic Transmission - 6T70 (MH2) - **DTC P0796 or P0797**
P0797	Automatic Transmission - 6T70 (MH2) - **DTC P0796 or P0797**
P0815	Automatic Transmission - 6T70 (MH2) - **DTC P0815, P0816, or P0826**
P0816	Automatic Transmission - 6T70 (MH2) - **DTC P0815, P0816, or P0826**
P0826	Automatic Transmission - 6T70 (MH2) - **DTC P0815, P0816, or P0826**
P0842	Automatic Transmission - 6T70 (MH2) - **DTC P0842 or P0843**
P0843	Automatic Transmission - 6T70 (MH2) - **DTC P0842 or P0843**
P0851	Automatic Transmission - 6T70 (MH2) - **DTC P0851**
P0856	Antilock Brake System - **DTC C0242 or P0856**
P0872	Automatic Transmission - 6T70 (MH2) - **DTC P0872 or P0873**
P0873	Automatic Transmission - 6T70 (MH2) - **DTC P0872 or P0873**
P0877	Automatic Transmission - 6T70 (MH2) - **DTC P0877 or P0878**
P0878	Automatic Transmission - 6T70 (MH2) - **DTC P0877 or P0878**
P0961	Automatic Transmission - 6T70 (MH2) - **DTC P0961-P0963**
P0962	Automatic Transmission - 6T70 (MH2) - **DTC P0961-P0963**
P0963	Automatic Transmission - 6T70 (MH2) - **DTC P0961-P0963**
P0965	Automatic Transmission - 6T70 (MH2) - **DTC P0965-P0967**
P0966	Automatic Transmission - 6T70 (MH2) - **DTC P0965-P0967**
P0967	Automatic Transmission - 6T70 (MH2) - **DTC P0965-P0967**
P0969	Automatic Transmission - 6T70 (MH2) - **DTC P0969-P0971**

DTC	Diagnostic Procedure
P0970	Automatic Transmission - 6T70 (MH2) - **DTC P0969-P0971**
P0971	Automatic Transmission - 6T70 (MH2) - **DTC P0969-P0971**
P0973	Automatic Transmission - 6T70 (MH2) - **DTC P0973 or P0974**
P0974	Automatic Transmission - 6T70 (MH2) - **DTC P0973 or P0974**
P0976	Automatic Transmission - 6T70 (MH2) - **DTC P0976 or P0977**
P0977	Automatic Transmission - 6T70 (MH2) - **DTC P0976 or P0977**
P0989	Automatic Transmission - 6T70 (MH2) - **DTC P0989 or P0990**
P0990	Automatic Transmission - 6T70 (MH2) - **DTC P0989 or P0990**
P1101	Engine Controls and Fuel - 3.6L (LFX) - **DTC P0068 or P1101**
P1255	Engine Controls and Fuel - 3.6L (LFX) - **DTC P1255 or P064A (Chassis Control Module)**
P1258	Engine Cooling - **DTC P1258**
P135A	Engine Controls and Fuel - 3.6L (LFX) - **DTC P135A or P135B**
P135B	Engine Controls and Fuel - 3.6L (LFX) - **DTC P135A or P135B**
P150C	Engine Controls and Fuel - 3.6L (LFX) - **DTC P150C**
P1516	Engine Controls and Fuel - 3.6L (LFX) - **DTC P1516, P2101, P2119, or P2176**
P155A	Cruise Control - **Cruise Control Malfunction - DTC B3794, P0564, P0565, P0567, P0568, P056C, P0580, P0581, P155A-P155C, or P162C**
P155B	Cruise Control - **Cruise Control Malfunction - DTC B3794, P0564, P0565, P0567, P0568, P056C, P0580, P0581, P155A-P155C, or P162C**
P155C	Cruise Control - **Cruise Control Malfunction - DTC B3794, P0564, P0565, P0567, P0568, P056C, P0580, P0581, P155A-P155C, or P162C**
P1629	Immobilizer - **DTC P1629**
P162B	Immobilizer - **DTC P162B**
P162C	Cruise Control - **Cruise Control Malfunction - DTC B3794, P0564, P0565, P0567, P0568, P056C, P0580, P0581, P155A-P155C, or P162C**
P1631	Immobilizer - **DTC P1631**
P1632	Immobilizer - **DTC P1632**
P163A	Engine Controls and Fuel - 3.6L (LFX) - **DTC P163A**
P1668	12 V Starting and Charging - **DTC P1668**
P1682	Engine Controls and Fuel - 3.6L (LFX) - **DTC P0685-P0687, P0689, P0690, or P1682**
P16A0	Engine Controls and Fuel - 3.6L (LFX) - **DTC P0121-P0123, P0222, P0223, P16A0-P16A2, or P2135**
P16A1	Engine Controls and Fuel - 3.6L (LFX) - **DTC P0121-P0123, P0222, P0223, P16A0-P16A2, or P2135**
P16A2	Engine Controls and Fuel - 3.6L (LFX) - **DTC P0121-P0123, P0222, P0223, P16A0-P16A2, or P2135**
P16F3	Engine Controls and Fuel - 3.6L (LFX) - **DTC P0601-P0604, P0606, P062B, P062F, P0630, P16F3, or P262B (ECM)**
P1761	Automatic Transmission - 6T70 (MH2) - **DTC P1761**
P182E	Automatic Transmission - 6T70 (MH2) - **DTC P182E or P1915**
P1915	Automatic Transmission - 6T70 (MH2) - **DTC P182E or P1915**

DTC	Diagnostic Procedure
P2088	Engine Controls and Fuel - 3.6L (LFX) - **DTC P0010, P0013, P0020, P0023, P2088, P2089, P2090, P2091, P2092, P2093, P2094, or P2095**
P2089	Engine Controls and Fuel - 3.6L (LFX) - **DTC P0010, P0013, P0020, P0023, P2088, P2089, P2090, P2091, P2092, P2093, P2094, or P2095**
P2090	Engine Controls and Fuel - 3.6L (LFX) - **DTC P0010, P0013, P0020, P0023, P2088, P2089, P2090, P2091, P2092, P2093, P2094, or P2095**
P2091	Engine Controls and Fuel - 3.6L (LFX) - **DTC P0010, P0013, P0020, P0023, P2088, P2089, P2090, P2091, P2092, P2093, P2094, or P2095**
P2092	Engine Controls and Fuel - 3.6L (LFX) - **DTC P0010, P0013, P0020, P0023, P2088, P2089, P2090, P2091, P2092, P2093, P2094, or P2095**
P2093	Engine Controls and Fuel - 3.6L (LFX) - **DTC P0010, P0013, P0020, P0023, P2088, P2089, P2090, P2091, P2092, P2093, P2094, or P2095**
P2094	Engine Controls and Fuel - 3.6L (LFX) - **DTC P0010, P0013, P0020, P0023, P2088, P2089, P2090, P2091, P2092, P2093, P2094, or P2095**
P2095	Engine Controls and Fuel - 3.6L (LFX) - **DTC P0010, P0013, P0020, P0023, P2088, P2089, P2090, P2091, P2092, P2093, P2094, or P2095**
P2096	Engine Controls and Fuel - 3.6L (LFX) - **DTC P2096 or P2098**
P2097	Engine Controls and Fuel - 3.6L (LFX) - **DTC P2097 or P2099**
P2098	Engine Controls and Fuel - 3.6L (LFX) - **DTC P2096 or P2098**
P2099	Engine Controls and Fuel - 3.6L (LFX) - **DTC P2097 or P2099**
P2101	Engine Controls and Fuel - 3.6L (LFX) - **DTC P1516, P2101, P2119, or P2176**
P2119	Engine Controls and Fuel - 3.6L (LFX) - **DTC P1516, P2101, P2119, or P2176**
P2122	Engine Controls and Fuel - 3.6L (LFX) - **DTC P2122, P2123, P2127, P2128, or P2138**
P2123	Engine Controls and Fuel - 3.6L (LFX) - **DTC P2122, P2123, P2127, P2128, or P2138**
P2127	Engine Controls and Fuel - 3.6L (LFX) - **DTC P2122, P2123, P2127, P2128, or P2138**
P2128	Engine Controls and Fuel - 3.6L (LFX) - **DTC P2122, P2123, P2127, P2128, or P2138**
P2135	Engine Controls and Fuel - 3.6L (LFX) - **DTC P0121-P0123, P0222, P0223, P16A0-P16A2, or P2135**
P2138	Engine Controls and Fuel - 3.6L (LFX) - **DTC P2122, P2123, P2127, P2128, or P2138**
P2147	Engine Controls and Fuel - 3.6L (LFX) - **DTC P2147, P2148, P2150, P2151, P2153, P2154, P2156, P2157, P216B, P216C, P216E, or P216F**
P2148	Engine Controls and Fuel - 3.6L (LFX) - **DTC P2147, P2148, P2150, P2151, P2153, P2154, P2156, P2157, P216B, P216C, P216E, or P216F**
P2150	Engine Controls and Fuel - 3.6L (LFX) - **DTC P2147, P2148, P2150, P2151, P2153, P2154, P2156, P2157, P216B, P216C, P216E, or P216F**
P2151	Engine Controls and Fuel - 3.6L (LFX) - **DTC P2147, P2148, P2150, P2151, P2153, P2154, P2156, P2157, P216B, P216C, P216E, or P216F**
P2153	Engine Controls and Fuel - 3.6L (LFX) - **DTC P2147, P2148, P2150, P2151, P2153, P2154, P2156, P2157, P216B, P216C, P216E, or P216F**
P2154	Engine Controls and Fuel - 3.6L (LFX) - **DTC P2147, P2148, P2150, P2151, P2153, P2154, P2156, P2157, P216B, P216C, P216E, or P216F**
P2156	Engine Controls and Fuel - 3.6L (LFX) - **DTC P2147, P2148, P2150, P2151, P2153, P2154, P2156, P2157, P216B, P216C, P216E, or P216F**

DTC	Diagnostic Procedure
P2157	Engine Controls and Fuel - 3.6L (LFX) - **DTC P2147, P2148, P2150, P2151, P2153, P2154, P2156, P2157, P216B, P216C, P216E, or P216F**
P216B	Engine Controls and Fuel - 3.6L (LFX) - **DTC P2147, P2148, P2150, P2151, P2153, P2154, P2156, P2157, P216B, P216C, P216E, or P216F**
P216C	Engine Controls and Fuel - 3.6L (LFX) - **DTC P2147, P2148, P2150, P2151, P2153, P2154, P2156, P2157, P216B, P216C, P216E, or P216F**
P216E	Engine Controls and Fuel - 3.6L (LFX) - **DTC P2147, P2148, P2150, P2151, P2153, P2154, P2156, P2157, P216B, P216C, P216E, or P216F**
P216F	Engine Controls and Fuel - 3.6L (LFX) - **DTC P2147, P2148, P2150, P2151, P2153, P2154, P2156, P2157, P216B, P216C, P216E, or P216F**
P2176	Engine Controls and Fuel - 3.6L (LFX) - **DTC P1516, P2101, P2119, or P2176**
P2199	Engine Controls and Fuel - 3.6L (LFX) - **DTC P2199**
P219A	Engine Controls and Fuel - 3.6L (LFX) - **DTC P219A or P219B**
P219B	Engine Controls and Fuel - 3.6L (LFX) - **DTC P219A or P219B**
P2269	Engine Controls and Fuel - 3.6L (LFX) - **DTC P2269**
P228C	Engine Controls and Fuel - 3.6L (LFX) - **DTC P0089, P00C6, P228C, or P228D**
P228D	Engine Controls and Fuel - 3.6L (LFX) - **DTC P0089, P00C6, P228C, or P228D**
P2300	Engine Controls and Fuel - 3.6L (LFX) - **DTC P0351-P0356, P2300, P2301, P2303, P2304, P2306, P2307, P2309, P2310, P2312, P2313, P2315, or P2316**
P2301	Engine Controls and Fuel - 3.6L (LFX) - **DTC P0351-P0356, P2300, P2301, P2303, P2304, P2306, P2307, P2309, P2310, P2312, P2313, P2315, or P2316**
P2303	Engine Controls and Fuel - 3.6L (LFX) - **DTC P0351-P0356, P2300, P2301, P2303, P2304, P2306, P2307, P2309, P2310, P2312, P2313, P2315, or P2316**
P2304	Engine Controls and Fuel - 3.6L (LFX) - **DTC P0351-P0356, P2300, P2301, P2303, P2304, P2306, P2307, P2309, P2310, P2312, P2313, P2315, or P2316**
P2306	Engine Controls and Fuel - 3.6L (LFX) - **DTC P0351-P0356, P2300, P2301, P2303, P2304, P2306, P2307, P2309, P2310, P2312, P2313, P2315, or P2316**
P2307	Engine Controls and Fuel - 3.6L (LFX) - **DTC P0351-P0356, P2300, P2301, P2303, P2304, P2306, P2307, P2309, P2310, P2312, P2313, P2315, or P2316**
P2309	Engine Controls and Fuel - 3.6L (LFX) - **DTC P0351-P0356, P2300, P2301, P2303, P2304, P2306, P2307, P2309, P2310, P2312, P2313, P2315, or P2316**
P2310	Engine Controls and Fuel - 3.6L (LFX) - **DTC P0351-P0356, P2300, P2301, P2303, P2304, P2306, P2307, P2309, P2310, P2312, P2313, P2315, or P2316**
P2312	Engine Controls and Fuel - 3.6L (LFX) - **DTC P0351-P0356, P2300, P2301, P2303, P2304, P2306, P2307, P2309, P2310, P2312, P2313, P2315, or P2316**
P2313	Engine Controls and Fuel - 3.6L (LFX) - **DTC P0351-P0356, P2300, P2301, P2303, P2304, P2306, P2307, P2309, P2310, P2312, P2313, P2315, or P2316**
P2315	Engine Controls and Fuel - 3.6L (LFX) - **DTC P0351-P0356, P2300, P2301, P2303, P2304, P2306, P2307, P2309, P2310, P2312, P2313, P2315, or P2316**
P2316	Engine Controls and Fuel - 3.6L (LFX) - **DTC P0351-P0356, P2300, P2301, P2303, P2304, P2306, P2307, P2309, P2310, P2312, P2313, P2315, or P2316**
P2534	Wiring Systems and Power Management - **DTC P2534 or P2535**
P2535	Wiring Systems and Power Management - **DTC P2534 or P2535**

DTC	Diagnostic Procedure
P2537	Wiring Systems and Power Management - **DTC P2537**
P2544	Engine Controls and Fuel - 3.6L (LFX) - **DTC P2544**
P258A	Hydraulic Brakes - **DTC P258A-P258D**
P258B	Hydraulic Brakes - **DTC P258A-P258D**
P258C	Hydraulic Brakes - **DTC P258A-P258D**
P258D	Hydraulic Brakes - **DTC P258A-P258D**
P262B	Engine Controls and Fuel - 3.6L (LFX) - **DTC P0601-P0604, P0606, P062B, P062F, P0630, P16F3, or P262B (ECM)**
P2635	Engine Controls and Fuel - 3.6L (LFX) - **DTC P2635 (Chassis Control Module)**
P263A	Engine Controls and Fuel - 3.6L (LFX) - **DTC P0650, P263A, or P263B**
P263B	Engine Controls and Fuel - 3.6L (LFX) - **DTC P0650, P263A, or P263B**
P2714	Automatic Transmission - 6T70 (MH2) - **DTC P2714 or P2715**
P2715	Automatic Transmission - 6T70 (MH2) - **DTC P2714 or P2715**
P2719	Automatic Transmission - 6T70 (MH2) - **DTC P2719-P2721**
P2720	Automatic Transmission - 6T70 (MH2) - **DTC P2719-P2721**
P2721	Automatic Transmission - 6T70 (MH2) - **DTC P2719-P2721**
P2723	Automatic Transmission - 6T70 (MH2) - **DTC P2723 or P2724**
P2724	Automatic Transmission - 6T70 (MH2) - **DTC P2723 or P2724**
P2728	Automatic Transmission - 6T70 (MH2) - **DTC P2728-P2730**
P2729	Automatic Transmission - 6T70 (MH2) - **DTC P2728-P2730**
P2730	Automatic Transmission - 6T70 (MH2) - **DTC P2728-P2730**
P2762	Automatic Transmission - 6T70 (MH2) - **DTC P2762, P2763, or P2764**
P2763	Automatic Transmission - 6T70 (MH2) - **DTC P2762, P2763, or P2764**
P2764	Automatic Transmission - 6T70 (MH2) - **DTC P2762, P2763, or P2764**

SYMPTOM BYTE LIST

Symptom Byte	Symptom Byte Description	Symptom Byte Definition
(00-0F) General Electrical Failures This category includes standard wiring failure modes (for example, shorts and opens), direct current (DC) quantities related by Ohm's Law and quantities related to amplitude, frequency or rate of change, and wave shape.		
00	-	This sub type is used for failures that cannot be assigned to a specific sub type. No additional information is available.
01	Short to Battery	This sub type is used for failures where the Electronic Control Unit measures vehicle system (battery positive) potential for greater than a specified time period or when some other value is expected.
02	Short to Ground	This sub type is used for failures where the Electronic Control Unit measures ground (battery negative) potential for greater than a specified

Symptom Byte	Symptom Byte Description	Symptom Byte Definition
		time period or when some other value is expected.
03	Low Voltage	This sub type is used for failures where the Electronic Control Unit measures a voltage below a specified range but not necessarily a short to ground.
04	Open	This sub type is used for failures where the Electronic Control Unit determines an open circuit via lack of bias voltage, low current flow, no change in state of an input in response to an output, etc.
05	High Voltage/Open	This sub type is used for failures where the condition detected by the Electronic Control Unit is the same for either indicated failure mode.
06	Low Voltage/Open	This sub type is used for failures where the condition detected by the Electronic Control Unit is the same for either indicated failure mode.
07	High Voltage	This sub type is used for failures where the Electronic Control Unit measures a voltage above a specified range but not necessarily a short to battery.
08	Performance - Signal Invalid	This sub type is used for failures where the value of the signal is not plausible given the operating conditions.
09	Too Fast Transitions	This sub type is used for failures where the signal transitions more quickly than is reasonably allowed.
0A	Too Slow Transitions	This sub type is used for failures where the signal transitions more slowly than is reasonably allowed.
0B	High Current	This sub type is used for failures where the Electronic Control Unit measures current flow above a specified range.
0C	Low Current	This sub type is used for failures where the Electronic Control Unit measures current flow below a specified range.
0D	High Resistance	This sub type is used for failures where the Electronic Control Unit infers a circuit resistance above a specified range.
0E	Low Resistance	This sub type is used for failures where the Electronic Control Unit infers a circuit resistance below a specified range.
0F	Signal Erratic	This sub type is used for failures where the signal is momentarily implausible (not long enough for

Symptom Byte	Symptom Byte Description	Symptom Byte Definition
		Signal Invalid) or discontinuous.
(10-1F) Additional General Electrical Failures This category includes the overflow from category 0.		
10	-	Currently not used.
11	High Input	This sub type is used for failures where some circuit quantity is above a specified range.
12	Low Input	This sub type is used for failures where some circuit quantity is below a specified range.
13	Low Voltage/High Temperature	This sub type is used for failures where a temperature sensor with a negative temperature coefficient detects a voltage below a specified range.
14	High Voltage/Low Temperature	This sub type is used for failures where a temperature sensor with a negative temperature coefficient detects a voltage above a specified range.
15	Performance - Signal Rising Time Failure	This sub type is used for failures where the signal rise time is outside a specified range.
16	Performance - Signal Falling Time Failure	This sub type is used for failures where the signal fall time is outside a specified range.
17	Performance - Signal Shape/Waveform Failure	This sub type is used for failures where the shape of the signal (plot of the amplitude with respect to time) is not correct (for example, improper circuit impedance.)
18	Low Signal Amplitude	This sub type is used for failures where the Electronic Control Unit measures a signal voltage below a specified range but not necessarily a short to ground (for example, gain too low).
19	High Signal Amplitude	This sub type is used for failures where the Electronic Control Unit measures a signal voltage above a specified range but not necessarily a short to battery (for example, gain too high).
1A	Performance - Bias Level Out of Range	This sub type is used for failures where the Electronic Control Unit applies a bias voltage to a circuit upon which is superimposed a signal voltage (for example, Oxygen Sensor Circuit.)
1B	Signal Cross Coupled	This sub type is used for failures where the Electronic Control Unit detects a circuit shorted to another circuit when both circuits are controlled by the Electronic Control Unit.
1C	-	Currently not used.
1D	-	Currently not used.
1E	-	Currently not used.

Symptom Byte	Symptom Byte Description	Symptom Byte Definition
1F	Erratic	This sub type is used for failures where the Electronic Control Unit momentarily detects one of the conditions defined above but not long enough to set a specific sub type.
(20-2F) FM / PWM Failures This category includes faults related to Frequency Modulated (FM) and Pulse Width Modulated (PWM) inputs and outputs of the Electronic Control Unit and faults where position is determined by counts.		
20	-	Currently not used.
21	Incorrect Period	This sub type is used for failures where the Electronic Control Unit measures an incorrect duration for one cycle of the output.
22	Too Short Low-Time	This sub type is used for failures where the Electronic Control Unit detects the low pulse is too narrow with respect to time.
23	Too Long Low-Time	This sub type is used for failures where the Electronic Control Unit detects the low pulse is too wide with respect to time.
24	Too Short High-Time	This sub type is used for failures where the Electronic Control Unit detects the high pulse is too narrow with respect to time.
25	Too Long High-Time	This sub type is used for failures where the Electronic Control Unit detects the high pulse is too wide with respect to time.
26	Low Frequency	This sub type is used for failures where the Electronic Control Unit detects too few cycles in a given time period.
27	High Frequency	This sub type is used for failures where the Electronic Control Unit detects too many cycles in a given time period.
28	Incorrect Frequency	This sub type is used for failures where the Electronic Control Unit measures an incorrect number of cycles in a given time period.
29	Too Few Pulses	This sub type is used for failures where the Electronic Control Unit measures too few pulses (for example, position is calibrated in counts from one extreme to the other).
2A	Too Many Pulses	This sub type is used for failures where the Electronic Control Unit measures too many pulses (for example, position is calibrated in counts from one extreme to the other).
2B	Missing Reference	This sub type is used for failures where the Electronic Control Unit does not detect a reference for a signal circuit or a group of signal circuits.

Symptom Byte	Symptom Byte Description	Symptom Byte Definition
2C	-	Currently not used.
2D	-	Currently not used.
2E	-	Currently not used.
2F	-	Currently not used.
(30-3F) Electronic Control Unit Internal Failures This category includes faults related to memory, software, and internal electrical circuitry; requiring component replacement.		
30	-	Currently not used.
31	Internal Checksum Error	This sub type is used by the Electronic Control Unit to indicate an incorrect checksum calculation where memory type is not specified.
32	General Memory Malfunction	This sub type is used by the Electronic Control Unit to indicate a memory failure where memory type is not specified.
33	Special Memory Malfunction	This sub type is used by the Electronic Control Unit to indicate a memory failure where the specific memory type is not defined in this category.
34	RAM Malfunction	This sub type is used by the Electronic Control Unit to indicate a Random Access Memory (RAM) failure.
35	ROM Malfunction	This sub type is used by the Electronic Control Unit to indicate a Read Only Memory (ROM) failure.
36	EEPROM Performance/Malfunction	This sub type is used by the Electronic Control Unit to indicate an Electrically Erasable Programmable Read Only Memory (EEPROM) failure.
37	Software Malfunction	This sub type is used by the Electronic Control Unit to indicate a failure in the execution of operational software
38	Supervision Software Malfunction	This sub type is used by the Electronic Control Unit to indicate a loop time error in the execution of the operational software.
39	Internal Malfunction	This sub type is used by the Electronic Control Unit to indicate the detection of an internal circuit failure.
3A	Incorrect Component Installed	This sub type is used by the Electronic Control Unit to indicate a mismatch between the hardware connected to the Electronic Control Unit and the hardware expected by the Electronic Control Unit.

Symptom Byte	Symptom Byte Description	Symptom Byte Definition
3B	Self-Test Malfunction	This sub type is used by the Electronic Control Unit to indicate a sensor self-test failure launched by an Electronic Control Unit command.
3C	Internal Communication Malfunction	This sub type is used by the Electronic Control Unit to indicate loss of an internal communication line, for example, between microprocessors in a dual microprocessor configuration.
3D	-	Currently not used.
3E	-	Currently not used.
3F	-	Currently not used.
(40-4F) Electronic Control Unit Programming Failures This category includes faults related to operational software, calibrations, and options; remedied by programming the Electronic Control Unit.		
40	-	Currently not used.
41	Not Programmed	This sub type is used to indicate that only boot software is present in the Electronic Control Unit.
42	Calibration Not Programmed	This sub type is used to indicate that operational software is present but calibration data is not.
43	EEPROM Incorrect Programming	This sub type is used to indicate an EEPROM error that may be remedied by reprogramming the module.
44	Security Access Not Activated	This sub type is used to indicate that programming was attempted without unlocking the Electronic Control Unit.
45	Variant Not Programmed	This sub type is used to indicate the need to enter (program) the sub system option content.
46	Configuration Not Programmed	This sub type is used to indicate the need to enter (program) the vehicle option content.
47	VIN Not Programmed	This sub type is used to indicate the need to enter (program) the vehicle identification number (VIN).
48	Security Code Not Programmed	This sub type is used to indicate the need to enter (program) the theft / security code.
49	RAM Incorrect Programming	This sub type is used by the Electronic Control Unit to indicate a Random Access Memory (RAM) error remedied by reprogramming.
4A	Programming Checksum Error	This sub type is used by the Electronic Control Unit to indicate an incorrect checksum calculation where memory type is not specified.
4B	Calibration Not Learned	This sub type is used by the Electronic Control Unit to indicate that a password, operational range, etc. for a sensor or actuator must be learned by the Electronic Control Unit.

Symptom Byte	Symptom Byte Description	Symptom Byte Definition
4C	DTC Memory Full	This sub type is used by the Electronic Control Unit to indicate that more DTCs have been detected than can be accommodated by the memory allocated for DTC storage.
4D	Stack Overflow	This subtype is used by the Electronic Control Unit to indicate that more memory has been used in a stack than is allocated to a program.
4E	-	Currently not used.
4F	-	Currently not used.
(50-5F) Algorithm Based Failures This category includes faults based on comparing two or more input parameters for plausibility or comparing a single parameter to itself with respect to time.		
50	-	Currently not used.
51	-	Currently not used.
52	-	Currently not used.
53	Low Temperature	This sub type is used for failures where the Electronic Control Unit calculates a low temperature condition based upon the duration of certain operating parameters.
54	High Temperature	This sub type is used for failures where the Electronic Control Unit calculates a high temperature condition based upon the duration of certain operating parameters.
55	Too Few Transitions	This sub type is used for failures where the Electronic Control Unit monitors a parameter over time within specified limits and detects fewer than the expected number of transitions.
56	Too Many Transitions	This sub type is used for failures where the Electronic Control Unit monitors a parameter over time within specified limits and detects more than the expected number of transitions.
57	-	Currently not used.
58	Performance	This sub type is used for failures where the Electronic Control Unit does not see the expected change to a parameter or group of parameters in response to a particular event.
59	Protection Time-Out	This sub type is used for failures where the Electronic Control Unit detects a function is active for greater than a specified time period.
5A	Not Plausible	This sub type is used for failures where the Electronic Control Unit compares two or more input parameters for plausibility.
5B	-	Currently not used.
5C	-	Currently not used.

Symptom Byte	Symptom Byte Description	Symptom Byte Definition
5D	-	Currently not used.
5E	-	Currently not used.
5F	-	Currently not used.
(60-6F) Mechanical Failures This category includes faults detected by inappropriate motion in response to an Electronic Control Unit controlled output.		
60	-	Currently not used.
61	Stuck	This sub type is used for failures where the Electronic Control Unit does not detect any motion in response to energizing a motor, solenoid, relay, etc.
62	Stuck Open	This sub type is used for failures where the Electronic Control Unit does not detect any motion upon commanding the operation of a motor, solenoid, relay, etc., to close some piece of equipment.
63	Stuck Closed	This sub type is used for failures where the Electronic Control Unit does not detect any motion upon commanding the operation of a motor, solenoid, relay, etc., to open some piece of equipment.
64	Slip Detected	This sub type is used for failures where the Electronic Control Unit detects excessive duration to command a motor, solenoid, relay, etc., to move a piece of equipment to a desired position.
65	Emergency Position Not Achievable	This sub type is used for failures where the Electronic Control Unit is unable to command a motor, solenoid, relay, etc., to move a piece of equipment to the emergency position.
66	Incorrect Mounting	This sub type is used for failures where the server detects incorrectly mounted components, for example, acceleration sensor showing a position error of 90Â°.
67	Incorrect Assembly	This sub type is used for failures where the control module has detected that the component has been incorrectly installed (for example, hydraulic pipes crossed over, circuits cross wired) or polarity errors.
68	-	Currently not used.
69	-	Currently not used.
6A	-	Currently not used.
6B	-	Currently not used.
6C	-	Currently not used.

Symptom Byte	Symptom Byte Description	Symptom Byte Definition
6D	-	Currently not used.
6E	-	Currently not used.
6F	-	Currently not used.
(70-7F) Bus Signal / Message Failures This category includes faults related to bus hardware and signal integrity. This category is also used when the physical input for a signal is located in one Electronic Control Unit and another Electronic Control Unit diagnoses the circuit.		
70	-	Currently not used.
71	Invalid Data	This sub type is used by the Electronic Control Unit to indicate a signal was received with the corresponding validity bit equal to Invalid or post processing of the signal determines it is invalid.
72	Message Counter Incorrect	This sub type is used by the Electronic Control Unit to indicate a signal was received without the corresponding rolling count value being properly updated.
73	Parity Error	This sub type is used by the Electronic Control Unit to indicate a message was processed with an incorrect parity calculation.
74	Bus Signal Checksum Error	This sub type is used by the Electronic Control Unit to indicate a message was processed with an incorrect protection (checksum) calculation.
75	Serial Data Link High Input	This sub type is used for failures where some circuit quantity, reported via serial data, is above a specified range.
76	Serial Data Link Low Input	This sub type is used for failures where some circuit quantity, reported via serial data, is below a specified range.
77	-	Currently not used.
78	-	Currently not used.
79	-	Currently not used.
7A	-	Currently not used.
7B	-	Currently not used.
7C	-	Currently not used.
7D	-	Currently not used.
7E	-	Currently not used.
7F	Bus Signal Erratic	This sub type is used for failures where the signal, reported via serial data, is momentarily implausible or discontinuous.

- **Starter Solenoid Does Not Click**
- **Starter Solenoid Clicks, Engine Does Not Crank**
- **Engine Cranks Slowly**

ENGINE CRANKS BUT DOES NOT RUN

Refer to the appropriate diagnostic procedure below for the vehicle being serviced.

Engine Cranks But Does Not Run - 3.6L engine

INSPECTION/MAINTENANCE SYSTEM CHECK

Refer to the appropriate diagnostic procedure below for the vehicle being serviced.

Inspection/Maintenance System Check - 3.6L engine

DIAGNOSTIC REPAIR VERIFICATION

NOTE: **After a repair has been made, some DTCs require the ignition to be turned Off and then back On before the scan tool function will clear the DTC.**

1. Ignition/Vehicle Off.
2. Install any components or connectors that have been removed or replaced during diagnosis.
3. Perform any adjustment, programming or setup procedures that are required when a component or module is removed or replaced.
4. Ignition On/Vehicle in Service Mode.
5. Clear the DTCs.
6. Ignition/Vehicle Off for greater than 60s.
7. Perform the Circuit/System Verification and verify the result ends with an All OK.—If available

   or

   If the repair was related to a DTC, duplicate the Conditions for Running the DTC and use the Freeze Frame/Failure Records, if applicable, in order to verify the DTC does not set.If the DTC sets or another DTC is present, refer to:**Diagnostic Trouble Code (DTC) List - Vehicle**

   or

   If the repair was symptom related, duplicate the conditions under which the customer concern occurred to verify the repair.If the customer concern reoccurs or another symptom is present, refer to:**Symptoms - Vehicle**

DIAGNOSTIC INFORMATION AND PROCEDURES

VIBRATION DIAGNOSIS, STARTING POINT, AND CORRECTION

The information contained in this Vibration Diagnosis and Correction section is designed to cover various vehicle designs and configurations. Not all content will apply to all vehicles.

NOTE: **The following steps must be completed before using the analysis tables or the symptom tables.**

1. Perform the **Vibration Analysis - Road Testing (EL-38792-A Electronic Vibration Analyzer)Vibration Analysis - Road Testing (CH-51450-NVH Oscilloscope)** table before using the other Vibration Analysis tables or the Symptom tables in order to effectively diagnose the customer's concern.

   The use of Vibration Analysis - Road Testing will first provide duplication of virtually any vibration concern and then identify the correct procedure for diagnosing the area of concern which has been duplicated.

2. Review the following Vibration Diagnostic Process.
3. Review the general descriptions to familiarize yourself with vibration theory and terminology, the **CH-51450-NVH** Oscilloscope Diagnostic Kit (w/NVH) , or the **EL-38792-A** Electronic Vibration Analyzer (EVA) 2 , and

the **EL-38792-VS** Vibrate Software. Reviewing this information will help you determine whether the condition described by the customer is a potential operating characteristic or not.

Refer to the following:

- **Vibration Theory and Terminology**
- **Oscilloscope Diagnostic Kit Description and Operation**
- **Electronic Vibration Analyzer (EVA) Description and Operation**
- **Vibrate Software Description and Operation**
- **Reed Tachometer Description**

Vibration Diagnostic Process

NOTE: **Using the following steps of the vibration diagnostic process will help you to effectively narrow-down and pin-point the search for the specific source of a vibration concern and to arrive at an accurate repair.**

1. Gather specific information on the customer's vibration concern.
2. Perform the road testing steps in sequence as identified in Vibration Analysis - Road Testing in order to duplicate the customer's concern and evaluate the symptoms of the concern under changing conditions. Observe what the vibration feels like and what it sounds like. Observe when the symptoms first appear, when they change, and when they cease.
3. Determine if the customer's vibration concern is truly an abnormal condition or something that is potentially an operating characteristic of the vehicle.
4. Systematically eliminate or "rule-out" possible vehicle systems.
5. Focus diagnostic efforts on the remaining vehicle system and systematically eliminate or "rule-out" possible components of that system.
6. Make a repair on the remaining component, or components, which have not been eliminated systematically, and must therefore be the cause of the vibration.
7. Verify that the customer's concern has been eliminated or at least brought to an acceptable level.
8. Again perform the road testing steps in sequence as identified in Vibration Analysis - Road Testing in order to verify that the vehicle did not have more than one vibration occurring.

Preliminary Visual/Physical Inspection

- Inspect for aftermarket equipment and modifications which could affect the operation of the vehicle rotating component systems.
- Inspect the easily accessible or visible components of the vehicle rotating component systems for obvious damage or conditions which could cause the symptom.
- Inspect the tire inflation pressures for the proper pressure.

Diagnostic Aids

Improper component routing or isolation, or components which are worn or faulty may be the cause of intermittent conditions that are difficult to duplicate. If the vibration concern could not be duplicated by following the steps of the Vibration Diagnostic Process, refer to **Vibration Diagnostic Aids**.

VIBRATION ANALYSIS - ROAD TESTING (EL-38792-A ELECTRONIC VIBRATION ANALYZER)

Test Description

The numbers below refer to the step numbers on the diagnostic table.

5

Obtaining rotational speed for the components rotating at tire/wheel speed is critical to systematically eliminating specific vehicle component groups. These component rotational speeds can be generated by using the **J-38792-VS** Vibrate Software , or through calculating them manually.

10

NOTE: **Be certain to OBSERVE for disturbances that match the customer's description FIRST, then look at the J-38792-A Electronic Vibration Analyzer 2 (EVA 2) frequency which corresponds with that disturbance.**

Proper location of the **J-38792-A** Electronic Vibration Analyzer 2 (EVA 2) , sensor onto the component which is most excited by the vibration disturbance is critical to obtaining an accurate frequency reading.

This test will duplicate virtually any disturbance which occurs while the vehicle is in motion.

11

Accelerate to a speed high enough above the speed of the disturbance to allow for the time needed to shift into NEUTRAL and for the engine to decrease in RPM to idle speed, before coasting down through the disturbance range.

12

This test will either eliminate or confirm the engine as a contributing cause of the customer concern.

Step	Action	Yes	No
WARNING: **Refer to Road Test Warning .**			
1	Did you review the Diagnostic Starting Point - Vibration Diagnosis?	Go to **Step 2**	Go to **Vibration Diagnosis, Starting Point, and Correction**
2	Did the customer concern indicate that the vibration occurs ONLY while the vehicle is standing still?	Go to **Step 6**	Go to **Step 3**
3	Visually inspect the tire and wheel assemblies, steering components and suspension components for any possible faults. Are the tire and wheel assemblies, steering components and suspension components in good working condition?	Go to **Step 5**	Go to **Step 4**
4	**NOTE:** **Do NOT operate the vehicle until the faults are**	Go to **Step 5**	Go to **Step 3**

Step	Action	Yes	No
	corrected. Correct the faults with the tire and wheel assemblies, steering components, and/or the suspension components before proceeding .Did you correct the faults with the tire and wheel assemblies, steering components, and/or the suspension components?		
5	1. Obtain the drive axle final drive ratio. 2. If the **J-38792-VS** Vibrate Software , IS available, obtain the transmission gear ratios. 3. If the **J-38792-VS** Vibrate Software is NOT available, take note of the tire size on each axle, then calculate the tire rotational speed for each size tire used. Refer to **Component Rotational Speed Calculation**. Did you obtain the powertrain ratios for use with the **J-38792-VS** Vibrate Software , or calculate the component rotational speeds, if **J-38792-VS** Vibrate Software is NOT available?	Go to **Step 6**	-
6	1. Install a scan tool. 2. With the scan tool, bring up the Powertrain Control Module data list and select Engine Speed. Is the scan tool operating properly?	Go to **Step 7**	**Diagnostic Starting Point - Vehicle**
7	Using the **J-38792-A** Electronic Vibration Analyzer 2 (EVA 2) , is the preferred method for gathering necessary vibration frequency data. If the **J-38792-A** Electronic Vibration Analyzer 2 (EVA 2) is not available, the necessary vibration frequency data will have to be obtained based on symptoms observed during testing. Review **Symptoms - Vibration Diagnosis and Correction** to become familiar with the possible frequency ranges. Review Symptoms - Vibration Diagnosis and Correction, as necessary throughout the remainder of diagnostics. Is the **J-38792-A** Electronic Vibration Analyzer 2 (EVA 2) available for use?	Go to **Step 8**	Go to **Step 9**
8	Install the **J-38792-A** Electronic Vibration Analyzer 2 (EVA 2). Is the **J-38792-A** Electronic Vibration Analyzer 2 (EVA 2) operating properly?	Go to **Step 9**	Go to **Electronic Vibration Analyzer (EVA) Description and Operation**
9	Did the customer concern indicate that the vibration occurs ONLY while the vehicle is standing still?	Go to **Vibration Analysis - Engine**	Go to **Step 10**
10	1. Install the **J-38792-A** Electronic Vibration Analyzer 2 (EVA 2) sensor, if available, to the component identified by the customer as most	Go to **Step 11**	Go to **Vibration Diagnostic Aids**

Step	Action	Yes	No
	respondent to the vibration. If no component was identified, install the **J-38792-A** Electronic Vibration Analyzer 2 (EVA 2) sensor, if available, to the steering column. You may have to move the sensor to other locations later. 2. Select a smooth, level road and slowly accelerate the vehicle up to highway speed. 3. Observe the vehicle for disturbances that match the customer's description and note the following conditions: • The vehicle speed • The engine RPM • The transmission gear range and the specific gear • The vibration frequency reading, if detected by the **J-38792-A** Electronic Vibration Analyzer 2 (EVA 2) • The feel and/or sound of the disturbance 4. If the vibration seems to excite a particular component of the vehicle more than the steering column, then move the **J-38792-A** Electronic Vibration Analyzer 2 (EVA 2) sensor, if available, onto that component and repeat steps 2 and 3. Were you able to duplicate the customer's concern?		
11	1. Accelerate the vehicle to a speed higher than the speed at which the disturbance occurs. **NOTE:** **If the vehicle is equipped with an automatic transmission, let the vehicle coast to a stop before shifting back into gear.** 2. Shift the vehicle into NEUTRAL and allow the vehicle to coast down through the disturbance range. Does the disturbance still occur while coasting-down in NEUTRAL?	Go to **Step 13**	Go to **Step 12**

Step	Action	Yes	No
12	1. Select a smooth, level road and slowly accelerate the vehicle up to the speed at which the disturbance occurs. 2. Decelerate and safely downshift by one gear range. 3. Operate the vehicle at the same VEHICLE SPEED at which the disturbance occurs. Does the same disturbance still occur while going the same vehicle speed in a lower gear range?	Go to **Vibration Analysis - Hub and/or Axle Input**	Go to **Vibration Analysis - Engine**
13	If the **J-38792-A** Electronic Vibration Analyzer 2 (EVA 2) is not available, refer to **Symptoms - Vibration Diagnosis and Correction**. Did the **J-38792-A** Electronic Vibration Analyzer 2 (EVA 2) detect a dominant frequency?	Go to **Step 14**	Go to **Symptoms - Vibration Diagnosis and Correction**
14	1. If the **J-38792-VS** Vibrate Software IS available, use the drive axle final drive ratio, the specific transmission gear ratio, and the engine RPM to make a comparison to the dominant frequency reading recorded. 2. If the **J-38792-VS** Vibrate Software is NOT available, compare the dominant frequency reading recorded to the component rotational data which you calculated previously. Does the frequency data clearly fall within the tire/wheel parameters ONLY?	Go to **Vibration Analysis - Tire and Wheel**	Go to **Symptoms - Vibration Diagnosis and Correction**

VIBRATION ANALYSIS - ROAD TESTING (CH-51450-NVH OSCILLOSCOPE)

Special Tools

- **CH-51450-NVH** Oscilloscope Diagnostic Kit (w/NVH)
- **EL-47955** Multi Diagnostic Interface (MDI)

For equivalent regional tools, refer to **Special Tools and Equipment**.

Test Description

The numbers below refer to the step numbers on the diagnostic table.

NOTE: **Be certain to OBSERVE for disturbances that match the customers description FIRST, then look at the CH-51450-NVH Oscilloscope Diagnostic Kit (w/NVH) frequency which corresponds with that disturbance.**

10

Proper location of the **CH-51450-NVH** oscilloscope accelerometer onto the component which is most excited by the vibration disturbance is critical to obtaining an accurate frequency reading.

This test will duplicate virtually any disturbance which occurs while the vehicle is in motion.

11

Accelerate to a speed high enough above the speed of the disturbance to allow for the time needed to shift into NEUTRAL and for the engine to decrease in RPM to idle speed before coasting down through the disturbance range.

12

This test will either eliminate or confirm the engine as a contributing cause of the customer concern.

Step	Action	Yes	No
1	Did you review the Diagnostic Starting Point - Vibration Diagnosis?	Go to **Step 2**	Go to **Diagnostic Starting Point - Vehicle**
2	Did the customer concern indicate that the vibration occurs ONLY while the vehicle is standing still?	Go to **Step 6**	Go to **Step 3**
3	Visually inspect the tire and wheel assemblies, steering components and suspension components for any possible faults. Are the tire and wheel assemblies, steering components and suspension components in good working condition?	Go to **Step 5**	Go to **Step 4**
4	**NOTE:** **Do NOT operate the vehicle until the faults are corrected.** Correct the faults with the tire and wheel assemblies, steering components, and/or the suspension components before proceeding.Did you correct the faults with the tire and wheel assemblies, steering components, and/or the suspension components?	Go to **Step 5**	Go to **Step 3**
5	Obtain the drive axle final drive ratio. Did you obtain the drive axle final drive ratio?	Go to **Step 6**	-
6	Install the **CH-51450-NVH** Oscilloscope and the **EL-47955** MDI. Is the **CH-51450-NVH** Oscilloscope operating properly?	Go to **Step 7**	**Oscilloscope Diagnostic Kit Description and Operation**
7	Did the customer concern indicate that the vibration occurs ONLY while the vehicle is standing still?	Go to **Vibration Analysis - Engine**	Go to **Step 8**
8	Did the customer concern indicate that the vibration occurs ONLY during heavy acceleration at launch?	Go to **Step 9**	Go to **Step 10**
9	1. Install the **CH-51450-NVH-TA183** accelerometer to the pinion area of the drive axle. Route the accelerometer cable clear of rotating parts and loosely secure the wire clear of moving parts. If it	Go to **Vibration Analysis - Hub and/or Axle Input**	Go to **Step 10**

Step	Action	Yes	No
	is not possible to install the **CH-51450-NVH-TA183** accelerometer to the drive axle, install the accelerometer to an exposed portion of the floor panel or seat track in the area that the customer noted is most respondent to the vibration. 2. Select a smooth, level road. 3. With the vehicle at a stand-still, apply the brake pedal and place the transmission in the lowest forward gear. **NOTE:** **Do not accelerate to the point of causing the drive wheels to squeal, slip, or hop. This would obscure the results of the test.** 4. Release the brake pedal and accelerate aggressively to 32 km/h (20 mph). 5. Observe the vehicle for disturbances that match the customers description and note the following conditions: • The vibration frequency reading, if detected, by the **CH-51450-NVH** Oscilloscope • The feel and/or sound of the disturbance 6. If a reading could not be obtained by the **CH-51450-NVH** Oscilloscope, move the **CH-51450-NVH-TA183** accelerometer to another part that is respondent to the vibration and repeat Steps 3-5. Were you able to duplicate the customer concern?		
10	1. Install the **CH-51450-NVH-TA183** accelerometer to the component identified by the customer as most respondent to the vibration. If no component was identified, install the **CH-51450-NVH-TA183** accelerometer to the drivers side right seat rail. You may have to move the sensor to other locations later. 2. Select a smooth, level road and slowly accelerate the vehicle up to highway speed.	Go to **Step 11**	Go to **Vibration Diagnostic Aids**

Step	Action	Yes	No
	3. Observe the vehicle for disturbances that match the customers description and note the following conditions or take a snapshot using the **CH-51450-NVH** software: • The vehicle speed • The engine RPM • The transmission gear range and the specific gear • The vibration frequency reading, if detected, by the **CH-51450-NVH** Oscilloscope • The feel and/or the sound of the disturbance 4. If the vibration seems to excite a particular component of the vehicle more than the sear rail, move the **CH-51450-NVH-TA183** accelerometer onto that component and repeat Steps 2 and 3. Were you able to duplicate the customer concern?		
11	1. Accelerate the vehicle to a speed higher than the speed at which the disturbance occurs. **NOTE:** **If the vehicle is equipped with a continuously variable type automatic transmission, let the vehicle coast to a stop before shifting back into gear.** 2. Shift the vehicle into NEUTRAL and allow the vehicle to coast down through the disturbance range. Does the disturbance still occur while coasting down in NEUTRAL?	Go to **Step 13**	Go to **Step 12**

Step	Action	Yes	No
12	1. Select a smooth, level road and slowly accelerate the vehicle up to the speed at which the disturbance occurs. 2. Decelerate and safely downshift by one gear range. 3. Operate the vehicle at the same VEHICLE SPEED at which the disturbance occurs. Does the same disturbance still occur while going the same vehicle speed in a lower gear range?	Go to **Vibration Analysis - Hub and/or Axle Input**	Go to **Vibration Analysis - Engine**
13	If the **CH-51450-NVH** Oscilloscope is not available, refer to **Symptoms - Vibration Diagnosis and Correction**. Did the **CH-51450-NVH** Oscilloscope detect a dominant frequency?	Go to **Step 14**	Go to **Symptoms - Vibration Diagnosis and Correction**
14	Does the frequency data clearly fall within the tire/wheel parameters ONLY?	Go to **Vibration Analysis - Tire and Wheel**	Go to **Symptoms - Vibration Diagnosis and Correction**

COMPONENT ROTATIONAL SPEED CALCULATION

Special Tools

- **CH-51450-NVH** Oscilloscope Diagnostic Kit (w/NVH)
- **EL-38792-A** Electronic Vibration Analyzer (EVA) 2
- **EL-47955** Multi Diagnostic Interface (MDI)

For equivalent regional tools, refer to **Special Tools and Equipment**.

NOTE: **If using the CH-51450-NVH Oscilloscope Diagnostic Kit (w/NVH) , the component rotation is integrated into the tool. The diameter of the pulley will need to be measured and manually entered into the NVH software.**

Tire Rotational Speed

Determining Tire Revolutions Per Second at 8 km/h (5 mph) - Using EVA

Tire and wheel assembly rotational speed can be obtained through using the **EL-38792-A** Electronic Vibration Analyzer (EVA) 2. Perform the following steps using the **EL-38792-A** Electronic Vibration Analyzer (EVA) 2 to obtain the rotational speed at 8 km/h (5 mph). Use the Enter key to advance and the Exit key to backup.

1. On the Main Menu screen, select Auto Mode.
2. On the Suspected Source screen, select Vehicle Speed.
3. On the Tire Info Source screen, select Manual Entry.
4. On the Tire Width screen, enter the specific width of the tires.

   For example: For a P245/45/R18 tire, enter 245.

5. On the Aspect Ratio screen, enter the specific aspect ratio of the tires.

For example: For a P245/45/R18 tire, enter 0.45.

6. On the Rim Diameter screen, enter the specific rim diameter size.

   For example: For a P245/45/R18 tire, enter 18.0.

7. On the Driveshaft Configuration screen, enter FWD, even if the vehicle is a rear wheel drive.
8. The next screen will display the tire size just entered for confirmation.

   For example: 245 0.45 18.0 -Front Wheel Drive. If the tire size displayed is correct, press Enter.

9. On the Vehicle Speed Units screen, press Enter, disregard mph or km/h.
10. Press the Exit key several times slowly while watching the backwards progression of the screens. Stop at the Tire Info Source screen.
11. On the Tire Info Source screen, select RPS at 5 mph.
12. The next screen will display the revolutions per second (RPS) at 8 km/h (5 mph) for that specific tire size.

    For example: The P245/45/R18 will display 1.08 RPS.

Calculating Tire Revolutions Per Second at 8 km/h (5 mph) - Without Ocilloscope or EVA

If the **EL-38792-A** Electronic Vibration Analyzer (EVA) 2 is not available, the tire and wheel assembly rotational speed can be calculated approximately by performing the following steps.

1. Convert the rim diameter size from inches to centimeters.

   For example: For a P245/45/R18 tire, the rim diameter of 18 in X 2.54 converts to 45.72 cm.

2. Calculate the radius of the rim by dividing the rim diameter by 2.

   For example: For a P245/45/R18 tire, the rim diameter of 18 is converted to 45.72 cm divided by 2 = rim radius 22.86 cm.

3. Calculate the approximate tire sidewall height by multiplying the specific tire tread width by the aspect ratio, then reduce 7 percent from the amount by multiplying by 93 percent to approximate load on the tire reducing the sidewall height.

   For example: For a P245/45/R18 tire, tread width 245 mm X aspect ratio as a decimal 0.45 = 110 mm X 0.93 = approximate sidewall height 102.30 mm.

4. Convert the calculated approximate tire sidewall height from millimeters to centimeters.

   For example: For a P245/45/R18 tire, approximate sidewall height 102.30 mm converts to 10.23 cm.

5. Calculate the approximate tire and wheel assembly radius by adding the rim radius and approximate sidewall height, both in cm.

   For example: For a P245/45/R18 tire, rim radius 22.86 cm + 10.23 cm = approximate tire and wheel assembly radius 33.09 cm.

6. Calculate the approximate circumference of the tire and wheel assembly by multiplying 2 X pi, or 6.283185 X the approximate tire and wheel assembly radius.

For example: For a P245/45/R18 tire, 6.283185 X approximate tire and wheel assembly radius 33.09 cm = approximate tire and wheel assembly circumference 207.911 cm.

7. Calculate the approximate revolutions per kilometer by dividing the number of cm in 1 km, 100,000 cm by the approximate tire and wheel assembly circumference.

   For example: For a P245/45/R18 tire, 100,000 cm divided by approximate tire and wheel assembly circumference 207.911 cm = approximate revolutions per kilometer 480.975.

8. Calculate the approximate revolutions per second (RPS), or Hz, by dividing the approximate revolutions per kilometer by the number of seconds to travel 1 km at a speed of 8 km per hour, 450 seconds.

   For example: For a P245/45/R18 tire, approximate revolutions per kilometer 480.975 divided by the number of seconds to travel 1 km at a speed of 8 km per hour, 450 seconds = approximate RPS, or Hz 1.069 rounded to 1.07.

Calculating Tire Revolutions Per Second, or Hz at Concern Speed

A size P235/75R15 tire rotates ONE complete revolution per second (RPS), or 1 Hz, at a vehicle speed of 8 km/h (5 mph). This means that at 16 km/h (10 mph), the same tire will make TWO complete revolutions in one second, 2 Hz, and so on.

1. Determine the rotational speed of the tires in revolutions per second (RPS), or Hertz (Hz), at 8 km/h (5 mph), based on the size of the tires. Refer to the preceding Tire Rotational Speed information.

   For example: According to the Tire Rotational Speed information, a P245/45R18 tire makes 1.08 revolutions per second (Hz) at a vehicle speed of 8 km/h (5 mph). This means that for every increment of 8 km/h (5 mph) in vehicle speed, the tire's rotation increases by 1.08 revolutions per second, or Hz.

2. Determine the number of increments of 8 km/h (5 mph) that are present, based on the vehicle speed in km/h (mph) at which the disturbance occurs.

   For example: Assume that a disturbance occurs at a vehicle speed of 96 km/h (60 mph). A speed of 96 km/h (60 mph) has 12 INCREMENTS of 8 km/h (5 mph):

   96 km/h (60 mph) divided by 8 km/h (5 mph) = 12 increments

3. Determine the rotational speed of the tires in revolutions per second, or Hz, at the specific vehicle speed in km/h (mph) at which the disturbance occurs.

   For example: To determine the tire rotational speed at 96 km/h (60 mph), multiply the number of increments of 8 km/h (5 mph) by the revolutions per second, or Hz, for one increment:

   12 increments X 1.08 Hz = 12.96 Hz, rounded to 13 Hz

   NOTE: **If the EL-38792-A Electronic Vibration Analyzer (EVA) 2 is not available, compare the calculated rotational speed to the frequency range associated with the symptoms of the vibration concern. Refer to Symptoms - Vibration Diagnosis and Correction.**

4. Compare the rotational speed of the tires at the specific vehicle speed at which the disturbance occurs, to the dominant frequency recorded on the **EL-38792-A** Electronic Vibration Analyzer (EVA) 2 during testing. If the frequencies match, then a first-order disturbance related to the rotation of the tire/wheel assemblies is present.

If the frequencies do not match, then the disturbance may be related to a higher order of tire/wheel assembly rotation.

5. To compute higher order tire/wheel assembly rotation related disturbances, multiply the rotational speed of the tires at the specific vehicle speed at which the disturbance occurs, by the order number:

   13 Hz X 2, for second order = 26 Hz second-order tire/wheel assembly rotation related

   13 Hz X 3, for third order = 39 Hz third-order tire/wheel assembly rotation related

   If any of these computations match the frequency of the disturbance, a disturbance of that particular order, relating to the rotation of the tire/wheel assemblies and/or driveline components, also rotating at the same speed, is present.

Component Rotational Speed Worksheet

Utilize the following worksheet as an aid in calculating the first, second and third order of tire/wheel assembly rotational speed related disturbances that may be present in the vehicle.

If after completing the Tire/Wheel Rotation Worksheet, the frequencies calculated do NOT match the dominant frequency of the disturbance recorded during testing, either recheck the data, or attempt to rematch the figures allowing for 1 1/2 -8 km/h (1-5 mph) of speedometer error.

If the possible tire/wheel assembly rotational speed related frequencies still do not match the dominant frequency of the disturbance, the disturbance is most likely torque/load sensitive.

If after completing the Tire/Wheel Rotation Worksheet, one of the frequencies calculated DOES match the dominant frequency of the disturbance, the disturbance is related to the rotation of that component group - tire/wheel assembly related.

VIBRATION ANALYSIS - TIRE AND WHEEL

Test Description

The numbers below refer to the step numbers in the diagnostic table:

4

A build-up of foreign material on a tire and wheel assembly and/or a damaged, abnormally or excessively worn tire and wheel assembly could cause a vibration disturbance.

6

Tire and wheel assemblies that exhibit excessive runout when measured while mounted on the vehicle, may or may not be contributing to, or causing a vibration disturbance. On-vehicle runout, if present, could contribute to, or cause a vibration disturbance, but the cause of the on-vehicle runout may not be the tire and wheel assemblies.

7

Tire and wheel assemblies that exhibit excessive runout when measured off of the vehicle could cause a vibration disturbance.

9

Tire and wheel assemblies that exhibit marginal runout-within acceptable limits, but close to the maximum-when measured off of the vehicle could still be contributing to a vibration disturbance, if its mating hub/axle flange also exhibits marginal runout. When the tire and wheel assembly and the hub axle flange are mounted to each other, the combined stack-up of their marginal amounts of runout could combine to produce an excessive amount of runout, which could cause a vibration disturbance.

14

Brake rotors and/or brake drums, if equipped, that exhibit excessive imbalance could contribute to, or possibly cause a vibration disturbance.

15

A hub/axle flange and/or wheel studs that exhibit excessive runout could cause a vibration disturbance.

16

When the tire and wheel assembly and the hub axle flange are mounted to each other, the combined stack-up of their marginal amounts of runout could combine to produce an excessive amount of runout, which could cause a vibration disturbance. Match-mounting or vectoring the tire and wheel assembly to the hub/axle flange will modify the amount of combined runout.

18

Force variation may be present in a tire and wheel assembly that exhibited acceptable balance and runout. Force variation, if present, could contribute to, or cause a vibration disturbance.

20

Vibration disturbances could be affected by, or possibly caused by, components that are susceptible to steering input and/or torque-load input.

22

On-vehicle balancing, or finish-balancing can be used to reduce small amounts of imbalance which may be present as a result of the combined stack-up of the tire and wheel assembly with other components which may exhibit marginal balance.

Step	Action	Yes	No
1	Has the Vibration Analysis - Road Testing table been completed?	Go to **Step 2**	Go to **Vibration Analysis - Road Testing (EL-38792-A Electronic Vibration Analyzer)Vibration Analysis - Road Testing (CH-51450-NVH Oscilloscope)**
2	Based on the Vibration Analysis - Road Testing table, is the concern first-order tire and wheel assembly related?	Go to **Step 4**	Go to **Step 3**

Step	Action	Yes	No
3	Based on the Vibration Analysis - Road Testing table, is the concern second-order, or higher-order tire and wheel assembly related?	Go to **Step 18**	Go to **Vibration Analysis - Road Testing (EL-38792-A Electronic Vibration Analyzer)Vibration Analysis - Road Testing (CH-51450-NVH Oscilloscope)**
4	Visually inspect the tire and wheel assemblies for the following: • Debris build-up, such as packed mud, undercoating, ice/snow buildup, road tar, etc. • Damage, abnormal or excessive wear Refer to **Tire and Wheel Inspection**. Do any of the tire and wheel assemblies exhibit any of the conditions listed?	Go to **Step 5**	Go to **Step 6**
5	1. Remove the debris from the tire and wheel assemblies. 2. Replace the damaged, abnormally or excessively worn wheels or tires as necessary. Did you complete the repair or replacement?	Go to **Step 23**	-
6	Measure the on-vehicle runout of the tire and wheel assemblies. Refer to **Tire and Wheel Assembly Runout Measurement - On-Vehicle**. Does the runout measurement indicate a runout concern?	Go to **Step 7**	Go to **Step 12**
7	Measure the off-vehicle runout of the tire and wheel assemblies. Refer to **Tire and Wheel Assembly Runout Measurement - Off Vehicle**. Does the runout measurement indicate a runout concern?	Go to **Step 19**	Go to **Step 8**
8	Is the vehicle equipped with run-flat tires?	Go to **Step 12**	Go to **Step 9**
9	Are any of the tire and wheel assembly runout measurements marginal; within acceptable limits, but close to the maximum?	Go to **Step 10**	Go to **Step 15**
10	**NOTE:** **Ensure that each tire and wheel assembly that is match-mounted is properly balanced**	Go to **Step 11**	Go to **Step 19**

Step	Action	Yes	No
	before reinstalling to the vehicle. 1. Match-mount the tire-to-wheel for each tire and wheel assembly with marginal runout. Refer to **Tire-to-Wheel Match-Mounting (Vectoring)**. 2. Measure the runout of each match-mounted tire and wheel assembly. Refer to **Tire and Wheel Assembly Runout Measurement - Off Vehicle**. Were you able to significantly reduce the amount of tire and wheel assembly runout?		
11	Re-measure the on-vehicle runout of the tire and wheel assemblies. Refer to **Tire and Wheel Assembly Runout Measurement - On-Vehicle**. Does the measurement indicate a runout concern?	Go to **Step 15**	Go to **Step 23**
12	Inspect the balance of the tire and wheel assemblies. Refer to **Tire and Wheel Assembly Balancing - Off Vehicle**. Are any or the tire and wheel assemblies out of balance?	Go to **Step 13**	Go to **Step 14**
13	Balance the tire and wheel assemblies as necessary. Refer to **Tire and Wheel Assembly Balancing - Off Vehicle**. Were you able to achieve balance?	Go to **Step 23**	Go to **Vibration Diagnostic Aids**
14	1. Inspect the brake rotors and brake drums, if equipped, for damage. 2. Inspect the balance of the brake rotors and brake drums, if equipped. Refer to **Brake Rotor/Drum Balance Inspection**. 3. Replace brake rotors and/or brake drums, if equipped, that are damaged and/or out of balance. Did you find and correct a condition?	Go to **Step 23**	Go to **Step 17**

Step	Action	Yes	No
15	1. Measure the runout of the hub/axle flanges and the wheel studs, if equipped. 2. Inspect the wheel bolts, if equipped, for straightness and damage. 3. Refer to **Hub/Axle Flange and Wheel Stud Runout Inspection**. 4. If the inspection procedure indicates a runout concern, replace the appropriate components: • Wheel studs, if equipped • Wheel bolts, if equipped • Wheel bearing/hub assembly Did you find and correct a condition?	Go to **Step 23**	Go to **Step 16**
16	1. Match-mount the tire and wheel assemblies-to-hub/axle flanges. Refer to **Tire and Wheel Assembly-to-Hub/Axle Flange Match-Mounting**. 2. Re-measure the on-vehicle runout of tire and wheel assemblies. Refer to **Tire and Wheel Assembly Runout Measurement - On-Vehicle**. Were you able to significantly reduce the amount of on-vehicle tire and wheel assembly runout?	Go to **Step 23**	Go to **Step 2**
17	Inspect for radial and lateral force variation. Refer to **Tire and Wheel Assembly Isolation Test**. Were you able to isolate one or more of the tire and wheel assemblies as the cause of the disturbance?	Go to **Step 19**	Go to **Step 20**
18	Inspect for radial and lateral force variation. Refer to **Tire and Wheel Assembly Isolation Test**. Were you able to isolate one or more of the tire and wheel assemblies as the cause of the disturbance?	Go to **Step 19**	Go to **Step 21**
19	Replace any tires and/or wheels that were isolated as the cause of the disturbance, as necessary. Did you complete the replacement?	Go to **Step 23**	-
20	Perform the Vibration Analysis - Hub/Axle Input table. Refer to **Vibration Analysis - Hub and/or Axle Input**. Did you find and correct a condition?	Go to **Step 23**	Go to **Step 22**
21	Perform the Vibration Analysis - Hub/Axle Input table. Refer to **Vibration Analysis - Hub and/or Axle Input**. Did you find and correct a condition?	Go to **Step 23**	Go to **Vibration Diagnostic Aids**
22	Finish-balance the tire and wheel assemblies on-vehicle. Refer to **Tire and Wheel Assembly Balancing - On-Vehicle**. Did you complete the on-vehicle finish balancing?	Go to **Step 23**	-

Step	Action	Yes	No
23	1. Install or connect any components that were removed or disconnected during diagnosis. 2. Perform the Vibration Analysis - Road Testing table. Refer to **Vibration Analysis - Road Testing (EL-38792-A Electronic Vibration Analyzer)Vibration Analysis - Road Testing (CH-51450-NVH Oscilloscope)**. Is the vibration still present?	Go to **Step 2**	System OK

VIBRATION ANALYSIS - HUB AND/OR AXLE INPUT

Test Description

The numbers below refer to the step numbers on the diagnostic table:

2

This test will determine the effect of turning input on the vibration.

6

This test will determine the effect of an initial heavy torque load on the vibration.

7

Damaged or worn wheel drive shafts may cause a noise or vibration that may be transferred into the passenger compartment.

8

Damaged or worn wheel bearings may cause a noise or vibration that may be transferred into the passenger compartment.

9

Damaged or worn suspension components may cause a noise or vibration that may be transferred into the passenger compartment.

10

Damaged or worn powertrain mounts and/or exhaust mounts may cause a noise or vibration that may be transferred into the passenger compartment.

11

Incorrect trim height may cause binding and/or interference between components that may produce a vibration.

Step	Action	Yes	No
WARNING:			

Step	Action	Yes	No
Refer to Road Test Warning .			
1	Has the Vibration Analysis - Road Testing table been completed?	Go to **Step 2**	Go to **Vibration Analysis - Road Testing (EL-38792-A Electronic Vibration Analyzer)Vibration Analysis - Road Testing (CH-51450-NVH Oscilloscope)**
2	1. Operate the vehicle at the speed of the vibration concern. 2. While maintaining the concern speed, drive the vehicle through slow, sweeping turns - first in one direction, then in the other direction. 3. Observe the vehicle for changes in the vibration disturbance. 4. Select a smooth, level surface, such as an empty parking lot or a remote road. 5. While maintaining the vehicle at the concern speed if possible, drive the vehicle through sharp turns; 360 degrees - first in one direction, then in the other direction. 6. Observe the vehicle for changes in the vibration disturbance. Did the characteristics of the vibration change significantly-become worse or go away-during these steps?	Go to **Step 3**	Go to **Step 6**
3	Did you hear a clicking noise and/or feel a shudder during these steps?	Go to **Step 7**	Go to **Step 4**
4	Did you hear a growling noise during these steps?	Go to **Step 8**	Go to **Step 5**
5	Did you hear a popping noise during these steps?	Go to **Step 9**	Go to **Step 12**
6	1. With the vehicle at a stand-still, apply the regular brake and place the transmission in the lowest forward gear. **NOTE:** **Do not accelerate to the point of causing the drive wheels to squeal, slip or hop-**	Go to **Step 7**	Go to **Vibration Diagnostic Aids**

Step	Action	Yes	No
	this would obscure the results of the test. 2. Release the regular brakes and accelerate aggressively to 32 km/h (20 mph). 3. Observe the vehicle for changes in the vibration disturbance. Did you feel a shudder or shaking during these steps?		
7	1. Inspect the wheel drive shafts, if equipped, for damage, abnormal and/or excessive wear. 2. If the inspection indicated that a wheel drive shaft is damaged, abnormally and/or excessively worn, replace the shaft. Did you find and correct a condition?	Go to **Step 12**	Go to **Step 9**
8	1. Inspect the wheel bearings for wear and/or damage. 2. Replace any of the wheel bearings found to be worn and/or damaged. Did you find and correct a condition?	Go to **Step 12**	Go to **Vibration Diagnostic Aids**
9	1. Inspect the following suspension components for wear, damage, looseness and/or possible contact with other vehicle components: • Struts/shock absorbers • Springs • Bushings • Insulators 2. Replace any of the suspension components found to be worn, damaged, loose and/or contacting other vehicle components. Did you find and correct a condition?	Go to **Step 12**	Go to **Step 10**
10	1. Inspect the powertrain mounts-engine, transmission, transfer case, and direct-mount differential, if equipped-and any powertrain braces for the following conditions: • Loose and/or missing fasteners • Improper alignment • Cracked, dry-rotted, and/or oil-soaked insulators • Twisted, broken, torn, and/or collapsed insulators	Go to **Step 12**	Go to **Step 11**

Step	Action	Yes	No
	• Bent, twisted, and/or deformed brackets 2. Replace powertrain mounts as necessary. 3. Inspect the exhaust system components for the following: • Loose and/or missing fasteners • Heat Shields • Joints and/or couplings: Nuts, bolts, studs, clamps, straps • Bracket and/or insulator mounting • Inadequate clearance to body and/or chassis components Inspect with the exhaust system both COLD and HOT; in NEUTRAL, FORWARD and REVERSE gears • Improper alignment • Disconnected and/or missing insulators • Cracked, dry-rotted, and/or oil-soaked insulators • Stretched, twisted, broken, torn, and/or collapsed insulators • Bent, twisted, cracked, and/or deformed brackets 4. Repair, replace, and/or realign exhaust system components as necessary. Did you find and correct a condition?		
11	Inspect the vehicle trim height and adjust as necessary. Refer to **Trim Height Inspection** . Did you find and correct a condition?	Go to **Step 12**	Go to **Vibration Diagnostic Aids**
12	1. Install or connect any components that were removed or disconnected during diagnosis. 2. Perform the Vibration Analysis - Road Testing table. Refer to **Vibration Analysis - Road Testing (EL-38792-A Electronic Vibration Analyzer)Vibration Analysis - Road Testing (CH-51450-NVH Oscilloscope)**. Is the vibration still present?	Go to **Step 2**	System OK

VIBRATION ANALYSIS - ENGINE

Test Description

The numbers below refer to the step numbers on the diagnostic table.

2

If powertrain related DTCs are present, there may be a powertrain performance condition present which could be a contributing cause to the customer's concern.

5

Making comparisons of the customer's vehicle with an equally equipped, same model year and type, KNOWN GOOD vehicle will help determine if certain disturbances may be characteristic of a vehicle design.

Step	Action	Yes	No
WARNING: **Refer to Work Stall Test Warning .**			
1	Has the Vibration Analysis - Road Testing table been completed?	Go to **Step 2**	Go to **Vibration Analysis - Road Testing (EL-38792-A Electronic Vibration Analyzer)Vibration Analysis - Road Testing (CH-51450-NVH Oscilloscope)**
2	Using a scan tool, determine if any DTCs are set. Were any DTCs set?	Go to **Vibration Diagnosis, Starting Point, and Correction**	Go to **Step 3**
3	1. Block the front wheels. 2. Apply BOTH the service brakes and the park brake. 3. With the scan tool and the **J-38792-A** Electronic Vibration Analyzer (EVA) 2 , if available, still installed, start the engine. 4. Place the transmission in NEUTRAL or PARK. 5. Slowly increase the engine RPM to the level at which the disturbance is most noticeable. 6. Record the engine RPM obtained on the scan tool and the most dominant frequency reading if obtained on the **J-38792-A** Electronic Vibration Analyzer (EVA) 2 , if available. 7. Place the transmission in DRIVE. 8. Slowly increase the engine RPM to the level at which the disturbance is most noticeable. 9. Record the engine RPM obtained on the	Go to **Step 4**	Go to **Vibration Diagnostic Aids**

Step	Action	Yes	No
	scan tool and the most dominant frequency reading if obtained on the **J-38792-A** Electronic Vibration Analyzer (EVA) 2 , if available. 10. If no frequency data was obtained, or if the **J-38792-A** Electronic Vibration Analyzer (EVA) 2 , is not available, place the transmission into REVERSE, then repeat steps 8 and 9. Reverse-loading of the powertrain may increase or change the characteristics of the vibration. Were you able to duplicate the customer's concern?		
4	Did the **J-38792-A** Electronic Vibration Analyzer (EVA) 2 detect a dominant frequency, or was a significant vibration present?	Go to **Vibration Analysis - Engine/Accessory Isolation**	Go to **Step 5**
5	Compare the test results of the customer's vehicle to the results of the same tests run, at the same engine RPM, on an equally-equipped, same model year and type, KNOWN GOOD vehicle. Refer to **Vehicle-to-Vehicle Diagnostic Comparison**. 1. Install a scan tool into the known good vehicle. 2. Install the **J-38792-A** Electronic Vibration Analyzer (EVA) 2 , if available, into the known good vehicle; place the sensor in exactly the same location as it was placed in the customer's vehicle. 3. Block the front wheels. 4. Apply BOTH the service brakes and the park brake. 5. Start the engine. 6. Place the transmission in NEUTRAL or PARK. 7. Slowly increase the engine RPM to the level at which the disturbance was most noticeable in the customer's vehicle. 8. Record the engine RPM obtained on the scan tool and the most dominant frequency reading if obtained on the **J-38792-A** Electronic Vibration Analyzer (EVA) 2 , if available. 9. Place the transmission in DRIVE. 10. Slowly increase the engine RPM to the level	Go to **Vibration Diagnostic Aids**	Go to **Vibration Analysis - Engine/Accessory Isolation**

Step	Action	Yes	No
	at which the disturbance was most noticeable in the customer's vehicle. 11. Record the engine RPM obtained on the scan tool and the most dominant frequency reading if obtained on the **J-38792-A** Electronic Vibration Analyzer (EVA) 2 , if available. 12. If no frequency data was obtained, or if the **J-38792-A** Electronic Vibration Analyzer (EVA) 2 , is not available, place the transmission into REVERSE, then repeat steps 10 and 11. Reverse-loading of the powertrain may increase or change the characteristics of the vibration. Did both of the vehicles exhibit the same characteristics?		

ENGINE ORDER CLASSIFICATION

Engine First Order Classification

1. Convert the engine speed in revolutions per minute (RPM), recorded during duplication of the disturbance into Hertz , revolutions per second (RPS), by dividing the RPM by 60 seconds. Refer to the following example:

   1,200 RPM divided by 60 = 20 Hz (or RPS)

2. Compare the dominant frequency in Hz, recorded during duplication of the disturbance with the engine speed just converted into Hz, to determine if they are related.
3. If the dominant frequency in Hz, recorded during duplication of the disturbance and the engine speed, converted into Hz, ARE related, then an engine FIRST ORDER related disturbance is present. Engine first order disturbances are usually related to an imbalanced component. Refer to the Engine Order Related Disturbances table.
4. If the dominant frequency in Hz, recorded during duplication of the disturbance and the engine speed, converted into Hz, are NOT related, then determine if the disturbance is related to the engine's firing frequency. Proceed to Engine Firing Frequency Classification.

Engine Firing Frequency Classification

Engine firing frequency is a term used to describe the number of firing pulses (one firing pulse = one cylinder firing) that occur during ONE complete revolution of the crankshaft, multiplied by the number of crankshaft revolutions per second, Hz.

1. Calculate the engine firing frequency.
   - To determine the firing frequency of a 4-stroke engine during ONE complete revolution of the crankshaft, multiply the engine speed, converted into Hz, by HALF of the total number of cylinders in the engine.
   - For example: The engine speed, converted into Hz, was 20 Hz; if the vehicle was equipped with a V8 engine, 4 of the 8 cylinders would actually fire during ONE complete revolution of the crankshaft.

- Multiply the converted engine speed (20 Hz) by 4 cylinders firing.

  20 Hz X 4 = 80 Hz

- The engine firing frequency for a V8 engine at the original engine speed of 1,200 RPM, recorded during duplication of the disturbance, would be 80 Hz.
- In like manner, a 6-cylinder engine would have a firing frequency of 60 Hz at the same engine speed of 1,200 RPM.

  20 Hz X 3 = 60 Hz

2. Compare the dominant frequency in Hz, recorded during duplication of the disturbance with the engine firing frequency in Hz, just calculated, to determine if they are related.
3. If the dominant frequency in Hz, recorded during duplication of the disturbance and the engine firing frequency in Hz, just calculated ARE related, then an engine FIRING FREQUENCY related disturbance is present. Engine firing frequency disturbances are usually related to improper isolation of a component. Refer to the Engine Order Related Disturbances table.
4. If the dominant frequency in Hz, recorded during duplication of the disturbance and the engine firing frequency in Hz, just calculated are NOT related, then determine if the disturbance is related to another engine order classification. Proceed to Other Engine Order Classification.

Other Engine Order Classification

1. Multiply the engine speed, converted into Hz, recorded during duplication of the disturbance by different possible order-numbers, other than 1 (first order) or the number used to determine the firing frequency of the engine.
2. Compare the dominant frequency in Hz, recorded during duplication of the disturbance with the other possible engine orders just calculated, to determine if they are related.
3. If the dominant frequency in Hz, recorded during duplication of the disturbance and one of the other engine order frequencies in Hz, just calculated ARE related, then an engine related disturbance of that order is present. If an engine related disturbance is present that is NOT related to first order or firing frequency, then it could be related to an engine driven accessory system. Proceed to Engine Driven Accessories Related to Engine Order.

Engine Driven Accessories Related to Engine Order

Engine driven accessory systems can be related to specific engine orders depending upon the relationship of the accessory pulley diameter to the crankshaft pulley diameter. For example:

- If the crankshaft pulley measured 20 cm (8 in) in diameter and one of the engine driven accessory pulleys measured 10 cm (4 in) in diameter, then that accessory pulley would rotate 2 times for every one rotation of the crankshaft pulley. If that accessory system was not isolated properly, or was not operating properly, it would be identifiable as a 2nd order engine related disturbance.
- In like manner, if an engine driven accessory pulley measured 5 cm (2 in) in diameter, then that accessory pulley would rotate 4 times for every one rotation of the crankshaft pulley. If that accessory system was not isolated properly, or was not operating properly, it would be identifiable as a 4th order engine related disturbance.

Engine driven accessories that contribute to, are excited by, or are the sole cause of a disturbance are usually doing so because of improper isolation that causes a transfer path into the passenger compartment or to another major component of the vehicle body.

Using the **EL-38792-VS** Vibrate Software , accurately measuring the diameters of the accessory pulleys and the crankshaft pulley, and performing the appropriate diagnostic procedures completely will lead to the specific accessory system which is either contributing to, or causing the customer's concern.

VIBRATION ANALYSIS - ENGINE/ACCESSORY ISOLATION

Special Tools

- **CH-51450-NVH** Oscilloscope Diagnostic Kit (w/NVH)
- **EL-38792-A** Electronic Vibration Analyzer (EVA) 2
- **EL-38792-25** Inductive Pickup Timing Light

- **EL-47955** Multi Diagnostic Interface MDI

For equivalent regional tools, refer to **Special Tools and Equipment**.

Test Description

The numbers below refer to the step numbers on the diagnostic table.

5

A loose, damaged, misaligned, or defective powertrain insulator and/or bracket may create a transfer path into the passenger compartment.

6

A loose, damaged, misaligned, or defective exhaust system insulator and/or bracket may create a transfer path into the passenger compartment.

7

Incorrectly seated and/or aligned powertrain components and/or exhaust system components may create a transfer path into the passenger compartment.

When loosening powertrain mounts in order to re-bed the powertrain observe the following:

Do not loosen the mount bracket-to-engine bolts/nuts, do not loosen the mount bracket-to-vehicle frame bolts/nuts if mount brackets are used.

Loosen the mount-to-mount bracket bolts/nuts if mount brackets are used, or loosen the mount-to-slotted holes in vehicle frame bolts/nuts if a direct-mount design is used.

8

Non-rotating engine driven accessory component systems can no longer produce a unique disturbance.

9

Non-rotating engine driven accessory components can no longer produce a unique disturbance. If a disturbance is still present, but the characteristics have been altered, it is possible that these component systems are acting as a transfer path for engine firing frequency or a first order engine disturbance.

If a disturbance is still present, but the characteristics have NOT been altered, it is NOT likely that these component systems are acting as a transfer path for engine firing frequency or a first order engine disturbance.

12

If the mark placed on the face of an engine driven accessory pulley seems to stand still while running this test, then that accessory system is either responding to an existing frequency, such as engine firing pulses, or creating a disturbance.

13

A loose, damaged, misaligned, or defective engine driven accessory system insulator and/or bracket may create a transfer path into the passenger compartment.

15

Removing the engine driven accessory and bracket, or brackets from the engine allows a thorough inspection to determine if any conditions are present that may create a transfer path into the passenger compartment.

Step	Action	Yes	No
WARNING: **Refer to** **Work Stall** **Test Warning** **.**			
1	Were you sent here from the Vibration Analysis - Engine table?	Go to **Step 2**	Go to **Vibration Analysis - Engine**
2	Is the **CH-51450-NVH** Oscilloscope Diagnostic Kit (w/NVH) or the **EL-38792-A** Electronic Vibration Analyzer (EVA) 2 , available?	Go to **Step 3**	Go to **Step 5**
3	1. Using the engine RPM and frequency data recorded for the customer's vehicle, determine the order of engine rotation to which the disturbance is related. 2. Determine the possible causes of the disturbance as it relates to a specific order of engine rotation. Refer to **Engine Order Classification**.Does the Engine Order Classification table indicate that the disturbance is of the same order as the engine firing frequency?	Go to **Step 5**	Go to **Step 4**
4	Does the Engine Order Classification table indicate that the disturbance is likely related to engine driven accessories?	Go to **Step 8**	Go to **Step 5**
5	Inspect the powertrain mounts-engine, transmission, transfer case, and direct-mount drive axle, if equipped-and any powertrain braces for the following conditions: • Loose and/or missing fasteners • Improper alignment • Cracked, dry-rotted, and/or oil-soaked insulators • Twisted, broken, torn, and/or collapsed insulators • Bent, twisted, and/or deformed brackets Realign or replace powertrain mounts as indicated by the inspection. Did you find and correct a condition?	Go to **Step 15**	Go to **Step 6**

6	Inspect the exhaust system components for the following:
	• Loose and/or missing fasteners
	  • Heat Shields
	  • Joints and/or couplings:
		Go to **Step 15**	Go to **Step 7**

Step	Action	Yes	No
	Nuts, bolts, studs, clamps, straps • Bracket and/or insulator mounting • Inadequate clearance to body and/or chassis components Inspect with the exhaust system both COLD and HOT; in NEUTRAL, FORWARD and REVERSE gears • Improper alignment • Disconnected and/or missing insulators • Cracked, dry-rotted, and/or oil-soaked insulators • Stretched, twisted, broken, torn, and/or collapsed insulators • Bent, twisted, cracked, and/or deformed brackets Repair, replace, and/or realign exhaust system components as indicated by the inspection. Did you find and correct a condition?		
7	Perform the Powertrain Mount Balance Procedure if available or perform the following procedure to re-bed the powertrain: 1. Loosen, but do not remove, all powertrain mounts and exhaust system hangers. 2. Ensure that the exhaust flexible coupling, if equipped, moves freely. 3. Start the engine. 4. Settle the powertrain by shifting the transmission from DRIVE to REVERSE. 5. Place the transmission into NEUTRAL. 6. Turn OFF the ignition. 7. Tighten all of the loosened fasteners with the powertrain in a relaxed position. Did you complete the operation?	Go to **Step 15**	-
8	**CAUTION:** **Do not run the engine for longer than 60 seconds with the accessory**	Go to **Step 10**	Go to **Step 9**

Step	Action	Yes	No
	drive belt, or belts removed, or overheating and/or damage may result. 1. Remove the engine accessory drive belt, or belts. 2. Block the front wheels. 3. Apply BOTH the service brakes and the park brake. 4. With the scan tool still installed, start the engine. 5. Place the transmission in NEUTRAL or PARK. 6. Increase the engine RPM to the level recorded during duplication of the disturbance. 7. Allow the engine to idle, then place the transmission in DRIVE. 8. Increase the engine RPM to the level recorded during duplication of the disturbance. 9. Turn OFF the ignition. 10. Install the engine accessory drive belt, or belts. Was the disturbance significantly reduced or eliminated?		
9	Were the characteristics of the disturbance altered but still present?	Go to **Step 13**	Go to **Step 17**
10	Is the **CH-51450-NVH** Oscilloscope Diagnostic Kit (w/NVH) being used for diagnosis?	Go to **Step 11**	Go to **Step 12**
11	1. Measure the diameter of the suspected accessory pulleys, including any related idler pulleys, and enter this information into the **CH-51450-NVH** Oscilloscope Diagnostic Kit (w/NVH). 2. Block the front wheels. 3. Apply BOTH the service brakes and the park brake. 4. With the **CH-51450-NVH** Oscilloscope Diagnostic Kit (w/NVH) and the **EL-47955** Multi Diagnostic Interface MDI still installed, start the engine. 5. Have an assistant place the transmission in NEUTRAL or PARK. 6. Slowly increase the engine RPM to the level recorded during the duplication of the disturbance, then maintain that speed. The frequency of the suspected pulleys will show up on the Record and Analyze tab within the software. 7. Turn OFF the engine.	Go to **Step 13**	Go to **Vibration Diagnostic Aids**

Step	Action	Yes	No
	Did you identify an engine driven accessory system as being related to the disturbance?		
12	1. Mark the face of the suspected accessory pulleys, including any related idler pulleys, near the outer edge with a paint mark. 2. Install the **EN-38792-25** Inductive Pickup Timing Light , to the **EL-38792-A** Electronic Vibration Analyzer (EVA) 2. For information on the use of the EVA features, refer to **Electronic Vibration Analyzer (EVA) Description and Operation**. 3. Block the front wheels. 4. Apply BOTH the service brakes and the park brake. 5. With the scan tool and the **EL-38792-A** Electronic Vibration Analyzer (EVA) 2 , still installed, start the engine. 6. Select the Smart Strobe feature on the **EL-38792-A** Electronic Vibration Analyzer (EVA) 2. 7. Enter the recorded frequency of the disturbance as the initial frequency for strobe operation. 8. Have an assistant place the transmission in NEUTRAL or PARK. 9. Slowly increase the engine RPM to the level recorded during duplication of the disturbance, then maintain that speed. 10. Using the **EL-38792-A** Inductive Pickup Timing Light , check each of the suspected accessory pulleys to determine if any of them is related to the frequency of the disturbance. Check each of the accessory systems, both engaged and under maximum load and disengaged or under minimum load. 11. Allow the engine to idle, then place the transmission in DRIVE. 12. Slowly increase the engine RPM to the level recorded during duplication of the disturbance, then maintain that speed closely. 13. Using the **EL-38792-25** Inductive Pickup Timing Light , check each of the suspected accessory pulleys to determine if any of them is related to the frequency of the disturbance. Check each of the accessory systems, both engaged	Go to **Step 13**	Go to **Vibration Diagnostic Aids**

Step	Action	Yes	No
	and under maximum load and disengaged or under minimum load. 14. Turn OFF the ignition. Did you identify an engine driven accessory system as being related to the frequency of the disturbance?		

13	Inspect the components of the engine driven accessory system for the following:
	
	• Loose and/or missing fasteners
	  • Heat Shields, if equipped
	  • Joints and/or couplings:
	
	  Nuts, bolts, studs, clamps, straps
	
	  • Bracket and/or insulator mounting
	• Inadequate clearance to body and/or chassis components
	
	Inspect with the accessory system both under a LOAD and NOT loaded
	
	• Improper alignment
	• Bent or damaged pulleys
	• Disconnected and/or missing insulators
	• Cracked, dry-rotted, and/or oil-soaked component insulators
	• Stretched, twisted, broken, torn, and/or collapsed component insulators
	• Bent, twisted, cracked and/or deformed component brackets
	
	Repair, replace, and/or realign the engine driven accessory system components as indicated by the inspection.
	Did you find and correct a condition?
		Go to **Step 15**	Go to **Step 14**

Step	Action	Yes	No
14	1. Remove the engine driven accessory and bracket, or brackets from the engine. 2. Thoroughly inspect the accessory bracket, or brackets, bolts/nuts/studs, and the accessory itself for signs of the following: Bent, twisted, cracked and/or deformed conditions 3. Replace any of the components found to exhibit any of these conditions. 4. Reinstall the components to the engine. Did you find and correct a condition?	Go to **Step 15**	Go to **Step 19**
15	Check the vehicle to determine if the disturbance is now significantly reduced or eliminated. Perform the following steps: 1. Install a scan tool into the customer's vehicle. 2. Install the **CH-51450-NVH** Oscilloscope Diagnostic Kit (w/NVH) or the **EL-38792-A** Electronic Vibration Analyzer (EVA) 2 , if available, into the customer's vehicle; place the sensor in exactly the same location as it was originally placed in the vehicle. 3. Block the front wheels. 4. Apply BOTH the service brakes and the park brake. 5. Start the engine. 6. Place the transmission in NEUTRAL or PARK. 7. Slowly increase the engine RPM to the level at which the disturbance was most noticeable. 8. Record the engine RPM obtained on the scan tool and the most dominant frequency reading if obtained on the **CH-51450-NVH** Oscilloscope Diagnostic Kit (w/NVH) or the **EL-38792-A** Electronic Vibration Analyzer (EVA) 2 , if available. 9. Place the transmission in DRIVE. 10. Slowly increase the engine RPM to the level at which the disturbance was most noticeable. 11. Record the engine RPM obtained on the scan tool and the most dominant frequency reading if obtained on the **CH-51450-NVH** Oscilloscope Diagnostic Kit (w/NVH) or the **EL-38792-A** Electronic Vibration Analyzer (EVA) 2 , if available. 12. If the disturbance has been significantly reduced or	Go to **Step 20**	Go to **Step 16**

Step	Action	Yes	No
	eliminated, confirm the results by placing the transmission into REVERSE, then repeat steps 10 and 11. Reverse-loading of the powertrain may increase or change the characteristics of the vibration. Has the disturbance been significantly reduced or eliminated?		
16	Have you investigated powertrain isolation as a possible cause of the disturbance?	Go to **Step 17**	Go to **Step 5**
17	Have you investigated engine driven accessories as a possible cause of the disturbance?	Go to **Vibration Analysis - Engine Balance**	Go to **Step 18**
18	Is the **CH-51450-NVH** Oscilloscope Diagnostic Kit (w/NVH) or the **EL-38792-A** Electronic Vibration Analyzer (EVA) 2 available?	Go to **Step 8**	Go to **Vibration Diagnostic Aids**
19	Replace the engine driven accessory component causing the disturbance. Did you complete the replacement?	Go to **Step 20**	-
20	1. Install or connect any components that were removed or disconnected during diagnosis. 2. Perform the Vibration Analysis - Road Testing table. Refer to **Vibration Analysis - Road Testing (EL-38792-A Electronic Vibration Analyzer)Vibration Analysis - Road Testing (CH-51450-NVH Oscilloscope)**. Is the disturbance still present?	Go to **Step 2**	System OK

VIBRATION ANALYSIS - ENGINE BALANCE

Special Tools

- **CH-51450-NVH** Oscilloscope Diagnostic Kit (w/NVH)
- **EL-38792-A** Electronic Vibration Analyzer (EVA) 2
- **EL-47955** Multi Diagnostic Interface MDI

For equivalent regional tools, refer to **Special Tools and Equipment**.

Test Description

The numbers below refer to the step numbers on the diagnostic table.

4

If sufficient clearance exists to separate the transmission torque converter from the engine flywheel/flexplate, then further tests can be used to isolate the transmission from the engine.

5

An engine flywheel/flexplate that has excessive lateral runout, when combined with the mass of the transmission torque converter, can produce a disturbance.

6

An engine flywheel/flexplate that is loose at the engine crankshaft or that is cracked or damaged, when combined with the mass of the transmission torque converter, can produce a disturbance.

7

This step is designed to isolate the transmission from the engine to determine if the disturbance is related to the engine ONLY.

9

Re-indexing the transmission torque converter to the engine flywheel/flexplate alters the balance relationship between the torque converter and the rear of the engine.

11

Placing the **CH-51450-NVH** Oscilloscope Diagnostic Kit (w/NVH) or the **EL-38792-A** Electronic Vibration Analyzer (EVA) 2 sensor onto the underside of the engine oil pan along the FRONT and the REAR edge allows for a determination to be made, which will help to narrow down the cause of the disturbance.

13

An engine flywheel that has excessive lateral runout, when combined with the extra mass of the clutch pressure plate and clutch driven plate, can produce a disturbance.

14

The clutch pressure plate and the engine flywheel are marked for proper indexing of the heavy-spot of one to the light-spot of the other. Improper indexing of the pressure plate to the flywheel can produce a disturbance.

15

An engine flywheel that is loose at the engine crankshaft or that is cracked, damaged and/or missing balance weights; and/or a clutch pressure plate and clutch driven plate that has loose springs, cracks, warpage, damage and/or missing balance weights - can produce a disturbance when their mass is combined.

16

An engine flywheel that is loose at the engine crankshaft or that is cracked, damaged and/or missing balance weights; and/or a clutch pressure plate and clutch driven plate that has loose springs, cracks, warpage, damage and/or missing balance weights - can produce a disturbance when their mass is combined.

17

Re-indexing the pressure plate to the engine flywheel alters the balance relationship between the pressure plate/flywheel assembly and the rear of the engine.

18

An engine flywheel/flexplate that is damaged, misaligned, and/or imbalanced, can produce a disturbance.

19

An engine crankshaft balancer that is damaged, misaligned, and/or imbalanced, can produce a disturbance.

Step	Action	Yes	No
1	Were you sent here from the Vibration Analysis - Engine/Accessory Isolation table?	Go to **Step 2**	Go to **Vibration Analysis - Engine/Accessory Isolation**
2	Is the **CH-51450-NVH** Oscilloscope Diagnostic Kit (w/NVH) or the **EL-38792-A** Electronic Vibration Analyzer (EVA) 2 , available?	Go to **Step 3**	Go to **Vibration Diagnostic Aids**
3	Is the vehicle equipped with a manual transmission?	Go to **Step 11**	Go to **Step 4**
4	1. Raise and support the vehicle. Refer to **Lifting and Jacking the Vehicle** . 2. Remove the flywheel/flexplate-to-torque converter bolts access cover, if equipped. 3. Determine if sufficient clearance exists to separate the transmission torque converter away from the engine flywheel/flexplate and safely secure the torque converter from accidentally engaging with the flywheel/flexplate. Is there sufficient clearance to separate and safely secure the transmission torque converter away from the engine flywheel/flexplate?	Go to **Step 5**	Go to **Step 11**

Step	Action	Yes	No
5	1. With the flywheel/flexplate-to-torque converter access cover still removed, and with the vehicle still raised, mark the position of the transmission torque converter in relation to the engine flywheel/flexplate. 2. Disconnect the torque converter and move it away from the flywheel/flexplate. 3. Secure the transmission torque converter away from the engine flywheel/flexplate to avoid accidental engagement with the flywheel/flexplate. 4. Lower the vehicle, start the engine and allow the engine to idle. 5. Raise and support the vehicle. Refer to **Lifting and Jacking the Vehicle** . 6. Visually inspect the flywheel/flexplate for excessive lateral runout. 7. Lower the vehicle. 8. Turn OFF the ignition. Did the flywheel/flexplate exhibit excessive lateral runout?	Go to **Step 8**	Go to **Step 6**
6	1. Raise and support the vehicle. Refer to **Lifting and Jacking the Vehicle** . 2. Inspect the flywheel/flexplate for the following: • Looseness at the engine crankshaft • Cracks and/or damage • Missing balance weights Did the flywheel/flexplate exhibit any of the conditions listed?	Go to **Step 8**	Go to **Step 7**
7	1. With the transmission torque converter still secured away from the engine flywheel/flexplate to avoid accidental engagement with the flywheel/flexplate, lower the vehicle. 2. Block the front wheels. 3. Apply BOTH the service brakes and the park brake. 4. With the **CH-51450-NVH** Oscilloscope Diagnostic Kit (w/NVH) and the **EL-47955** Multi Diagnostic Interface MDI or the scan tool and the **EL-38792-A** Electronic Vibration Analyzer (EVA) 2 still installed, start the engine. 5. Place the transmission in NEUTRAL or PARK.	Go to **Step 9**	Go to **Step 11**

Step	Action	Yes	No
	6. Slowly increase the engine RPM to the level at which the disturbance is most noticeable. 7. Record the engine RPM obtained on the scan tool and the most dominant frequency reading if obtained on the **EL-38792-A** Electronic Vibration Analyzer (EVA) 2. 8. Turn OFF the ignition. Has the disturbance been significantly reduced or eliminated?		
8	1. If the flywheel/flexplate is loose at the engine crankshaft, tighten the flywheel/flexplate mounting bolts in sequence and to specification. 2. If the flywheel/flexplate is cracked, damaged, and/or has missing balance weights, replace the damaged flywheel/flexplate. Did you complete the tightening or replacement?	Go to **Step 20**	-

Step	Action	Yes	No
9	1. Raise and support the vehicle. Refer to **Lifting and Jacking the Vehicle** . 2. Re-index the transmission torque converter to the engine flywheel/flexplate, 120 degrees from its original position. 3. Reconnect the transmission torque converter to the engine flywheel/flexplate. 4. Lower the vehicle. 5. Block the front wheels. 6. Apply BOTH the service brakes and the park brake. 7. With the **CH-51450-NVH** Oscilloscope Diagnostic Kit (w/NVH) and the **EL-47955** Multi Diagnostic Interface MDI or the scan tool and the **EL-38792-A** Electronic Vibration Analyzer (EVA) 2 still installed, start the engine. 8. Place the transmission in NEUTRAL or PARK. 9. Slowly increase the engine RPM to the level at which the disturbance is most noticeable. 10. Record the engine RPM obtained on the scan tool and the most dominant frequency reading if obtained on the **CH-51450-NVH** Oscilloscope Diagnostic Kit (w/NVH) or the **EL-38792-A** Electronic Vibration Analyzer (EVA) 2. 11. If the disturbance is still noticeable, re-index the torque converter again to obtain the least amount of disturbance. Has the disturbance been significantly reduced or eliminated?	Go to **Step 20**	Go to **Step 10**
10	Replace the out-of-balance transmission torque converter. Did you complete the replacement?	Go to **Step 20**	-
11	1. Raise and support the vehicle. Refer to **Lifting and Jacking the Vehicle** . 2. Position the **CH-51450-NVH** Oscilloscope Diagnostic Kit (w/NVH) accelerometer or the **EL-38792-A** Electronic Vibration Analyzer (EVA) 2 sensor onto the underside of the engine oil pan, along the FRONT edge. 3. Lower the vehicle. 4. Block the front wheels. 5. Apply BOTH the service brakes and the park brake.	Go to **Step 19**	Go to **Step 12**

Step	Action	Yes	No
	6. With the **CH-51450-NVH** Oscilloscope Diagnostic Kit (w/NVH) and the **EL-47955** Multi Diagnostic Interface MDI or the scan tool and the **EL-38792-A** Electronic Vibration Analyzer (EVA) 2 , still installed, start the engine. 7. Place the transmission in NEUTRAL or PARK. 8. Slowly increase the engine RPM to the level at which the disturbance is most noticeable. 9. Record the engine RPM obtained on the scan tool and the most dominant frequency reading if obtained on the **CH-51450-NVH** Oscilloscope Diagnostic Kit (w/NVH) or the **EL-38792-A** Electronic Vibration Analyzer (EVA) 2 from the underside of the engine oil pan. 10. Repeat steps 1 through 9, placing the **CH-51450-NVH** Oscilloscope Diagnostic Kit (w/NVH) accelerometer or the **EL-38792-A** Electronic Vibration Analyzer (EVA) 2 sensor onto the underside of the engine oil pan, along the REAR edge. Is the disturbance greater along the FRONT of the engine?		
12	Is the vehicle equipped with an automatic transmission?	Go to **Step 18**	Go to **Step 13**
13	1. Raise and support the vehicle. Refer to **Lifting and Jacking the Vehicle** . 2. Remove the flywheel inspection cover. 3. Start the engine. Allow the engine to idle. 4. Visually inspect the engine flywheel clutch surface for excessive lateral runout. Does the engine flywheel clutch surface exhibit excessive lateral runout?	Go to **Step 18**	Go to **Step 14**
14	Inspect the clutch pressure plate to engine flywheel mounting for proper factory indexing. Is the clutch pressure plate properly indexed to the engine flywheel?	Go to **Step 16**	Go to **Step 15**
15	1. Remove the clutch pressure plate and clutch driven plate from the engine flywheel. 2. Inspect the engine flywheel for the following: • Looseness at the engine crankshaft • Cracks, warpage and/or damage • Missing balance weights	Go to **Step 18**	Go to **Step 17**

Step	Action	Yes	No
	3. Inspect the clutch pressure plate and clutch driven plate for the following: • Loose and/or damaged clutch driven plate damper springs • Loose and/or damaged clutch pressure plate diaphragm springs • Cracks, warpage and/or damage • Missing balance weights Do any of the above conditions exist?		
16	1. Remove the clutch pressure plate and clutch driven plate from the engine flywheel. 2. Inspect the engine flywheel for the following: • Looseness at the engine crankshaft • Cracks, warpage and/or damage • Missing balance weights 3. Inspect the clutch pressure plate and clutch driven plate for the following: • Loose and/or damaged clutch driven plate damper springs • Loose and/or damaged clutch pressure plate diaphragm springs • Cracks, warpage and/or damage • Missing balance weights Do any of the above conditions exist?	Go to **Step 18**	Go to **Vibration Diagnostic Aids**
17	Re-index the pressure plate to the engine flywheel. Did you complete the re-indexing?	Go to **Step 20**	-
18	Replace the engine flywheel/flexplate. Did you complete the replacement?	Go to **Step 20**	-
19	Replace the engine crankshaft balancer. Did you complete the replacement?	Go to **Step 20**	-
20	Check the vehicle to determine if the disturbance is now significantly reduced or eliminated. Perform the following steps: 1. Install or connect any components that were removed or disconnected during diagnosis. 2. Install a scan tool into the customer's vehicle. 3. Install the **CH-51450-NVH** Oscilloscope Diagnostic Kit (w/NVH) or the **EL-38792-A** Electronic Vibration Analyzer (EVA) 2 , if available, into the customer's vehicle; place the sensor in exactly the same location as it was originally placed in the vehicle.	Go to **Step 21**	Go to **Vibration Diagnostic Aids**

Step	Action	Yes	No
	4. Block the front wheels. 5. Apply BOTH the service brakes and the park brake. 6. Start the engine. 7. Place the transmission in NEUTRAL or PARK. 8. Slowly increase the engine RPM to the level at which the disturbance was most noticeable. 9. Record the engine RPM obtained on the scan tool and the most dominant frequency reading if obtained on the **CH-51450-NVH** Oscilloscope Diagnostic Kit (w/NVH) or the **EL-38792-A** Electronic Vibration Analyzer (EVA) 2 , if available. 10. Place the transmission in DRIVE. 11. Slowly increase the engine RPM to the level at which the disturbance was most noticeable. 12. Record the engine RPM obtained on the scan tool and the most dominant frequency reading if obtained on the **CH-51450-NVH** Oscilloscope Diagnostic Kit (w/NVH) or the **EL-38792-A** Electronic Vibration Analyzer (EVA) 2 , if available. 13. If the disturbance has been significantly reduced or eliminated, confirm the results by placing the transmission into REVERSE, then repeat steps 11 and 12. Reverse-loading of the powertrain may increase or change the characteristics of the vibration. Has the disturbance been significantly reduced or eliminated?		
21	Perform the Vibration Analysis - Road Testing table. Refer to **Vibration Analysis - Road Testing (EL-38792-A Electronic Vibration Analyzer)Vibration Analysis - Road Testing (CH-51450-NVH Oscilloscope)**. Is the disturbance still present?	Go to **Vibration Diagnostic Aids**	System OK

VIBRATION DIAGNOSTIC AIDS

NOTE: **If you have not reviewed the Diagnostic Starting Point - Vibration Diagnosis and completed the Vibration Analysis tables as indicated, refer to Vibration Diagnosis, Starting Point, and Correction BEFORE proceeding.**

The diagnostic information contained in this Diagnostic Aids section will help you determine the correct course of action to take for the following 4 main conditions. Refer to the appropriate condition from this list:

- Vibration Diagnostic Aids - Vibration Intermittent or Not Duplicated
- Vibration Diagnostic Aids - Vibration Duplicated, Component Not Identified
- Vibration Diagnostic Aids - Vibration Duplicated, Difficult to Isolate/Balance Component
- Vibration Diagnostic Aids - Vibration Duplicated, Appears to Be Potential Operating Characteristic

VIBRATION DIAGNOSTIC AIDS - VIBRATION INTERMITTENT OR NOT DUPLICATED

NOTE: **If you have not completed the Vibration Analysis tables as indicated and reviewed Vibration Diagnostic Aids, refer to Vibration Diagnostic Aids BEFORE proceeding.**

If you have not been able to duplicate the vibration concern or have only been able to duplicate the concern intermittently, review the following information.

Most vibration concerns that cannot be duplicated are due to either specific conditions that are not present during the duplicating attempts, or due to not following the procedures designed to duplicate concerns properly and in the sequence indicated.

Specific Conditions Can Affect the Condition

Consider the following conditions which may not have been present while attempts were made to duplicate the vibration concern. Attempt to obtain more specific information from the customer as to the EXACT conditions that are present when they experience the vibration which they are concerned about. Attempt to duplicate the vibration concern again while recreating the EXACT conditions necessary, except those which pose a safety concern or are outside the boundaries of normal operating conditions, such as loading the vehicle beyond its designed weight ratings, etc.

Most attempts to duplicate a vibration concern are made after the vehicle has been driven to the repair facility and perhaps even sat inside the building for a time; the vehicle may be too warm to detect the concern during duplication efforts. The opposite could also occur; perhaps the vehicle has sat out in the cold for a time and fails to reach full operating temperatures during attempts to duplicate the concern.

Temperature, Ground-Out, Accessory Load

Flat Spots on Tires

Tires which have sat and been cool for a time can develop flat spots.

Irregular Wear on Tire Treads

Tires which have sat and been cool for a time will be stiffer and any irregular wear conditions will be more noticeable than they will be once the tires have warmed and softened.

Exhaust System Growth

Exhaust systems may exhibit a ground-out condition when cool which goes away once the system is hot. The opposite may be true that the exhaust system is fine when cool but a ground-out condition occurs once the system reaches operating temperatures. Exhaust systems can grow by 2 1/2 -5 cm (1-2 in) when hot.

Engine-Driven Accessory Noises

NOTE: **When a stethoscope equipped with a probe is used to assist in identifying possible vibrating components, the results must be compared to the sound quality of the**

same accessory, in a equally-equipped, same model year and type, KNOWN GOOD vehicle, and under the same conditions. Refer to Vehicle-to-Vehicle Diagnostic Comparison.

A stethoscope equipped with a probe can be used as an additional means to assist in identifying accessories which may be causing or contributing to a vibration concern.

- Belt Whipping

  An engine accessory drive belt, or belts could exhibit a whipping condition if a belt is deteriorating and deposits are building up on the underside of the belt.

- Loose Mounting Brackets or Component Ground-Out

  Engine-driven accessories such as a generator, a power steering pump, or an air conditioning compressor could exhibit noise conditions due to either loose mounting brackets or due to related components of the system in a ground-out condition during certain operation of that accessory system.

- Cold or Hot

  Accessories could exhibit noise conditions when cool which go away once they are fully warmed-up, or the opposite may be true.

- Load on an Accessory Component

  Accessories could exhibit a noise condition while under a heavy load - perhaps when combined with a cool or fully warmed-up condition.

- Bent or Misaligned Pulleys

  Bent or mis-aligned pulleys in one or more engine-driven accessory systems could contribute to a noise or vibration condition.

- Fluid Level in Accessory Systems

  Accessories could exhibit a noise condition due to an abnormal amount of fluid contained in the system of which the accessory is a part. For example:

  - An improper power steering fluid level could produce noises in the power steering system.
  - An improper air conditioning refrigerant level or an excessive amount of refrigerant oil could produce noises or possibly vibrations in the air conditioning system.

- Incorrect Fluid Type in Accessory Systems

  Accessories could exhibit a noise condition due to the incorrect type of fluid contained in the system of which the accessory is a part.

Vehicle Payload

The vibration concern may only occur when the vehicle is carrying heavy payloads or towing a trailer; the vehicle may have been empty during duplication efforts.

Heavy Payload

The vehicle may have been empty during attempts to duplicate the vibration concern, but the customer may actually experience the vibration concern while the vehicle is carrying a large payload.

Trailer Towing

The customer may experience the vibration concern only while towing a trailer.

Roadway Selection

The selection of roadways used to perform the vibration duplication procedures is likely to be in the near vicinity of the repair facility and may not provide a road surface that is similar enough to the surface on which the customer usually drives the vehicle.

The customer may only experience the vibration on a particular roadway. Perhaps the roadway is overly crowned or is very bumpy or rough.

VIBRATION DIAGNOSTIC AIDS - VIBRATION DUPLICATED, COMPONENT NOT IDENTIFIED

NOTE: **If you have not completed the Vibration Analysis tables as indicated and reviewed Vibration Diagnostic Aids, refer to Vibration Diagnostic Aids BEFORE proceeding.**

Aftermarket Add-On Accessories

Aftermarket accessories which have been added to the vehicle can actually transmit and magnify INHERENT component rotational frequencies, if the accessories were not installed correctly.

An accessory should be installed in such a way that it is isolated from becoming a possible transfer path into the rest of the vehicle. For example, if a set of running boards has been installed improperly and they are sensitive to a particular frequency of a rotating component, the running boards could begin to respond to the frequency and actually create a disturbance once the amplitude of the frequency reaches a high enough point , probably at a higher vehicle speed.

If the same set of running boards were installed properly-isolated properly-the transfer path would be removed and the disturbance would no longer be present.

VIBRATION DIAGNOSTIC AIDS - VIBRATION DUPLICATED, DIFFICULT TO ISOLATE/BALANCE COMPONENT

NOTE: **If you have not completed the Vibration Analysis tables as indicated and reviewed Vibration Diagnostic Aids, refer to Vibration Diagnostic Aids BEFORE proceeding.**

If you have duplicated the vibration concern but have had difficulty in balancing a component or isolating a component, refer to the following information.

Most vibration concerns are corrected or eliminated through correcting excessive runout of a component, correcting balance of a component or isolating a component which has come into abnormal contact with another object/component.

Components which can generate a lot of energy and are experiencing excessive runout, imbalance or ground-out can produce a vibration with a strong enough amplitude that the vibration can transmit to components which are closely related. This type of a condition is usually related to and sensitive to torque-load. The most likely system that could exhibit this type of a condition is the driveline.

VIBRATION DIAGNOSTIC AIDS - VIBRATION DUPLICATED, APPEARS TO BE POTENTIAL OPERATING CHARACTERISTIC

NOTE: **If you have not completed the Vibration Analysis tables as indicated and reviewed Vibration Diagnostic Aids, refer to Vibration Diagnostic Aids BEFORE proceeding.**

Check Service Bulletins

If BOTH of the following statements are TRUE, then check service bulletins for the condition identified. If the condition has already been identified and investigated prior to this vehicle, and has been determined to be something that is not truly an operating characteristic or that perhaps is not design-intent, there will likely be adjustments or corrections identified which will address the condition.

- You CAREFULLY followed the steps indicated through reviewing the Diagnostic Starting Point - Vibration Diagnosis and completing the Vibration Analysis tables identified and you have duplicated the vibration concern.
- You have come to the conclusion through comparison with a very equally-equipped, same model year and type, KNOWN GOOD vehicle that the customer's concern is a condition that appears to be a potential operating characteristic of the vehicle.

SYMPTOMS - VIBRATION DIAGNOSIS AND CORRECTION

NOTE: **Perform the following steps in sequence BEFORE using these symptom tables.**

1. Begin the diagnosis of a vibration concern by reviewing **Vibration Diagnosis, Starting Point, and Correction** to become familiar with the diagnostic process used to properly diagnose vibration concerns.
2. Perform the **Vibration Analysis - Road Testing (EL-38792-A Electronic Vibration Analyzer)Vibration Analysis - Road Testing (CH-51450-NVH Oscilloscope)** table before using these symptom tables in order to duplicate and effectively diagnose the customer's concern.

Symptom Tables

Refer to a Vibration Analysis table as indicated in the following symptom tables, based on the most dominant characteristic of the customer's vibration concern, felt or heard, that is evident during the appropriate condition of the occurrence.

Vibration Symptoms that are Felt

Category	Description	Typical Frequency Range	Condition of Occurrence	Area of Focus
Shake	Can sometimes be seen or felt in the steering wheel, seat or console. Related terminology: shimmy, wobble, waddle, shudder, hop	5-20 Hz	Vehicle Speed Sensitive Still occurs during coast down in NEUTRAL	Go to **Vibration Analysis - Tire and Wheel**
			Vehicle Speed Sensitive Affected by torque/load and/or steering input	Go to **Vibration Analysis - Hub and/or Axle Input**
			Engine Speed Sensitive	Go to **Vibration Analysis - Engine**
Roughness	Similar to the feeling of holding a jigsaw.	20-50 Hz	Vehicle Speed Sensitive Still occurs during coast down in NEUTRAL	Go to **Vibration Analysis - Tire and Wheel**

Category	Description	Typical Frequency Range	Condition of Occurrence	Area of Focus
			Vehicle Speed Sensitive Affected by torque/load and/or steering input	Go to **Vibration Analysis - Hub and/or Axle Input**
			Engine Speed Sensitive	Go to **Vibration Analysis - Engine**
Buzz	Similar to the feeling of holding an electric razor. May be felt in the hands through the steering wheel, in the feet through the floor, or in the seat of the pants.	50-100 Hz	Vehicle Speed Sensitive Affected by torque/load and/or steering input	Go to **Vibration Analysis - Hub and/or Axle Input**
			Engine Speed Sensitive	Go to **Vibration Analysis - Engine**
Tingling	May produce a "pins and needles" sensation or may put hands or feet "to sleep". Highest vibration frequency range that can still be felt.	Greater than 100 Hz	Vehicle Speed Sensitive Affected by torque/load and/or steering input	Go to **Vibration Analysis - Hub and/or Axle Input**
			Engine Speed Sensitive	Go to **Vibration Analysis - Engine**

Vibration Symptoms that are Heard

Category	Description	Typical Frequency Range	Condition of Occurrence	Area of Focus
Boom	Usually heard as an interior noise similar to the noise of a bowling ball rolling down an alley, deep thunder, or a bass drum. • Related terminology- droning, growling, moaning, roaring, rumbling, humming • May not be accompanied by a perceptible vibration or roughness	20-60 Hz	Vehicle Speed Sensitive Still occurs during coast down in NEUTRAL	Go to **Vibration Analysis - Tire and Wheel**
			Vehicle Speed Sensitive Affected by torque/load and/or steering input	Go to **Vibration Analysis - Hub and/or Axle Input**
Moan or Drone	Similar to the sound of a bumblebee or blowing air across the top of a bottle. • Related terminology- humming, buzzing, resonance • May be accompanied by a perceptible vibration such as a buzz	60-120 Hz	Vehicle Speed Sensitive Affected by torque/load and/or steering input	Go to **Vibration Analysis - Hub and/or Axle Input**
			Engine Speed Sensitive	Go to **Vibration Analysis - Engine**

Category	Description	Typical Frequency Range	Condition of Occurrence	Area of Focus
Howl	Similar to the sound of the wind howling.	120-300 Hz	Vehicle Speed Sensitive Affected by torque/load and/or steering input	Go to **Vibration Analysis - Hub and/or Axle Input**
			Engine Speed Sensitive	Go to **Vibration Analysis - Engine**
Whine	Similar to the sound of mosquitoes, turbine engines, or vacuum cleaners.	300-500 Hz	Vehicle Speed Sensitive Affected by torque/load	Go to transmission diagnostic information

VEHICLE-TO-VEHICLE DIAGNOSTIC COMPARISON

Comparing the customer's vehicle to a KNOWN GOOD vehicle that is essentially identical will help determine if the customer's concern may be characteristic of a vehicle design. To arrive at a valid conclusion, the comparison must be performed under the same conditions, using the same criteria, on a vehicle that has the same option content as the customer's vehicle.

The comparison vehicle must match the customer's vehicle in the following areas:

- Model Year
- Make
- Model
- Body style
- Powertrain configuration
- Driveline configuration
- Final drive ratio
- Tire/wheel size and type
- Suspension package
- Trailering package
- GVW rating
- Performance options
- Luxury options

TIRE AND WHEEL INSPECTION

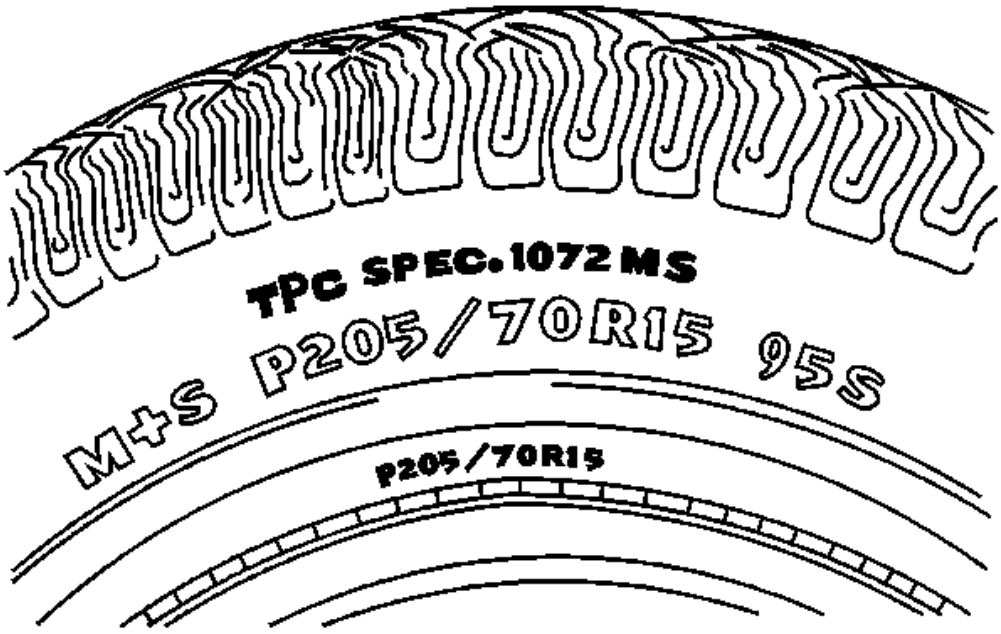

Fig. 2: Identifying Tire Performance Criteria (TPC) Rating Markings
Courtesy of GENERAL MOTORS COMPANY

The tires on all new production models have a tire performance criteria (TPC) rating number molded on the sidewall. The TPC rating will appear as a 4-digit number preceded by the letters TPC SPEC on the tire wall near the tire size. A replacement tire should have the same TPC rating.

Tire Wear

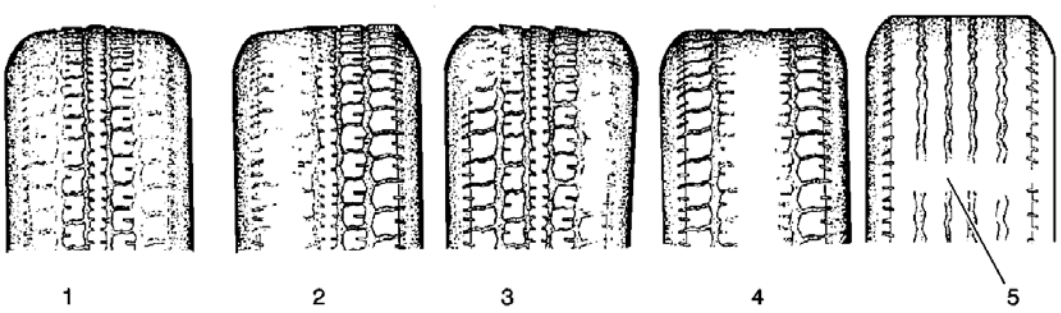

Fig. 3: Identifying Types Of Tire Wear
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Hard Cornering/Underinflation
2	Incorrect Alignment/Lack of Rotation
3	Incorrect Alignment/Non-uniform Tire
4	Heavy Acceleration/Over inflation
5	Wear Indicator

Inspect the tire and wheel assemblies for the following conditions:

- Unusual wear such as cupping, flat spots, and/or heel-and-toe wear

  These conditions can cause tire growl, tire howl, slapping noises, and/or vibrations throughout the vehicle.

- Proper inflation to specifications for the vehicle
- Bulges in the sidewalls

  Do not confuse bulges, which are an abnormal condition, with normal ply splices which are commonly seen as indentations in the sidewall.

- Bent rim flanges

TIRE AND WHEEL ASSEMBLY RUNOUT MEASUREMENT - ON-VEHICLE

1. Raise and support the vehicle.
2. Closely inspect each tire for proper and even bead seating.
3. If any of the tire beads were not properly or evenly seated, reseat the tire bead, then proceed to step 4. Refer to **Tire and Wheel Removal and Installation** .
4. Following the tire inflation placard on the drivers door, inspect and if necessary adjust the tire inflation pressures.

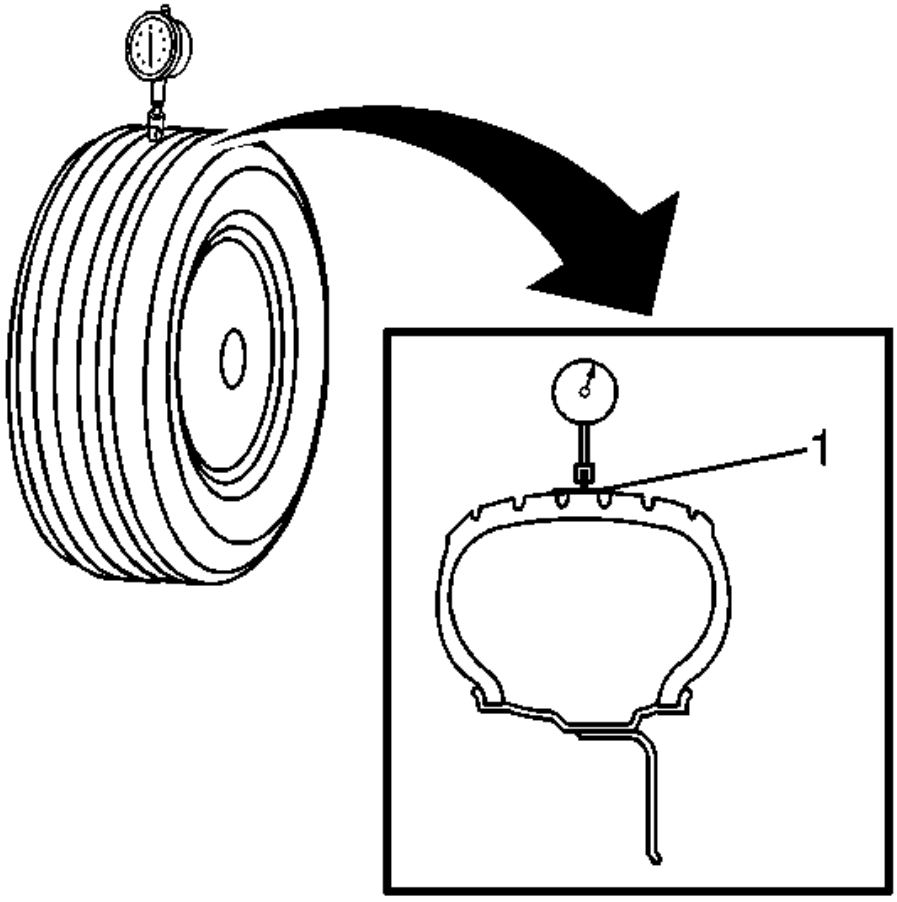

Fig. 4: Measuring Tire & Wheel Assembly Radial Runout
Courtesy of GENERAL MOTORS COMPANY

5. Wrap the circumference of each tire with tape (1) in the center tread area.

   Wrapping the tread with tape allows for a smooth and accurate reading of radial runout to be obtained.

6. Position the dial indicator on the taped portion of the tire tread such that the dial indicator is perpendicular to the tire tread surface.
7. Slowly rotate the tire and wheel assembly one complete revolution in order to find the low spot.
8. Set the dial indicator to zero at the low spot.
9. Slowly rotate the tire and wheel assembly one more complete revolution and measure the total amount of radial runout.

   Specification

   Maximum tire and wheel assembly radial runout - measured on-vehicle: 1.52 mm (0.060 in)

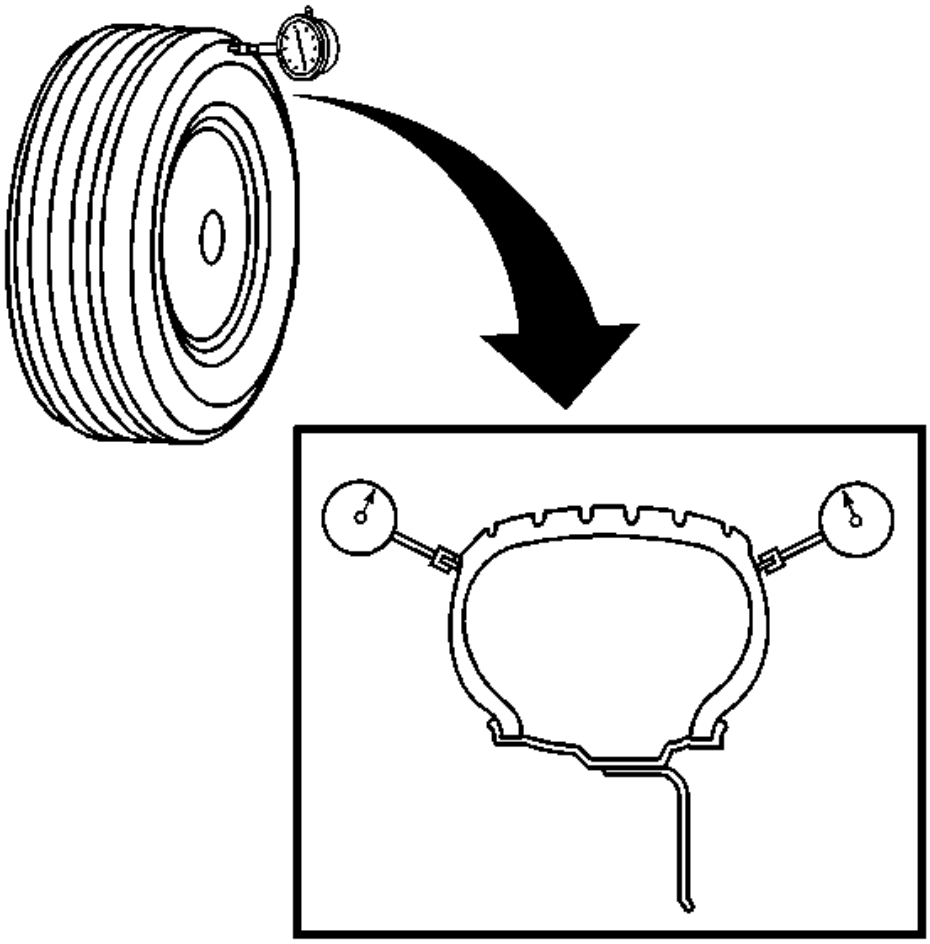

Fig. 5: Measuring Tire & Wheel Assembly Lateral Runout
Courtesy of GENERAL MOTORS COMPANY

10. Position the dial indicator on a smooth portion of the tire sidewall, as close to the tread as possible, such that the dial indicator is perpendicular to the tire sidewall surface.
11. Slowly rotate the tire and wheel assembly one complete revolution in order to find the low spot. Ignore any jumps or dips due to sidewall splices.
12. Set the dial indicator to zero at the low spot.
13. Slowly rotate the tire and wheel assembly one more complete revolution and measure the total amount of lateral runout. Ignore any jumps or dips due to sidewall splices and attain an average runout measurement.

    Specification

    Maximum tire and wheel assembly lateral runout - measured on-vehicle: 1.52 mm (0.060 in)

14. Repeat steps 4 through 12 until all of the tire and wheel assembly radial and lateral runout measurements have been taken.
15. Lower the vehicle.

TIRE AND WHEEL ASSEMBLY RUNOUT MEASUREMENT - OFF VEHICLE

1. Raise and support the vehicle.

2. Mark the location of the wheels to the wheel studs and mark the specific vehicle position on each tire and wheel - LF, LR, RF, RR.
3. Remove the tire and wheel assemblies from the vehicle.
4. Closely inspect each tire for proper and even bead seating.
5. If any of the tire beads were not properly or evenly seated, reseat the tire bead, then proceed to step 6. Refer to **Tire and Wheel Removal and Installation** .
6. Mount a tire and wheel assembly on a spin-type wheel balancer.

   Locate the tire and wheel assembly on the balancer with a cone through the back side of the center pilot hole.

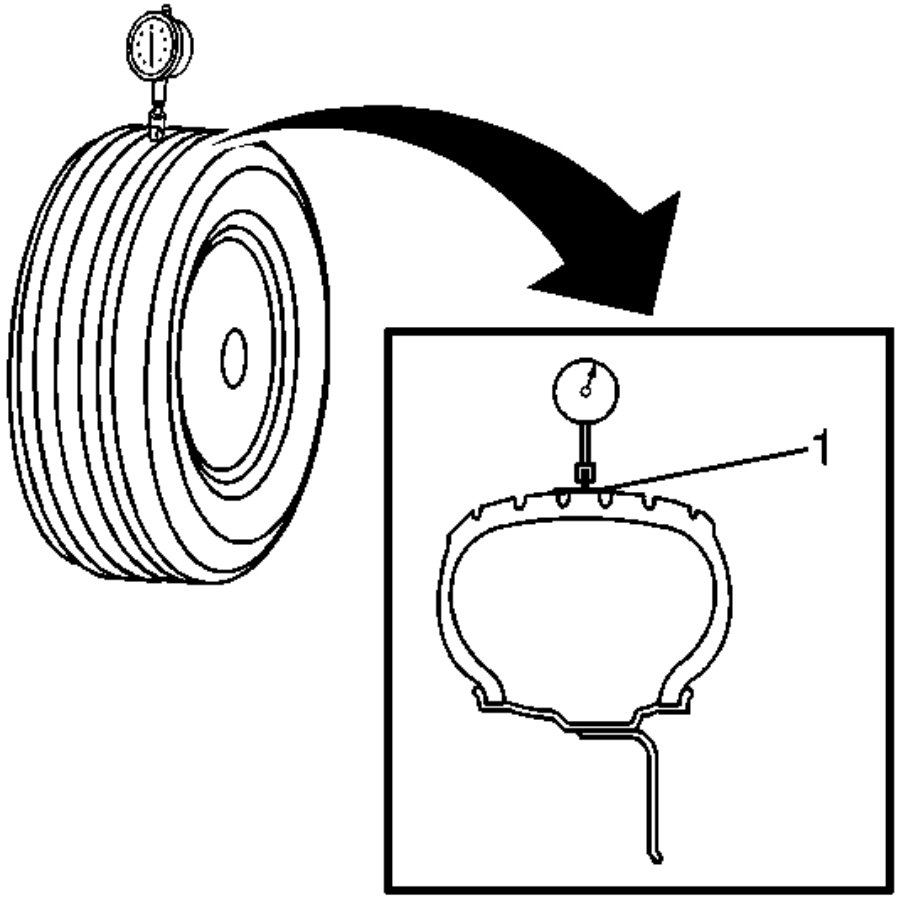

Fig. 6: Measuring Tire & Wheel Assembly Radial Runout
Courtesy of GENERAL MOTORS COMPANY

7. Wrap the outer circumference of each tire with tape (1) in the center tread area.

   Wrapping the tread with tape allows for a smooth and accurate reading of radial runout to be obtained.

8. Position the dial indicator on the taped portion of the tire tread such that the dial indicator is perpendicular to the tire tread surface.
9. Slowly rotate the tire and wheel assembly one complete revolution in order to find the low spot.
10. Set the dial indicator to zero at the low spot.

11. Slowly rotate the tire and wheel assembly one more complete revolution and measure the total amount of radial runout.

    Specification

    Maximum tire and wheel assembly radial runout - measured off-vehicle: 1.27 mm (0.050 in)

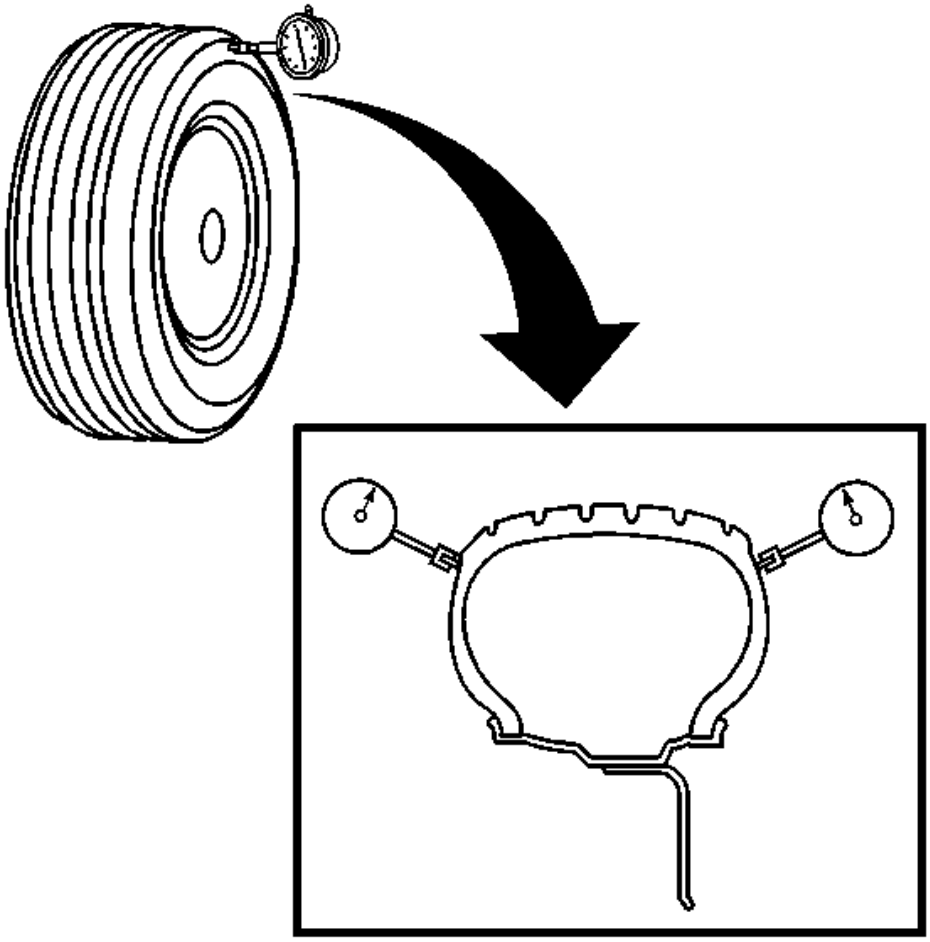

Fig. 7: Measuring Tire & Wheel Assembly Lateral Runout
Courtesy of GENERAL MOTORS COMPANY

12. Position the dial indicator on a smooth portion of the tire sidewall, as close to the tread as possible, such that the dial indicator is perpendicular to the tire sidewall surface.
13. Slowly rotate the tire and wheel assembly one complete revolution in order to find the low spot. Ignore any jumps or dips due to sidewall splices.
14. Set the dial indicator to zero at the low spot.
15. Slowly rotate the tire and wheel assembly one more complete revolution and measure the total amount of lateral runout. Ignore any jumps or dips due to sidewall splices and attain an average runout measurement.

    Specification

    Maximum tire and wheel assembly lateral runout - measured off-vehicle: 1.27 mm (0.050 in)

16. Repeat steps 6 through 15 until all of the tire and wheel assembly radial and lateral runout measurements have

been taken.

17. If ANY of the tire and wheel assembly runout measurements were NOT within specifications, proceed to step 19.
18. If ALL of the tire and wheel assembly runout measurements WERE within specifications, then the off-vehicle tire and wheel assembly runout is considered acceptable.

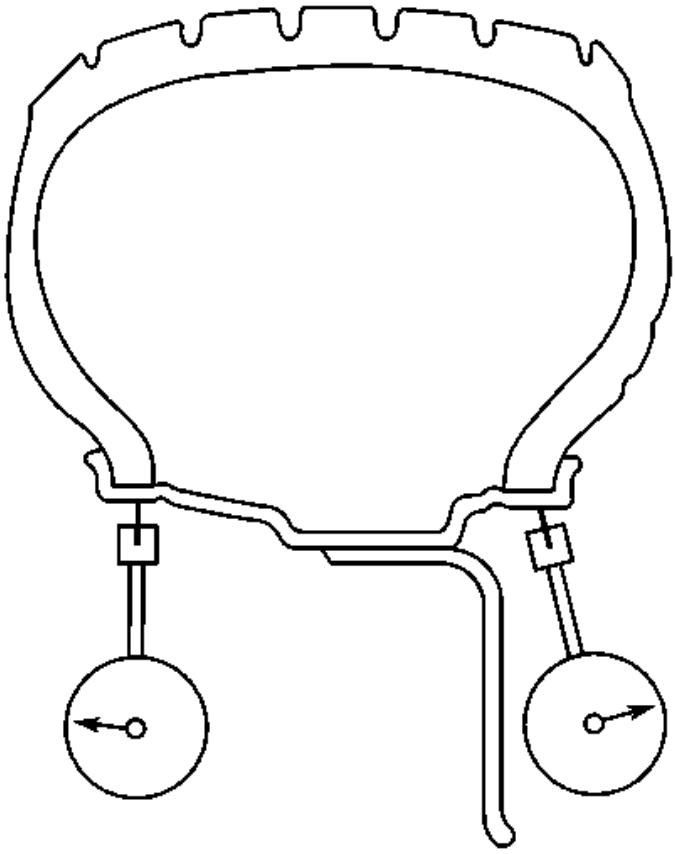

Fig. 8: Measuring Wheel Radial Runout (Off-Vehicle, Tire Mounted)
Courtesy of GENERAL MOTORS COMPANY

19. Position the dial indicator on the horizontal outer surface of the wheel rim flange - with the tire still mounted - such that the dial indicator is perpendicular to the rim flange surface.

    Wheel runout should be measured on both the inboard and outboard rim flanges, unless wheel design will not permit. Ignore any jumps or dips due to paint drips, chips, or welds.

20. Slowly rotate the tire and wheel assembly one complete revolution in order to find the low spot.
21. Set the dial indicator to zero at the low spot.
22. Slowly rotate the tire and wheel assembly one more complete revolution and measure the total amount of wheel radial runout.

Specification

- Maximum aluminum wheel radial runout - measured off-vehicle, tire mounted: 0.762 mm (0.030 in)
- Maximum steel wheel radial runout - measured off-vehicle, tire mounted: 1.015 mm (0.040 in)

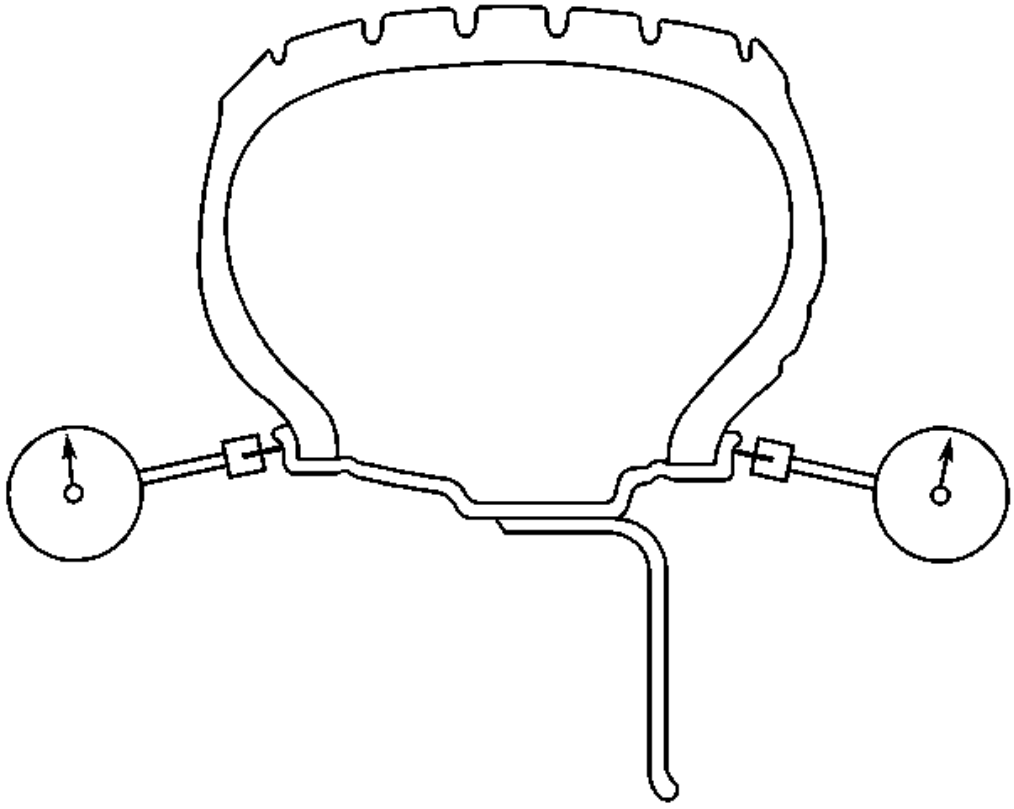

Fig. 9: Measuring Wheel Lateral Runout (Off-Vehicle, Tire Mounted)
Courtesy of GENERAL MOTORS COMPANY

23. Position the dial indicator on the vertical outer surface of the wheel rim flange - with the tire still mounted - such that the dial indicator is perpendicular to the rim flange surface.

    Wheel runout should be measured on both the inboard and outboard rim flanges, unless wheel design will not permit. Ignore any jumps or dips due to paint drips, chips, or welds.

24. Slowly rotate the tire and wheel assembly one complete revolution in order to find the low spot.
25. Set the dial indicator to zero at the low spot.
26. Slowly rotate the tire and wheel assembly one more complete revolution and measure the total amount of wheel lateral runout.

    Specification

    - Maximum aluminum wheel lateral runout - measured off-vehicle, tire mounted: 0.762 mm (0.030 in)
    - Maximum steel wheel lateral runout - measured off-vehicle, tire mounted: 1.143 mm (0.045 in)

27. Repeat steps 19 through 26 until all of the wheel radial and lateral runout measurements have been taken on each of the - tire and wheel - assemblies with assembly runout measurements which were NOT within specifications.
28. If any of the wheel runout measurements were NOT within specifications, proceed to Measuring Wheel Runout - Tire Dismounted.
29. For any of the wheel runout measurements which WERE within specifications, while the - tire and wheel - assembly runout measurements were NOT within specifications, replace the tire, then balance the assembly. Refer to **Tire and Wheel Assembly Balancing - Off Vehicle**.
30. After replacement of any tires, always re-measure the runout of the affected tire and wheel assembly, or assemblies.
31. Using the matchmarks made prior to removal, install the tire and wheel assemblies to the vehicle.
32. Lower the vehicle.

Wheel Runout Measurement - Tire Dismounted

1. On the tire and wheel assembly, or assemblies with wheel runout measurements - tire mounted - which were NOT within specifications, mark each tire and wheel in relation to each other.
2. Dismount the tire from the wheel.
3. Mount the wheel on a spin-type wheel balancer.
4. Locate the wheel on the balancer with a cone through the back side of the center pilot hole.

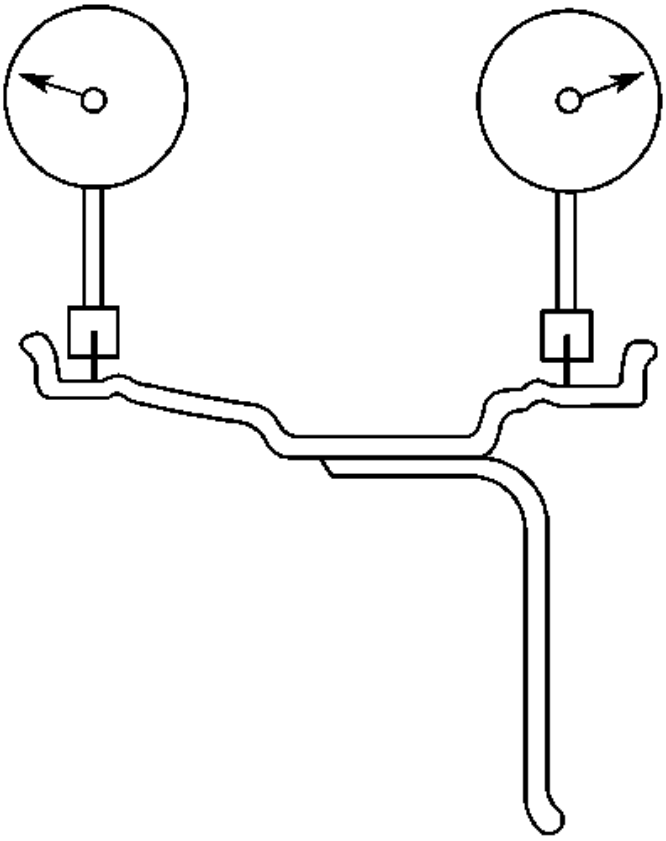

Fig. 10: Measuring Wheel Radial Runout (Off-Vehicle, Tire Dismounted)
Courtesy of GENERAL MOTORS COMPANY

5. Position the dial indicator on the horizontal inner surface of the wheel rim flange - with the tire dismounted - such that the dial indicator is perpendicular to the rim flange surface.

   Wheel runout should be measured on both the inboard and outboard rim flanges. Ignore any jumps or dips due to paint drips, chips, or welds.

6. Slowly rotate the wheel one complete revolution in order to find the low spot.
7. Set the dial indicator to zero at the low spot.
8. Slowly rotate the wheel one more complete revolution and measure the total amount of wheel radial runout.

   Specification

   - Maximum aluminum wheel radial runout - measured off-vehicle, tire dismounted: 0.762 mm (0.030 in)
   - Maximum steel wheel radial runout - measured off-vehicle, tire dismounted: 1.015 mm (0.040 in)

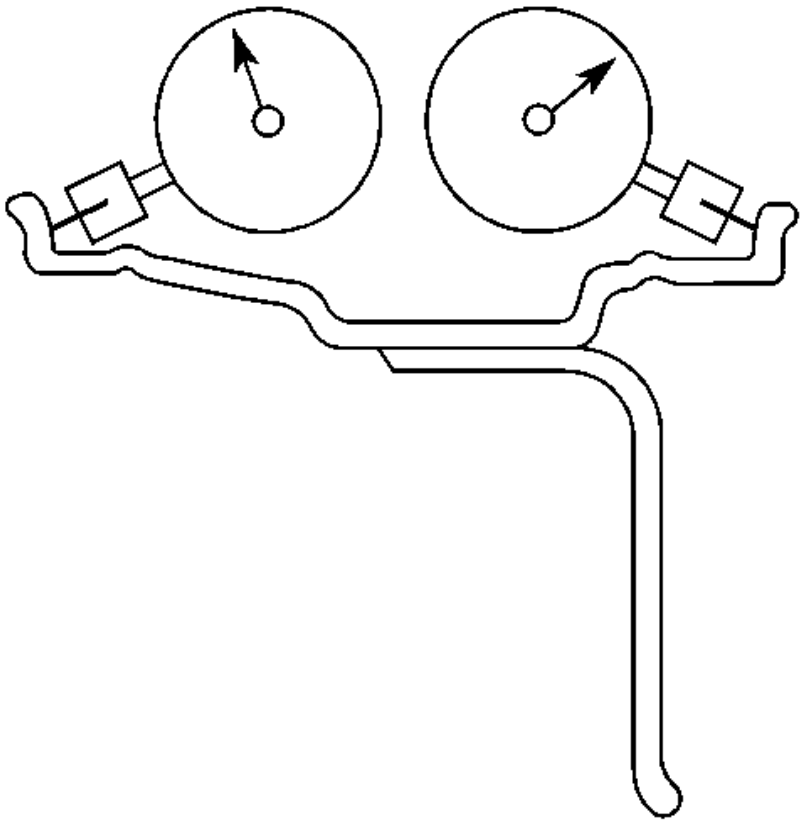

Fig. 11: Measuring Wheel Lateral Runout (Off-Vehicle, Tire Dismounted)
Courtesy of GENERAL MOTORS COMPANY

9. Position the dial indicator on the vertical inner surface of the wheel rim flange - with the tire dismounted - such

that the dial indicator is perpendicular to the rim flange surface.

Wheel runout should be measured on both the inboard and outboard rim flanges. Ignore any jumps or dips due to paint drips, chips, or welds.

10. Slowly rotate the wheel one complete revolution in order to find the low spot.
11. Set the dial indicator to zero at the low spot.
12. Slowly rotate the wheel one more complete revolution and measure the total amount of wheel lateral runout.

    Specification

    - Maximum aluminum wheel lateral runout - measured off-vehicle, tire dismounted: 0.762 mm (0.030 in)
    - Maximum steel wheel lateral runout - measured off-vehicle, tire dismounted: 1.143 mm (0.045 in)
13. Repeat steps 2 through 12 until all of the wheel radial and lateral runout measurements - tire dismounted - have been taken on each wheel with runout measurements - tire mounted - which were NOT within specifications.
14. If any of the wheel runout measurements - tire dismounted - were NOT within specifications, replace the wheel.

    Always measure the runout of any replacement wheels.

15. For any of the wheel runout measurements which WERE within specifications, while the - tire and wheel - assembly runout measurements were NOT within specifications, replace the tire, then balance the assembly. Refer to **Tire and Wheel Assembly Balancing - Off Vehicle**.
16. Using the matchmarks made prior to dismounting the tire, or tires, mount the tire, or tires to the wheel, or wheels, then balance the assembly, or assemblies. Refer to **Tire and Wheel Assembly Balancing - Off Vehicle**.

    Always measure the runout of any of the tire and wheel assemblies which have had the tires dismounted and mounted.

17. Using the matchmarks made prior to removal, install the tire and wheel assemblies to the vehicle.
18. Lower the vehicle.

BRAKE ROTOR/DRUM BALANCE INSPECTION

1. Support the vehicle drive axle on a suitable hoist. Refer to **Lifting and Jacking the Vehicle** .
2. Remove the tire and wheel assemblies from the drive axle. Refer to **Tire and Wheel Removal and Installation** .

WARNING: Refer to Work Stall Test Warning .

3. Reinstall the wheel nuts in order to retain the brake rotors.
4. Run the vehicle at the concern speed while inspecting for the presence of the vibration.

CAUTION: Do not depress the brake pedal with the brake rotors and/or the brake drums removed, or with the brake calipers repositioned away from the brake rotors, or damage to the brake system may result.

5. If the vibration is still present, remove the rotors from the drive axle, then run the vehicle back to the concern speed.
6. If the vibration is eliminated when the brake rotors are removed from the drive axle, repeat the test with one

rotor installed at a time. Replace the rotor that is causing or contributing to the vibration concern.

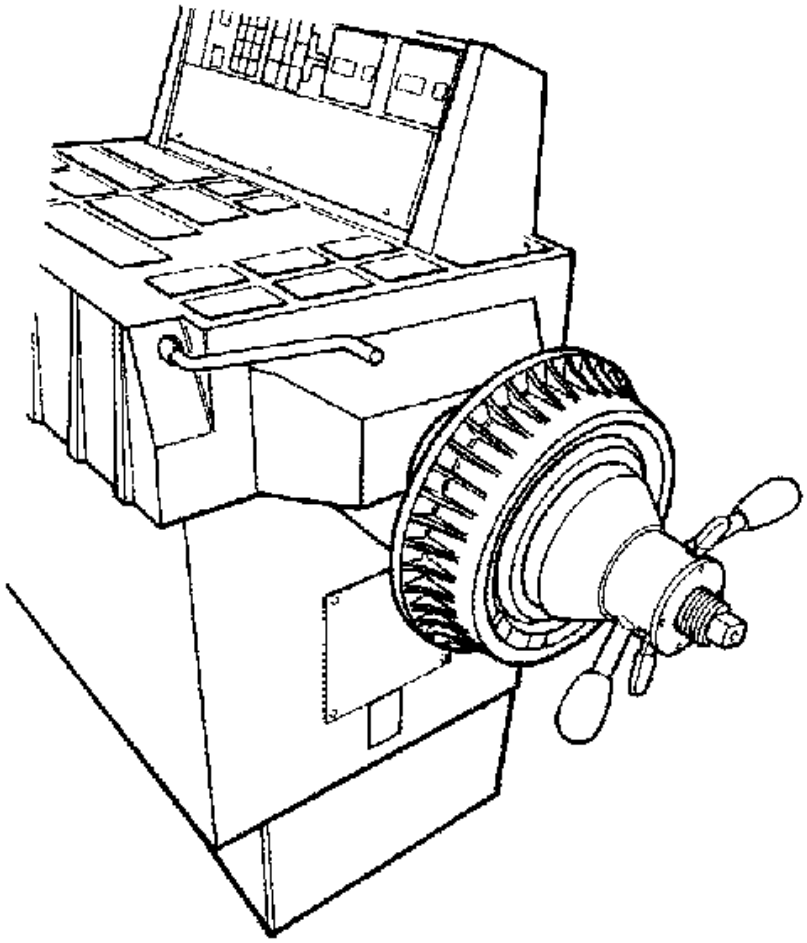

Fig. 12: Balancing Brake Drum
Courtesy of GENERAL MOTORS COMPANY

7. If a brake rotor was replaced as a result of following the previous steps, or if necessary to confirm the results obtained during the previous steps, and/or to check the non-drive axle components, perform the following:
    1. Mount the brake rotor/drum on a balancer in the same manner as a tire and wheel assembly.

        NOTE: Check brake rotors/drums for static imbalance only; ignore the dynamic imbalance readings.

    2. Inspect the rotor/drum for static imbalance.

There is not a set tolerance for brake rotor/drum static imbalance. However, any brake rotor/drum measured in this same manner which is over 21 g (3/4 oz) may have the potential to cause or contribute to a vibration. Rotors/drums suspected of causing or contributing to a vibration should be replaced. Any rotor/drum that is replaced should be checked for imbalance in the same manner.

HUB/AXLE FLANGE AND WHEEL STUD RUNOUT INSPECTION

Special Tools

GE-8001 Dial Indicator Set , or equivalent

1. Raise and support the vehicle. Refer to **Lifting and Jacking the Vehicle** .
2. Mark the location of the wheels to the wheel studs and mark the specific vehicle position on each tire and wheel - LF, LR, RF, RR.
3. Remove the tire and wheel assemblies from the vehicle. Refer to **Tire and Wheel Removal and Installation** .
4. Remove the brake rotors and/or brake drums from the vehicle. Clean the mounting surfaces of the brake rotors, the brake drums, if equipped, and the hub/axle flanges of any loose debris, rust, and corrosion.

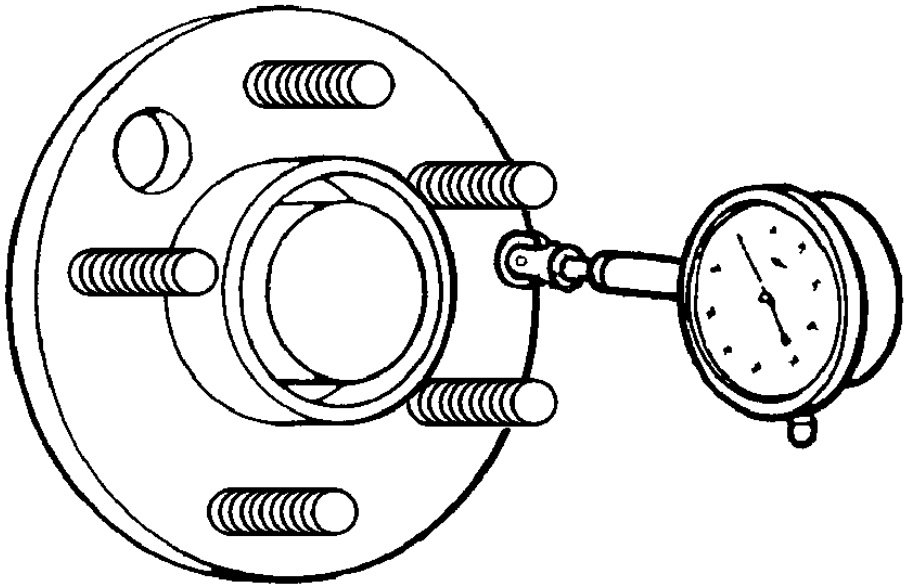

Fig. 13: Measuring Wheel Hub/Axle Flange Runout
Courtesy of GENERAL MOTORS COMPANY

5. Position the **GE-8001** Dial Indicator Set , or equivalent, on the machined surface of the wheel hub/axle flange outside of the wheel studs.
6. Rotate the hub one complete revolution in order to find the low spot.
7. Set the **GE-8001** Dial Indicator Set , or equivalent, to zero at the low spot.
8. Rotate the hub one more complete revolution and measure the total amount of wheel hub/axle flange runout.

Specification - Guideline

Wheel hub/axle flange runout tolerance guideline: 0.132 mm (0.005 in)

9. If the runout of the wheel hub/axle flange IS within specification and the vehicle is equipped with wheel studs, proceed to step 13.
10. If the runout of the wheel hub/axle flange IS within specification and the vehicle is equipped with wheel bolts, proceed to step 19.
11. If the runout of the wheel hub/axle flange is marginal, the wheel hub may or may not be the source of the disturbance.
12. If the runout of the wheel hub/axle flange is excessive, replace the wheel hub/axle flange. Measure the runout of the new wheel hub/axle flange.

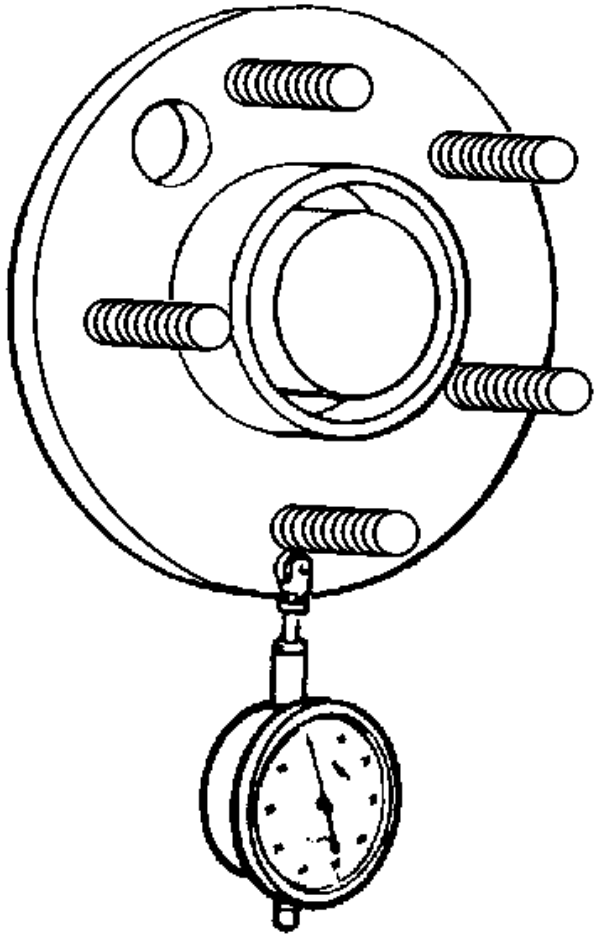

Fig. 14: Measuring Wheel Stud Runout
Courtesy of GENERAL MOTORS COMPANY

13. Position the **GE-8001** Dial Indicator Set , or equivalent, in order to contact the wheel mounting studs.

    Measure the stud runout as close to the flange as possible.

14. Turn the hub one complete revolution to register on each of the wheel studs.
15. Zero the **GE-8001** Dial Indicator Set , or equivalent, on the lowest stud.
16. Rotate the hub one more complete revolution and measure the total amount of wheel stud - stud circle - runout.

    Specification - Guideline

Wheel stud runout tolerance guideline: 0.254 mm (0.010 in)

17. If the runout of the wheel studs - stud circle - is marginal, the wheel studs may or may not be contributing to the disturbance.
18. If the runout of the wheel studs - stud circle - is excessive, replace the wheel studs as necessary. Measure the runout of the new wheel studs.
19. Inspect the threads and the tapered seat portion on each of the wheel bolts for damage.
20. Wheel bolts exibiting damaged threads and/or damaged tapered seats require replacement.
21. Place the threaded portion of each wheel bolt along a straight edge to inspect for straightness.
22. Wheel bolts that are not straight require replacement.

TIRE AND WHEEL ASSEMBLY ISOLATION TEST

Force Variation

Force variation refers to a radial or lateral movement of the tire and wheel assembly which acts much like runout, however, force variation has to do with variations in the construction of the tire. These variations in tire construction may actually cause vibration in a vehicle, even though the tire and wheel assembly runout and balance may be within specifications.

Radial Force Variation

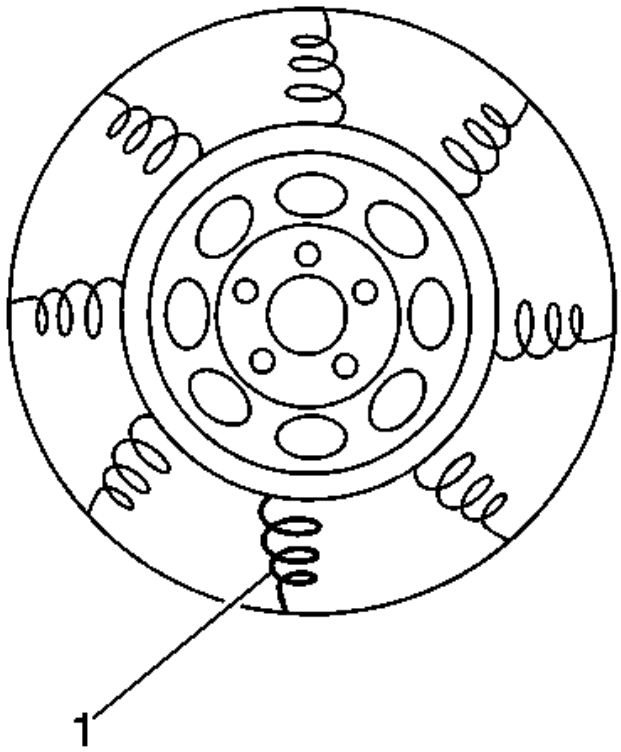

Fig. 15: Identifying Radial Force Variation
Courtesy of GENERAL MOTORS COMPANY

Radial force variation refers to the difference in the stiffness of a tire sidewall as the tire rotates and contacts the road. Tire sidewalls have some stiffness due to splices in the different plies of the tire, but these stiffness differences do not cause a problem unless the force variation is excessive. Stiff spots (1) in a tire sidewall can deflect a tire and wheel assembly upward as the assembly contacts the road.

Lateral Force Variation

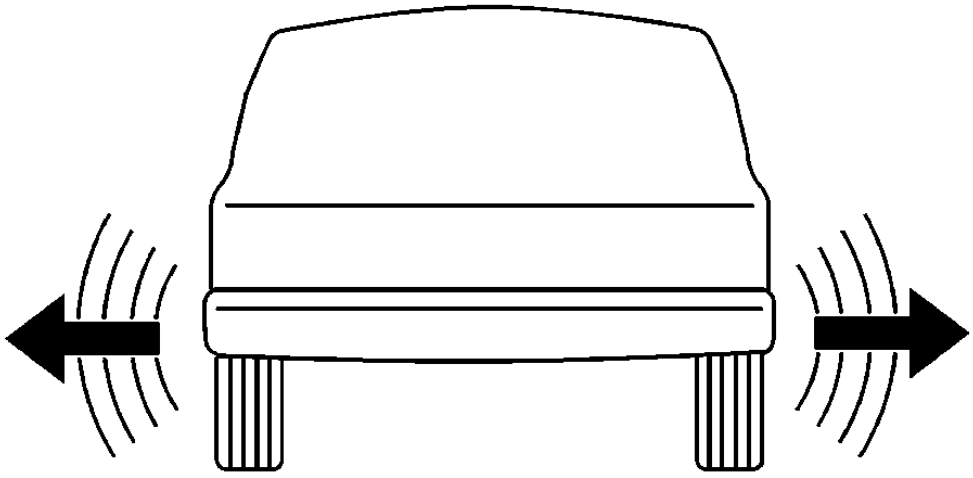

Fig. 16: Identifying Tire Wobble/Waddle
Courtesy of GENERAL MOTORS COMPANY

Lateral force variation refers to the difference in the stiffness or conformity of the belts within a tire as the tire rotates and contacts the road. Tire belts may have some stiffness or conformity differences, but these differences do not cause a problem unless the force variation is excessive. These variations in the belts of the tire can deflect the vehicle sideways or laterally. A shifted belt inside a tire may cause lateral force variation.

In most cases where excessive lateral force variation exists, the vehicle will display a wobble or waddle at low speeds, 8-40 km/h (5-25 mph), on a smooth road surface.

Isolation Test Procedure

Perform the following test in order to determine if force variation is present in the vehicle.

1. Substitute a set of KNOWN GOOD, pre-tested tire and wheel assemblies of the same size and type for the suspected original assemblies. Refer to **Tire and Wheel Removal and Installation** .
2. Road test the vehicle to determine if the vibration is still present. Refer to **Vibration Analysis - Road Testing (EL-38792-A Electronic Vibration Analyzer)Vibration Analysis - Road Testing (CH-51450-NVH Oscilloscope)**.
3. If the vibration is still present while using the known good set of tire and wheel assemblies, then force variation is not the cause of the vibration.
4. If the vibration is eliminated when using the known good set of tire and wheel assemblies, install one of the original tire and wheel assemblies using the matchmarks made prior to removal. Refer to **Tire and Wheel Removal and Installation** , . Road test the vehicle to determine if the vibration has returned. Refer to **Vibration Analysis - Road Testing (EL-38792-A Electronic Vibration Analyzer)Vibration Analysis - Road Testing (CH-51450-NVH Oscilloscope)**.
5. Continue the process of installing the original tire and wheel assemblies one at a time, then road testing the vehicle, until the tire and wheel assembly, or assemblies which is causing the vibration has been identified.
6. Replace the tire, or tires on the vibration-causing tire and wheel assembly, or assemblies, then balance the assembly, or assemblies. Refer to **Tire and Wheel Assembly Balancing - Off Vehicle**.

REPAIR INSTRUCTIONS

TIRE AND WHEEL ASSEMBLY BALANCING - OFF VEHICLE

WARNING: **Failure to adhere to the following precautions before tire balancing can result in personal injury or damage to components:**

- **Clean away any dirt or deposits from the inside of the wheels.**
- **Remove any stones from the tread.**
- **Wear eye protection.**
- **Use coated weights on aluminum wheels.**

Tire and Wheel Assembly Balancer Calibration

Tire and wheel balancers can drift out of calibration over time, or can become inaccurate as a result of heavy use. There will likely not be any visual evidence that a calibration problem exists. If a balancer is not calibrated within specifications, and a tire and wheel assembly is balanced on that machine, the assembly may actually be imbalanced.

Tire and wheel assembly balancer calibration should be checked approximately every 2 weeks, if the machine is used frequently, and/or whenever the balance readings are questionable.

Tire and Wheel Assembly Balancer Calibration Test

NOTE: **If the balancer fails any of the steps in this calibration test, the balancer should be calibrated according to the manufacturer's instructions. If the balancer cannot be calibrated, contact the manufacturer for assistance.**

Inspect the calibration of the tire and wheel assembly balancer according to the manufacturer's recommendations, or perform the following test.

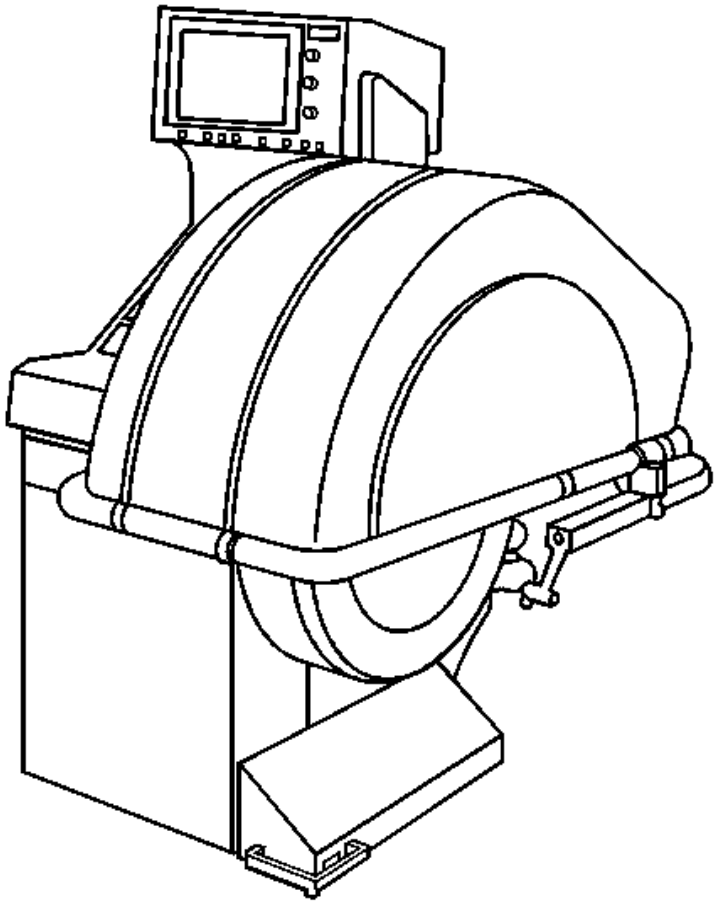

Fig. 17: View Of Tire & Wheel Assembly Balancer
Courtesy of GENERAL MOTORS COMPANY

1. Spin the balancer without a wheel or any of the adapters on the shaft.
2. Inspect the balancer readings.

   Specification

   Zero within 7 g (1/4 oz)

3. If the balancer is within the specification range, balance a tire and wheel assembly - that is within radial and lateral runout tolerances - to ZERO, using the same balancer.
4. After the tire and wheel assembly has been balanced, add an 85 g (3 oz) test weight to the wheel at any location.
5. Spin the tire and wheel assembly again. Note the readings.
   - In the static and dynamic modes, the balancer should call for 85 g (3 oz) of weight, 180 degrees opposite the test weight.
   - In the dynamic mode, the weight should be called for on the flange of the wheel opposite the test weight.
6. With the assembly imbalanced to 85 g (3 oz), cycle the balancer 5 times.
7. Inspect the balancer readings:

   Specification

Maximum variation: 7 g (1/4 oz)

8. Index the tire and wheel assembly on the balancer shaft, 90 degrees from the previous location.
9. Cycle the balancer with the assembly at the new location.
10. Inspect the balancer readings:

    Specification

    Maximum variation: 7 g (1/4 oz)

11. Repeat steps 8 through 10 until the tire and wheel assembly has been cycled and checked at each of the 4 locations on the balancer shaft.

Tire and Wheel Assembly Balancing Guidelines

NOTE: **Tire and wheel assemblies which exhibit excessive runout can produce vibrations even if the assemblies are balanced.**

It is strongly recommended that the tire and wheel assembly runout be measured and corrected if necessary BEFORE the assemblies are balanced.

If the runout of the tire and wheel assemblies has not yet been measured, refer to **Tire and Wheel Assembly Runout Measurement - Off Vehicle** before proceeding.

There are 2 types of tire and wheel balance:

Static Balance

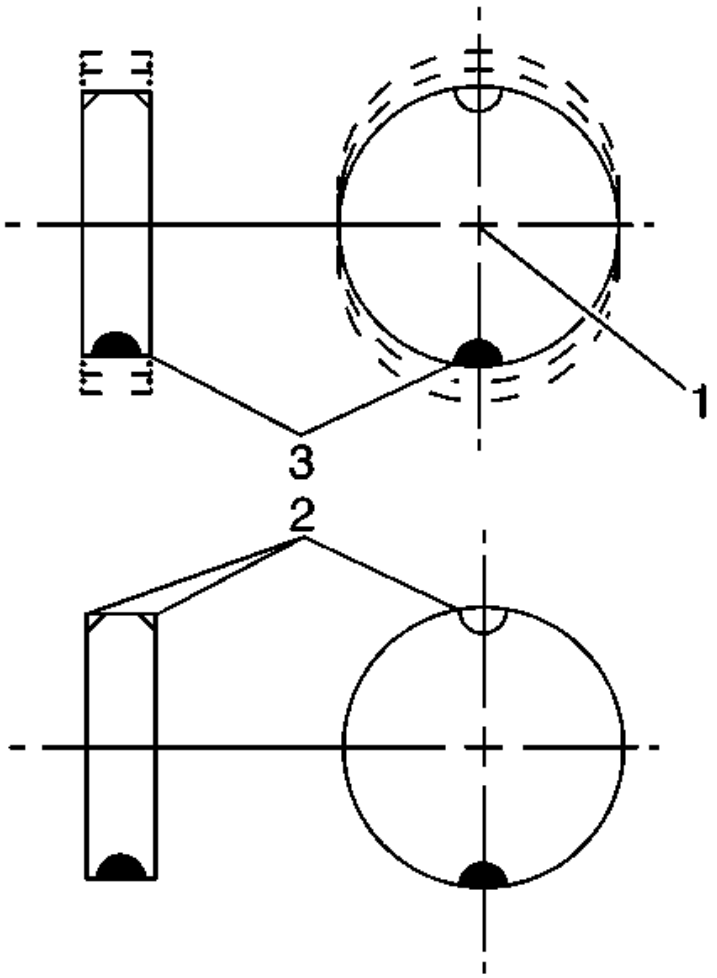

Fig. 18: View Of Static Balance
Courtesy of GENERAL MOTORS COMPANY

Static balance is the equal distribution of weight around the wheel circumference. The wheel balance weights (2) are positioned on the wheel in order to offset the effects of a heavy spot (3). Wheels that have static imbalance can produce a bouncing action called tramp.

Dynamic Balance

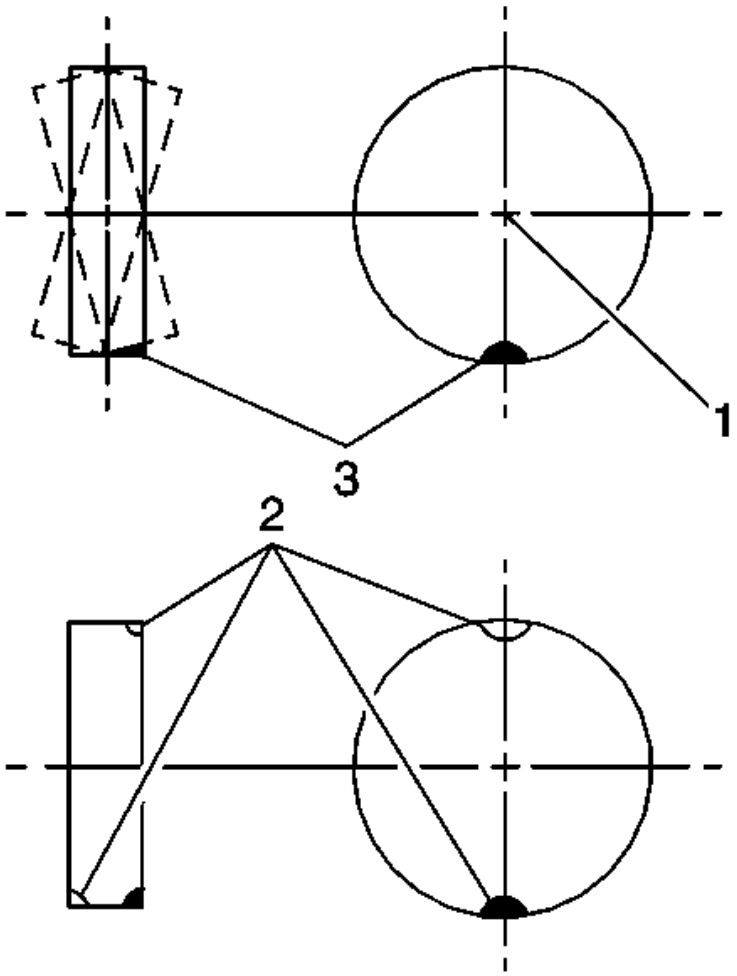

Fig. 19: View Of Dynamic Balance
Courtesy of GENERAL MOTORS COMPANY

Dynamic balance is the equal distribution of weight on each side of the tire and wheel assembly centerline. The wheel balance weights (2) are positioned on the wheel in order to offset the effects of a heavy spot (3). Wheels that have dynamic imbalance have a tendency to move from side to side and can cause an action called shimmy.

Most off-vehicle balancers are capable of checking both types of balance simultaneously.

As a general rule, most vehicles are more sensitive to static imbalance than to dynamic imbalance; however, vehicles equipped with low profile, wide tread path, high performance tires and wheels are susceptible to small amounts of dynamic imbalance. As little as 14-21 g (1/2 - 3/4 oz) imbalance is capable of inducing a vibration in some vehicle models.

Balancing Procedure

NOTE: **When balancing tire and wheel assemblies, use a known good, recently calibrated, off-vehicle, two-plane dynamic balancer set to the finest balance mode available.**

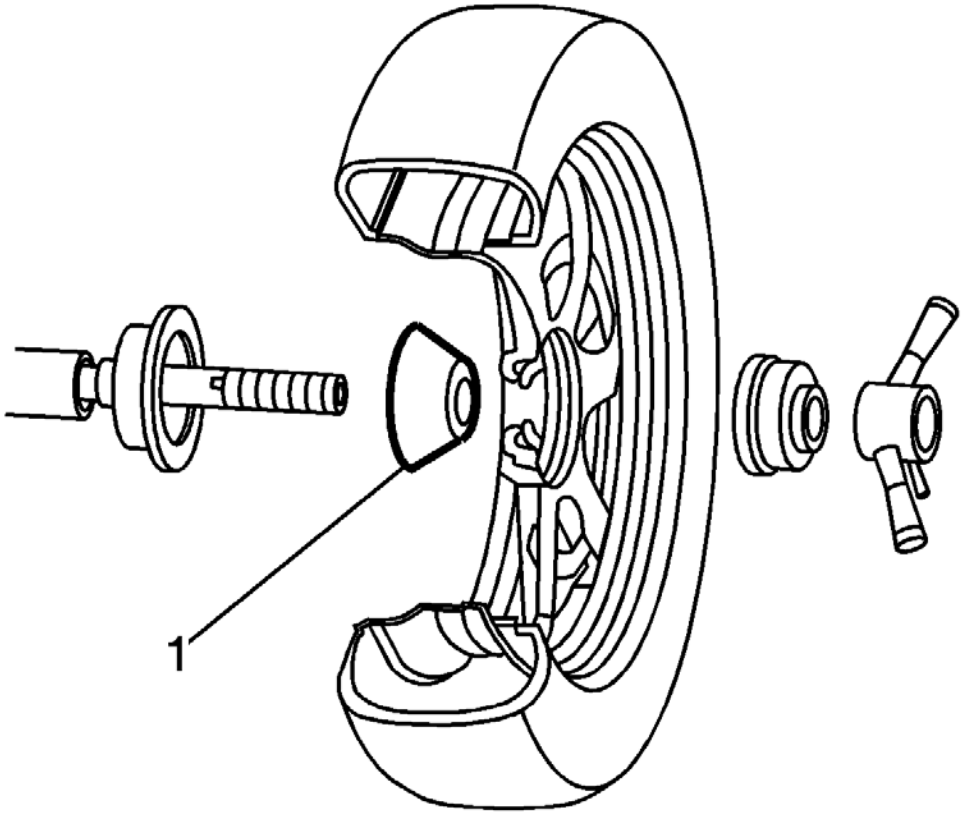

Fig. 20: Wheel Balancer Center Cone
Courtesy of GENERAL MOTORS COMPANY

NOTE: **Carefully follow the wheel balancer manufacturers's instructions for proper mounting of the center cone (1).**

1. Raise and support the vehicle. Refer to **Lifting and Jacking the Vehicle** .
2. Mark the location of the wheels to the wheel studs and mark the specific vehicle position on each tire and wheel - LF, LR, RF, RR.
3. Remove the tire and wheel assemblies one at a time and mount on a spin-type wheel balancer. Refer to **Tire and Wheel Removal and Installation** .
4. Carefully follow the wheel balancer manufacturer's instructions for proper mounting techniques to be used on different types of wheels.

   Regard aftermarket wheels, especially those incorporating universal lug patterns, as potential sources of runout and mounting concerns.

5. Be sure to use the correct type of wheel balance weights for the type of wheel rim being balanced. Be sure to use the correct type of coated wheel balance weights on aluminum wheels. Refer to Wheel Weight Usage.
6. Balance all four tire and wheel assemblies as close to zero as possible.
7. Using the matchmarks made prior to removal, install the tire and wheel assemblies to the vehicle. Refer to **Tire and Wheel Removal and Installation** .

8. Lower the vehicle.

Wheel Weight Usage

Tire and wheel assemblies can be balanced using either the static or dynamic method.

Clip-on Weights

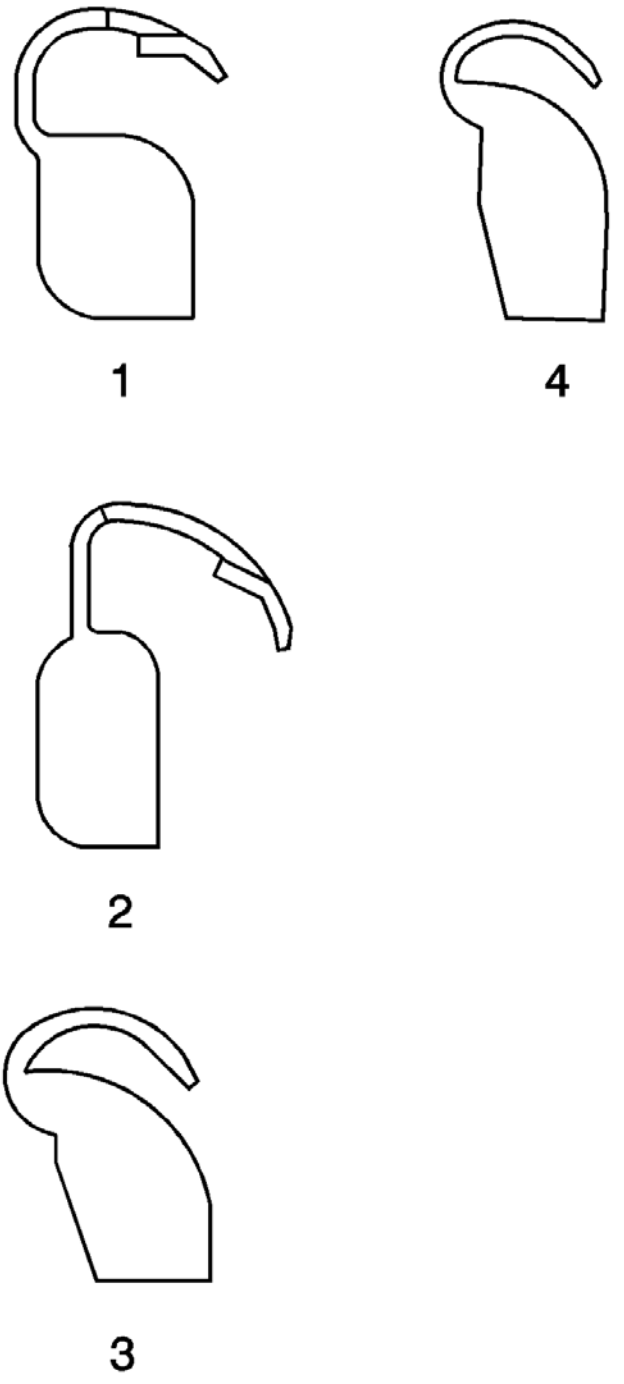

Fig. 21: Identifying Clip-On Wheel Weight Types
Courtesy of GENERAL MOTORS COMPANY

NOTE: **When balancing factory aluminum wheels with clip-on wheel balance weights, be sure to use special polyester-coated weights. These coated weights reduce the potential for corrosion and damage to aluminum wheels.**

These coated weights reduce the potential for corrosion and damage to aluminum wheels.

- MC (1) and AW (2) series weights are approved for use on aluminum wheels.
- P (3) series weights are approved for use on steel wheels only.
- T (4) series coated weights are approved for use on both steel and aluminum wheels.

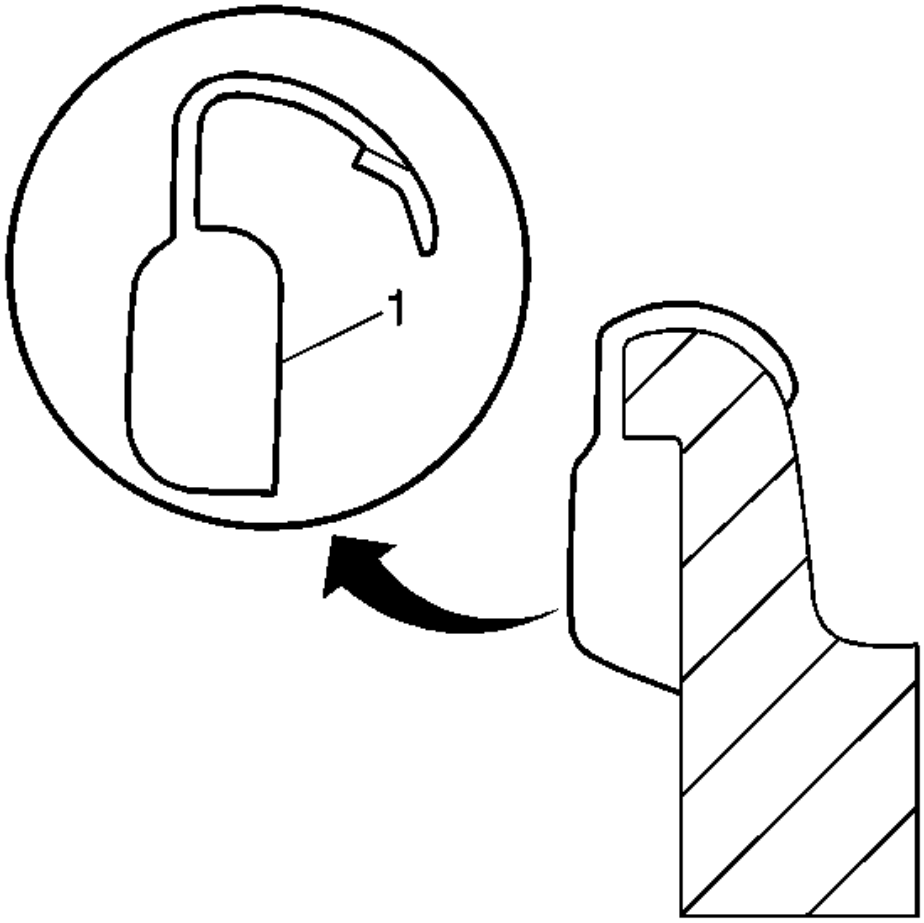

Fig. 22: Attaching Clip-On Wheel Weight
Courtesy of GENERAL MOTORS COMPANY

NOTE: **Use a nylon or plastic-tipped hammer when installing coated clip-on wheel balance weights to minimize the possibility of damage to the polyester coating.**

The contour and style of the wheel rim flange will determine which type of clip-on wheel weight (1) should be used. The weight should follow the contour of the rim flange. The weight clip should firmly grip the rim flange.

Wheel Weight Placement - Clip-on Weights

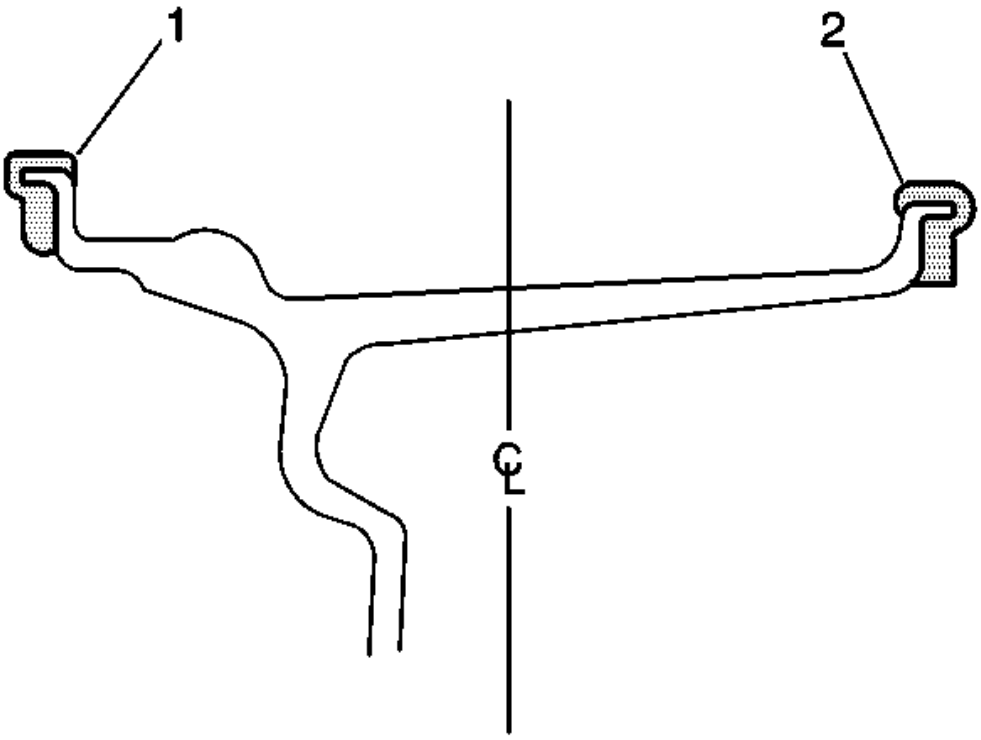

Fig. 23: Clip-On Weight Placement
Courtesy of GENERAL MOTORS COMPANY

When static balancing, locate the wheel balance weights on the inboard flange (2) if only 28 g (1 oz) or less is called for. If more than 28 g (1 oz) is called for, split the weights as equally as possible between the inboard (2) and outboard (1) flanges.

When dynamic balancing, locate the wheel balance weights on the inboard (2) and outboard (1) rim flanges at the positions specified by the wheel balancer.

Adhesive Weights

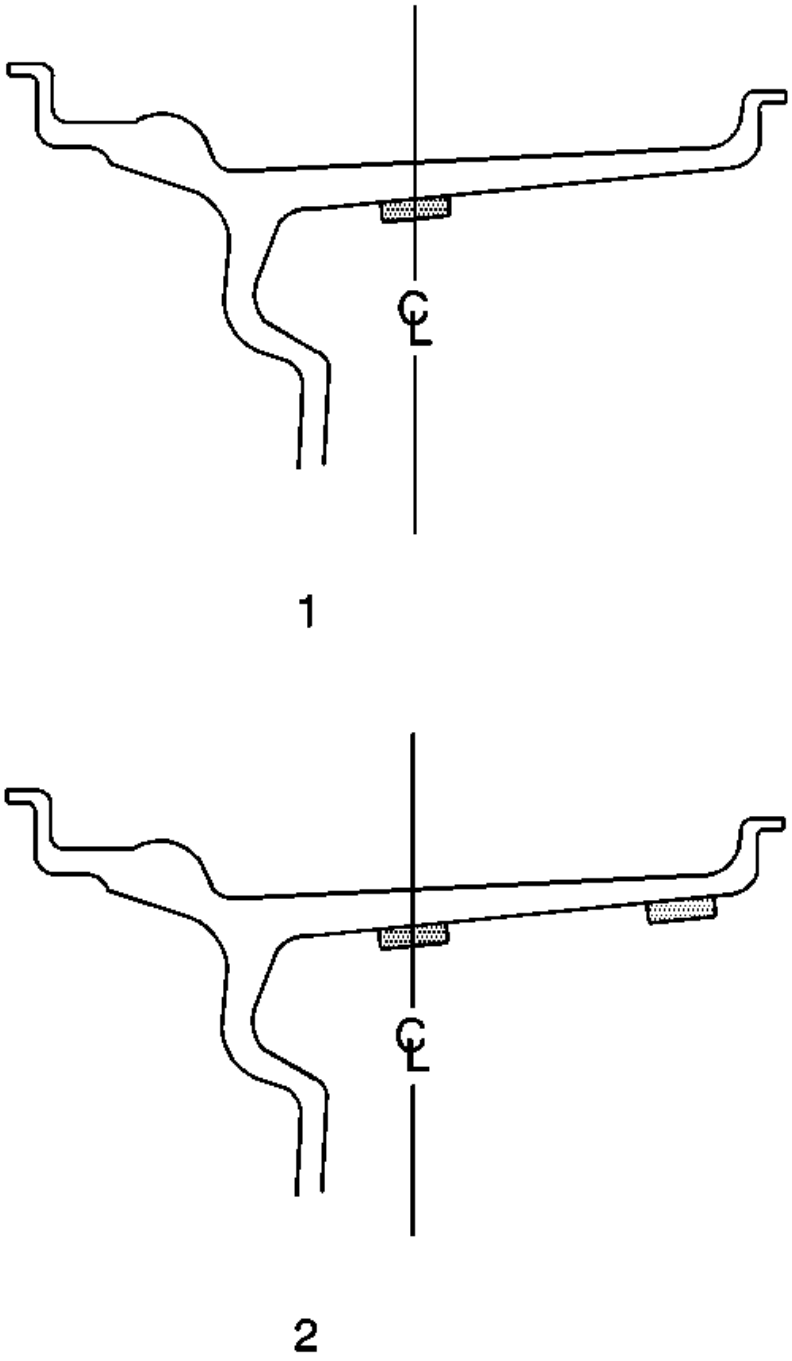

Fig. 24: Identifying Adhesive Weight Wheel Placement
Courtesy of GENERAL MOTORS COMPANY

NOTE: **When installing adhesive balance weights on flangeless wheels, do NOT install the weight on the outboard surface of the rim.**

Adhesive wheel balance weights may be used on factory aluminum wheels. Perform the following procedure to install adhesive wheel balance weights.

1. Determine the correct areas for placement of the wheel weights on the wheel.

- When static balancing, locate the wheel balance weights along the wheel centerline (1) on the inner wheel surface if only 28 g (1 oz) or less is called for. If more than 28 g (1 oz) is called for, split the weights as equally as possible between the wheel centerline and the inboard edge of the inner wheel surface (2).
- When dynamic balancing, locate the wheel balance weights along the wheel centerline and the inboard edge of the inner wheel surface (2) at the positions specified by the wheel balancer.

2. Ensure that there is sufficient clearance between the wheel weights and brake system components.

NOTE: **Do not use abrasives to clean any surface of the wheel.**

3. Using a clean cloth or paper towel with a general purpose cleaner, thoroughly clean the designated balance weight attachment areas of any corrosion, overspray, dirt or any other foreign material.
4. To ensure there is no remaining residue, wipe the balance weight attachment areas again, using a clean cloth or paper towel with a mixture of half isopropyl alcohol and half water.
5. Dry the attachment areas with hot air until the wheel surface is warm to the touch.
6. Warm the adhesive backing on the wheel balance weights to room temperature.
7. Remove the protective covering from the adhesive backing on the back of the balance weights. DO NOT touch the adhesive surface.
8. Apply the wheel balance weights to the wheel, press into place with hand pressure.
9. Secure the wheel balance weights to the wheel with a 90 N (21 lb) force applied with a roller.

TIRE AND WHEEL ASSEMBLY BALANCING - ON-VEHICLE

Special Tools

EL-38792-A Electronic Vibration Analyzer (EVA) 2

If after following the tire and wheel vibration diagnostic process, some amount of tire and wheel vibration is still evident, an on-vehicle high-speed spin balancer may be used to perform an on-vehicle balance in an attempt to finish balance the tire and wheel assemblies, wheel hubs, brake rotors, brake drums, if equipped, and wheel trim, if equipped, simultaneously. On-vehicle balancing can also compensate for minor amounts of residual runout encountered as a result of mounting the tire and wheel assembly on the vehicle, as opposed to the balance which was achieved on the off-vehicle balancer.

In order to perform an on-vehicle balancing procedure, carefully follow the on-vehicle balancer manufacturer's specific operating instructions and carefully consider the following information before proceeding:

- Vehicles equipped with low profile, wide tread path, high performance tires and wheels are susceptible to small amounts of dynamic imbalance.
- When performing an on-vehicle balance, great care must be taken when placing the wheel balance weights on the wheels. If the wheel balance weights are not placed accurately, they can actually induce dynamic imbalance and thus increase the severity of the vibration.
- Inspect the vehicle wheel bearings to ensure that they are in good condition.
- Thoroughly inspect all on-vehicle balancing equipment and ensure that it is fully within the manufacturer's recommended specifications.
- Do not remove the off-vehicle balance weights. The purpose of on-vehicle balance is to fine tune the assembly balance already achieved off-vehicle, not to start over.
- Leave all wheel trim installed whenever possible.

- If the on-vehicle balancer calls for more than 56 g (2 oz) of additional weight, split the weight between the inboard and outboard flanges of the wheel, so as not to upset the dynamic balance of the assembly achieved in the off-vehicle balance. For wheel balance weight information, refer to **Tire and Wheel Assembly Balancing - Off Vehicle**.
- If available, tape-off an area on top of the fenders and the quarter panels, then place the vibration sensor of the **EL-38792-A** Electronic Vibration Analyzer (EVA) 2 on the fender or quarter panel above the specific tire and wheel assembly while it is being on-vehicle balanced.

  The **EL-38792-A** Electronic Vibration Analyzer (EVA) 2 will provide a visual indication of the amplitude of the vibration, and the effect that the on-vehicle balance has on it.

TIRE-TO-WHEEL MATCH-MOUNTING (VECTORING)

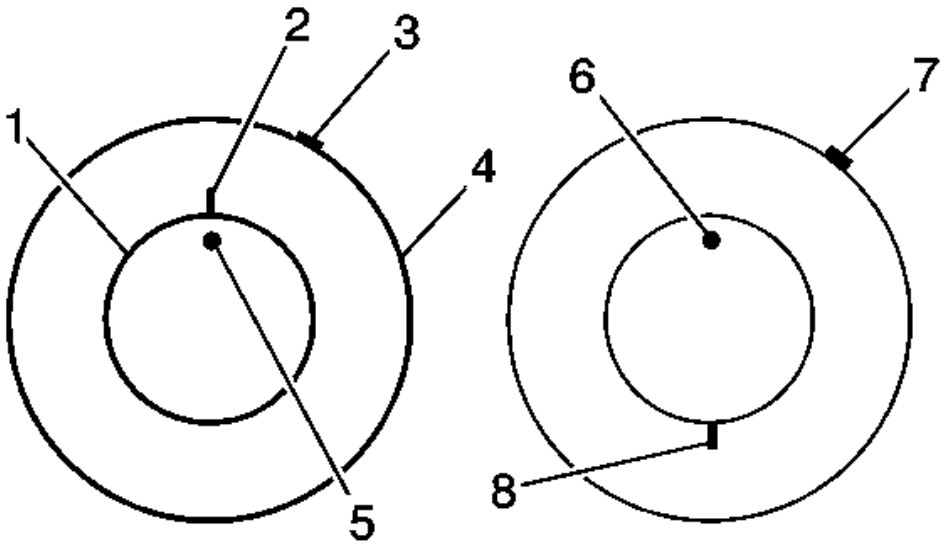

Fig. 25: View Of Tire-to-Wheel Match-Mounting
Courtesy of GENERAL MOTORS COMPANY

NOTE: **After remounting a tire to a wheel or after replacing a tire and/or a wheel, remeasure the tire and wheel assembly runout in order to verify that the amount of runout has been reduced and brought to within tolerances. Ensure that the tire and wheel assembly is properly balanced before reinstalling to the vehicle.**

1. Mark the location of the high spot (3) on the tire as determined during the off-vehicle tire and wheel assembly

runout measurement.

2. Place a reference mark (2) on the tire sidewall at the location of the valve stem (5).
    - Always refer to the valve stem as the 12 o'clock position.
    - Refer to the location of the high spot (3) by its clock position on the wheel, relative to the valve stem.
3. Mount the tire and wheel assembly on a tire machine and break down the bead. Do not dismount the tire from the wheel at this time.
4. Rotate the tire 180 degrees on the rim so that the valve stem reference mark (8) is now at the 6 o'clock position in relation to the valve stem (6). You may need to lubricate the bead in order to easily rotate the tire on the wheel.
5. Reinflate the tire and seat the bead properly.
6. Mount the assembly on the tire balancer and remeasure the runout. Mark the new location of the assembly runout high spot on the tire.
7. If the assembly runout has been reduced and is within tolerance, no further steps are necessary. Balance the tire and wheel assembly, then install the assembly to the vehicle. Refer to the following:
    - **Tire and Wheel Assembly Balancing - Off Vehicle**
    - **Tire and Wheel Removal and Installation**
8. If the clock location of the high spot remained at or near the original clock location of the high spot (7) and the assembly runout has NOT been reduced, the wheel is the major contributor to the assembly runout concern.

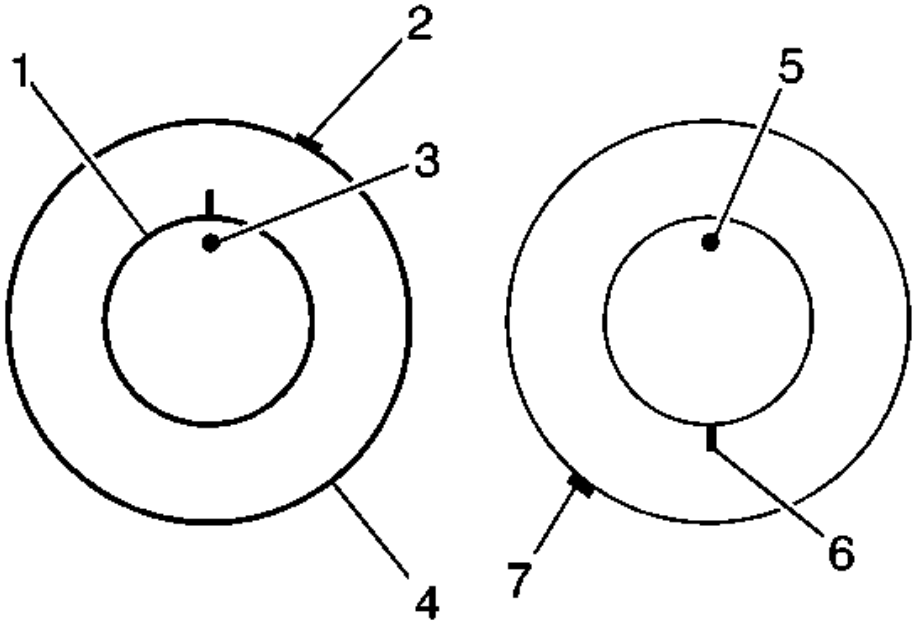

Fig. 26: View Of Match-Mounting Tire-To-Wheel
Courtesy of GENERAL MOTORS COMPANY

9. If the clock location of the high spot has moved, however the assembly runout has NOT been reduced, perform the following steps:
    1. If the clock location of the high spot (7) is now at or near a position 180 degrees from the original clock location of the high spot, the tire is the major contributor to the assembly runout concern.
    2. If the clock location of the high spot is now in-between the 2 extremes, then both the tire and the wheel are both contributing to the assembly runout concern. Rotate the tire an additional 90 degrees in both the clockwise and the counterclockwise directions to obtain the lowest amount of assembly runout.

TIRE AND WHEEL ASSEMBLY-TO-HUB/AXLE FLANGE MATCH-MOUNTING

NOTE: **After remounting a tire and wheel assembly to a hub/axle flange, remeasure the tire and wheel assembly on-vehicle runout in order to verify that the amount of runout has been reduced and brought to within tolerances.**

1. Mark the location of the high spot on the tire and wheel assembly as determined during the on-vehicle tire and wheel assembly runout measurement.
2. Place a reference mark on the wheel stud that is located closest to the wheel valve stem.
    - Always refer to the reference mark on the wheel stud as the 12 o'clock position.
    - Refer to the location of the high spot by its clock position on the tire and wheel assembly, relative to the marked wheel stud.
3. Remove the tire and wheel assembly from the hub/axle flange. Refer to **Tire and Wheel Removal and Installation** .
4. Rotate the tire and wheel assembly as close to 180 degrees as possible on the hub/axle flange, so that the wheel valve stem is now approximately at the 6 o'clock position in relation to the marked wheel stud.
5. Reinstall the wheel lug nuts to secure the tire and wheel assembly in the new position. Refer to **Tire and Wheel Removal and Installation** .
6. Remeasure the tire and wheel assembly on-vehicle runout. Mark the new location of the assembly on-vehicle runout high spot on the tire. Refer to **Tire and Wheel Assembly Runout Measurement - On-Vehicle**.
7. If the assembly on-vehicle runout has been reduced and is within tolerance, no further steps are necessary.
8. If the assembly runout has NOT been reduced, perform the following steps:
    1. If the clock location of the high spot remained at or near the original clock location of the high spot, the hub/axle flange and/or the brake rotor/drum mounting flange is the major contributor to the assembly on-vehicle runout concern.
    2. If the clock location of the high spot is now at or near a position 180 degrees from the original clock location of the high spot, the tire and wheel assembly is the major contributor to the assembly on-vehicle runout concern.
    3. If the clock location of the high spot is now in-between the 2 extremes, then both the tire and wheel assembly and the hub/axle flange are contributing to the assembly on-vehicle runout concern. Rotate the tire and wheel assembly as close to an additional 90 degrees as possible in both the clockwise and the counterclockwise directions to obtain the lowest amount of assembly on-vehicle runout.

DESCRIPTION AND OPERATION

VIBRATION THEORY AND TERMINOLOGY

Vibration Theory

The designs and engineering requirements of vehicles have undergone drastic changes over the last several years.

Vehicles are stiffer and provide more isolation from road input than they did previously. The structures of today's stiffer vehicles are less susceptible to many of the vibrations which could be present in vehicles of earlier designs, however, vibrations can still be detected in a more modern vehicle if a transfer path is created between a rotating component and the body of the vehicle.

There are not as many points of isolation from the road in many vehicles today. If a component produces a strong enough vibration, it may overcome the existing isolation and the component needs to be repaired or replaced.

The presence/absence of unwanted noise and vibration is linked to the customer's perception of the overall quality of the vehicle.

Vibration is the repetitive motion of an object, back and forth, or up and down. The following components cause most vehicle vibrations:

- A rotating component
- The engine combustion process firing impulses

Rotating components will cause vibrations when excessive imbalance or runout is present. During vibration diagnosis, the amount of allowable imbalance or runout should be considered a TOLERANCE and not a SPECIFICATION. In other words, the less imbalance or runout the better.

Rotating components will cause a vibration concern when they are not properly isolated from the passenger compartment: Engine firing pulses can be detected as a vibration if a motor mount is collapsed.

A vibrating component operates at a consistent rate (km/h, mph, or RPM). Measure the rate of vibration in question. When the rate/speed is determined, relate the vibration to a component that operates at an equal rate/speed in order to pinpoint the source. Vibrations also tend to transmit through the body structure to other components. Therefore, just because the seat vibrates does not mean the source of vibration is in the seat.

Vibrations consist of the following three elements:

- The source - the cause of the vibration
- The transfer path - the path the vibration travels through the vehicle
- The responder - the component where the vibration is felt

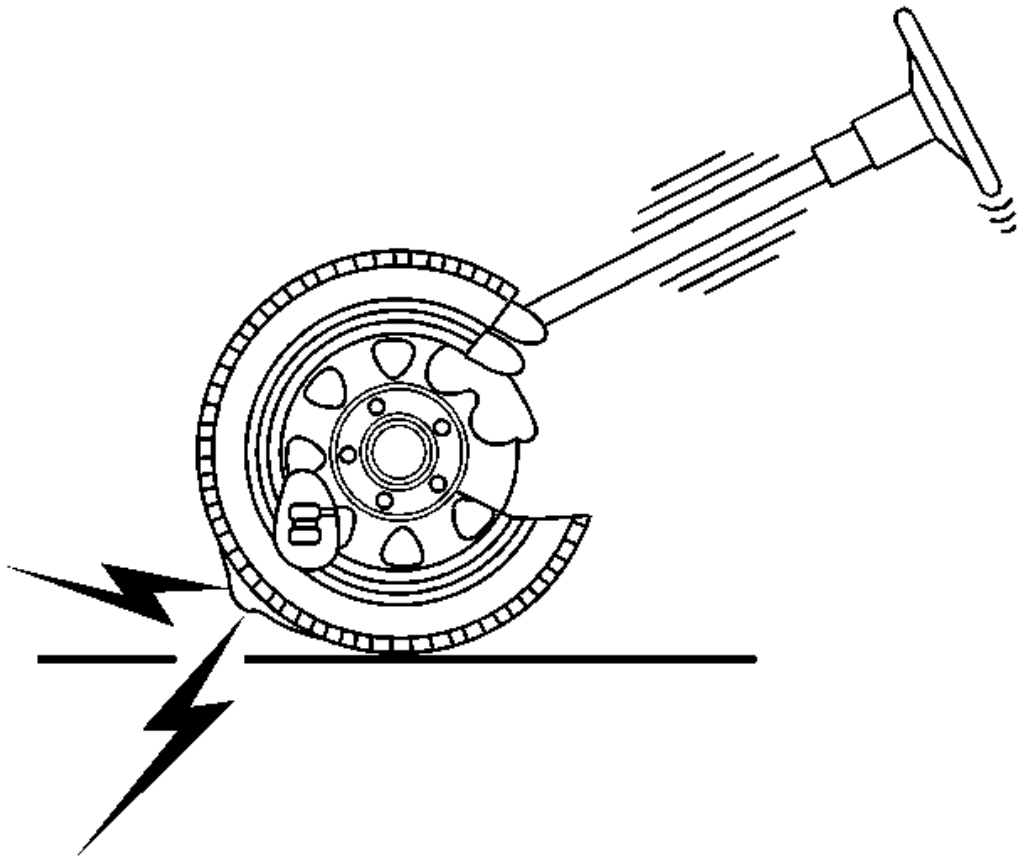

Fig. 27: Identifying Unbalanced Tire Vibration
Courtesy of GENERAL MOTORS COMPANY

In the preceding picture, the source is the unbalanced tire. The transfer path is the route the vibrations travels through the vehicle's suspension system into the steering column. The responder is the steering wheel, which the customer reports as vibrating. Eliminating any one of these three elements will usually correct the condition. Decide, from the gathered information, which element makes the most sense to repair. Adding a brace to the steering column may keep the steering wheel from vibrating, but adding a brace is not a practical solution. The most direct and effective repair would be to properly balance the tire.

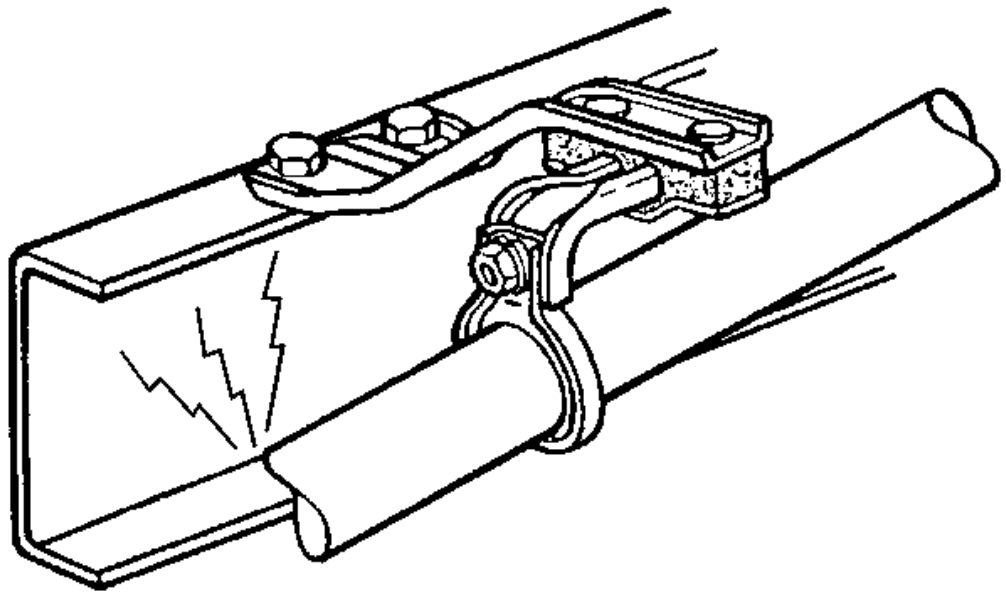

Fig. 28: Identifying Exhaust Pipe Noise
Courtesy of GENERAL MOTORS COMPANY

Vibration can also produce noise. As an example, consider a vehicle that has an exhaust pipe grounded to the frame. The source of the vibration is the engine firing impulses traveling through the exhaust. The transfer path is a grounded or bound-up exhaust hanger. The responder is the frame. The floor panel vibrates, acting as a large speaker, which produces noise. The best repair would be to eliminate the transfer path. Aligning the exhaust system and correcting the grounded condition at the frame would eliminate the transfer path.

Basic Vibration Terminology

The following are the 2 primary components of vibration diagnosis:

- The physical properties of objects
- The object's properties of conducting mechanical energy

The repetitive up and down or back and forth movement of a component cause most customer vibration complaints. The following are the common components that vibrate:

- The steering wheel
- The seat cushion
- The frame

- The IP

Vibration diagnosis involves the following simple outline:

1. Measure the repetitive motion and assign a value to the measurement in cycles per second or cycles per minute.
2. Relate the frequency back on terms of the rotational speed of a component that is operating at the same rate or speed.
3. Inspect and test the components for conditions that cause vibration.

For example, performing the following steps will help demonstrate the vibration theory:

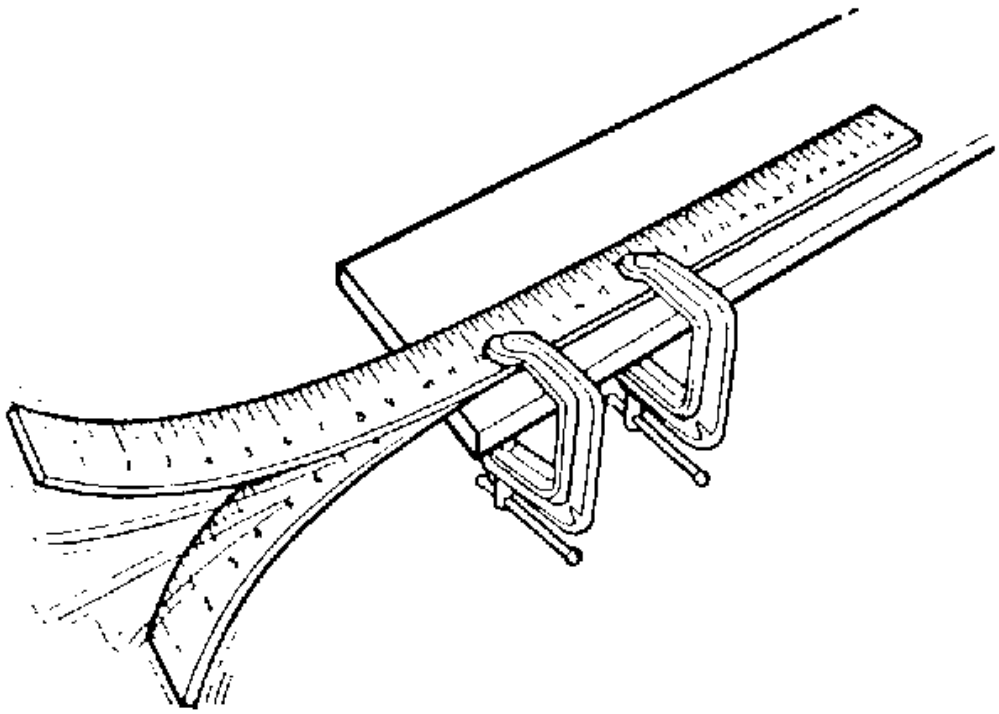

Fig. 29: Demonstrating Vibration Theory
Courtesy of GENERAL MOTORS COMPANY

1. Clamp a yardstick to the edge of a table, leaving about 50 cm (20 in) hanging over the edge of the table.
2. Pull down on the edge of the stick and release while observing the movement of the stick.

The motion of the stick occurs in repetitive cycles. The cycle begins at midpoint, continues through the lowest extreme of travel, then back past the midpoint, through the upper extreme of travel, and back to the midpoint where the cycle begins again.

The cycle occurs over and over again at the same rate, or frequency. In this case, about 10 cycles in one second. If we

measure the frequency to reflect the number of complete cycles that the yardstick made in one minute, the measure would be 10 cycles x 60 seconds = 600 cycles per minute (cpm).

We have also found a specific amount of motion, or amplitude, in the total travel of the yardstick from the very top to the very bottom. Redo the experiment as follows:

1. Reclamp the yardstick to the edge of a table, leaving about 25 cm (10 in) hanging over the edge of the table.
2. Pull down on the edge of the stick and release while observing the movement of the stick.

The stick vibrates at a much faster frequency: 30 cycles per second (1,800 cycles per minute).

Cycle

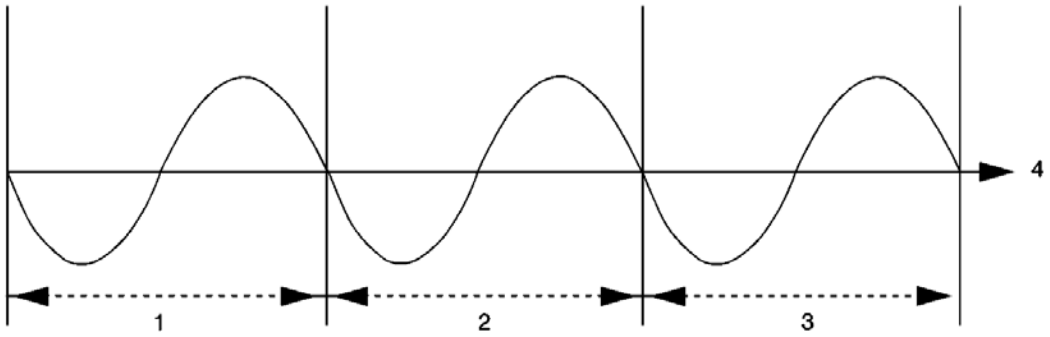

Fig. 30: Identifying Powertrain Vibration Cycles
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	1st Cycle
2	2nd Cycle
3	3rd Cycle
4	Time

Vibration Cycles in Powertrain Components

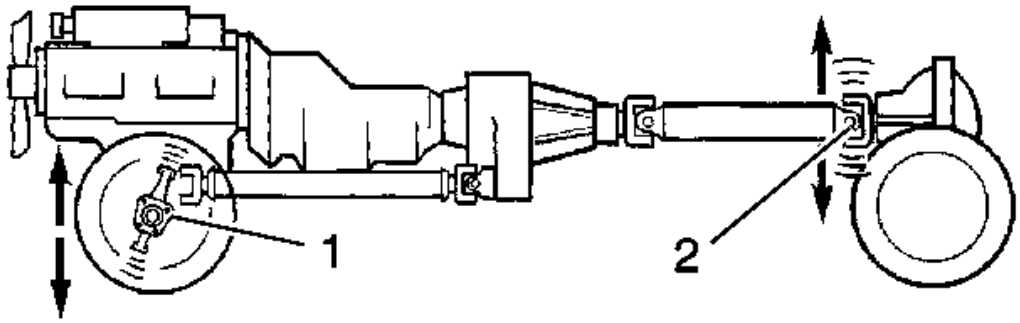

Fig. 31: Identifying Vibration Cycles In Powertrain Components
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Spindle
2	Pinion Nose

The word cycle comes from the same root as the word circle. A circle begins and ends at the same point, as thus, so does a cycle. All vibrations consist of repetitive cycles.

Frequency

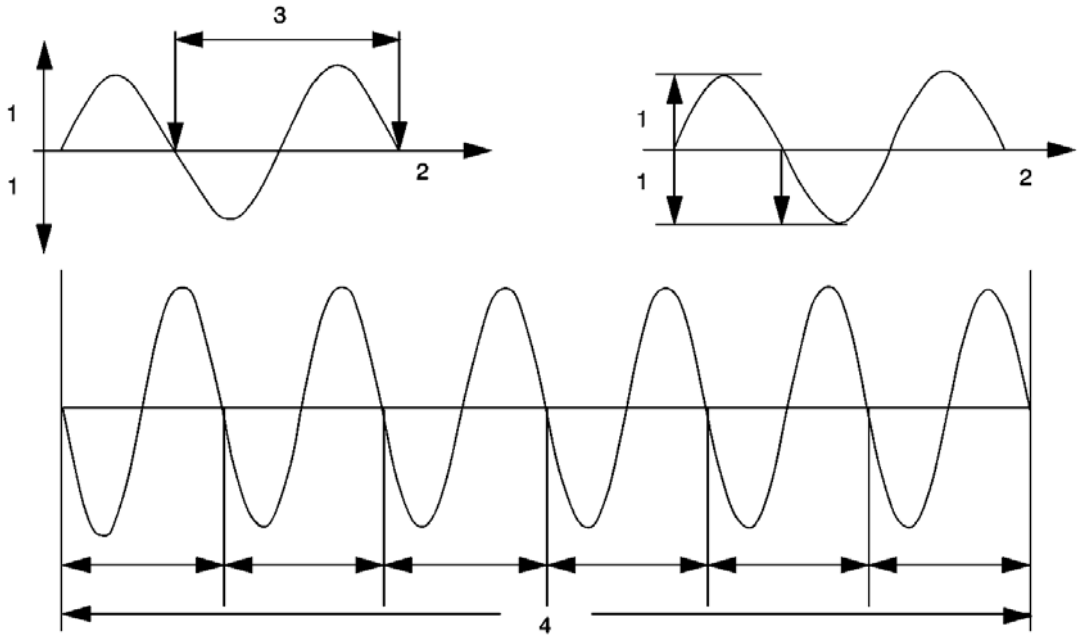

Fig. 32: Identifying Vibration Frequency
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Amplitude
2	Reference
3	Time in Seconds
4	1 Second

Frequency is defined as the rate at which an event occurs during a given period of time. With a vibration, the event is a cycle, and the period of time is 1 second. Thus, frequency is expressed in cycles per second.

The proper term for cycles per seconds is Hertz (Hz). This is the most common way to measure frequency. Multiply the Hertz by 60 to get the cycles or revolutions per minute (RPM).

Amplitude

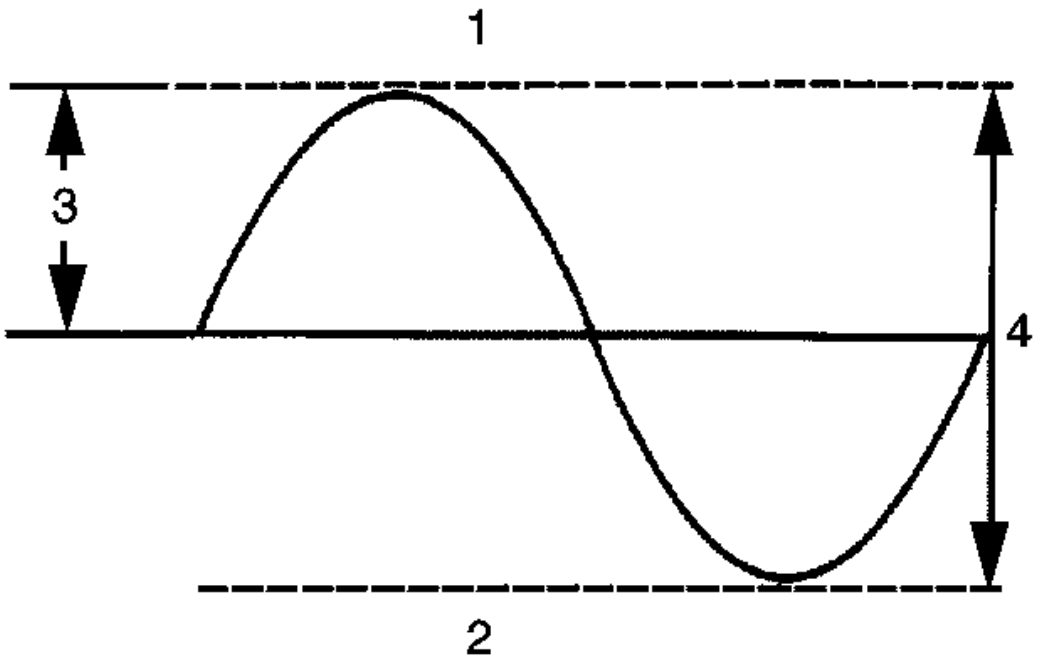

Fig. 33: Identifying Vibration Amplitude
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Maximum
2	Minimum
3	Zero-to-Peak Amplitude
4	Peak-to-Peak Amplitude

Amplitude is the maximum value of a periodically varying quantity. Used in vibration diagnostics, we are referring it to the magnitude of the disturbance. A severe disturbance would have a high amplitude; a minor disturbance would have a low amplitude.

Amplitude is measured by the amount of actual movement, or the displacement. For example, consider the vibration caused by an out-of-balance wheel at 80 km/h (50 mph) as opposed to 40 km/h (25 mph). As the speed increases, the amplitude increases.

Free Vibration

Free vibration is the continued vibration in the absence of any outside force. In the yardstick example, the yardstick continued to vibrate even after the end was released.

Forced Vibration

Forced vibration is when an object is vibrating continuously as a result of an outside force.

Centrifugal Force Due to an Imbalance

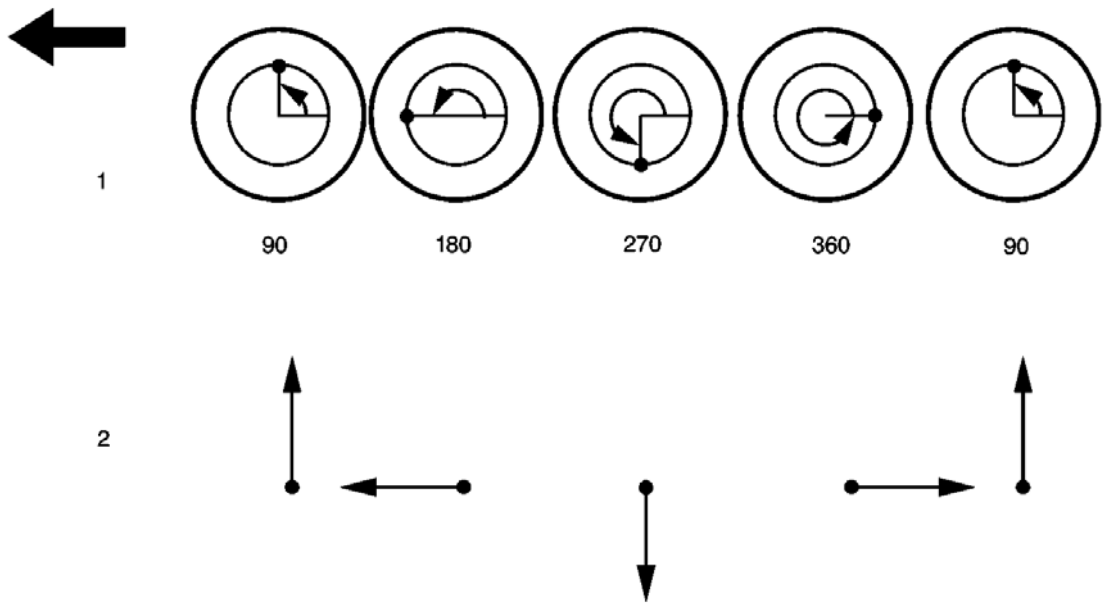

Fig. 34: Identifying Centrifugal Force Components
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Location of Imbalance (Degrees)
2	Centrifugal Force Acting on Spindle

A spinning object with an imbalance generates a centrifugal force. Performing the following steps will help to demonstrate centrifugal force:

1. Tie a nut to a string.
2. Hold the string. The nut hangs vertically due to gravity.
3. Spin the string. The nut will spin in a circle.

Centrifugal force is trying to make the nut fly outward, causing the pull you feel on your hand. An unbalanced tire follows the same example. The nut is the imbalance in the tire. The string is the tire, wheel, and suspension assembly. As the vehicle speed increases, the disturbing force of the unbalanced tire can be felt in the steering wheel, the seat, and the floor. This disturbance will be repetitive (Hz) and the amplitude will increase. At higher speeds, both the frequency and the amplitude will increase. As the tire revolves, the imbalance, or the centrifugal force, will alternately lift the tire up and force the tire downward, along with the spindle, once for each revolution of the tire.

Natural or Resonant Frequency

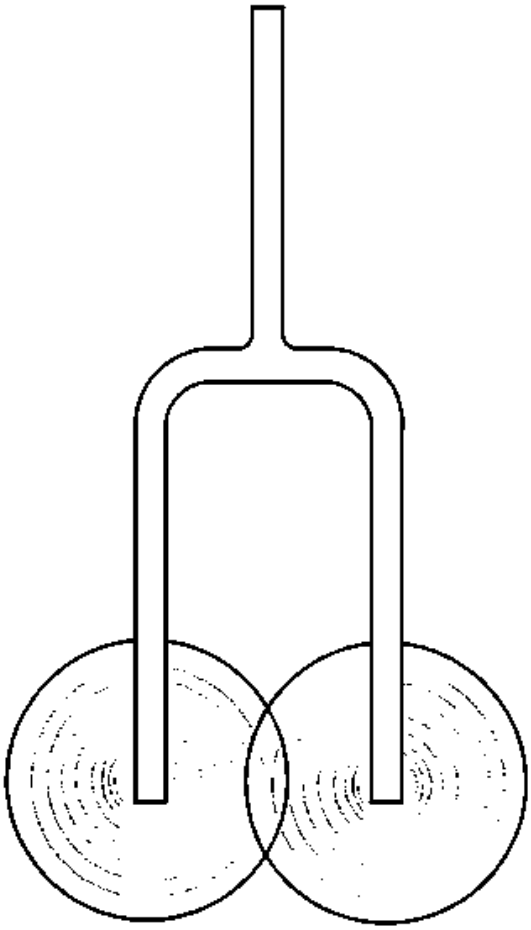

Fig. 35: View Of Natural Frequency
Courtesy of GENERAL MOTORS COMPANY

The natural frequency is the frequency at which an object tends to vibrate. Bells, guitar strings, and tuning forks are all examples of objects that tend to vibrate at specific frequencies when excited by an external force.

Suspension systems, and even engines within the mounts, have a tendency to vibrate at certain frequencies. This is why some vibration complaints occur only at specific vehicle speeds or engine RPM.

The stiffness and the natural frequency of a material have a relationship. Generally, the stiffer the material, the higher the natural frequency. The opposite is also true. The softer a material, the lower the natural frequency. Conversely, the greater the mass, the lower the natural frequency.

Resonance

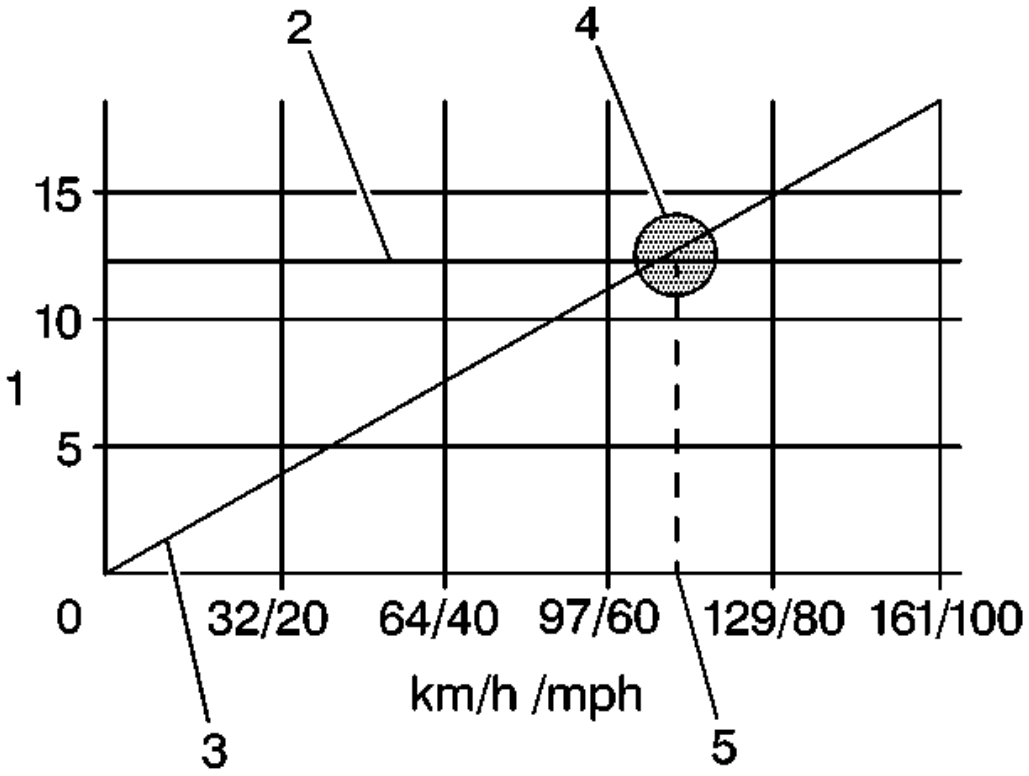

Fig. 36: Natural Frequency Of A Typical Automotive Front Suspension
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Frequency - cps
2	Suspension Frequency
3	Unbalanced Excitation
4	Point of Resonance
5	Problem Speed

All objects have natural frequencies. The natural frequency of a typical automotive front suspension is in the 10-15 Hz range. This natural frequency is the result of the suspension design. The suspension's natural frequency is the same at all vehicle speeds. As the tire speed increases along with the vehicle speed, the disturbance created by the tire increases in frequency. Eventually, the frequency of the unbalanced tire will intersect with the natural frequency of the suspension. This causes the suspension to vibrate. The intersecting point is called the resonance.

The amplitude of a vibration will be greatest at the point of resonance. While the vibration may be felt above and below the problem speed, the vibration may be felt the most at the point of resonance.

Damping

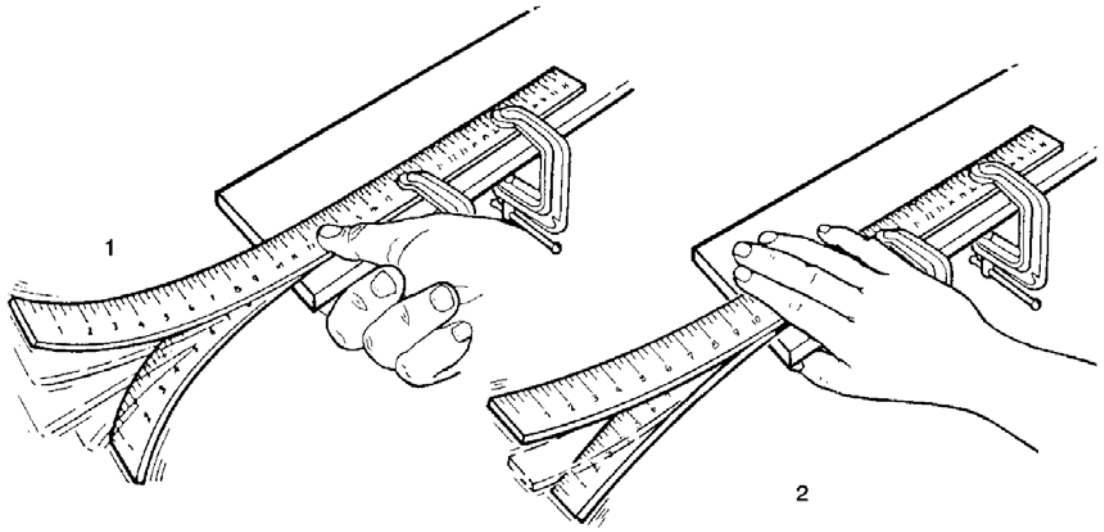

Fig. 37: Identifying Low & High Damping
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Low Damping
2	High Damping

Damping is the ability of an object or material to dissipate or absorb vibration. The automotive shock absorber is a good example. The function of the shock absorber is to absorb or dampen the oscillations of the suspension system.

Beating (Phasing)

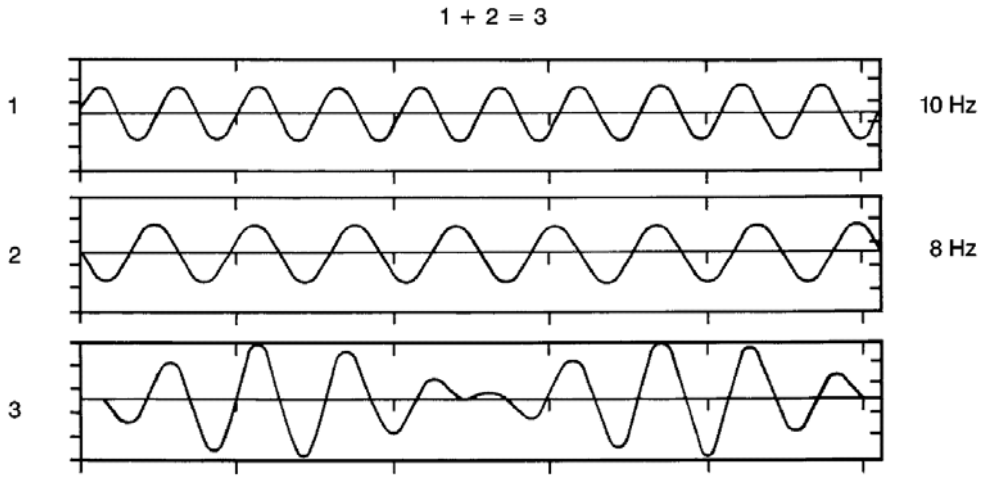

Fig. 38: Identifying Beating Or Phasing
Courtesy of GENERAL MOTORS COMPANY

Two separate disturbances that are relatively close together in frequency will lead to a condition called beating, or phasing. A beating vibration condition will increase in intensity or amplitude in a repetitive fashion as the vehicle travels at a steady speed. This beating vibration can produce the familiar droning noise heard in some vehicles.

Beating occurs when 2 vibrating forces are adding to each other's amplitude. However, 2 vibrating forces can also subtract from each other's amplitude. The adding and subtracting of amplitudes in similar frequencies is called beating. In many cases, eliminating either one of the disturbances can correct the condition.

Order

Order refers to how many times an event occurs during 1 revolution of a rotating component.

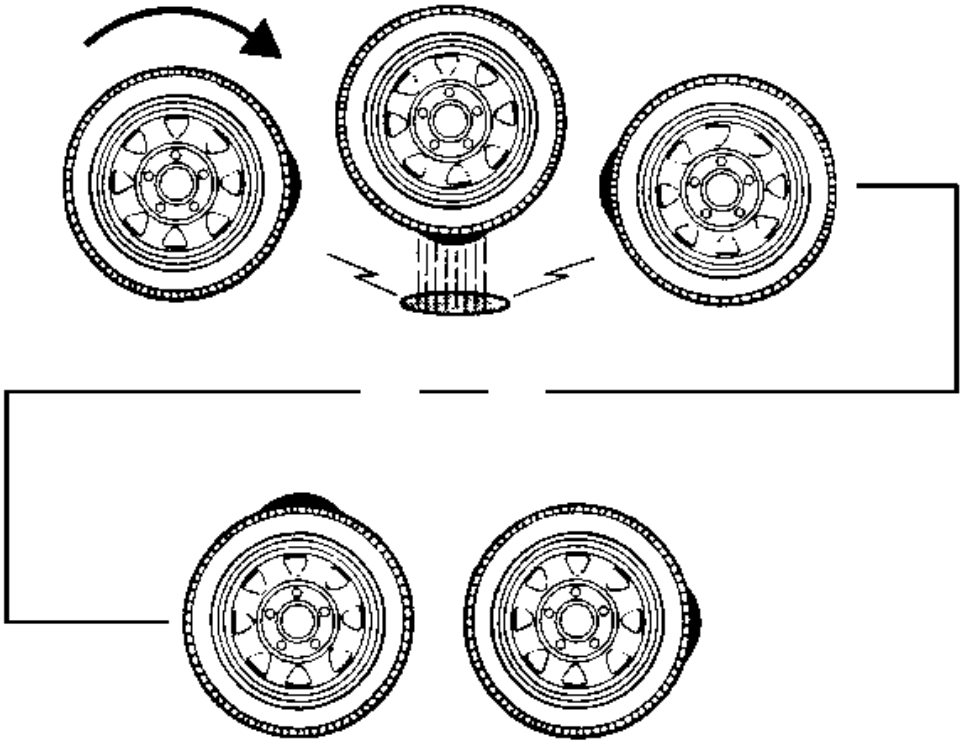

Fig. 39: Identifying First-Order Vibration
Courtesy of GENERAL MOTORS COMPANY

For example, a tire with 1 high spot would create a disturbance once for every revolution of the tire. This is called first-order vibration.

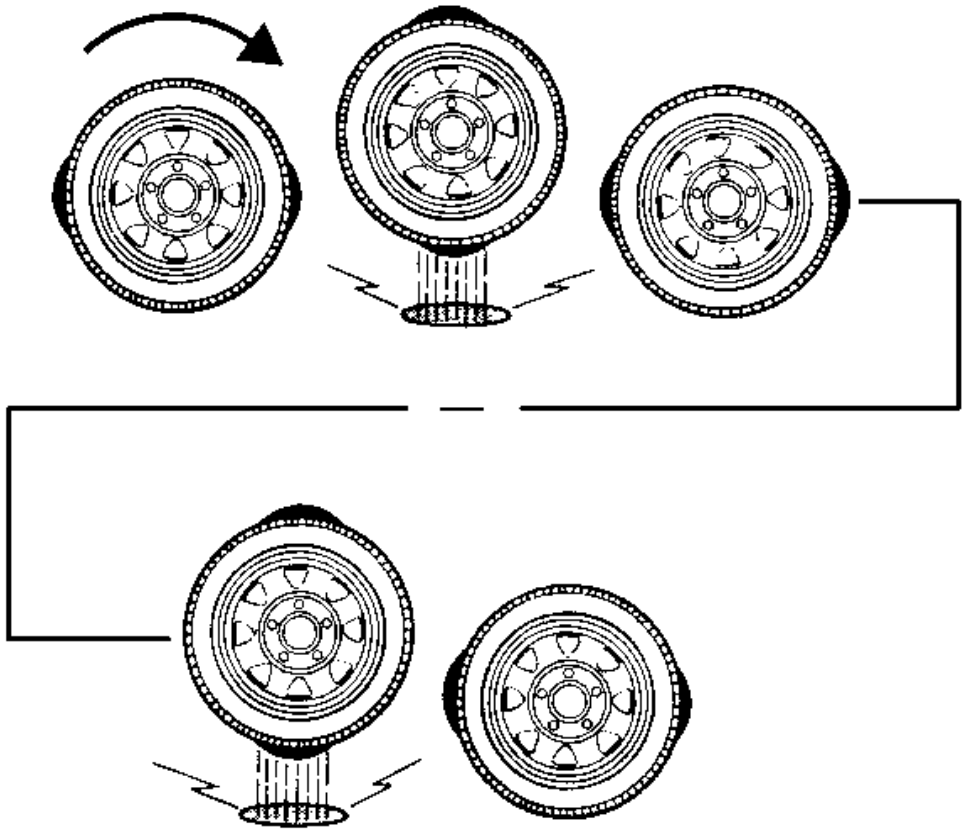

Fig. 40: Identifying Second-Order Vibration
Courtesy of GENERAL MOTORS COMPANY

An oval-shaped tire with 2 high spots would create a disturbance twice for every revolution. This is called second-order vibration. Three high spots would be third-order, and so forth. Two first-order vibrations may add or subtract from the overall amplitude of the disturbance, but that is all. Two first-order vibrations do not equal a second-order. Due to centrifugal force, an unbalanced component will always create at least a first-order vibration.

ELECTRONIC VIBRATION ANALYZER (EVA) DESCRIPTION AND OPERATION

Special Tools

- **EL-38792-25** Inductive Pickup Timing Light
- **EL-38792-A** Electronic Vibration Analyzer 2 (EVA 2)

For equivalent regional tools, refer to **Special Tools and Equipment**.

The **EL-38792-A** Electronic Vibration Analyzer 2 (EVA 2) , is a 12-volt powered hand-held device, similar to a scan tool, which receives input from an attached vibration sensor or accelerometer and displays the most dominate input frequency(ies) (up to three) on its liquid crystal display. The vibration concern frequency(ies) are obtained through the use of the **EL-38792-A** Electronic Vibration Analyzer 2 (EVA 2) while following the Vibration Analysis Diagnostic Tables. The frequency(ies) obtained, when applied to the Vibration Analysis Diagnostic Tables, are used as a primary

input to help determine the source of the vibration concern.

EVA Vibration Sensor

The **EL-38792-A** Electronic Vibration Analyzer 2 (EVA 2) vibration sensor incorporates a 6.1 m (20 ft) cord, that allows the sensor to be placed on virtually any component of the vehicle where a vibration concern is felt.

The **EL-38792-A** Electronic Vibration Analyzer 2 (EVA 2) contains 2 sensor input ports which can be activated individually to allow for 2 individual vibration sensor inputs. The vibration sensors can then be placed in 2 different locations in the vehicle and their individual inputs can be read without having to stop a test, move the sensor and resume the test. The use of 2 vibration sensors can help in more quickly finding and recording an accurate frequency of the vibration concern, and in more quickly making comparisons between 2 different areas of a single component, or a vehicle system, during the diagnostic process.

EVA Vibration Sensor Placement

Proper placement of the **EL-38792-A** Electronic Vibration Analyzer 2 (EVA 2) vibration sensor (accelerometer) is critical to ensure that proper vibration readings are obtained by the **EL-38792-A** Electronic Vibration Analyzer 2 (EVA 2). The vibration sensor should be placed on the specific vehicle component identified as being the most respondent to the vibration. If no component has been identified, install the sensor to the steering column as a starting point.

EVA Vibration Sensor-to-Component Attachment

NOTE: The EL-38792-A Electronic Vibration Analyzer 2 (EVA 2) vibration sensor must be attached to vehicle components in the manner indicated in order to achieve accurate frequency readings of the vibration disturbance.

The vibration sensor of the **EL-38792-A** Electronic Vibration Analyzer 2 (EVA 2) is designed to pickup disturbances which primarily occur in the vertical plane, since most vibrations are felt in that same up-and-down direction. The **EL-38792-A** Electronic Vibration Analyzer 2 (EVA 2) vibration sensor is therefore directional sensitive and must be attached to vehicle components such that the side of the sensor marked UP is always facing upright and the sensor body is as close to horizontal as possible. The sensor must be installed in the exact same position each time tests are repeated or comparisons are made to other vehicles.

The **EL-38792-A** Electronic Vibration Analyzer 2 (EVA 2) vibration sensor can be attached to vehicle components in various ways. For non-ferrous surfaces, such as the shroud of a steering column, the sensor can be attached using putty, or hook and loop fasteners. For ferrous surfaces, the sensor can be attached using a magnet supplied with the sensor.

EVA Software Cartridge

The **EL-38792-A** Electronic Vibration Analyzer 2 (EVA 2) uses a software cartridge, the GE-38792-60, which provides various information to the **EL-38792-A** Electronic Vibration Analyzer 2 (EVA 2). The GE-38792-60 provides the **EL-38792-A** Electronic Vibration Analyzer 2 (EVA 2) with an additional feature which can be selected and utilized to assist in diagnosing vibration concerns.

NOTE: The Auto-Mode function of the EL-38792-A Electronic Vibration Analyzer 2 (EVA 2) cartridge, GE-38792-60, is designed to be used in SUPPORT of the Vibration Analysis Diagnostic Tables ONLY.

This support-feature is available through the **EL-38792-A** Electronic Vibration Analyzer 2 (EVA 2) Auto-Mode function. When selected, the **EL-38792-A** Electronic Vibration Analyzer 2 (EVA 2) will prompt the user to select

which one of 2 vehicle systems (vehicle speed or engine speed), is the SUSPECTED source of the vibration concern. Using the inputted vehicle data parameters along with the most dominate vibration frequency obtained, it will identify a SUSPECTED source of the vibration concern, such as first-order tire and wheel. This can be a useful feature when used in conjunction with the Vibration Analysis Diagnostic Tables, to confirm results obtained through the diagnostic process.

EVA Smart Strobe Function

The **EL-38792-A** Electronic Vibration Analyzer 2 (EVA 2) can be used to identify some rotating components/systems which exhibit imbalance IF the component rotational speed is the dominant frequency of the vibration concern. The **EL-38792-A** Electronic Vibration Analyzer 2 (EVA 2) is equipped with a strobe light trigger wire which can be used with an inductive pickup timing light, **EL-38792-25** Inductive Pickup Timing Light , or equivalent included with the GE-38792-25-KIT, or available separately. Using the Smart Strobe function enables the user to input the vibration frequency to which the strobe will flash. By marking the suspected rotating component, such as a pulley, adjusting the strobe frequency to match the dominant vibration frequency at the engine RPM noted during diagnosis, and then operating the engine at that specific RPM, the mark on the object will appear to be stationary if that object is imbalanced.

EVA Strobe Balancing Function

The **EL-38792-A** Electronic Vibration Analyzer 2 (EVA 2) can be used to identify the light spot on a propeller shaft IF the propeller shaft rotational speed is the dominant frequency of the vibration concern. The **EL-38792-A** Electronic Vibration Analyzer 2 (EVA 2) is equipped with a strobe light trigger wire which can be used with an inductive pickup timing light, **GE-38792-25** Inductive Pickup Timing Light , or equivalent included with the J-38792-25-KIT, or available separately, and in conjunction with the **EL-38792-A** Electronic Vibration Analyzer 2 (EVA 2) vibration sensor to identify the light spot on a propeller shaft and to help in making a determination as to when propeller shaft balance is obtained.

Averaging/Non-Averaging Modes

The EVA provides 2 modes of displaying the most dominate frequencies which the EVA vibration sensor (accelerometer) detects; averaging and non-averaging (instantaneous).

The averaging mode uses multiple vibration samples taken over a period of time and then displays the most dominant frequencies which have been averaged-out. Using the averaging mode minimizes the distractions caused by a sudden vibration frequency being displayed that is not related to the concern vibration, such as from pot holes or from uneven road surfaces.

The non-averaging (instantaneous) mode is more sensitive to vibration disturbances than the averaging mode. Using the non-averaging mode will generate instantaneous frequency displays which are not averaged across multiple samples over a period of time; the specific vibration frequencies that occur at a specific moment during diagnostic testing will be displayed at that moment. The non-averaging (instantaneous) mode is useful when measuring a vibration disturbance that exists for only a short period of time or during acceleration/deceleration testing.

When operating the EVA in the averaging mode along with the Auto Mode, "A" will be displayed along the top of the screen to the left of the vibration sensor input port being used. When operating the EVA in the averaging mode and the Manual Mode, "AVG" will be displayed along the top center of the screen.

When operating the EVA in the non-averaging (instantaneous) mode along with the Auto Mode, "I" will be displayed along the top of the screen to the left of the vibration sensor input port being used. When operating the EVA in the non-averaging (instantaneous) mode and the Manual Mode, the top center of the screen will be blank.

EVA Display

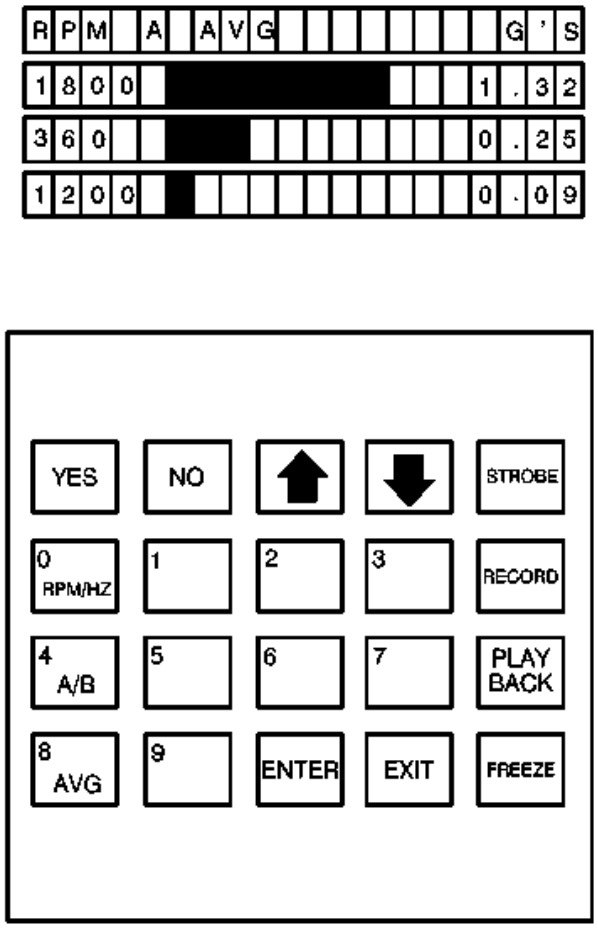

Fig. 41: View Of EVA Display
Courtesy of GENERAL MOTORS COMPANY

The most dominant input frequencies, up to three, received from the **EL-38792-A** Electronic Vibration Analyzer 2 (EVA 2) vibration sensor, are displayed in descending order of amplitude strength.

The frequency readings are displayed along the left side of the screen, followed to the right by either a bar graph or the suspected source of the vibration - depending upon the mode selected, then the amplitude reading for each frequency along the right side of the screen. The top row of the screen indicates the units of measure being displayed for the frequencies along the left side and for the amplitudes along the right side. The top row also indicates the vibration sensor input port which was selected on the keypad (A or B) and which mode was selected: averaging or non-averaging (instantaneous).

The frequency(ies) can be displayed in either revolutions per minute (RPM) or revolutions per second; Hertz (Hz). The selected display type (RPM or Hz) will be indicated at the left side of the screen, above the frequency readings.

When the AUTO MODE function is not in use, a bar graph is displayed next to each frequency to provide a quick visual indication of the relative amplitude strength.

When the AUTO MODE function is being used, the suspected source of the vibration is displayed next to each frequency to provide support to the diagnostic process.

The actual amplitude strength of each frequency is displayed at the right side of the screen and shown in G's-of-acceleration force.

OSCILLOSCOPE DIAGNOSTIC KIT DESCRIPTION AND OPERATION

Special Tools

- **CH-51450-NVH** Oscilloscope Diagnostic Kit (w/NVH)
- **EL-47966** Multi Diagnostic Interface MDI

For equivalent regional tools, refer to **Special Tools and Equipment**.

The **CH-51450-NVH** Oscilloscope Diagnostic Kit (w/NVH) is an automotive oscilloscope which receives input from an attached accelerometer and displays all input frequencies on a laptop or tablet computer. The vibration concern frequency(ies) are obtained through the use of the **CH-51450-NVH** Oscilloscope Diagnostic Kit (w/NVH) hardware, while vehicle component speed data is gathered through the **EL-47966** Multi Diagnostic Interface MDI. The MDI data is integrated into the Oscilloscope software so that vibration(s) can be tied to specific vehicle components based on their speed to determine the source of the vibration concern.

Oscilloscope Inputs

The **CH-51450-TA183** accelerometer incorporates a 3 m (9.8 ft) cord that allows the sensor to be placed on virtually any component of the vehicle where a vibration concern is felt. The accelerometer uses a self-powered NVH interface module. The NVH interface module uses a replaceable battery. Input B is the default port for a single accelerometer. The cord used to connect the NVH interface module to the **CH-51450-NVH** Oscilloscope is 5 m (16.4 ft) long.

Input D is used for the **CH-51450-TA186** optical tachometer sensor which is used during driveline balancing. It incorporates a 2.5 m (8.2 ft) cord and a 5 m (16.4 ft) cord.

There is also an optional microphone that can be used with the **CH-51450-NVH** Oscilloscope.

Oscilloscope Accelerometer Placement

Proper placement of the **CH-51450-TA183** accelerometer is critical to ensure that proper vibration readings are obtained by the **CH-51450-NVH** Oscilloscope. The accelerometer should be placed on the drivers side inboard seat track. Once a baseline reading has been taken, the accelerometer can be placed on the point of the customer concern to verify what the customer is hearing or feeling.

Oscilloscope Accelerometer-to-Component Attachment

NOTE: **The CH-51450-TA183 accelerometer must be attached to vehicle components in the manner indicated in order to achieve accurate frequency readings of the vibration disturbance.**

The accelerometer of the **CH-51450-NVH** Oscilloscope is designed to pick up disturbances which primarily occur in the vertical plane, since most vibrations are felt in that same up-and-down direction. The **CH-51450-TA183** accelerometer is therefore directionally sensitive, and must be attached to vehicle components such that the cord end is always facing upright, and the sensor body is as close to horizontal as possible. The sensor must be installed in the exact same position each time tests are repeated, or comparisons are made to other vehicles.

The **CH-51450-TA183** accelerometer can be attached to vehicle components in various ways. For non-ferrous surfaces, such as the shroud of a steering column, the sensor can be attached using putty, or hook and loop fasteners. For ferrous surfaces, the sensor can be attached using the **CH-51450-TA096** magnet supplied with the sensor. For

hard aluminum surfaces, a ferrous washer can be glued on using a cyanoacrylate (super glue) and then the magnet can be used.

NVH Software Set-up

Fig. 42: Identifying NVH Software Set-Up Display Screen
Courtesy of GENERAL MOTORS COMPANY

When the NVH software is first opened and the NVH tab is selected, there is a set-up wizard within the **CH-51450-NVH** NVH software which has a step-by-step guide to ensure the **CH-51450-NVH** Oscilloscope and MDI are connected correctly, and to input the vehicle information.

Oscilloscope NVH Display

The **CH-51450-NVH** Oscilloscope display consists of three tabs:

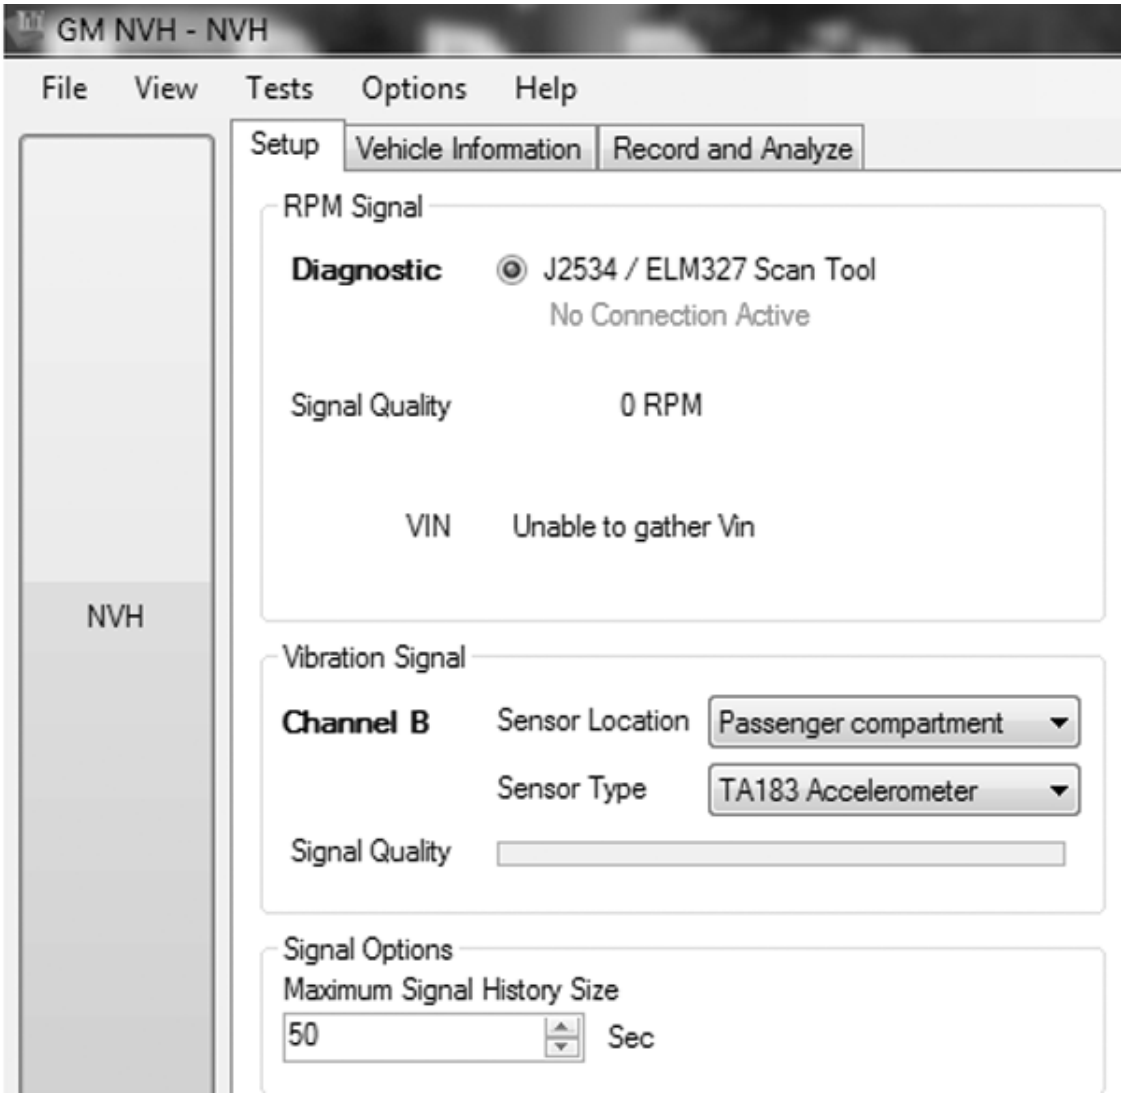

Fig. 43: Identifying Oscilloscope NVH Set-Up Display Screen
Courtesy of GENERAL MOTORS COMPANY

The first tab is set-up. The set-up information can be entered here if not already done through the set-up wizard. It can also be updated here, if necessary. A laptop or desktop computer, **EL-47966** Multi Diagnostic Interface MDI , **CH-51450-NVH** Oscilloscope , **CH-51450-TA148** NVH interface, and **CH-51450-TA183** accelerometer are needed to do a vibration analysis.

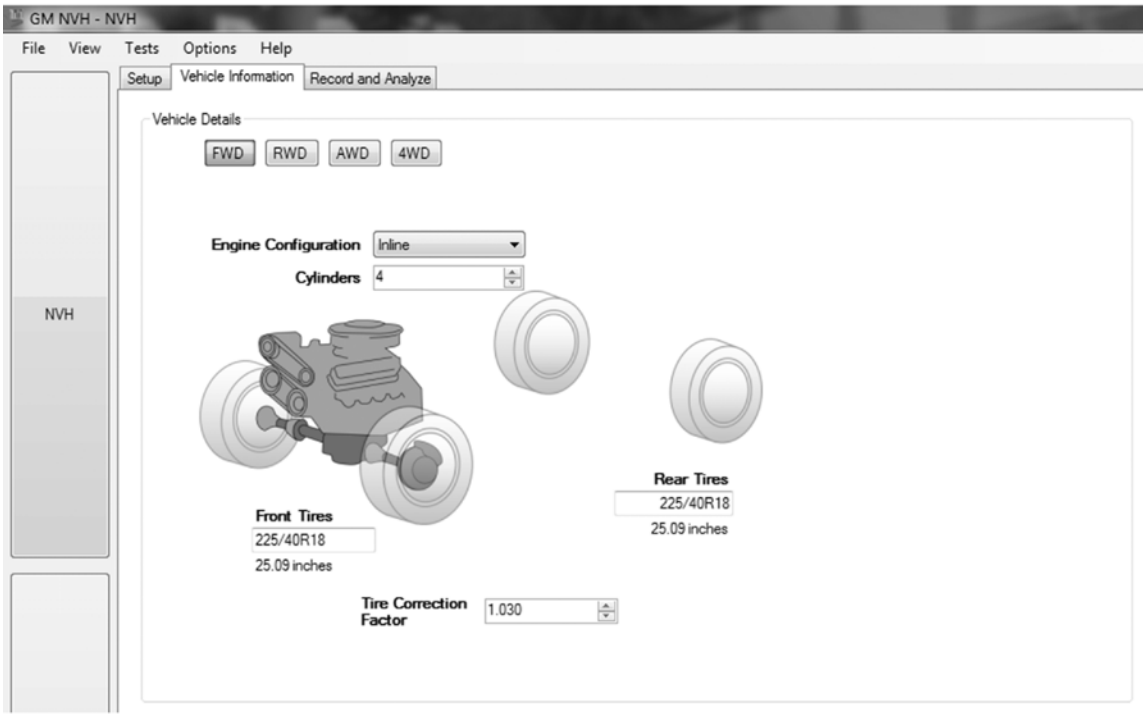

Fig. 44: Identifying Oscilloscope NVH Vehicle Information Display Screen
Courtesy of GENERAL MOTORS COMPANY

The second tab is vehicle information. The vehicle information can be entered here if not already done through the set-up wizard. It can also be updated here, if necessary.

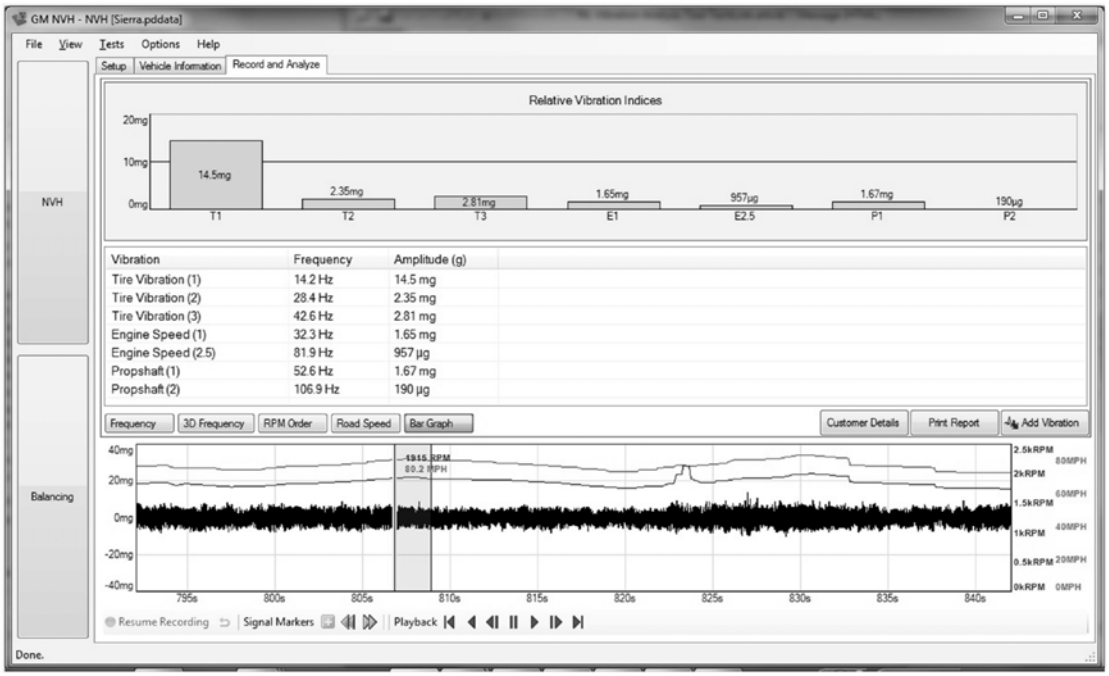

Fig. 45: Identifying Oscilloscope NVH Record And Analyze Display Screen
Courtesy of GENERAL MOTORS COMPANY

The third tab is the record and analyze tab. The standard display will show the known input frequencies received from the **CH-51450-TA183** accelerometer as a bar graph at the top of the screen. At the middle of the screen, the input frequencies are listed as text. The frequency(ies) are displayed in Hertz (Hz). If desired, the frequency(ies) can be displayed in RPM by clicking Options, then Advanced Options. The actual amplitude strength of each frequency is displayed and shown in g's of acceleration (expressed to the thousandth of a force of gravity, or "milli-g"). At the bottom of the screen, it also shows a plot of all frequency inputs along with engine speed in blue, and vehicle speed in red. The data can be saved in 50 second increments. The data can then be saved by clicking File, then Save. Files that are saved can then be loaded into the software by clicking File, then Load.

Oscilloscope Balancing

The **CH-51450-NVH** Oscilloscope with balancing software can be used to identify some rotating component/systems which exhibit imbalance IF the component rotational speed is the dominant frequency of the vibration concern. The **CH-51450-NVH** Oscilloscope is used with the **CH-51450-TA186** optical tachometer sensor. The optical tachometer sensor directly measures component rotational speed so a known weight can be added for a baseline reading. Then the oscilloscope will determine where to add a specific amount of weight to the component.

For example, the **CH-51450-NVH** Oscilloscope can be used to balance the driveline on rear wheel drive and all wheel drive vehicles. The methods that can be employed are a tuned weight approach for drivelines that use couplers and a dual hose clamp approach for drivelines that use CV or two-axis universal joints. The balancing process consists of the **CH-51450-TA186** optical tachometer sensor to directly read the driveline speed and software that directs where the weights should be placed depending on the type of driveline/propeller shaft being balanced.

Oscilloscope Balancing Software Set-up

Fig. 46: Identifying Oscilloscope Balancing Software Set-Up Display Screen
Courtesy of GENERAL MOTORS COMPANY

When the NVH software is first opened and the Balancing tab is selected, a pop-up box within the **CH-51450-NVH** balancing software will ask which type of balancing method is to be used. The two methods are pinion flange or hose clamp. Then either the wizard (which will walk through the connections and input data) or advanced configuration can be chosen to input the initial information and start the balancing procedure.

Oscilloscope Balancing Display

The propeller shaft balancing will consist of an initial run, three calibration runs, and a verification run. The software will walk through what is required for each run.

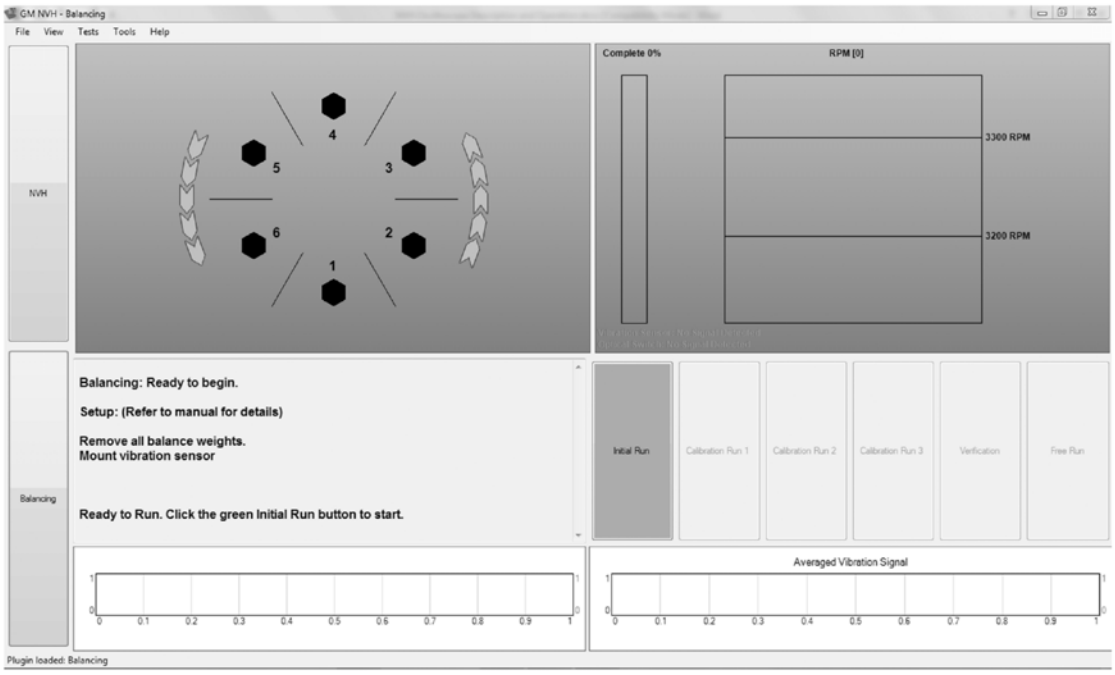

Fig. 47: Identifying Pinion Flange Balancing Screen

An example of the hose clamp balancing screen is shown above.

VIBRATE SOFTWARE DESCRIPTION AND OPERATION

The **EL-38792-VS** Vibrate Software , is a computer software program which is designed to be used in support of the Vibration Analysis diagnostic tables, along with the **EL-38792-A** Electronic Vibration Analyzer (EVA) 2 , and a scan tool, to help in determining the source of a vibration concern. The **EL-38792-VS** Vibrate Software is designed to provide quick calculations and produce a chart of the rotational speeds and frequency ranges for specific vehicle systems and components, based upon vehicle data parameters inputted by the user.

The **EL-38792-VS** Vibrate Software uses the vehicle data parameters, such as axle ratio, number of engine cylinders, etc. to create the base chart, depicting the relationships of the various vehicle systems and/or components. The chart view can be modified to show data related to vehicle speed only, engine speed only, or both vehicle speed and engine speed. The user can then plot the dominant frequency reading obtained on the **EL-38792-A** Electronic Vibration Analyzer (EVA) 2 which correlates with the vibration concern, and the engine RPM obtained on a scan tool which correlates with the concern. Once these pieces of data are correctly plotted, the chart will point to the source of the vibration concern, which should confirm the results obtained through the Vibration Analysis diagnostic tables.

The **CH-51450-NVH** Oscilloscope Diagnostic Kit (w/NVH) includes a version of the vibrate software within its help file.

REED TACHOMETER DESCRIPTION

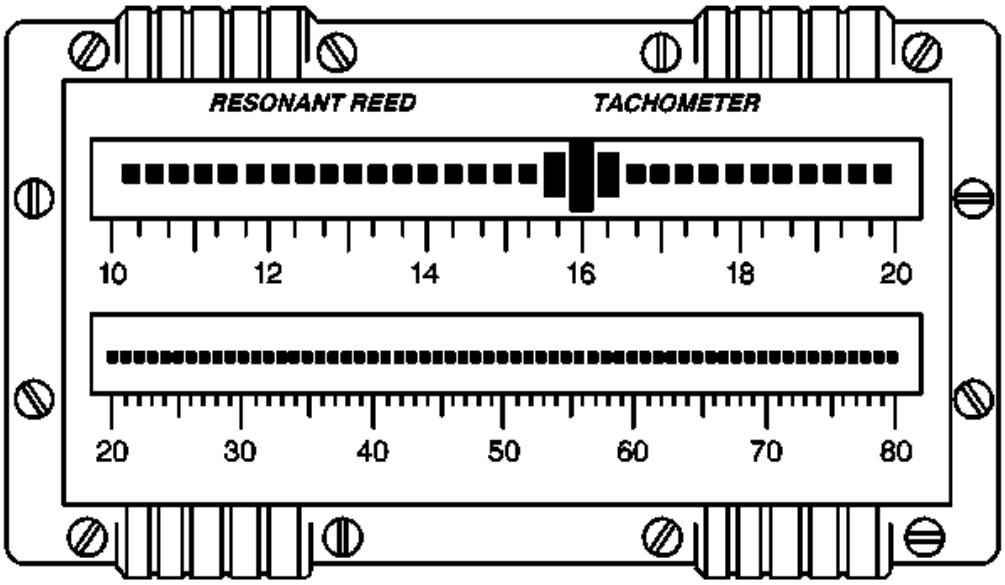

Fig. 49: Identifying Reed Tachometer
Courtesy of GENERAL MOTORS COMPANY

The reed tachometer consists of 2 rows of reeds arranged side-by-side. Each reed is tuned to vibrate or resonate when it is excited by a specific frequency. The reeds are arranged by their specific resonant frequency, increasing from left to right, ranging from 10-80 Hz. This arrangement allows for a visual display of the most dominate frequencies which fall within this range.

The reed tachometer can be a helpful diagnostic tool, however it is extremely sensitive to external inputs that are not related to the vibration concern, such as rough road surfaces, etc., and it is difficult to master its use. Due to these conditions, the reed tachometer has limited diagnostic capability.

Due to the limited diagnostic capability, limited availability and increasing costs of the reed tachometer, it is NOT recommended as the primary tool to use in diagnosing a vibration concern.

When diagnosing a vibration concern, use the **CH-51450-NVH** Oscilloscope Diagnostic Kit (w/NVH) or the **EL-38792-A** Electronic Vibration Analyzer (EVA) 2. The **CH-51450-NVH** Oscilloscope Diagnostic Kit (w/NVH) or thd **EL-38792-A** Electronic Vibration Analyzer (EVA) 2 have been designed to overcome the shortcomings to the reed tachometer. Refer to **Oscilloscope Diagnostic Kit Description and Operation**, or **Electronic Vibration Analyzer (EVA) Description and Operation**.

GENERAL INFORMATION

Waveforms - Injector Pattern Tutorial

* PLEASE READ THIS FIRST *

NOTE: **This is GENERAL information. This article is not intended to be specific to any unique situation or individual vehicle configuration. For model-specific information see appropriate articles where available.**

PURPOSE OF THIS ARTICLE

NOTE: **This is GENERAL information. This article is not intended to be specific to any unique situation or individual vehicle configuration. For model-specific information see appropriate articles where available.**

Learning how to interpret injector drive patterns from a Lab Scope can be like learning ignition patterns all over again. This article exists to ease you into becoming a skilled injector pattern interpreter.

You will learn:

- How a DVOM and noid light fall short of a lab scope.
- The two types of injector driver circuits, voltage controlled & current controlled.
- The two ways injector circuits can be wired, constant ground/switched power & constant power/switched ground.
- The two different pattern types you can use to diagnose with, voltage & current.
- All the valuable details injector patterns can reveal.

SCOPE OF THIS ARTICLE

This is NOT a manufacturer specific article. All different types of systems are covered here, regardless of the specific year/make/model/engine.

The reason for such broad coverage is because there are only a few basic ways to operate a solenoid-type injector. By understanding the fundamental principles, you will understand all the major points of injector patterns you encounter. Of course there are minor differences in each specific system, but that is where a waveform library helps out.

If this is confusing, consider a secondary ignition pattern. Even though there are many different implementations, each still has a primary voltage turn-on, firing line, spark line, etc.

If specific waveforms are available in On Demand for the engine and vehicle you are working on, you will find them in the Engine Performance section under the Engine Performance category.

IS A LAB SCOPE NECESSARY?

INTRODUCTION

You probably have several tools at your disposal to diagnose injector circuits. But you might have questioned "Is a lab scope necessary to do a thorough job, or will a set of noid lights and a multifunction DVOM do just as well?"

In the following text, we are going to look at what noid lights and DVOMs do best, do not do very well, and when they can mislead you. As you might suspect, the lab scope, with its ability to look inside an active circuit, comes to the rescue by answering for the deficiencies of these other tools.

OVERVIEW OF NOID LIGHT

The noid light is an excellent "quick and dirty" tool. It can usually be hooked to a fuel injector harness fast and the flashing light is easy to understand. It is a dependable way to identify a no-pulse situation.

However, a noid light can be very deceptive in two cases:

- If the wrong one is used for the circuit being tested. Beware: Just because a connector on a noid light fits the harness does not mean it is the right one.
- If an injector driver is weak or a minor voltage drop is present.

Use the Right Noid Light

In the following text we will look at what can happen if the wrong noid light is used, why there are different types of noid lights (besides differences with connectors), how to identify the types of noid lights, and how to know the right type to use.

First, let's discuss what can happen if the incorrect type of noid light is used. You might see:

- A dimly flashing light when it should be normal.
- A normal flashing light when it should be dim.

A noid light will flash dim if used on a lower voltage circuit than it was designed for. A normally operating circuit would appear underpowered, which could be misinterpreted as the cause of a fuel starvation problem.

Here are the two circuit types that could cause this problem:

- Circuits with external injector resistors. Used predominately on some Asian & European systems, they are used to reduce the available voltage to an injector in order to limit the current flow. This lower voltage can cause a dim flash on a noid light designed for full voltage.
- Circuits with current controlled injector drivers (e.g. "Peak and Hold"). Basically, this type of driver allows a quick burst of voltage/current to flow and then throttles it back significantly for the remainder of the pulse width duration. If a noid light was designed for the other type of driver (voltage controlled, e.g. "Saturated"), it will appear dim because it is expecting full voltage/current to flow for the entire duration of the pulse width.

Let's move to the other situation where a noid light flashes normally when it should be dim. This could occur if a more sensitive noid light is used on a higher voltage/amperage circuit that was weakened enough to cause problems (but not outright broken). A circuit with an actual problem would thus appear normal.

Let's look at why. A noid light does not come close to consuming as much amperage as an injector solenoid. If there is a partial driver failure or a minor voltage drop in the injector circuit, there can be adequate amperage to

fully operate the noid light BUT NOT ENOUGH TO OPERATE THE INJECTOR.

If this is not clear, picture a battery with a lot of corrosion on the terminals. Say there is enough corrosion that the starter motor will not operate; it only clicks. Now imagine turning on the headlights (with the ignition in the RUN position). You find they light normally and are fully bright. This is the same idea as noid light: There is a problem, but enough amp flow exists to operate the headlights ("noid light"), but not the starter motor ("injector").

How do you identify and avoid all these situations? By using the correct type of noid light. This requires that you understanding the types of injector circuits that your noid lights are designed for. There are three. They are:

- Systems with a voltage controlled injector driver. Another way to say it: The noid light is designed for a circuit with a "high" resistance injector (generally 12 ohms or above).
- Systems with a current controlled injector driver. Another way to say it: The noid light is designed for a circuit with a low resistance injector (generally less than 12 ohms) without an external injector resistor.
- Systems with a voltage controlled injector driver and an external injector resistor. Another way of saying it: The noid light is designed for a circuit with a low resistance injector (generally less than 12 ohms) and an external injector resistor.

NOTE: **Some noid lights can meet both the second and third categories simultaneously.**

If you are not sure which type of circuit your noid light is designed for, plug it into a known good car and check out the results. If it flashes normally during cranking, determine the circuit type by finding out injector resistance and if an external injector resistor is used. You now know enough to identify the type of injector circuit. Label the noid light appropriately.

Next time you need to use a noid light for diagnosis, determine what type of injector circuit you are dealing with and select the appropriate noid light.

Of course, if you suspect a no-pulse condition you could plug in any one whose connector fit without fear of misdiagnosis. This is because it is unimportant if the flashing light is dim or bright. It is only important that it flashes.

In any cases of doubt regarding the use of a noid light, a lab scope will overcome all inherent weaknesses.

OVERVIEW OF DVOM

A DVOM is typically used to check injector resistance and available voltage at the injector. Some techs also use it check injector on-time either with a built-in feature or by using the dwell/duty function.

There are situations where the DVOM performs these checks dependably, and other situations where it can deceive you. It is important to be aware of these strengths and weaknesses. We will cover the topics above in the following text.

Checking Injector Resistance

If a short in an injector coil winding is constant, an ohmmeter will accurately identify the lower resistance. The same is true with an open winding. Unfortunately, an intermittent short is an exception. A faulty injector with an intermittent short will show "good" if the ohmmeter cannot force the short to occur during testing.

Alcohol in fuel typically causes an intermittent short, happening only when the injector coil is hot and loaded by a current high enough to jump the air gap between two bare windings or to break down any oxides that may have formed between them.

When you measure resistance with an ohmmeter, you are only applying a small current of a few milliamps. This is nowhere near enough to load the coil sufficiently to detect most problems. As a result, most resistance checks identify intermittently shorted injectors as being normal.

There are two methods to get around this limitation. The first is to purchase an tool that checks injector coil windings under full load. The Kent-Moore J-39021 is such a tool, though there are others. The Kent-Moore costs around $240 at the time of this writing and works on many different manufacturer's systems.

The second method is to use a lab scope. Remember, a lab scope allows you to see the regular operation of a circuit in real time. If an injector is having an short or intermittent short, the lab scope will show it.

Checking Available Voltage At the Injector

Verifying a fuel injector has the proper voltage to operate correctly is good diagnostic technique. Finding an open circuit on the feed circuit like a broken wire or connector is an accurate check with a DVOM. Unfortunately, finding an intermittent or excessive resistance problem with a DVOM is unreliable.

Let's explore this drawback. Remember that a voltage drop due to excessive resistance will only occur when a circuit is operating? Since the injector circuit is only operating for a few milliseconds at a time, a DVOM will only see a potential fault for a few milliseconds. The remaining 90+% of the time the unloaded injector circuit will show normal battery voltage.

Since DVOMs update their display roughly two to five times a second, all measurements in between are averaged. Because a potential voltage drop is visible for such a small amount of time, it gets "averaged out", causing you to miss it.

Only a DVOM that has a "min-max" function that checks EVERY MILLISECOND will catch this fault consistently (if used in that mode). The Fluke 87 among others has this capability.

A "min-max" DVOM with a lower frequency of checking (100 millisecond) can miss the fault because it will probably check when the injector is not on. This is especially true with current controlled driver circuits. The Fluke 88, among others fall into this category.

Outside of using a Fluke 87 (or equivalent) in the 1 mS "min-max" mode, the only way to catch a voltage drop fault is with a lab scope. You will be able to see a voltage drop as it happens.

One final note. It is important to be aware that an injector circuit with a solenoid resistor will always show a voltage drop when the circuit is energized. This is somewhat obvious and normal; it is a designed-in voltage drop. What can be unexpected is what we already covered--a voltage drop disappears when the circuit is unloaded. The unloaded injector circuit will show normal battery voltage at the injector. Remember this and do not get confused.

Checking Injector On-Time With Built-In Function

Several DVOMs have a feature that allows them to measure injector on-time (mS pulse width). While they are accurate and fast to hookup, they have three limitations you should be aware of:

- They only work on voltage controlled injector drivers (e.g "Saturated Switch"), NOT on current controlled injector drivers (e.g. "Peak & Hold").
- A few unusual conditions can cause inaccurate readings.
- Varying engine speeds can result in inaccurate readings.

Regarding the first limitation, DVOMs need a well-defined injector pulse in order to determine when the injector turns ON and OFF. Voltage controlled drivers provide this because of their simple switch-like operation. They completely close the circuit for the entire duration of the pulse. This is easy for the DVOM to interpret.

The other type of driver, the current controlled type, start off well by completely closing the circuit (until the injector pintle opens), but then they throttle back the voltage/current for the duration of the pulse. The DVOM understands the beginning of the pulse but it cannot figure out the throttling action. In other words, it cannot distinguish the throttling from an open circuit (de-energized) condition.

Yet current controlled injectors will still yield a millisecond on-time reading on these DVOMs. You will find it is also always the same, regardless of the operating conditions. This is because it is only measuring the initial completely-closed circuit on-time, which always takes the same amount of time (to lift the injector pintle off its seat). So even though you get a reading, it is useless.

The second limitation is that a few erratic conditions can cause inaccurate readings. This is because of a DVOM's slow display rate; roughly two to five times a second. As we covered earlier, measurements in between display updates get averaged. So conditions like skipped injector pulses or intermittent long/short injector pulses tend to get "averaged out", which will cause you to miss important details.

The last limitation is that varying engine speeds can result in inaccurate readings. This is caused by the quickly shifting injector on-time as the engine load varies, or the RPM moves from a state of acceleration to stabilization, or similar situations. It too is caused by the averaging of all measurements in between DVOM display periods. You can avoid this by checking on-time when there are no RPM or load changes.

A lab scope allows you to overcome each one of these limitations.

Checking Injector On-Time With Dwell Or Duty

If no tool is available to directly measure injector millisecond on-time measurement, some techs use a simple DVOM dwell or duty cycle functions as a replacement.

While this is an approach of last resort, it does provide benefits. We will discuss the strengths and weaknesses in a moment, but first we will look at how a duty cycle meter and dwell meter work.

How A Duty Cycle Meter and Dwell Meter Work

All readings are obtained by comparing how long something has been OFF to how long it has been ON in a fixed time period. A dwell meter and duty cycle meter actually come up with the same answers using different scales. You can convert freely between them. See **RELATIONSHIP BETWEEN DWELL & DUTY CYCLE READINGS TABLE**.

The DVOM display updates roughly one time a second, although some DVOMs can be a little faster or slower. All measurements during this update period are tallied inside the DVOM as ON time or OFF time, and then the total ratio is displayed as either a percentage (duty cycle) or degrees (dwell meter).

For example, let's say a DVOM had an update rate of exactly 1 second (1000 milliseconds). Let's also say that it has been measuring/tallying an injector circuit that had been ON a total of 250 mS out of the 1000 mS. That is a ratio of one-quarter, which would be displayed as 25% duty cycle or 15Â° dwell (six-cylinder scale). Note that most duty cycle meters can reverse the readings by selecting the positive or negative slope to trigger on. If this reading were reversed, a duty cycle meter would display 75%.

Strengths of Dwell/Duty Meter

The obvious strength of a dwell/duty meter is that you can compare injector on-time against a known-good reading. This is the only practical way to use a dwell/duty meter, but requires you to have known-good values to compare against.

Another strength is that you can roughly convert injector mS on-time into dwell reading with some computations.

A final strength is that because the meter averages everything together it does not miss anything (though this is also a severe weakness that we will look at later). If an injector has a fault where it occasionally skips a pulse, the meter registers it and the reading changes accordingly.

Let's go back to figuring out dwell/duty readings by using injector on-time specification. This is not generally practical, but we will cover it for completeness. You NEED to know three things:

- Injector mS on-time specification.
- Engine RPM when specification is valid.
- How many times the injectors fire per crankshaft revolution.

The first two are self-explanatory. The last one may require some research into whether it is a bank-fire type that injects every 360Â° of crankshaft rotation, a bank-fire that injects every 720Â°, or an SFI that injects every 720Â°. Many manufacturers do not release this data so you may have to figure it out yourself with a frequency meter.

Here are the four complete steps to convert millisecond on-time:

1. Determine the injector pulse width and RPM it was obtained at. Let's say the specification is for one millisecond of on-time at a hot idle of 600 RPM.
2. Determine injector firing method for the complete 4 stroke cycle. Let's say this is a 360Â° bank-fired, meaning an injector fires each and every crankshaft revolution.
3. Determine how many times the injector will fire at the specified engine speed (600 RPM) in a fixed time period. We will use 100 milliseconds because it is easy to use. Six hundred crankshaft Revolutions Per Minute (RPM) divided by 60 seconds equals 10 revolutions per second. Multiplying 10 times .100 yields one; the crankshaft turns one time in 100 milliseconds. With exactly one crankshaft rotation in 100 milliseconds, we know that the injector fires exactly one time.
4. Determine the ratio of injector on-time vs. off-time in the fixed time period, then figure duty cycle and/or dwell. The injector fires one time for a total of one millisecond in any given 100 millisecond period. One hundred minus one equals 99. We have a 99% duty cycle. If we wanted to know the dwell (on 6 cylinder scale), multiple 99% times .6; this equals 59.4Â° dwell.

Weaknesses of Dwell/Duty Meter

The weaknesses are significant. First, there is no one-to-one correspondence to actual mS on-time. No manufacturer releases dwell/duty data, and it is time-consuming to convert the mS on-time readings. Besides, there can be a large degree of error because the conversion forces you to assume that the injector(s) are always firing at the same rate for the same period of time. This can be a dangerous assumption.

Second, all level of detail is lost in the averaging process. This is the primary weakness. You cannot see the details you need to make a confident diagnosis.

Here is one example. Imagine a vehicle that has a faulty injector driver that occasionally skips an injector pulse. Every skipped pulse means that that cylinder does not fire, thus unburned O2 gets pushed into the exhaust and passes the O2 sensor. The O2 sensor indicates lean, so the computer fattens up the mixture to compensate for the supposed "lean" condition.

A connected dwell/duty meter would see the fattened pulse width but would also see the skipped pulses. It would tally both and likely come back with a reading that indicated the "pulse width" was within specification because the rich mixture and missing pulses offset each other.

This situation is not a far-fetched scenario. Some early GM 3800 engines were suffering from exactly this. The point is that a lack of detail could cause misdiagnosis.

As you might have guessed, a lab scope would not miss this.

RELATIONSHIP BETWEEN DWELL & DUTY CYCLE READINGS

Dwell Meter (2)	Duty Cycle Meter
1Â°	1%
15Â°	25%
30Â°	50%
45Â°	75%
60Â°	100%

(1) These are just some examples for your understanding. It is okay to fill in the gaps.

(2) Dwell meter on the six-cylinder scale.

THE TWO TYPES OF INJECTOR DRIVERS

NOTE: **This is GENERAL information. This article is not intended to be specific to any unique situation or individual vehicle configuration. For model-specific information see appropriate articles where available.**

OVERVIEW

There are two types of transistor driver circuits used to operate electric fuel injectors: voltage controlled and current controlled. The voltage controlled type is sometimes called a "saturated switch" driver, while the current controlled type is sometimes known as a "peak and hold" driver.

The basic difference between the two is the total resistance of the injector circuit. Roughly speaking, if a particular leg in an injector circuit has total resistance of 12 or more ohms, a voltage control driver is used. If less than 12 ohms, a current control driver is used.

It is a question of what is going to do the job of limiting the current flow in the injector circuit; the inherent "high" resistance in the injector circuit, or the transistor driver. Without some form of control, the current flow through the injector would cause the solenoid coil to overheat and result in a damaged injector.

VOLTAGE CONTROLLED CIRCUIT ("SATURATED SWITCH")

The voltage controlled driver inside the computer operates much like a simple switch because it does not need to worry about limiting current flow. Recall, this driver typically requires injector circuits with a total leg resistance of 12 or more ohms.

The driver is either ON, closing/completing the circuit (eliminating the voltage-drop), or OFF, opening the circuit (causing a total voltage drop).

Some manufacturers call it a "saturated switch" driver. This is because when switched ON, the driver allows the magnetic field in the injector to build to saturation. This is the same "saturation" property that you are familiar with for an ignition coil.

There are two ways "high" resistance can be built into an injector circuit to limit current flow. One method uses an external solenoid resistor and a low resistance injector, while the other uses a high resistance injector without the solenoid resistor. See the left side of Fig. **Fig. 1**.

In terms of injection opening time, the external resistor voltage controlled circuit is somewhat faster than the voltage controlled high resistance injector circuit. The trend, however, seems to be moving toward use of this latter type of circuit due to its lower cost and reliability. The ECU can compensate for slower opening times by increasing injector pulse width accordingly.

NOTE: **Never apply battery voltage directly across a low resistance injector. This will cause injector damage from solenoid coil overheating.**

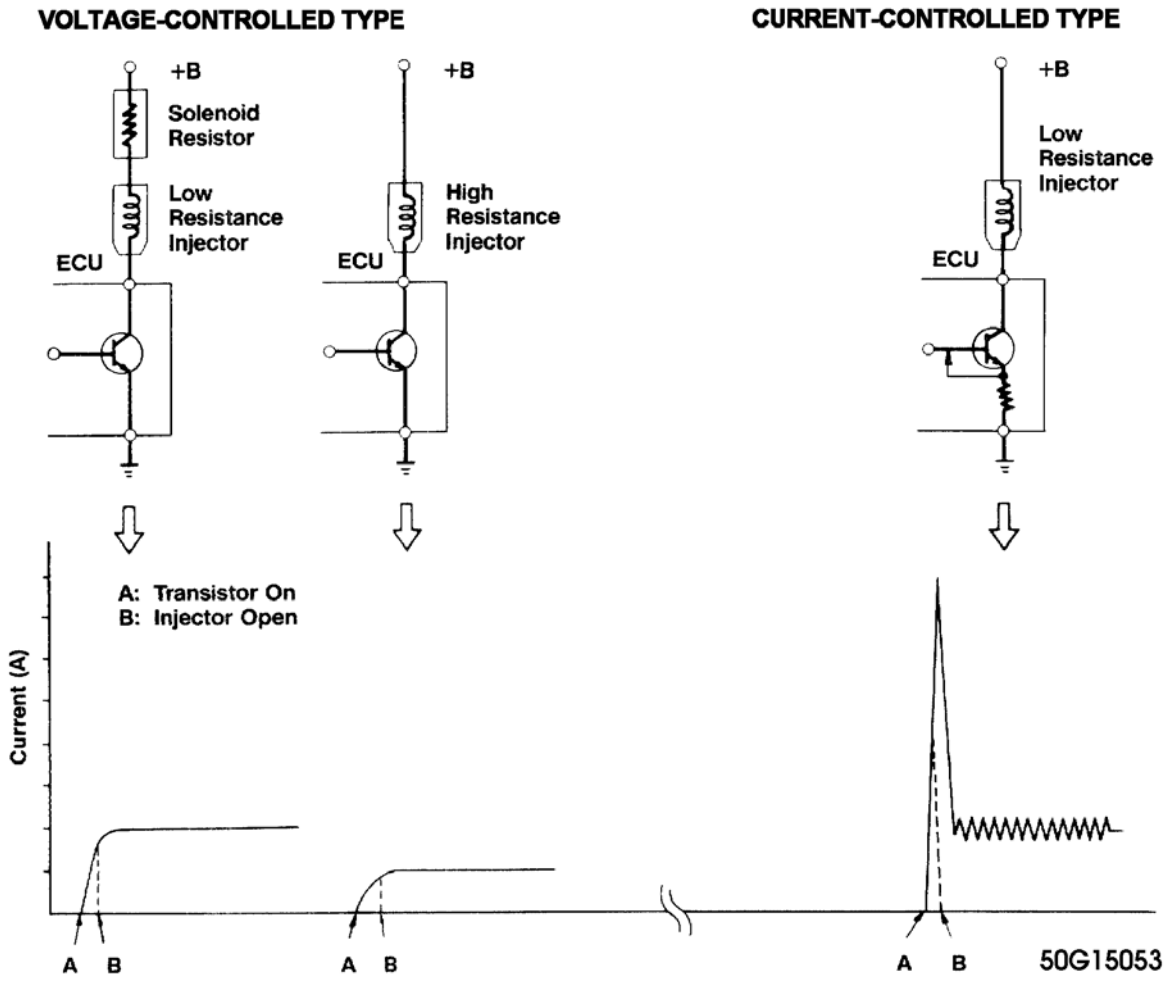

Fig. 1: Injector Driver Types - Current and Voltage

CURRENT CONTROLLED CIRCUIT ("PEAK & HOLD")

The current controlled driver inside the computer is more complex than a voltage controlled driver because as the name implies, it has to limit current flow in addition to its ON-OFF switching function. Recall, this driver typically requires injector circuits with a total leg resistance of less than 12 ohms.

Once the driver is turned ON, it will not limit current flow until enough time has passed for the injector pintle to open. This period is preset by the particular manufacturer/system based on the amount of current flow needed to open their injector. This is typically between two and six amps. Some manufacturers refer to this as the "peak" time, referring to the fact that current flow is allowed to "peak" (to open the injector).

Once the injector pintle is open, the amp flow is considerably reduced for the rest of the pulse duration to protect the injector from overheating. This is okay because very little amperage is needed to hold the injector open, typically in the area of one amp or less. Some manufacturers refer to this as the "hold" time, meaning that just enough current is allowed through the circuit to "hold" the already-open injector open.

There are a couple methods of reducing the current. The most common trims back the available voltage for the circuit, similar to turning down a light at home with a dimmer.

The other method involves repeatedly cycling the circuit ON-OFF. It does this so fast that the magnetic field never collapses and the pintle stays open, but the current is still significantly reduced. See the right side of Fig. **Fig. 1** for an illustration.

The advantage to the current controlled driver circuit is the short time period from when the driver transistor goes ON to when the injector actually opens. This is a function of the speed with which current flow reaches its peak due to the low circuit resistance. Also, the injector closes faster when the driver turns OFF because of the lower holding current.

NOTE: **Never apply battery voltage directly across a low resistance injector. This will cause injector damage from solenoid coil overheating.**

THE TWO WAYS INJECTOR CIRCUITS ARE WIRED

NOTE: **This is GENERAL information. This article is not intended to be specific to any unique situation or individual vehicle configuration. For model-specific information see appropriate articles where available.**

Like other circuits, injector circuits can be wired in one of two fundamental directions. The first method is to steadily power the injectors and have the computer driver switch the ground side of the circuit. Conversely, the injectors can be steadily grounded while the driver switches the power side of the circuit.

There is no performance benefit to either method. Voltage controlled and current controlled drivers have been successfully implemented both ways.

However, 95% percent of the systems are wired so the driver controls the ground side of the circuit. Only a handful of systems use the drivers on the power side of the circuit. Some examples of the latter are the 1970's Cadillac EFI system, early Jeep 4.0 EFI (Renix system), and Chrysler 1984-87 TBI.

INTERPRETING INJECTOR WAVEFORMS

NOTE: **This is GENERAL information. This article is not intended to be specific to any unique situation or individual vehicle configuration. For model-specific information see appropriate articles where available.**

INTERPRETING A VOLTAGE CONTROLLED PATTERN

NOTE: **Voltage controlled drivers are also known as "Saturated Switch" drivers. They typically require injector circuits with a total leg resistance of 12 ohms or more.**

NOTE: **This example is based on a constant power/switched ground circuit.**

- See **Fig. 2** for pattern that the following text describes.

Point "A" is where system voltage is supplied to the injector. A good hot run voltage is usually 13.5 or more volts. This point, commonly known as open circuit voltage, is critical because the injector will not get sufficient current saturation if there is a voltage shortfall. To obtain a good look at this precise point, you will need to shift your Lab Scope to five volts per division.

You will find that some systems have slight voltage fluctuations here. This can occur if the injector feed wire is also used to power up other cycling components, like the ignition coil(s). Slight voltage fluctuations are normal and are no reason for concern. Major voltage fluctuations are a different story, however. Major voltage shifts on the injector feed line will create injector performance problems. Look for excessive resistance problems in the feed circuit if you see big shifts and repair as necessary.

Note that circuits with external injector resistors will not be any different because the resistor does not affect open circuit voltage.

Point "B" is where the driver completes the circuit to ground. This point of the waveform should be a clean square point straight down with no rounded edges. It is during this period that current saturation of the injector windings is taking place and the driver is heavily stressed. Weak drivers will distort this vertical line.

Point "C" represents the voltage drop across the injector windings. Point "C" should come very close to the ground reference point, but not quite touch. This is because the driver has a small amount of inherent resistance. Any significant offset from ground is an indication of a resistance problem on the ground circuit that needs repaired. You might miss this fault if you do not use the negative battery post for your Lab Scope hook-up, so it is HIGHLY recommended that you use the battery as your hook-up.

The points between "B" and "D" represent the time in milliseconds that the injector is being energized or held open. This line at Point "C" should remain flat. Any distortion or upward bend indicates a ground problem, short problem, or a weak driver. Alert readers will catch that this is exactly opposite of the current controlled type drivers (explained in the next section), because they bend upwards at this point.

How come the difference? Because of the total circuit resistance. Voltage controlled driver circuits have a high resistance of 12+ ohms that slows the building of the magnetic field in the injector. Hence, no counter voltage is built up and the line remains flat.

On the other hand, the current controlled driver circuit has low resistance which allows for a rapid magnetic field build-up. This causes a slight inductive rise (created by the effects of counter voltage) and hence, the upward bend. You should not see that here with voltage controlled circuits.

Point "D" represents the electrical condition of the injector windings. The height of this voltage spike (inductive kick) is proportional to the number of windings and the current flow through them. The more current flow and greater number of windings, the more potential for a greater inductive kick. The opposite is also true. The less current flow or fewer windings means less inductive kick. Typically you should see a minimum 35 volts at the top of Point "D".

If you do see approximately 35 volts, it is because a zener diode is used with the driver to clamp the voltage. Make sure the beginning top of the spike is squared off, indicating the zener dumped the remainder of the spike. If it is not squared, that indicates the spike is not strong enough to make the zener fully dump, meaning the injector has a weak winding.

If a zener diode is not used in the computer, the spike from a good injector will be 60 or more volts.

Point "E" brings us to a very interesting section. As you can see, the voltage dissipates back to supply value after the peak of the inductive kick. Notice the slight hump? This is actually the mechanical injector pintle closing. Recall that moving an iron core through a magnetic field will create a voltage surge. The pintle is the iron core here.

This pintle hump at Point "E" should occur near the end of the downward slope, and not afterwards. If it does occur after the slope has ended and the voltage has stabilized, it is because the pintle is slightly sticking because of a faulty injector

If you see more than one hump it is because of a distorted pintle or seat. This faulty condition is known as "pintle float".

It is important to realize that it takes a good digital storage oscilloscope or analog lab scope to see this pintle hump clearly. Unfortunately, it cannot always be seen.

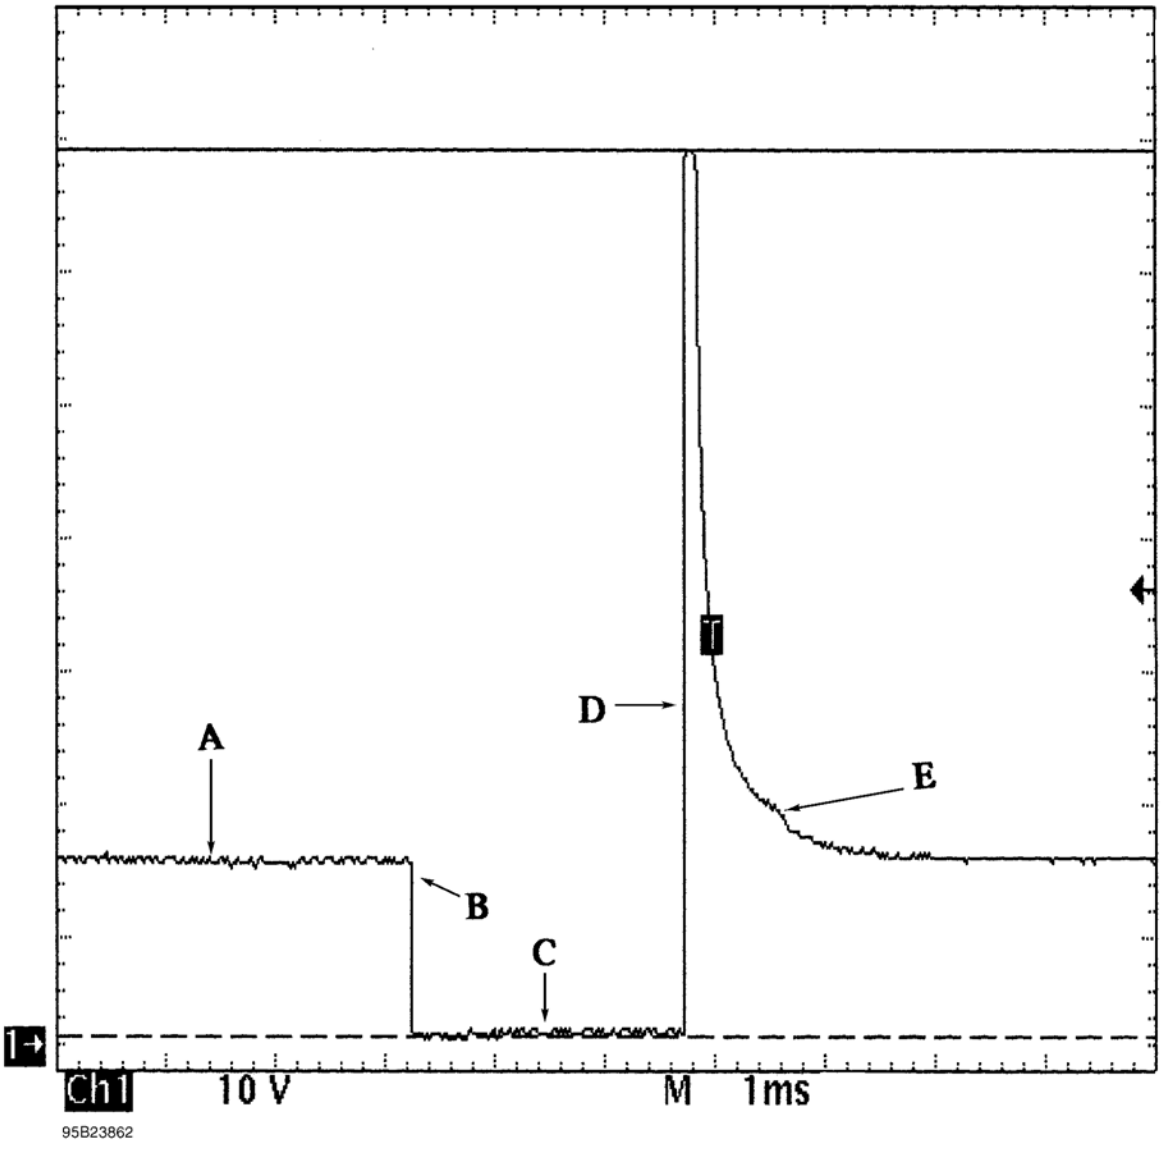

Fig. 2: Identifying Voltage Controlled Type Injector Pattern

INTERPRETING A CURRENT CONTROLLED PATTERN

NOTE: **Current controlled drivers are also known as "Peak and Hold" drivers. They typically require injector circuits with a total leg resistance with less than 12 ohm.**

NOTE: This example is based on a constant power/switched ground circuit.

- See **Fig. 3** for pattern that the following text describes.

Point "A" is where system voltage is supplied to the injector. A good hot run voltage is usually 13.5 or more volts. This point, commonly known as open circuit voltage, is critical because the injector will not get sufficient current saturation if there is a voltage shortfall. To obtain a good look at this precise point, you will need to shift your Lab Scope to five volts per division.

You will find that some systems have slight voltage fluctuations here. This could occur if the injector feed wire is also used to power up other cycling components, like the ignition coil(s). Slight voltage fluctuations are normal and are no reason for concern. Major voltage fluctuations are a different story, however. Major voltage shifts on the injector feed line will create injector performance problems. Look for excessive resistance problems in the feed circuit if you see big shifts and repair as necessary.

Point "B" is where the driver completes the circuit to ground. This point of the waveform should be a clean square point straight down with no rounded edges. It is during this period that current saturation of the injector windings is taking place and the driver is heavily stressed. Weak drivers will distort this vertical line.

Point "C" represents the voltage drop across the injector windings. Point "C" should come very close to the ground reference point, but not quite touch. This is because the driver has a small amount of inherent resistance. Any significant offset from ground is an indication of a resistance problem on the ground circuit that needs repaired. You might miss this fault if you do not use the negative battery post for your Lab Scope hook-up, so it is HIGHLY recommended that you use the battery as your hook-up.

Right after Point "C", something interesting happens. Notice the trace starts a normal upward bend. This slight inductive rise is created by the effects of counter voltage and is normal. This is because the low circuit resistance allowed a fast build-up of the magnetic field, which in turn created the counter voltage.

Point "D" is the start of the current limiting, also known as the "Hold" time. Before this point, the driver had allowed the current to free-flow ("Peak") just to get the injector pintle open. By the time point "D" occurs, the injector pintle has already opened and the computer has just significantly throttled the current back. It does this by only allowing a few volts through to maintain the minimum current required to keep the pintle open.

The height of the voltage spike seen at the top of Point "D" represents the electrical condition of the injector windings. The height of this voltage spike (inductive kick) is proportional to the number of windings and the current flow through them. The more current flow and greater number of windings, the more potential for a greater inductive kick. The opposite is also true. The less current flow or fewer windings means less inductive kick. Typically you should see a minimum 35 volts.

If you see approximately 35 volts, it is because a zener diode is used with the driver to clamp the voltage. Make sure the beginning top of the spike is squared off, indicating the zener dumped the remainder of the spike. If it is not squared, that indicates the spike is not strong enough to make the zener fully dump, meaning there is a problem with a weak injector winding.

If a zener diode is not used in the computer, the spike from a good injector will be 60 or more volts.

At Point "E", notice that the trace is now just a few volts below system voltage and the injector is in the current limiting, or the "Hold" part of the pattern. This line will either remain flat and stable as shown here, or will

cycle up and down rapidly. Both are normal methods to limit current flow. Any distortion may indicate shorted windings.

Point "F" is the actual turn-off point of the driver (and injector). To measure the millisecond on-time of the injector, measure between points "C" and "F". Note that we used cursors to do it for us; they are measuring a 2.56 mS on-time.

The top of Point "F" (second inductive kick) is created by the collapsing magnetic field caused by the final turn-off of the driver. This spike should be like the spike on top of point "D".

Point "G" shows a slight hump. This is actually the mechanical injector pintle closing. Recall that moving an iron core through a magnetic field will create a voltage surge. The pintle is the iron core here.

This pintle hump at Point "E" should occur near the end of the downward slope, and not afterwards. If it does occur after the slope has ended and the voltage has stabilized, it is because the pintle is slightly sticking. Some older Nissan TBI systems suffered from this.

If you see more than one hump it is because of a distorted pintle or seat. This faulty condition is known as "pintle float".

It is important to realize that it takes a good digital storage oscilloscope or analog lab scope to see this pintle hump clearly. Unfortunately, it cannot always be seen.

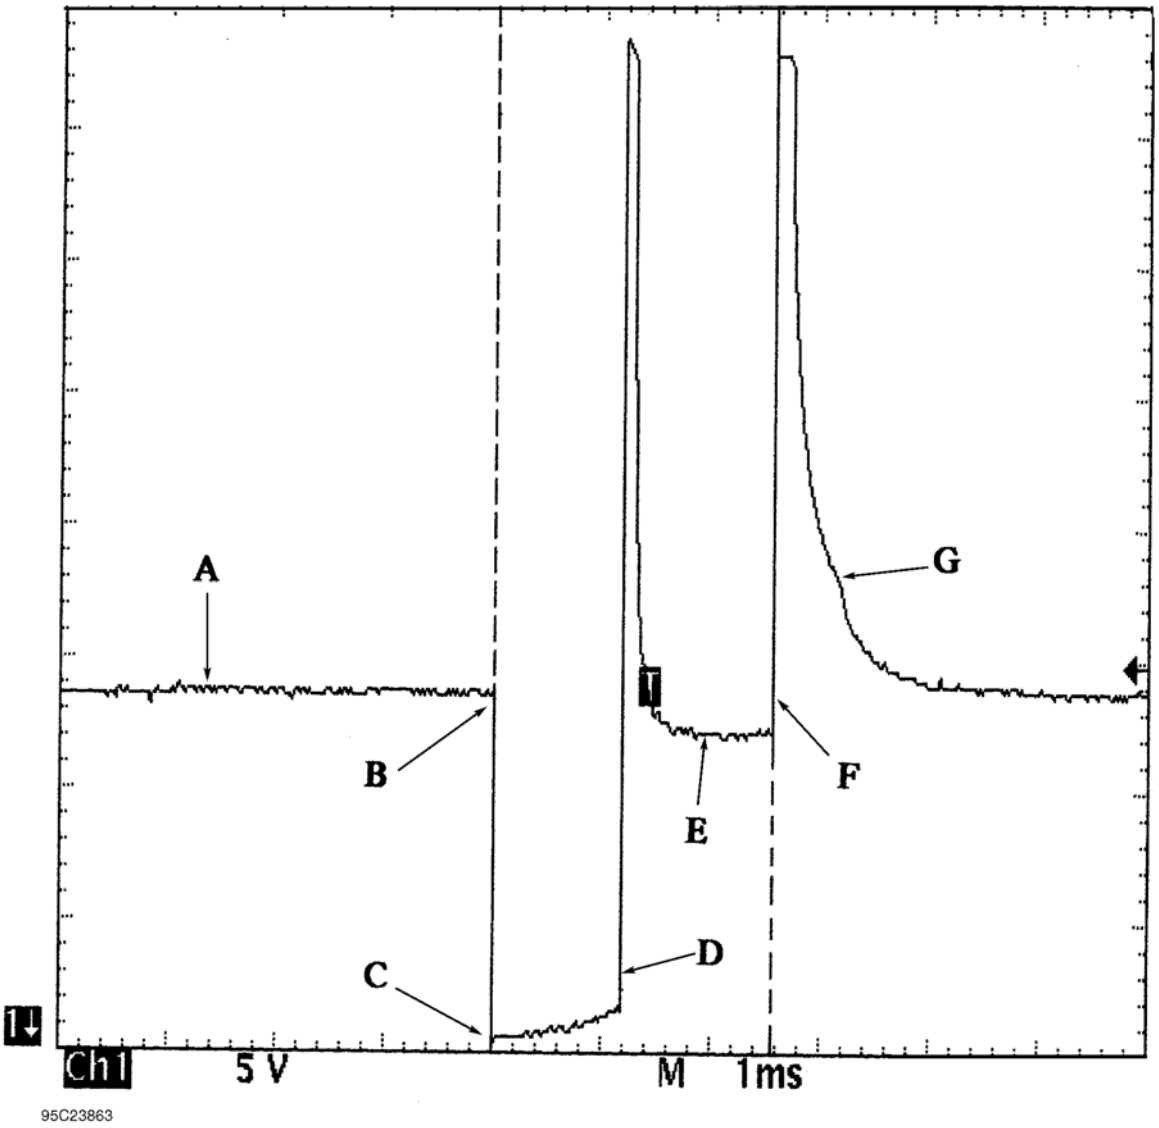

Fig. 3: Identifying Current Controlled Type Injector Pattern

CURRENT WAVEFORM SAMPLES

NOTE: **This is GENERAL information. This article is not intended to be specific to any unique situation or individual vehicle configuration. For model-specific information see appropriate articles where available.**

EXAMPLE #1 - VOLTAGE CONTROLLED DRIVER

The waveform pattern shown in Fig. **Fig. 4** indicate a normal current waveform from a Ford 3.0L V6 VIN [U] engine. This voltage controlled type circuit pulses the injectors in groups of three injectors. Injectors No. 1, 3, and 5 are pulsed together and cylinders 2, 4, and 6 are pulsed together. The specification for an acceptable bank resistance is 4.4 ohms. Using Ohm's Law and assuming a hot run voltage of 14 volts, we determine that the bank would draw a current of 3.2 amps.

However this is not the case because as the injector windings become saturated, counter voltage is created

which impedes the current flow. This, coupled with the inherent resistance of the driver's transistor, impedes the current flow even more. So, what is a known good value for a dynamic current draw on a voltage controlled bank of injectors? The waveform pattern shown below indicates a good parallel injector current flow of 2 amps. See **Fig. 4**.

Note that if just one injector has a resistance problem and partially shorts, the entire parallel bank that it belongs to will draw more current. This can damage the injector driver.

The waveform pattern in Fig. **Fig. 5** indicates this type of problem with too much current flow. This is on other bank of injectors of the same vehicle; the even side. Notice the Lab Scope is set on a one amp per division scale. As you can see, the current is at an unacceptable 2.5 amps.

It is easy to find out which individual injector is at fault. All you need to do is inductively clamp onto each individual injector and compare them. To obtain a known-good value to compare against, we used the good bank to capture the waveform in Fig. **Fig. 6**. Notice that it limits current flow to 750 milliamps.

The waveform shown in Fig. **Fig. 7** illustrates the problem injector we found. This waveform indicates an unacceptable current draw of just over one amp as compared to the 750 milliamp draw of the known-good injector. A subsequent check with a DVOM found 8.2 ohms, which is under the 12 ohm specification.

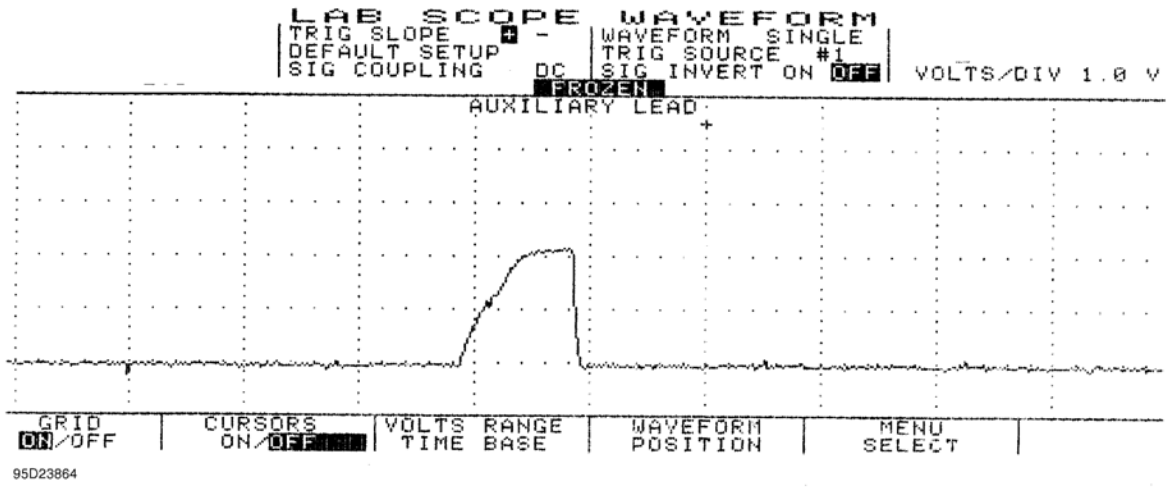

Fig. 4: Injector Bank w/Normal Current Flow - Current Pattern

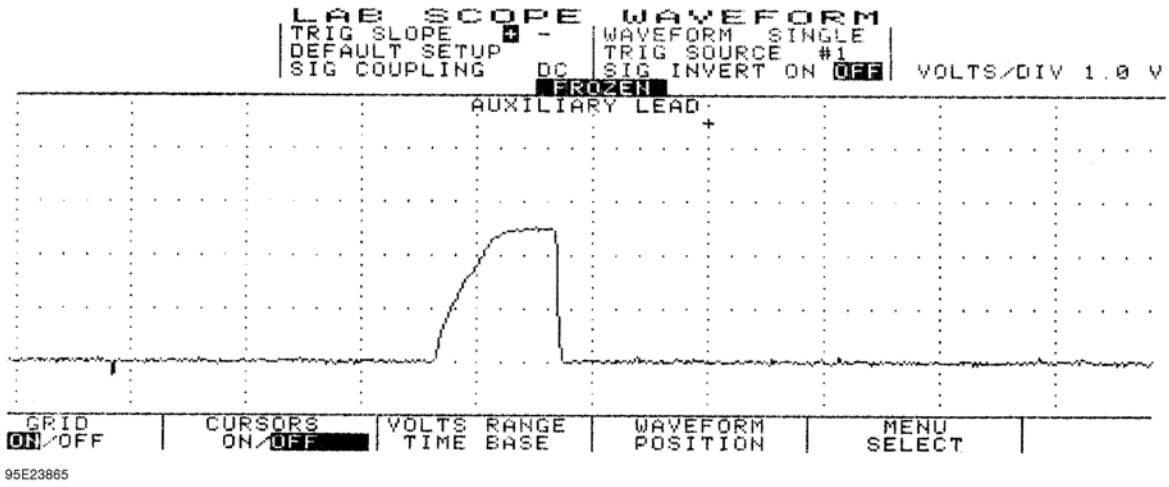

Fig. 5: Injector Bank w/Excessive Current Flow - Current Pattern

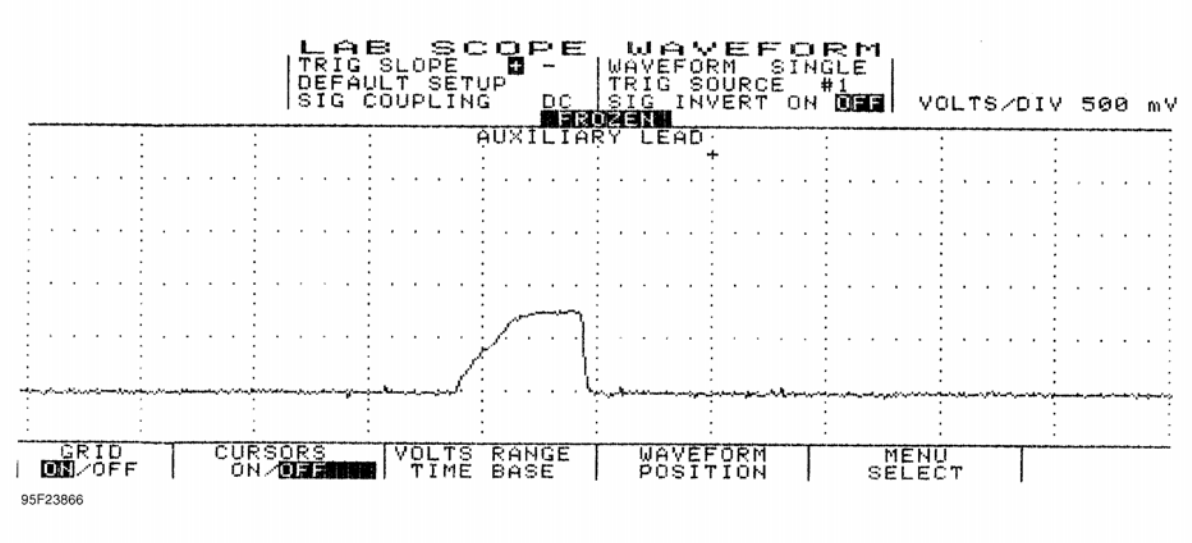

Fig. 6: Single Injector w/Normal Current Flow - Current Pattern

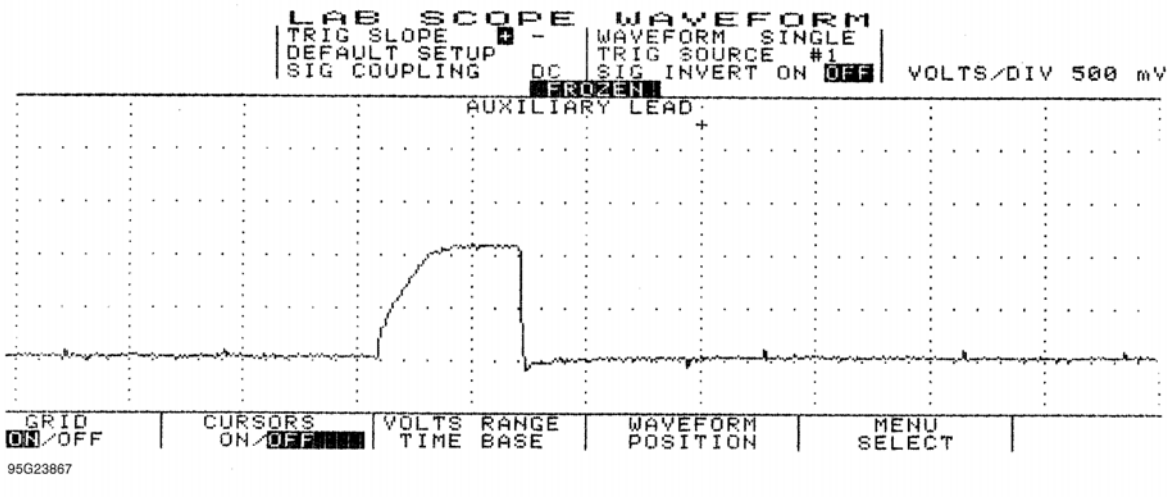

Fig. 7: Single Injector w/Excessive Current Flow - Current Pattern

EXAMPLE #2 - VOLTAGE CONTROLLED DRIVER

This time we will look at a GM 3.1L V6 VIN [T]. Fig. **Fig. 8** shows the 1, 3, 5 (odd) injector bank with the current waveform indicating about a 2.6 amp draw at idle. This pattern, taken from a known good vehicle, correctly stays at or below the maximum 2.6 amps current range. Ideally, the current for each bank should be very close in comparison.

Notice the small dimple on the current flow's rising edge. This is the actual injector opening or what engineers refer to as the "set point." For good idle quality, the set point should be uniform between the banks.

When discussing Ohm's Law as it pertains to this parallel circuit, consider that each injector has specified resistance of 12.2 ohms. Since all three injectors are in parallel the total resistance of this parallel circuit drops to 4.1 ohms. Fourteen volts divided by four ohms would pull a maximum of 3.4 amps on this bank of injectors. However, as we discussed in **EXAMPLE #1** above, other factors knock this value down to roughly the 2.6 amp neighborhood.

Now we are going to take a look at the even bank of injectors; injectors 2, 4, and 6. See **Fig. 9**. Notice this bank peaked at 1.7 amps at idle as compared to the 2.6 amps peak of the odd bank (Fig. **Fig. 8**). Current flow between even and odd injectors banks is not uniform, yet it is not causing a driveability problem. That is because it is still under the maximum amperage we figured out earlier. But be aware this vehicle could develop a problem if the amperage flow increases any more.

Checking the resistance of this even injector group with a DVOM yielded 6.2 ohms, while the odd injector group in the previous example read 4.1 ohms.

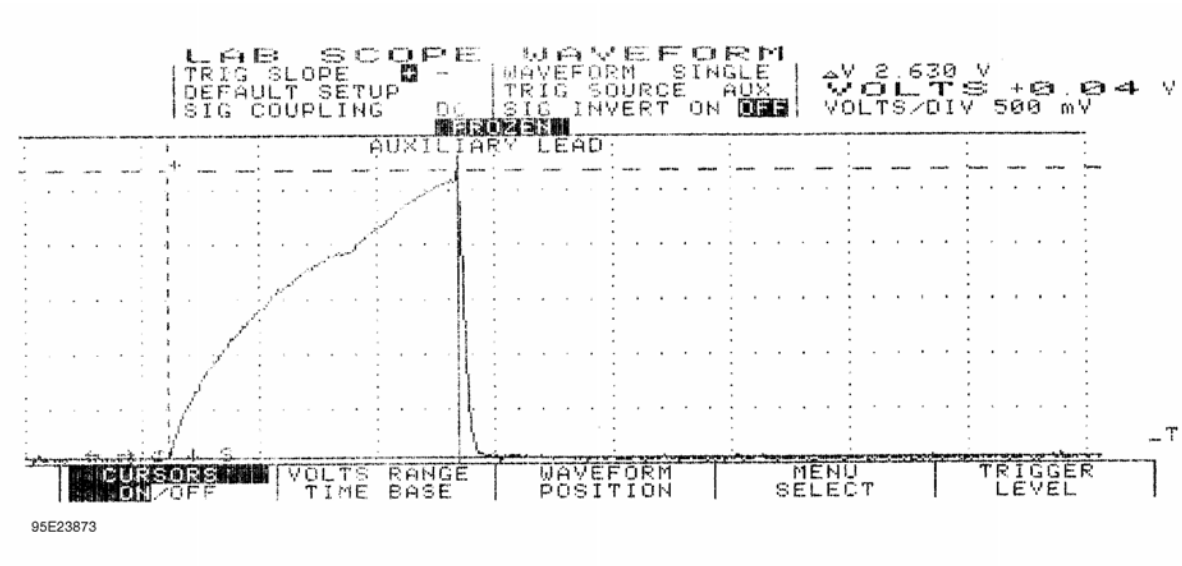

Fig. 8: Injector Odd Bank w/Normal Current Flow - Current Pattern

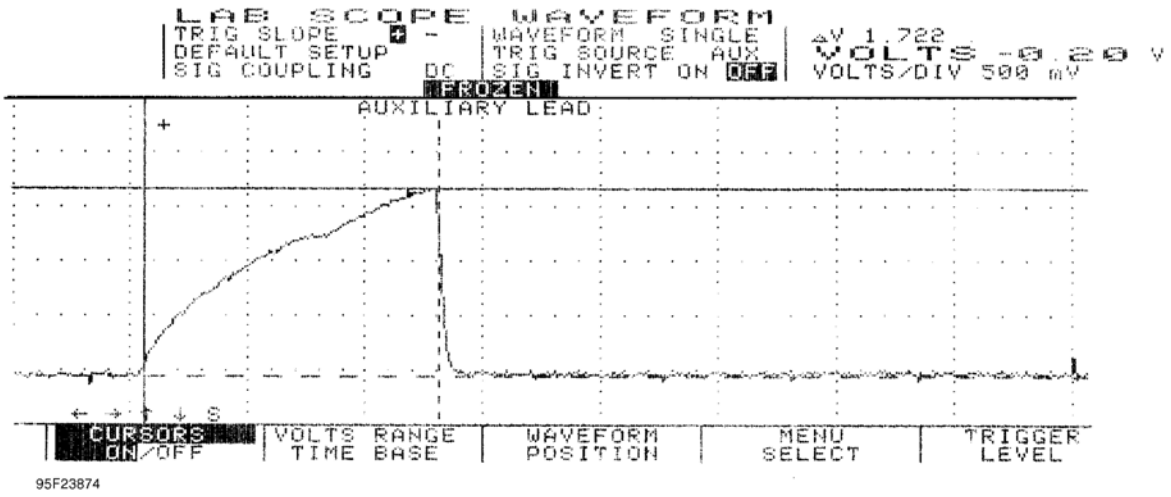

Fig. 9: Injector Even Bank w/Normal Current Flow - Current Pattern

EXAMPLE #3 - VOLTAGE CONTROLLED DRIVER

Example #3 is of a Ford 5.0L V8 SEFI. Fig. **Fig. 10** shows a waveform of an individual injector at idle with the Lab Scope set on 200 milliamps per division. Notice the dimple in the rising edge. This dimple indicates the actual opening of the injector (set point) occurred at 400 milliamps and current peaked at 750 milliamps. This is a good specification for this engine.

The next waveform pattern in Fig. **Fig. 11** shows an abnormality with another injector. With the Lab Scope set on 500 milliamps per division, you can see that the current waveform indicates a 1200 milliamp draw. This is a faulty injector.

Abnormally low resistance injectors create excessive current draw, causing rough idle, and possible computer driver damage.

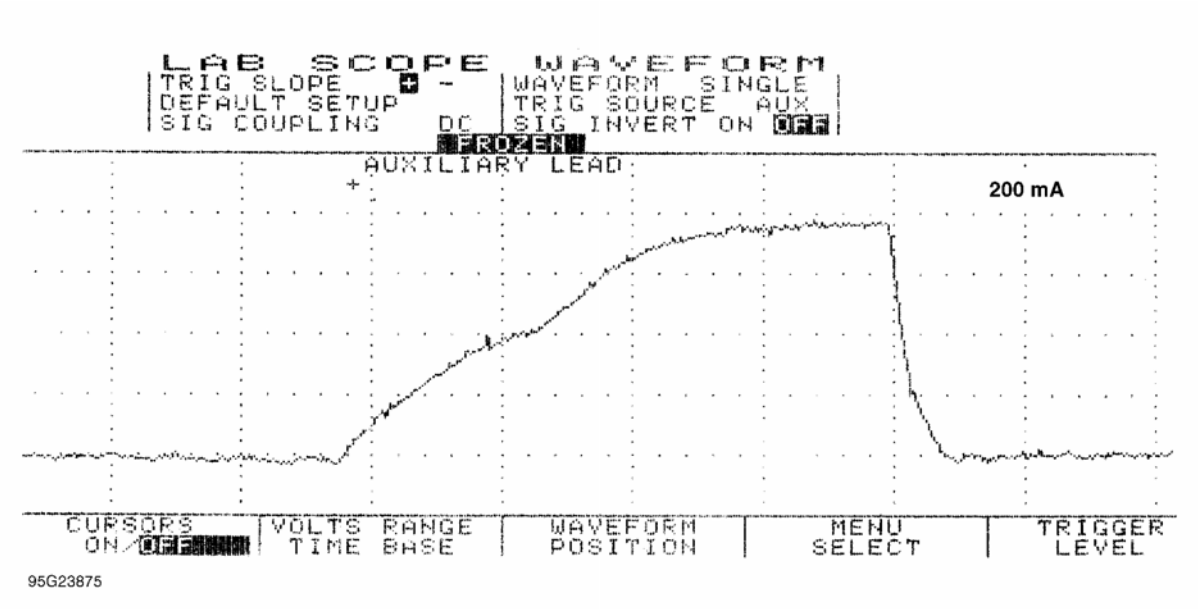

Fig. 10: Single Injector w/Normal Current Flow - Current Pattern

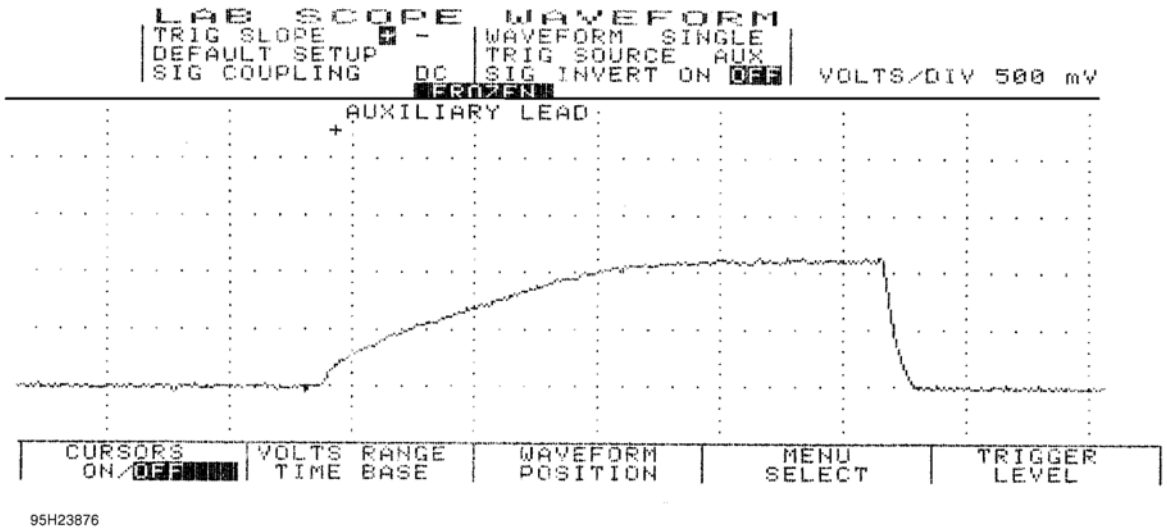

Fig. 11: Single Injector w/Excessive Current Flow - Current Pattern

EXAMPLE #4 - CURRENT CONTROLLED DRIVER

Example #4 is of a Ford 4.6L SEFI VIN [W]. See **Fig. 12** for the known-good waveform pattern. This Ford system is different from the one above in **EXAMPLE #3** as it peaks at 900 milliamps and the actual opening of the injector (set point) is just below 600 milliamps.

This is offered as a comparison against the Ford pattern listed above, as they are both Ford SEFI injectors but with different operating ranges. The point is that you should not make any broad assumptions for any manufacturer.

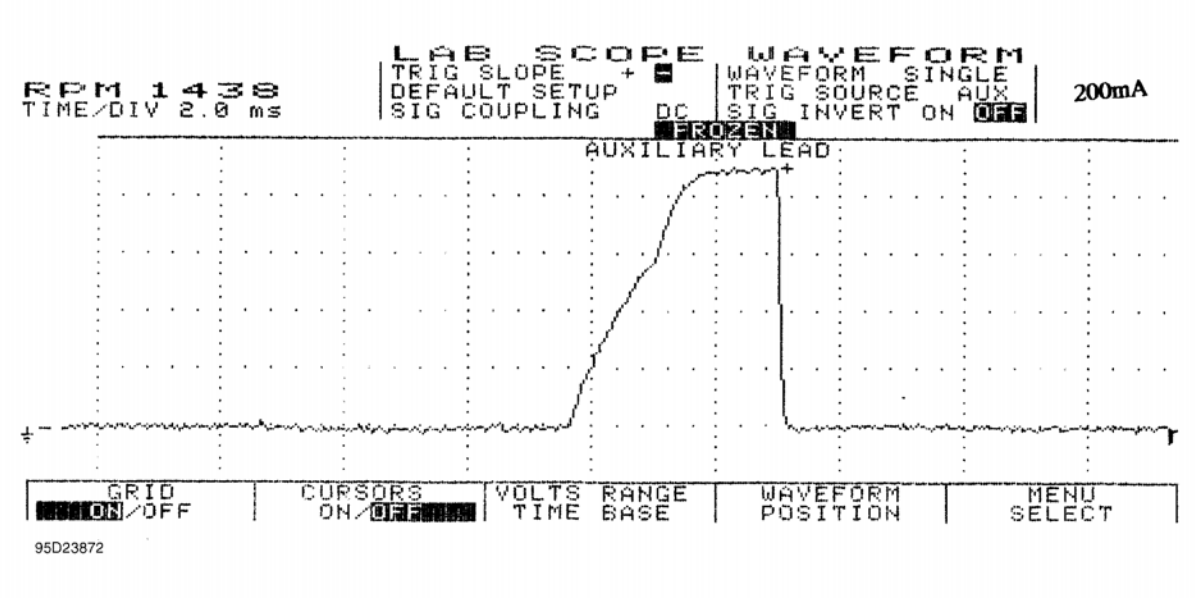

Fig. 12: Single Injector w/Normal Current Flow - Current Pattern

EXAMPLE #5 - CURRENT CONTROLLED DRIVER

The known-good waveform in Fig. **Fig. 13** is from a Chrysler 3.0L V6 PFI VIN [3]. It is a perfect example of

the peak and hold theory. The waveform shows a 1-amp per division current flow, ramping to 4 amps and then decreasing to 1-amp to hold the injector open.

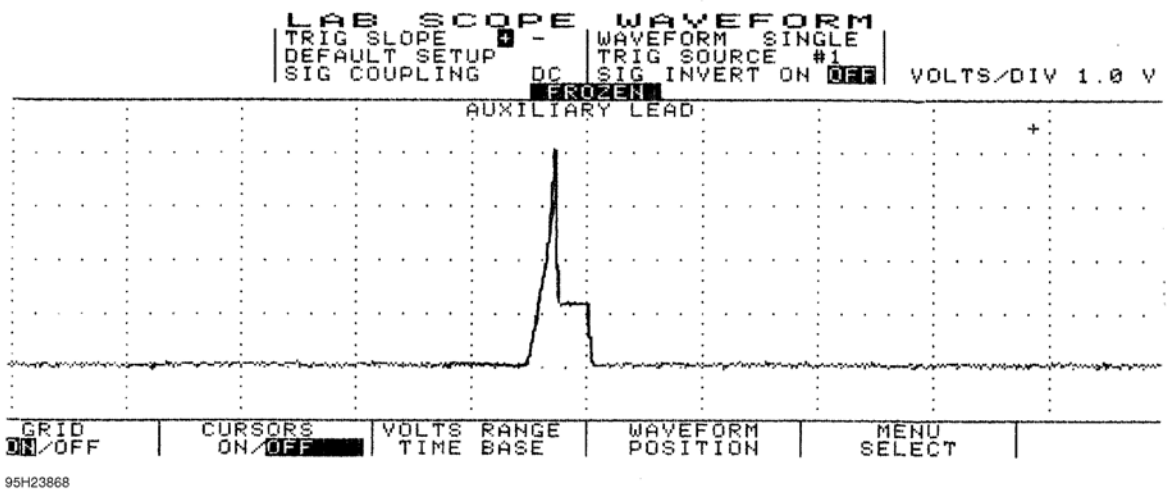

Fig. 13: Injector Bank w/Normal Current Flow - Current Pattern

EXAMPLE #6 - CURRENT CONTROLLED DRIVER

This next known-good waveform is from a Ford 5.0L V8 CFI VIN [F]. See **Fig. 14**. The pattern, which is set on a 250 milliamps scale, indicates a 1.25 amp peak draw and a hold at 350 milliamps.

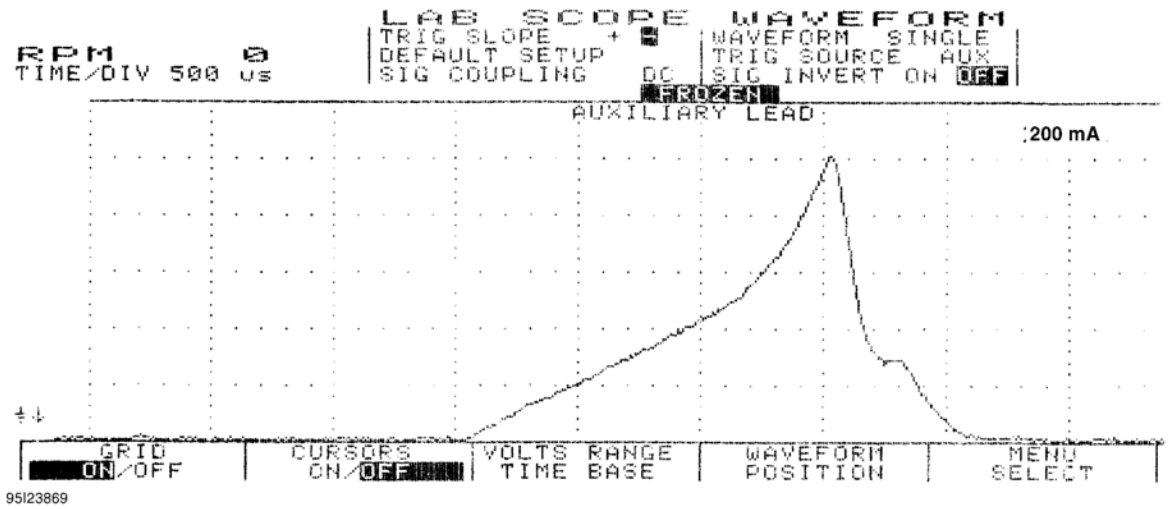

Fig. 14: Single Injector w/Normal Current Flow - Current Pattern

EXAMPLE #7 - CURRENT CONTROLLED DRIVER

The known-good current controlled type waveform in Fig. **Fig. 15** is from a GM 2.0L TBI VIN [1]. With the lab scope set at 2 amps per division, notice that this system peaks at 4 amps and holds at 1 amp.

The next waveform is from the same type of engine, except that it shows a faulty injector. See **Fig. 16**. Notice that the current went to almost 5 amps and stayed at 1 amp during the hold pattern. Excessive amounts of

current flow from bad injectors are a common source of intermittent computer shutdown. Using a current waveform pattern is the most accurate method of pinpointing this problem.

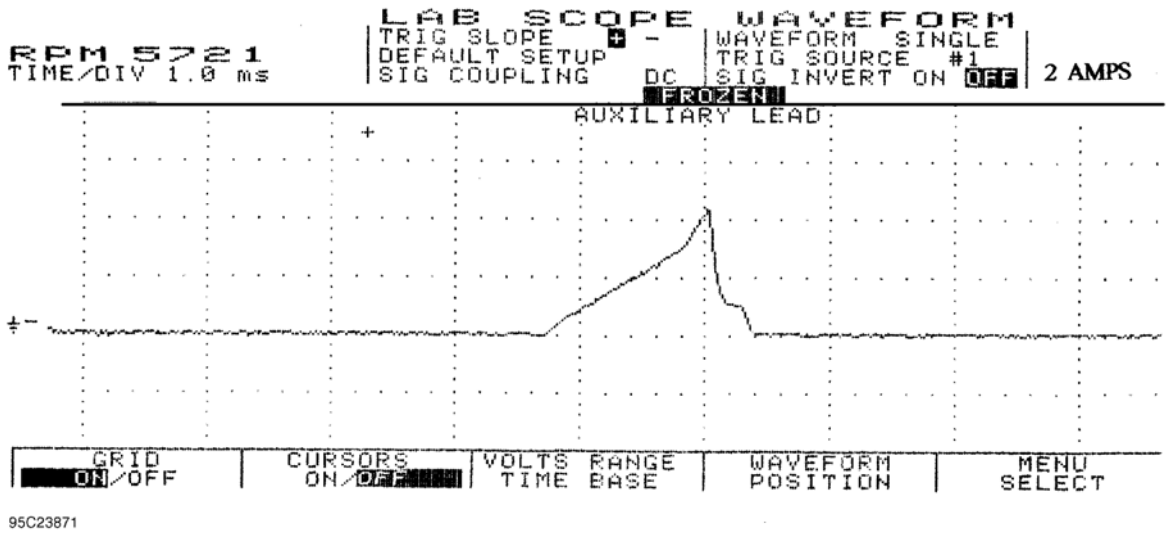

Fig. 15: Single Injector w/Normal Current Flow - Current Pattern

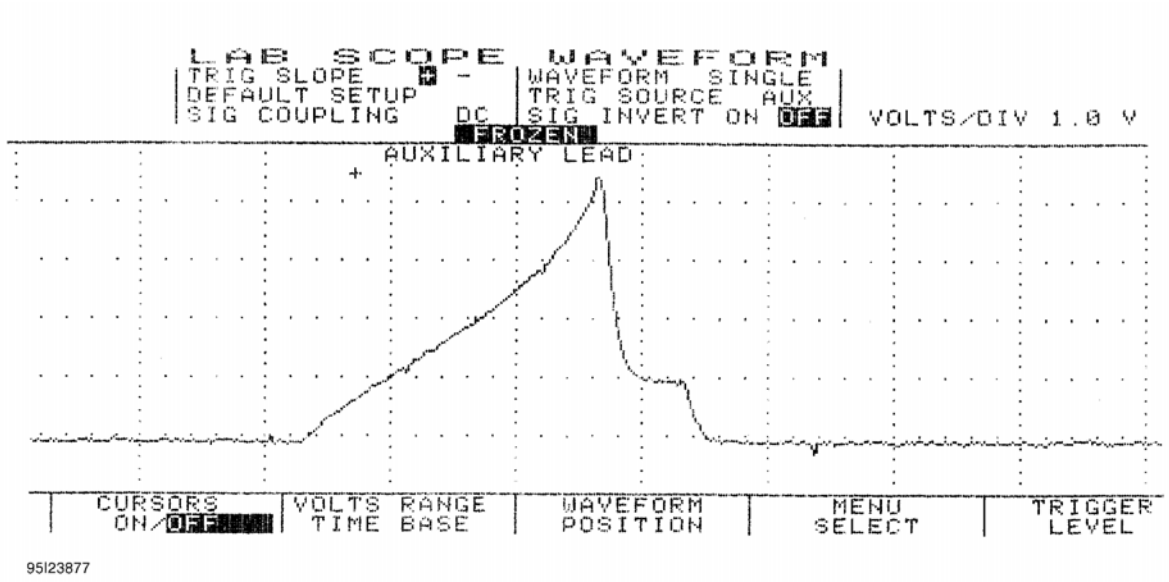

Fig. 16: Single Injector w/Excessive Current Flow - Current Pattern

EXAMPLE #8 - CURRENT CONTROLLED DRIVER

This known-good CPI system waveform from a GM 4.3L V6 CPI VIN [W] peaks at 4 amps and holds at 1-amp. See **Fig. 17** for waveform.

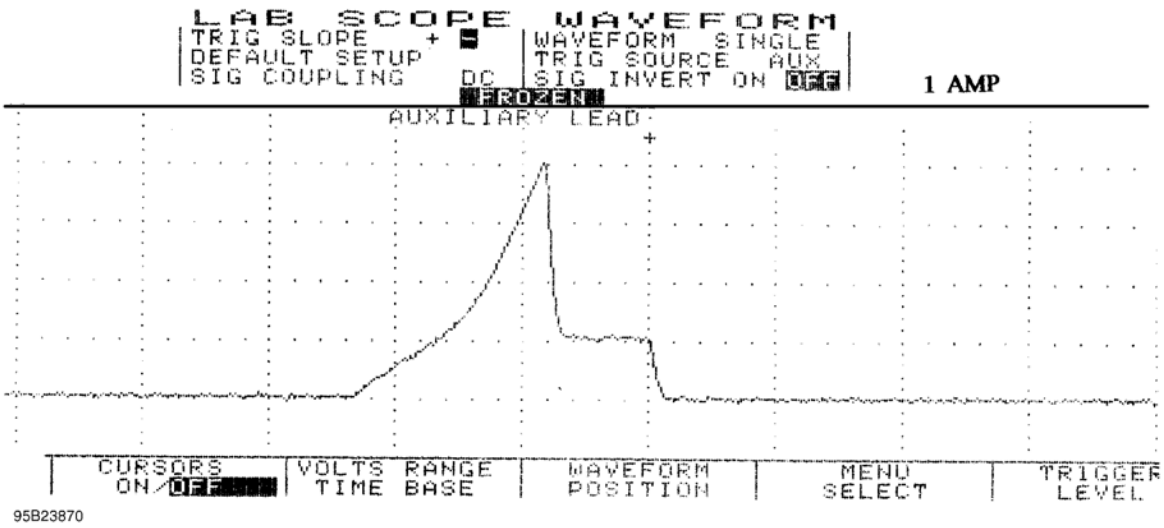

Fig. 17: Single Injector w/Normal Current Flow - Current Pattern

VOLTAGE WAVEFORM SAMPLES

NOTE: **This is GENERAL information. This article is not intended to be specific to any unique situation or individual vehicle configuration. For model-specific information see appropriate articles where available.**

EXAMPLE #1 - VOLTAGE CONTROLLED DRIVER

These two known-good waveform patterns are from a Ford 4.6L V8 VIN [W]. Fig. **Fig. 18** illustrates the 64 volt inductive kick on this engine, indicating no clamping is occurring. The second pattern, Fig. **Fig. 19**, was taken during hot idle, closed loop, and no load.

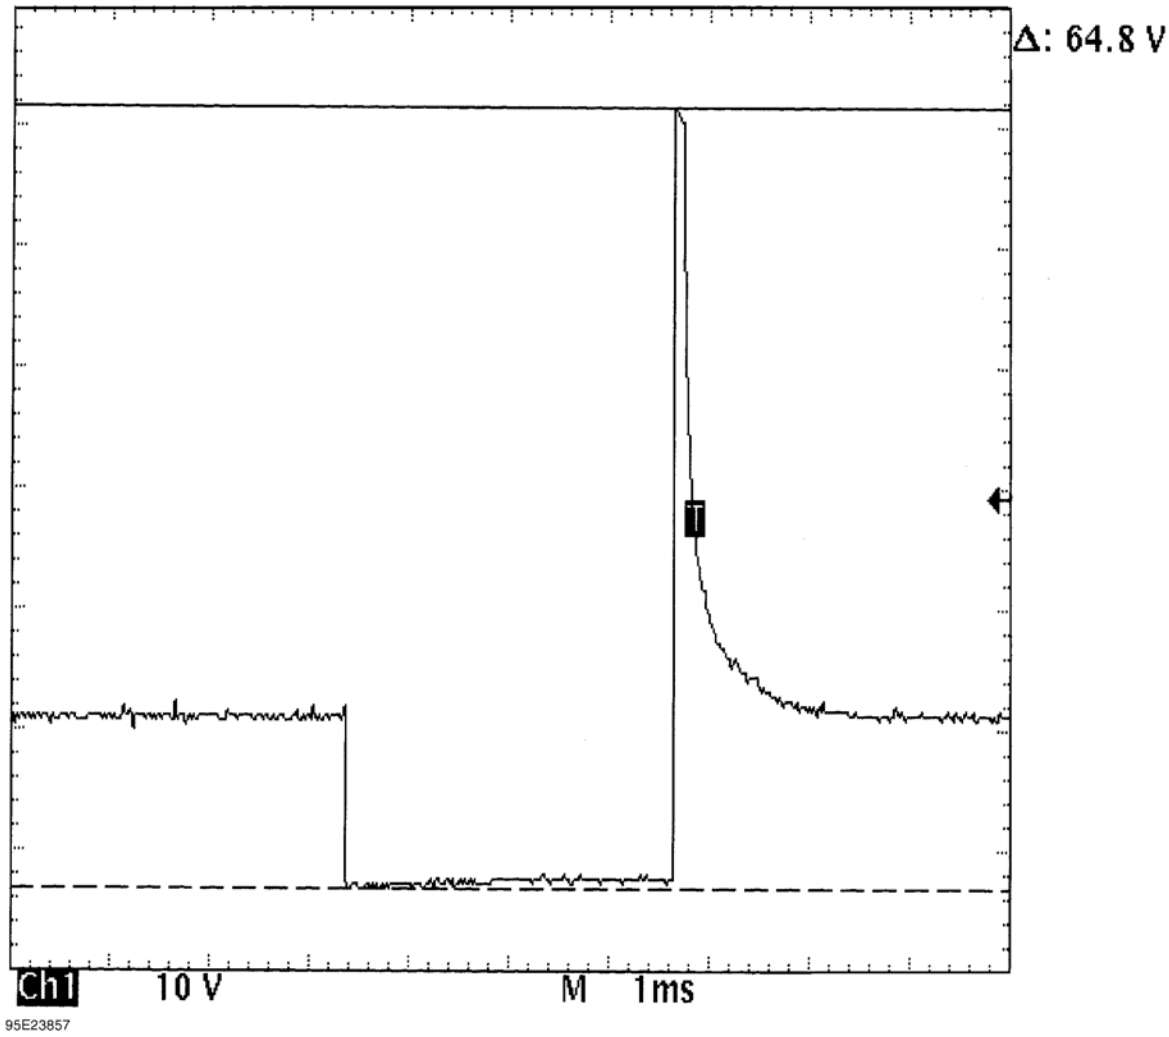

Fig. 18: Injector Bank - Known Good - Voltage Pattern

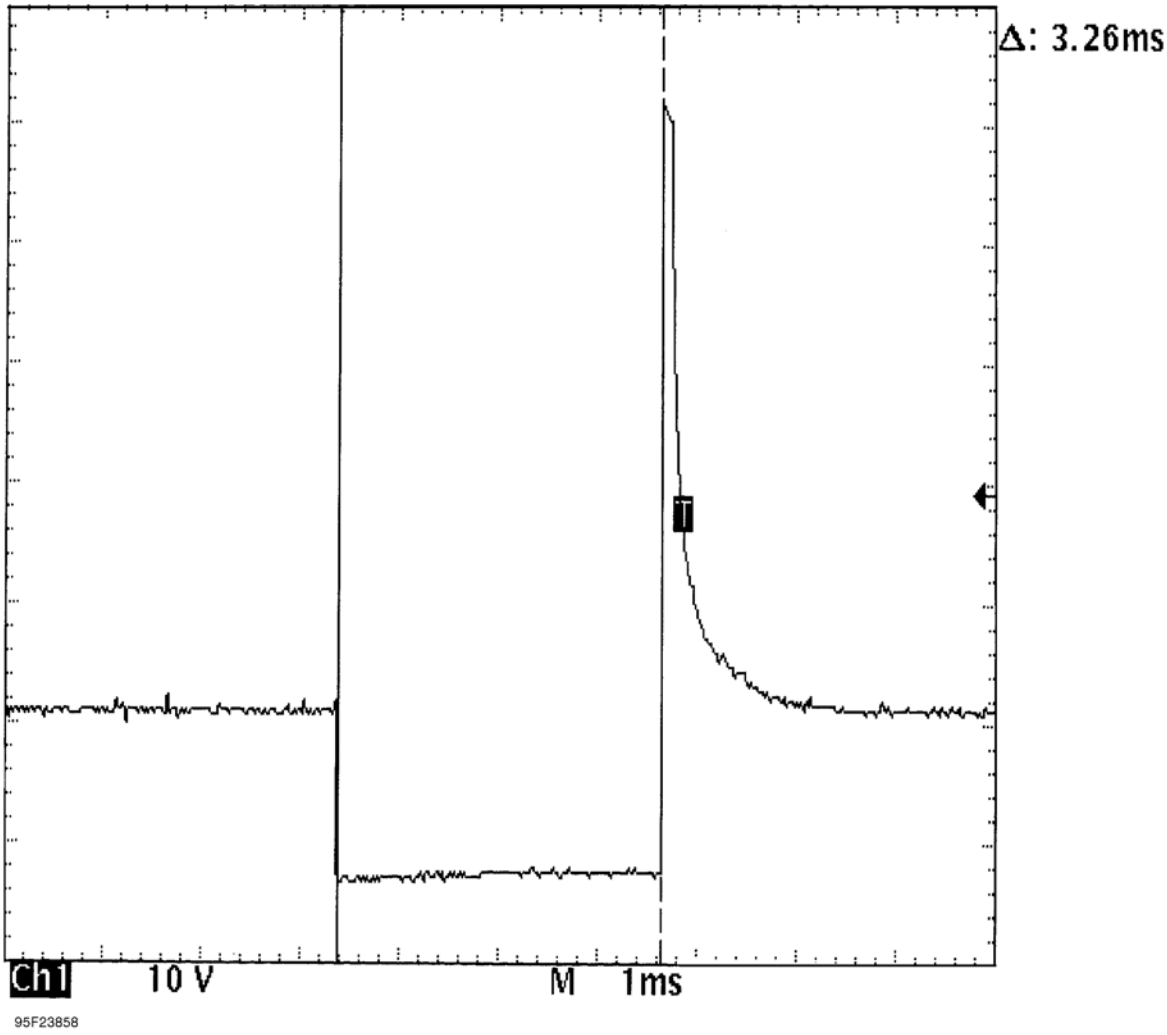

Fig. 19: Injector Bank - Known Good - Voltage Pattern

EXAMPLE #2 - VOLTAGE CONTROLLED DRIVER

The known-good waveform pattern in Fig. **Fig. 20** is from a GM 3.8L V6 PFI VIN [3]. It was taken during hot idle, closed loop and no load.

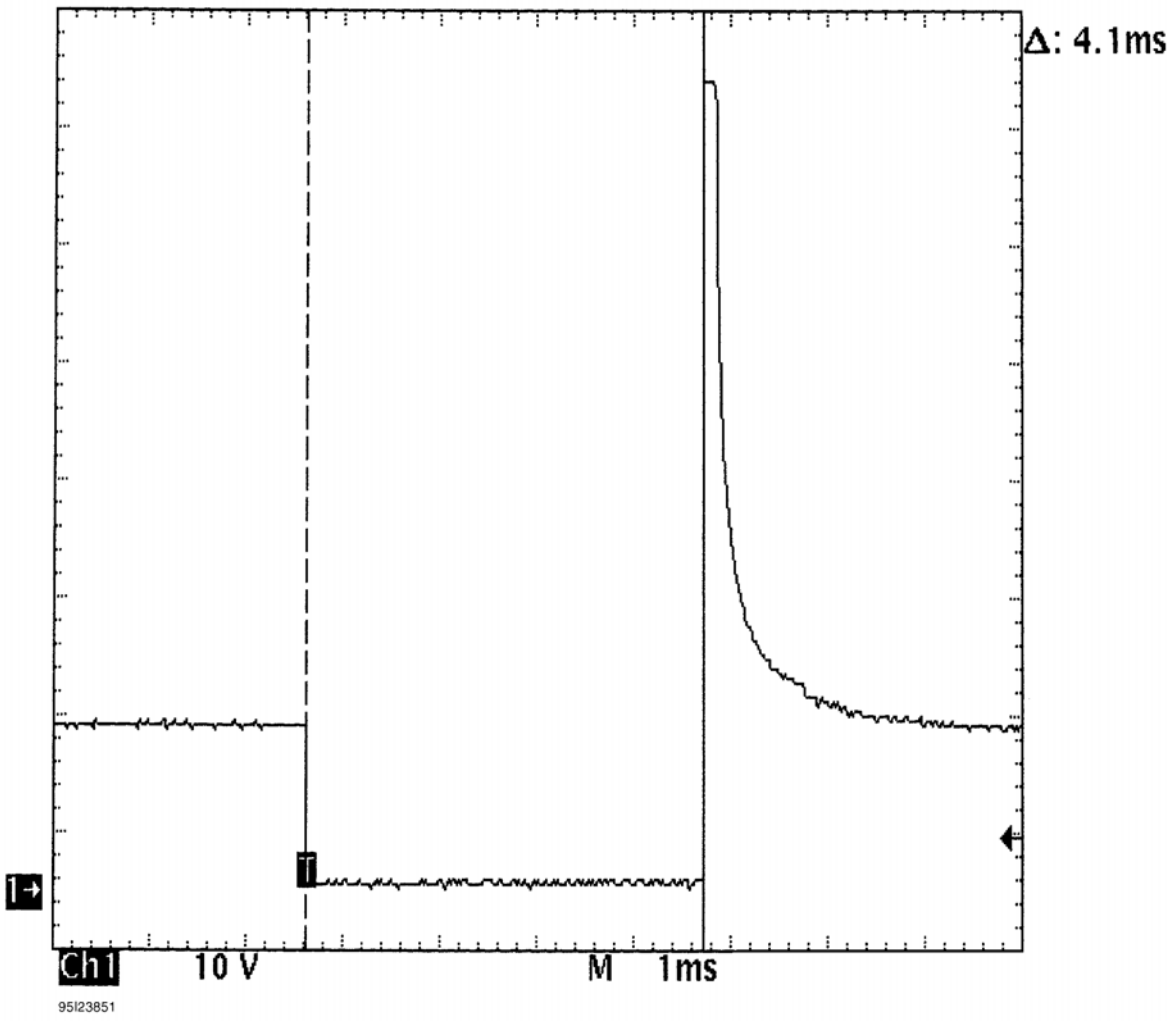

Fig. 20: Injector Bank - Known Good - Voltage Pattern

EXAMPLE #3 - VOLTAGE CONTROLLED DRIVER

This known-good waveform pattern, Fig. **Fig. 21**, is from a GM 5.0L V8 TPI VIN [F]. It was taken during hot idle, closed loop and no load.

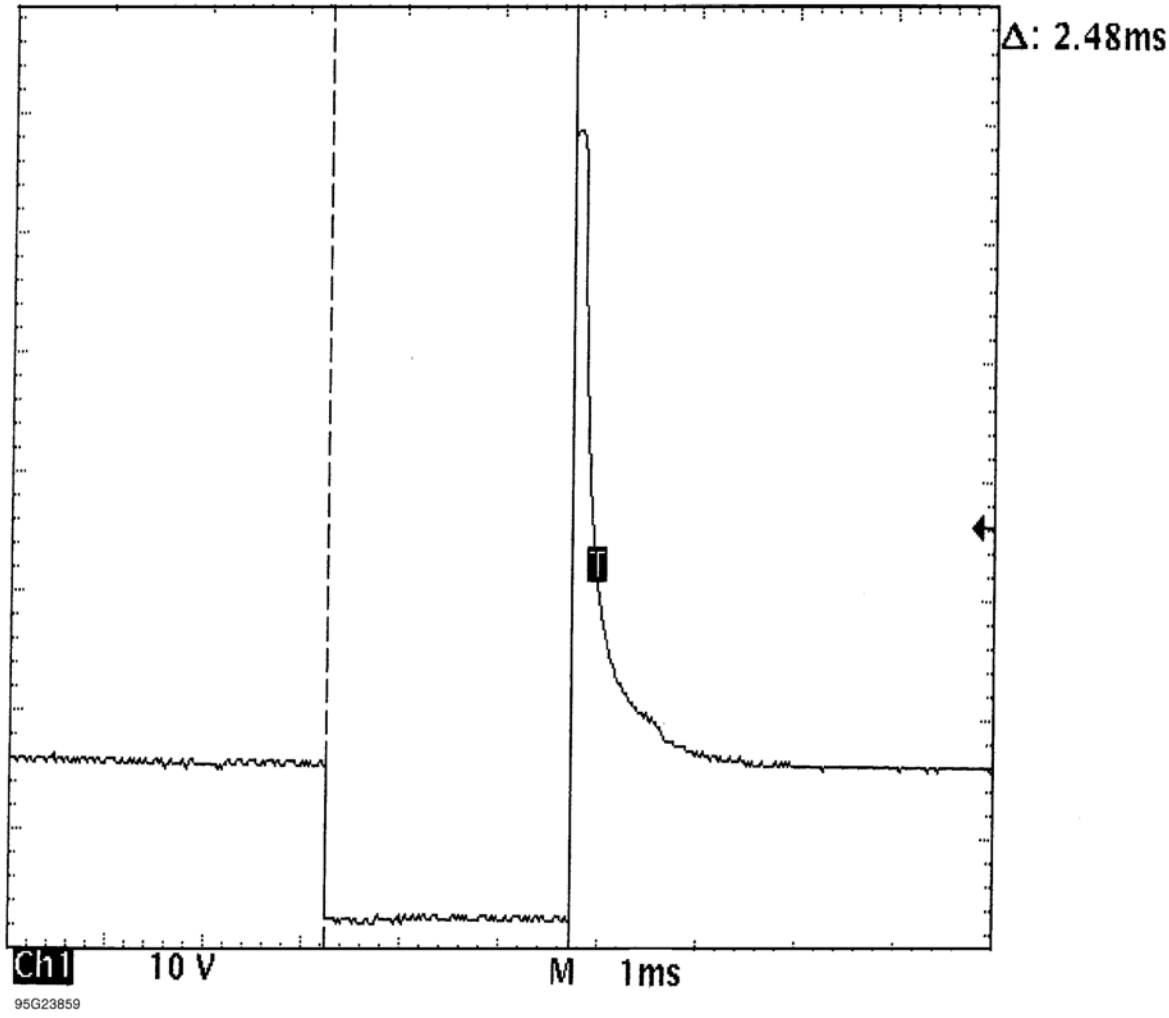

Fig. 21: Injector Bank - Known Good - Voltage Pattern

EXAMPLE #4 - CURRENT CONTROLLED DRIVER

From 1984 to 1987, Chrysler used this type injector drive on their TBI-equipped engines. See **Fig. 22** for a known-good pattern. Instead of the ground side controlling the injector, Chrysler permanently grounds out the injector and switches the power feed side. Most systems do not work this way.

These injectors peak at 6 amps of current flow and hold at 1 amp.

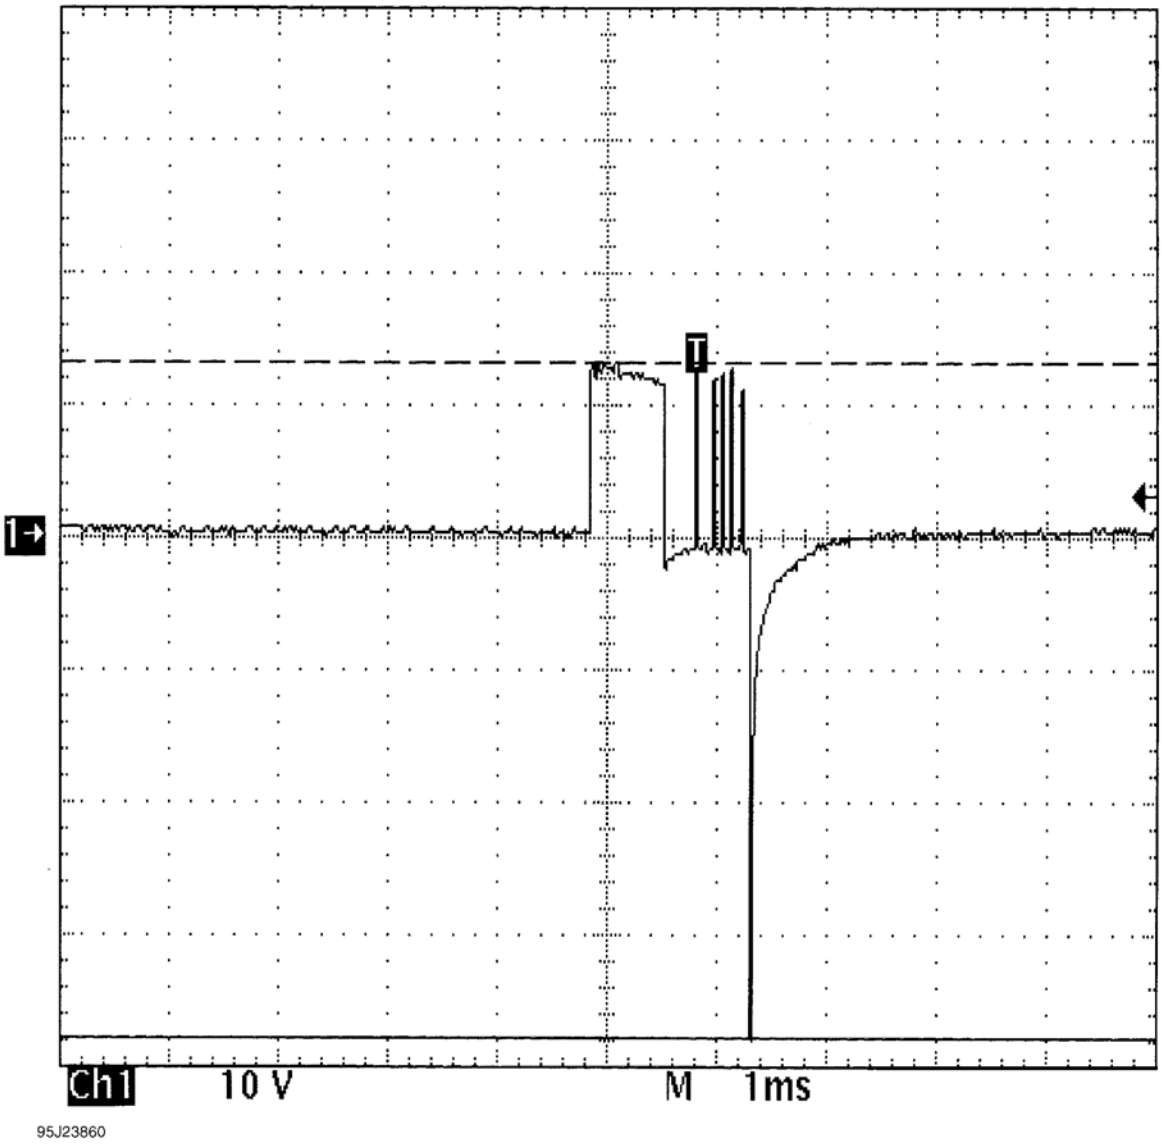

Fig. 22: Single Injector - Known Good - Voltage Pattern

EXAMPLE #5 - CURRENT CONTROLLED DRIVER

These two known-good waveform patterns are from a Chrysler 3.0L V6 VIN [3]. The first waveform, Fig. **Fig. 23**, is a dual trace pattern that illustrates how Chrysler uses the rising edge of the engine speed signal to trigger the injectors. The second waveform, Fig. **Fig. 24**, was taken during hot idle, closed loop, and no load.

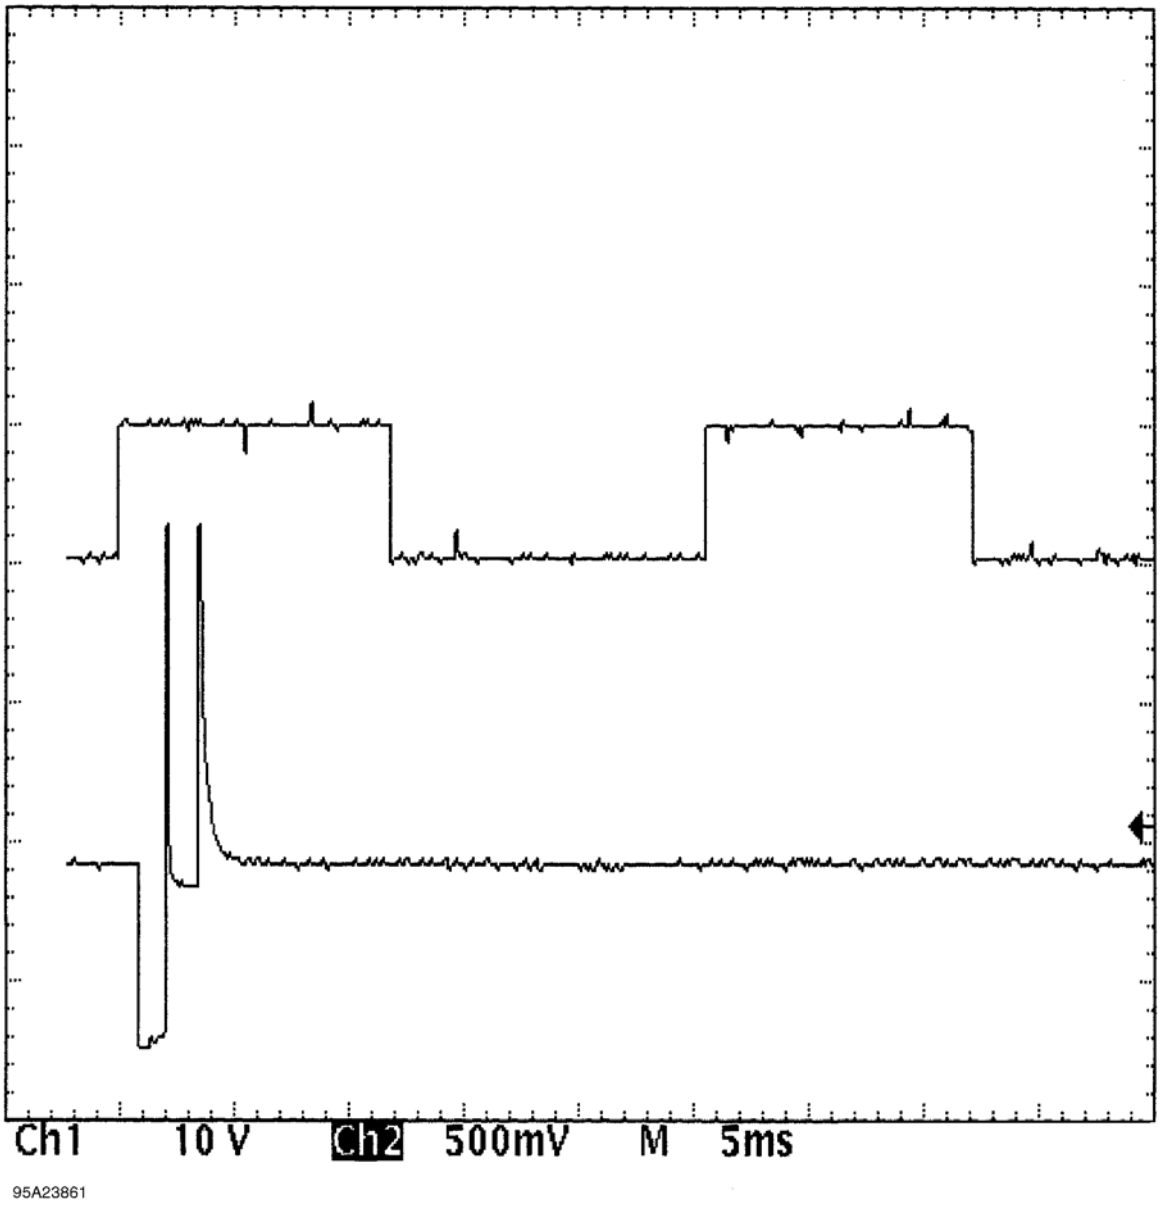

Fig. 23: Injector Bank - Known Good - Voltage Pattern

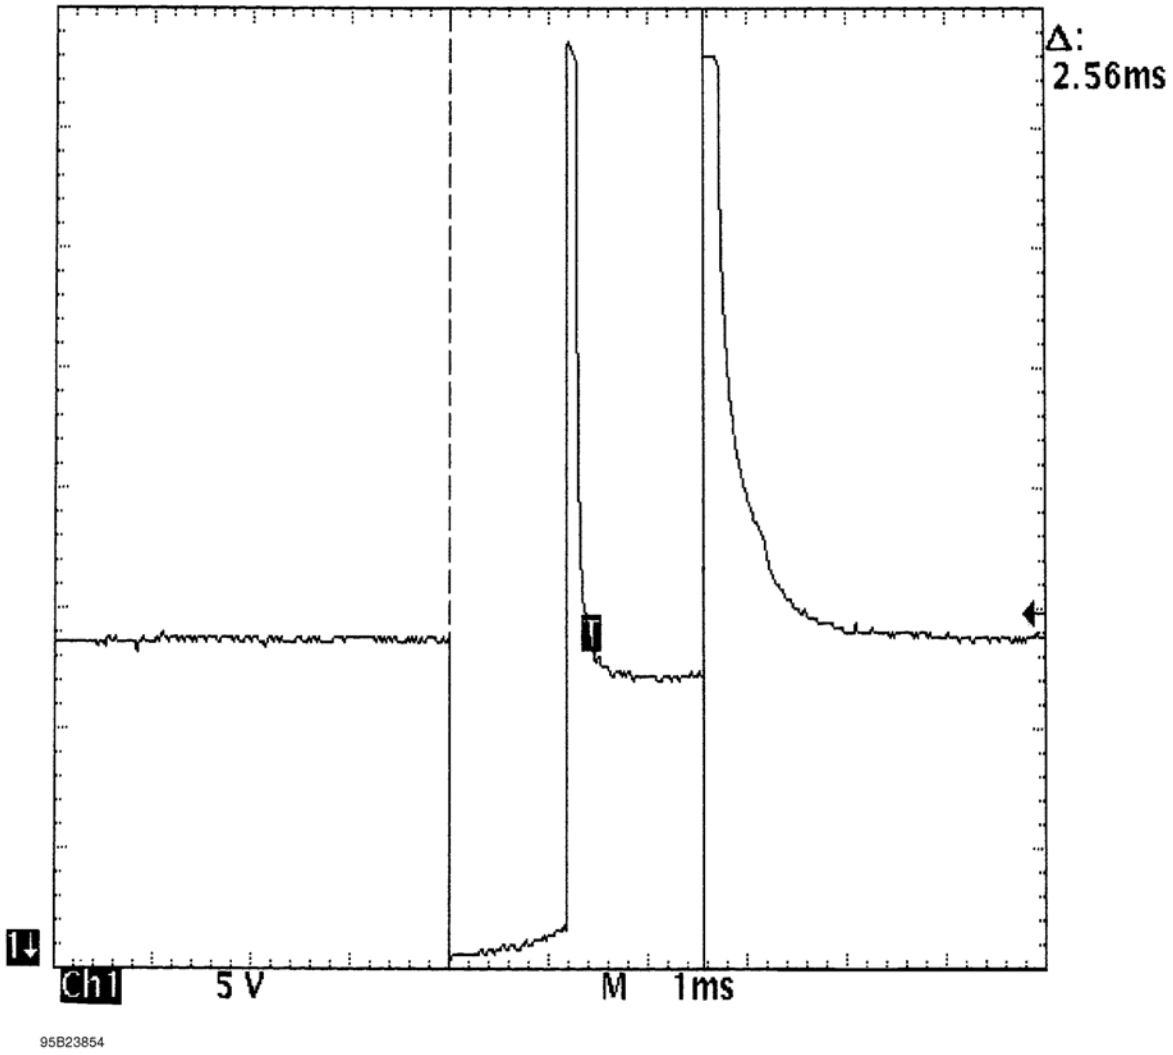

Fig. 24: Injector Bank - Known Good - Voltage Pattern

EXAMPLE #6 - CURRENT CONTROLLED DRIVER

This known-good pattern from a Ford 3.0L V6 PFI VIN [U] illustrates that a zener diode inside the computer is used to clamp the injector's inductive kick to 35-volts on this system. See **Fig. 25**.

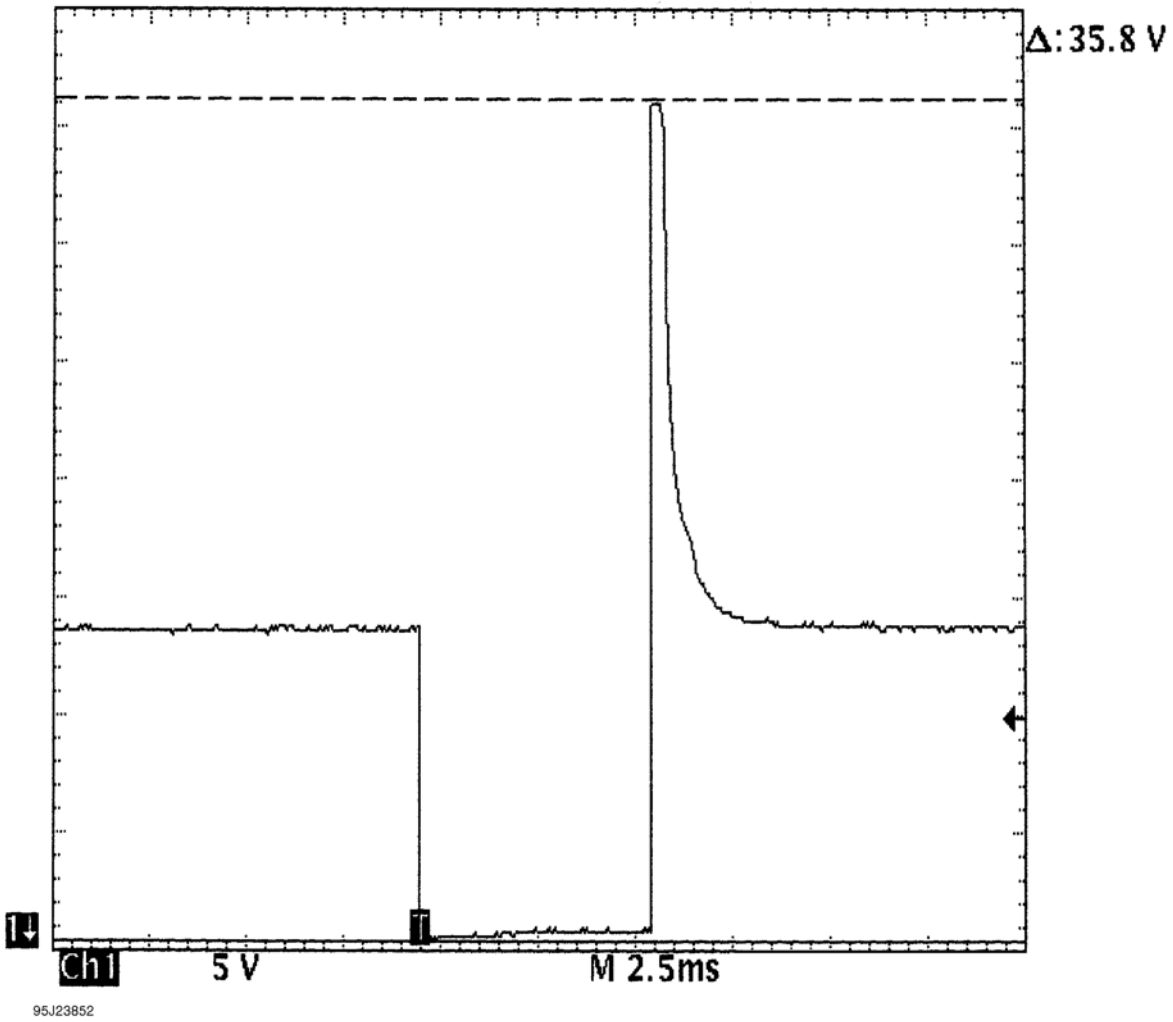

Fig. 25: Injector Bank - Known Good - Voltage Pattern

EXAMPLE #7 - CURRENT CONTROLLED DRIVER

This known-good waveform from a Ford 5.0L V8 CFI VIN [F] was taken during hot idle, closed loop, and no load. See **Fig. 26**.

Article GUID: A00010328

GENERAL INFORMATION

Wheel Alignment Theory & Operation

* PLEASE READ THIS FIRST *

NOTE: **This is GENERAL information. This article is not intended to be specific to any unique situation or individual vehicle configuration. For model-specific information see appropriate articles where available.**

PRE-ALIGNMENT INSTRUCTIONS

NOTE: **This is GENERAL information. This article is not intended to be specific to any unique situation or individual vehicle configuration. For model-specific information see appropriate articles where available.**

GENERAL ALIGNMENT CHECKS

Before adjusting wheel alignment, check the following:

- Each axle uses tires of same construction and tread style, equal in tread wear and overall diameter. Verify that radial and axial runout is not excessive. Inflation should be at manufacturer's specifications.
- Steering linkage and suspension must not have excessive play. Check for wear in tie rod ends and ball joints. Springs must not be sagging. Control arm and strut rod bushings must not have excessive play. See **Fig. 1**.

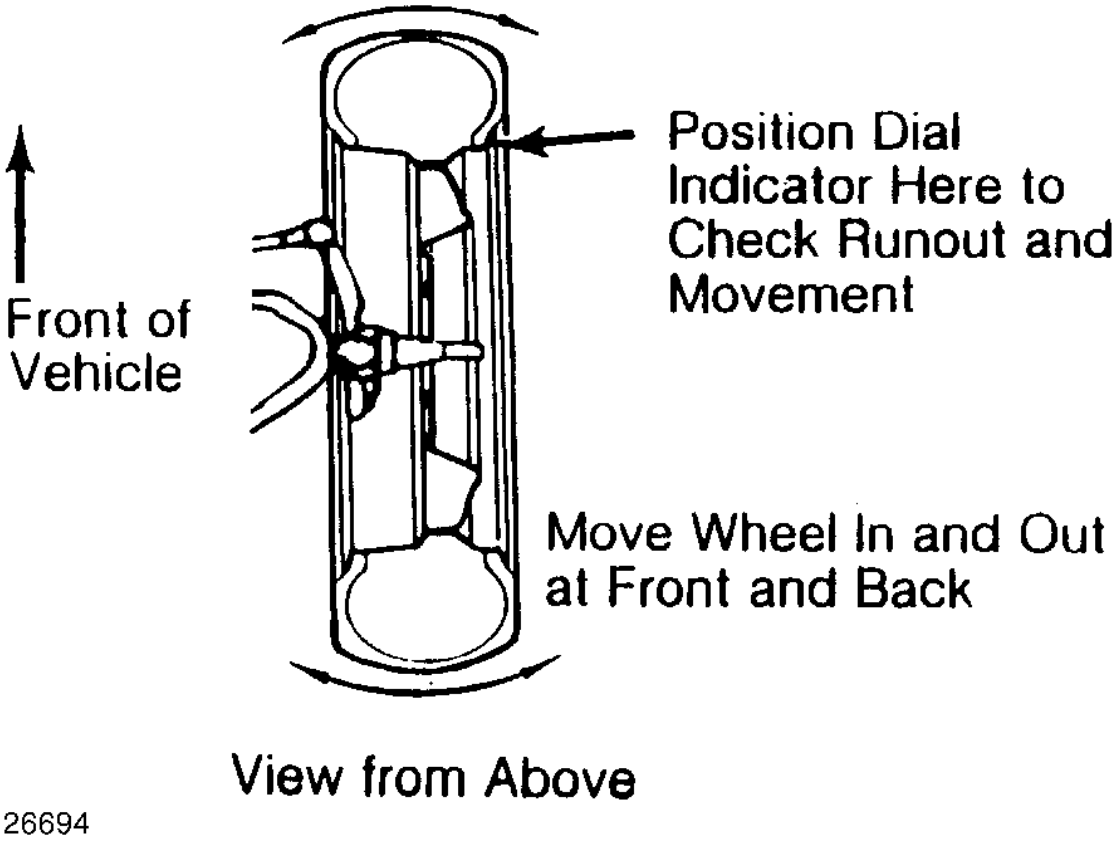

Fig. 1: Checking Steering Linkage

- Vehicle must be on level floor with full fuel tank, no passenger load, spare tire in place and no load in trunk. Bounce front and rear end of vehicle several times. Confirm vehicle is at normal riding height.
- Steering wheel must be centered with wheels in straight ahead position. If required, shorten one tie rod adjusting sleeve and lengthen opposite sleeve (equal amount of turns). See **Fig. 2**.
- Wheel bearings should have the correct preload and lug nuts must be tightened to manufacturer's specifications. Adjust camber, caster and toe-in using this sequence. Follow instructions of the alignment equipment manufacturer.

CAUTION: DO NOT attempt to correct alignment by straightening parts. Damaged parts MUST be replaced.

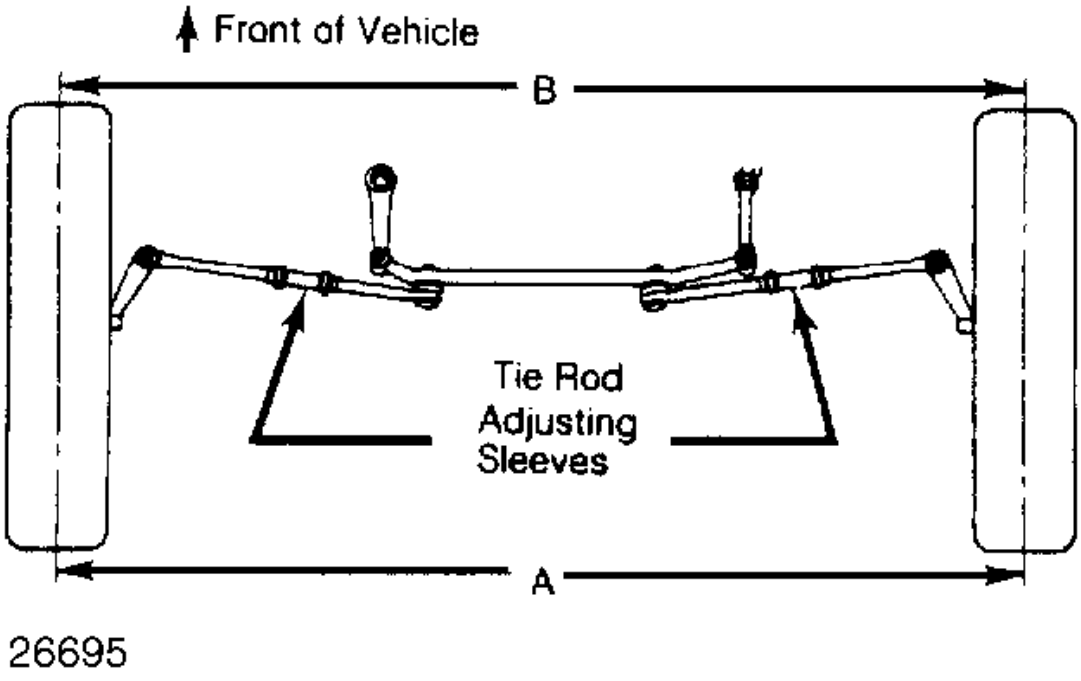

Fig. 2: Adjusting Tie Rod Sleeves (Top View)

ADJUSTMENTS

NOTE: **This is GENERAL information. This article is not intended to be specific to any unique situation or individual vehicle configuration. For model-specific information see appropriate articles where available.**

CAMBER

1. Camber is the tilting of the wheel, outward at either top or bottom, as viewed from front of vehicle. See **Fig. 3**.
2. When wheels tilts outward at the top (from centerline of vehicle), camber is positive. When wheels tilt inward at top, camber is negative. Amount of tilt is measured in degrees from vertical.

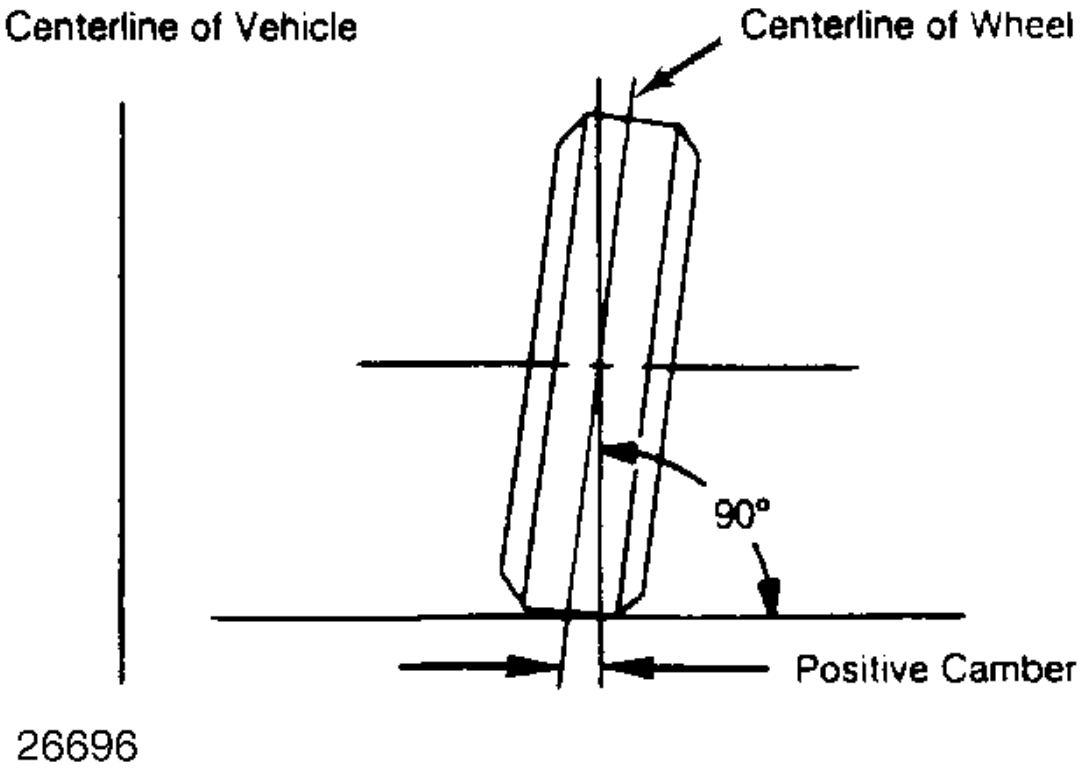

Fig. 3: Determining Camber Angle

CASTER

1. Caster is tilting of front steering axis either forward or backward from vertical, as viewed from side of vehicle. See **Fig. 4**.
2. When axis is tilted backward from vertical, caster is positive. This creates a trailing action on front wheels. When axis is tilted forward, caster is negative, causing a leading action on front wheels.

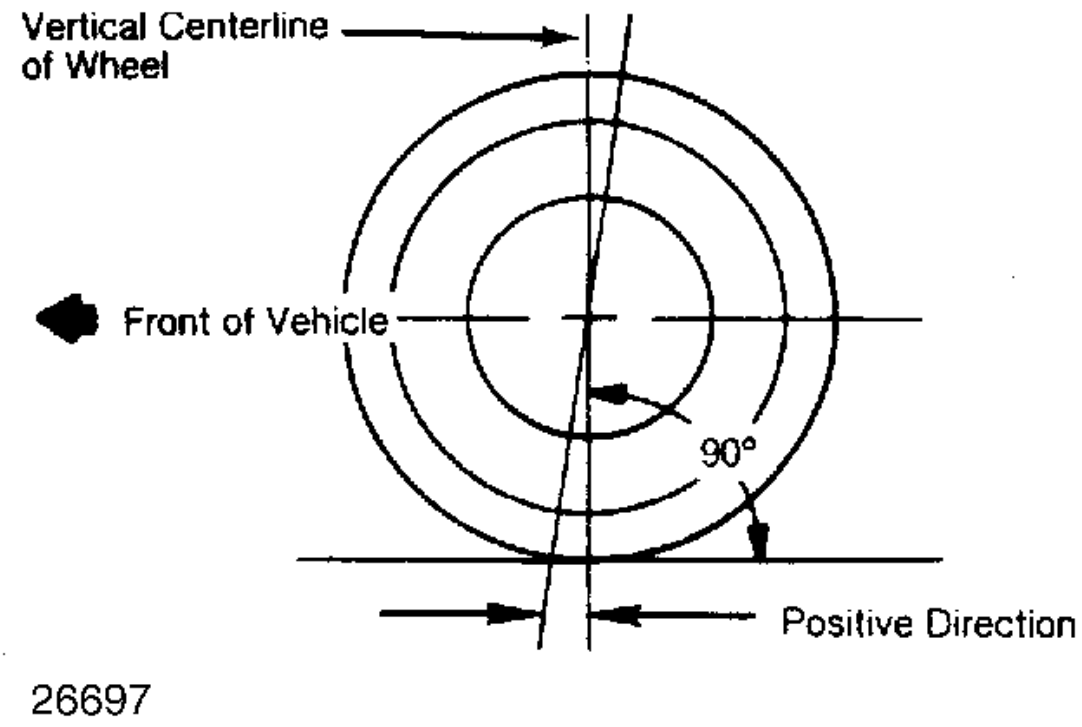

Fig. 4: Determining Caster Angle

TOE-IN ADJUSTMENT

Toe-in is the width measured at the rear of the tires subtracted by the width measured at the front of the tires at about spindle height. A positive figure would indicate toe-in and a negative figure would indicate toe-out. If the distance between the front and rear of the tires is the same, toe measurement would be zero. To adjust:

1) Measure toe-in with front wheels in straight ahead position and steering wheel centered. To adjust toe-in, loosen clamps and turn adjusting sleeve or adjustable end on right and left tie rods. See **Fig. 2** and **Fig. 5** .

2) Turn equally and in opposite directions to maintain steering wheel in centered position. Face of tie rod end must be parallel with machined surface of steering rod end to prevent binding.

3) When tightening clamps, make certain that clamp bolts are positioned so there will be no interference with other parts throughout the entire travel of linkage.

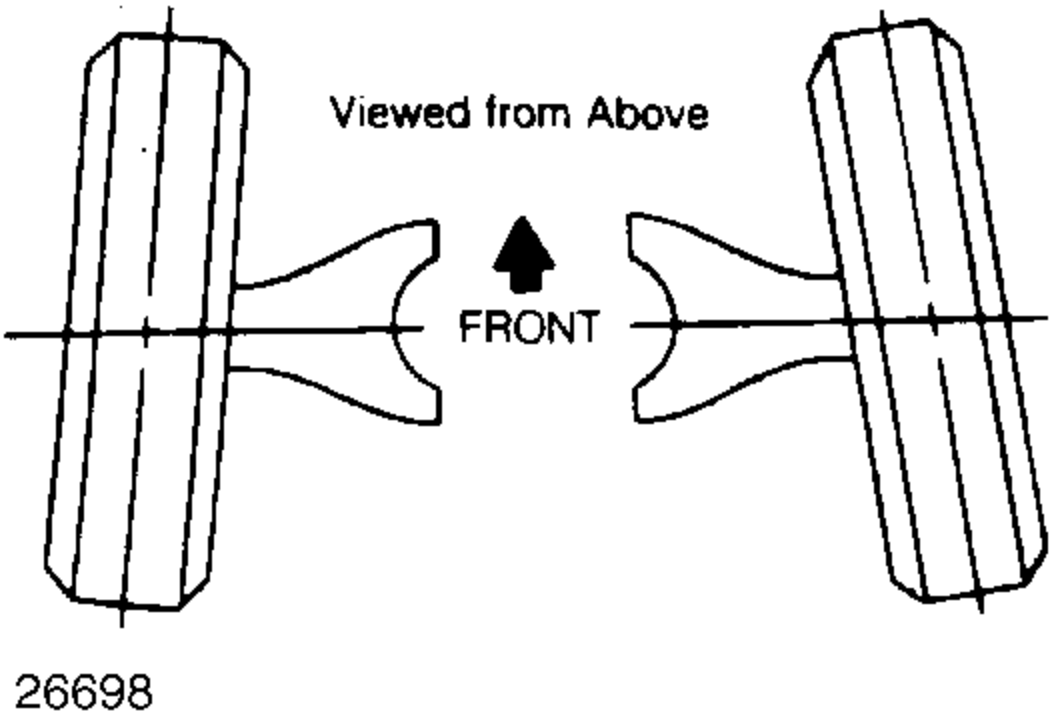

Fig. 5: Wheel Toe-In (Dimension A Less Dimension B)

TOE-OUT ON TURNS

1. Toe-out on turns (turning radius) is a check for bent or damaged parts, and not a service adjustment. With caster, camber, and toe-in properly adjusted, check toe-out with weight of vehicle on wheels.
2. Use a full floating turntable under each wheel, repeating test with each wheel positioned for right and left turns. Incorrect toe-out generally indicates a bent steering arm. Replace arm, if necessary, and recheck wheel alignment.

STEERING AXIS INCLINATION

1. Steering axis inclination is a check for bent or damaged parts, and not a service adjustment. Vehicle must be level and camber should be properly adjusted. See **Fig. 6**.
2. If camber cannot be brought within limits and steering axis inclination is correct, steering knuckle is bent. If camber and steering axis inclination are both incorrect by approximately the same amount, the upper and lower control arms are bent.

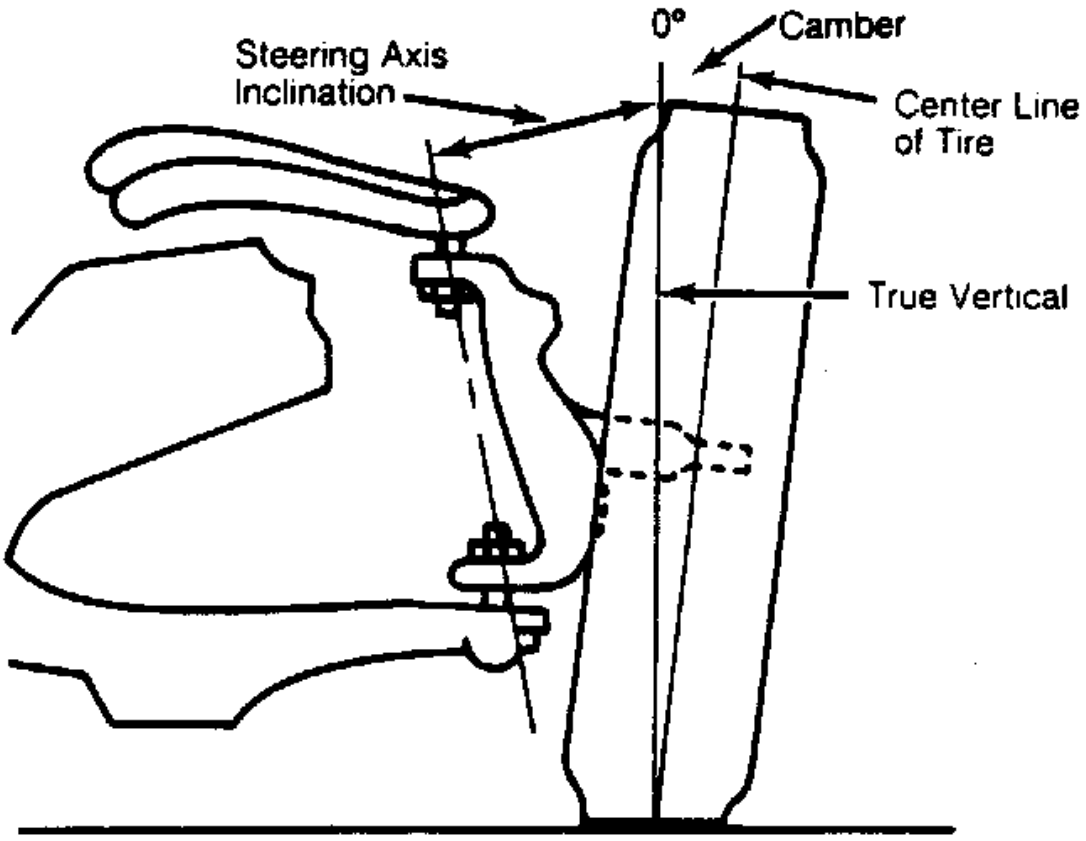

Fig. 6: Checking Steering Axis Inclination

- **GE-46297** A/C Dye Injector Kit
- **GE-46297-12** Replacement Dye Cartridges

For equivalent regional tools. Refer to **Special Tools**.

Refrigerant Leak Testing

NOTE: **All A/C system repairs must be verified using electronic leak detection. Dye detection may take up 2 or 3 days to be reliable.**

NOTE: **General Motors vehicles are now manufactured with fluorescent dye installed**

directly into the air conditioning (A/C) system.

The fluorescent dye mixes and flows with the air conditioning oil throughout the refrigerant system.

Verifying some passive leaks may require using the **GE-50078** Electric Leak Detector , even though the A/C system contains fluorescent dye.

The only time that adding additional fluorescent dye is required, is after flushing the A/C system.

Visual Inspection

Visually trace the entire refrigerant system and look for signs of lubricant leakage, damage, and corrosion on all lines hoses and components (Oil can be an indication of a leak). Each questionable area should be checked for leaks using an electric leak detector.

Fluorescent Leak Detector

NOTE: Always use UV protective eyewear when working with UV light.

Fluorescent dye will assist in locating any leaks in the A/C system.

NOTE: Air conditioning oil is water soluble.

- Condensation on the evaporator core or the refrigerant lines may wash the air conditioning oil and fluorescent dye away from the actual leak. Condensation may also carry dye through the HVAC module drain.
- Leaks in the A/C system will be indicated in a light green or yellow color when using the leak detection lamp.

  Use the leak detection lamp in the following areas:

  - All fittings or connections that use seal washers or O-rings
  - All of the A/C components
  - The A/C compressor shaft seal
  - The A/C hoses and pressure switches
  - The HVAC module drain tube, if the evaporator core is suspected of leaking
  - The service port sealing caps

    The sealing cap is the primary seal for the service ports.

- Follow the instructions supplied with the **GE-42220** Universal 12V Leak Detection Lamp.
- To prevent false diagnosis in the future, thoroughly clean the residual dye from any area where leaks were found. Use a rag and the approved **GE-43872** Fluorescent Dye Cleaner.

Fluorescent Dye Injection

NOTE: Use only fluorescent dye approved by General Motors.

- **GE-41447 R-134A A/C Tracer Dye-Box of 24 can be poured directly into a removed A/C component.**

- **GE-46297-12 Replacement Dye Cartridges is injected into the low side port using GE-46297 A/C Dye Injector Kit.**

- Not all of the fluorescent dyes are compatible with all air conditioning oils. Some types of dye decrease the oil viscosity or may chemically react with the oil.
- R-134A leak detection dye requires time to work. Depending upon the leak rate, a leak may not become visible for between 15 minutes and 7 days.

NOTE: **Do NOT overcharge the A/C system with dye. Use only one 7.39 ml (0.25 oz) charge.**

- To prevent false diagnosis, thoroughly clean any residual dye from the service port with a rag and the approved fluorescent dye cleaner **GE-43872** Fluorescent Dye Cleaner.

Electric Leak Detector

WARNING: **Do not operate the detector in a combustible atmosphere since its sensor operates at high temperatures or personal injury and/or damage to the equipment may result.**

Ensure that the vehicle has at least 0.45 kg (1 lb) of refrigerant in the A/C refrigeration system in order to perform a leak test. Refer to **Refrigerant Recovery and Recharging** for recharging the A/C system.

NOTE: **Electronic leak detectors are sensitive to the following items:**

- **Windshield washing solutions**
- **Many solvents and cleaners**
- **Some adhesives used in the vehicle**

Clean and dry all surfaces in order to prevent a false warning. Liquids will damage the detector.

Do not use:

- Soap solutions (not effective for leak detection)
- Shop air (will introduce contamination to the refrigerant system)
- High pressure gasses i.e. nitrogen (may cause system damage)

Air movement from the engine cooling fan can affect the detectors ability to detect leaks. Always leak test with engine off and if possible after engine has reached normal operating temperature.

- All fittings and components should be checked.
- Take care not to contaminate the probe tip if the part being tested is contaminated.
- No cleaners containing solvents should be used prior to using electronic leak detector.
- Always follow the refrigerant system around in a continuous path so that no areas of potential leaks are missed. Move the tip along the refrigerant system at a rate of no more than 3 inches per second and a distance of 3/8 inch from the surface being tested. If a leak is found, always continue to test the remainder of the system.

Follow the instructions supplied with the **GE-50078** Electric Leak Detector.

AIR CONDITIONING (A/C) SYSTEM PERFORMANCE TEST (LFX)

Test Description

This test measures the operating efficiency of the A/C system under the following conditions:

- The current ambient air temperature
- The current relative humidity
- The high side pressure of the A/C system
- The low side pressure of the A/C system
- The temperature of the air being discharged into the passenger compartment

The number(s) below refer to the step number(s) on the diagnostic table.

1

This step determines if the A/C system has at least the minimum refrigerant charge required to operate the system without damage.

2

This step measures the performance of the A/C system.

3

This step is to allow for vehicle variations as well as high ambient air temperatures.

Step	Action	Value(s)	Yes	No
NOTE: • **The ambient air temperature must be at least 16Â°C (60Â°F) .** • **Do not induce additional air flow across the front of the vehicle during the test.** • **If you were sent here from a DTC**				

Step	Action	Value(s)	Yes	No
	diagnostic table, clear the DTC upon completion of this test.			
1	1. Park the vehicle inside or in the shade. 2. Open the windows in order to ventilate the interior of the vehicle. 3. If the A/C system was operating, allow the A/C system to equalize for about 2 minutes. 4. Turn OFF the ignition 5. Install the **J 43600** ACR 2000 Air Conditioning Service Center. 6. Record the ambient air temperature displayed on the **J 43600** ACR 2000 Air Conditioning Service Center. 7. Record readings of the low and high side STATIC pressures. Are both the low and high side pressures within the specified value?	Above 16Â°C (60Â°F) - 345 kPa (50 psi) Above 24Â°C (75Â°F) - 483 kPa (70 psi) Above 33Â°C (90Â°F) - 690 kPa (100 psi)	Go to **Step 2**	Go to **Leak Testing**
2	**NOTE:** **Record the relative humidity and the ambient air temperature AT THE TIME OF THE TEST.** 1. Close the vehicle doors and windows. 2. Open the driver door window 12.7-15.2 cm (5-6 in). 3. Select the following HVAC control setting: • The A/C is ON • The coldest temperature setting • The maximum blower speed • Recirculation mode • The IP panel outlet mode	-	Go to **Step 5**	Go to **Step 3**

Step	Action	Value(s)	Yes	No
	• All IP panel outlets are OPEN • The passenger side of a Dual Zone HVAC control module is turned OFF 4. Install the temperature probes of the **J 43600** ACR 2000 Air Conditioning Service Center in the left and right center panel air outlets. 5. Apply the parking brake. 6. Place the transmission in PARK 7. Start the engine. 8. Operate the A/C system for 5 minutes. 9. Inspect A/C components for the following conditions: • Abnormal frost areas • Unusual noises **NOTE:** **When performing this step it is necessary to press the RESET button on the J 43600 ACR 2000 Air Conditioning Service Center before pressing the PRINT button.** 10. Print the following information: • The panel outlet air temperatures • The low-side pressure • The high-side pressure 11. Compare the low and high side pressures and the panel output temperatures to the A/C performance table below. Does all the data recorded fall within the specified ranges of the A/C performance table?			

Step	Action	Value(s)	Yes	No
3	If the pressures and temperatures recorded do not fall within the specified ranges: 1. Continue to operate the A/C system for an additional 5 minutes. 2. Record the pressures and temperatures again. 3. Compare the low and high side pressures and the panel output temperature to the A/C performance table. Does all the data recorded fall within the specified ranges of the A/C performance table?	-	Go to **Step 5**	Go to **Step 4**
4	Perform the necessary repairs. Refer to **A/C Diagnostics Chart**. Is the action complete?	-	Go to **Step 5**	-
5	Operate the system in order to verify the test results. Did you find the same results?	-	System OK	Go to **Symptoms - HVAC Systems - Manual**

A/C Performance Table

Ambient Air Temperature	Relative Humidity	Service Port Pressure		Maximum Left Center Discharge Air Temperature
		Low Side	High Side	
13-18Â°C (55-65Â°F)	0-100%	151-213 kPa (22-31 psi)	1067-1371 kPa (129-168 psi)	7Â°C (43Â°F)
19-24Â°C (66-75Â°F)	Below 40%	151-227 kPa (22-33 psi)	1040-1329 kPa (151-193 psi)	8Â°C (45Â°F)
	Above 40%	165-241 kPa (24-35 psi)	1150-1467 kPa (167-213 psi)	8Â°C (46Â°F)
25-29Â°C (76-85Â°F)	Below 35%	172-241 kPa (25-35 psi)	1157-1391 kPa (168-202 psi)	9Â°C (48Â°F)
	35-50%	186-248 kPa (27-36 psi)	1233-1446 kPa (179-210 psi)	9Â°C (48Â°F)
	Above 50%	192-261 kPa (28-38 psi)	1281-1550 kPa (186-225 psi)	12Â°C (52Â°F)
30-35Â°C (86-95Â°F)	Below 30%	192-254 kPa (28-37 psi)	1240-1467 kPa (180-213 psi)	12Â°C (52Â°F)
	30-50%	199-268 kPa (29-39 psi)	1288-1550 kPa (187-225 psi)	13Â°C (54Â°F)
	Above 50%	206-282 kPa (30-41 psi)	1371-1646 kPa (199-239 psi)	14Â°C (57Â°F)
36-41Â°C (96-105Â°F)	Below 20%	206-275 kPa (30-40 psi)	1322-1543 kPa (192-224 psi)	13Â°C (55Â°F)

Ambient Air Temperature	Relative Humidity	Service Port Pressure		Maximum Left Center Discharge Air Temperature
		Low Side	High Side	
	20-40%	213-282 kPa (31-41 psi)	1357-1612 kPa (197-234 psi)	14Â°C (57Â°F)
	Above 40%	220-289 kPa (32-42 psi)	1433-1681 kPa (208-244 psi)	15Â°C (59Â°F)
42-46Â°C (106-115Â°F)	Below 20%	227-289 kPa (33-42 psi)	1419-1619 kPa (206-235 psi)	14Â°C (57Â°F)
	Above 20%	234-296 kPa (34-43 psi)	1460-1688 kPa (2212-245 psi)	17Â°C (61Â°F)
47-49Â°C (116-120Â°F)	Below 30%	248-310 kPa (36-45 psi)	1543-1743 kPa (224-253 psi)	18Â°C (63Â°F)

A/C DIAGNOSTICS CHART

A/C System Concern		Potential Causes
Compressor Inoperative		Electrical Wiring Issue
		No or Low Refrigerant Charge
		Compressor Internal Malfunction
		Compressor Clutch Malfunction
		A/C Pressure Sensor Malfunction
		Evaporator Air Temperature (EAT) Malfunction
		HVAC Controls Malfunction
Low Side Gauge Reading	**High Side Gauge Reading**	**Potential Causes**
Same as High Side	Same as Low Side	No or Low Refrigerant Charge
		Compressor Malfunction
		A/C Pressure Sensor Malfunction
		EAT Malfunction
		HVAC Controls Malfunction
Normal	Normal	Temperature Actuator Malfunction
		Temperature Door Malfunction
Low	Low	Low Refrigerant Charge
		Restriction between the Compressor Outlet and Low Side Port
	Low/Normal	Evaporator Freezing/EAT Malfunction
	High	Compressor Stuck at Maximum Displacement/EAT Malfunction
Normal/High	Normal/High	PAG or POE Oil Overcharge
High	Low	Restriction between the Low Side Port and Compressor Inlet
		Expansion Device Stuck Open
		Compressor has Low Displacement or Internal Malfunction

A/C System Concern		Potential Causes
	High	Malfunctioning Cooling Fans
		Refrigerant Overcharge
		Restricted Condenser Air Flow
		Air in A/C System

NOTE:

Restrictions can occur in any part of an A/C system and may result in various gauge pressure values, depending on the system design and service port locations. The use of a non-contact, infrared thermometer can help diagnose a restricted A/C system with the ability to quickly observe significant, unexpected temperature changes in components and plumbing due to debris, contamination, pinched/damaged hoses, etc.

HEATING PERFORMANCE DIAGNOSTIC

Step	Action	Yes	No
DEFINITION: Heating system performance.			
1	Were you sent here from Symptoms or another diagnostic table?	Go to **Step 2**	Go to **Symptoms - HVAC Systems - Manual**
2	1. Start the engine. 2. Allow the engine to idle. Does the engine reach normal operating temperature?	Go to **Step 3**	Go to **Step 9**

Step	Action	Yes	No
3	**WARNING:** **Refer to Moving Parts and Hot Surfaces Warning .** 1. Allow the engine to idle. 2. Select the FLOOR mode. 3. Select the minimum blower speed. 4. Select the warmest temperature setting. 5. Feel the temperature of the inlet and outlet heater hoses at the heater core. Does the inlet heater hose feel warmer than the outlet heater hose?	Go to **Step 7**	Go to **Step 4**
4	1. Install a thermometer into the center I/P PANEL air outlet. 2. Secure a thermometer to the heater core outlet heater hose. 3. Select the PANEL mode. 4. Select the maximum blower speed. 5. Select the warmest temperature setting. 6. Record the temperature at the following locations: • The center I/P PANEL air outlet • The heater core outlet heater hose 7. Compare the recorded temperatures. Are the two temperature readings about equal?	Go to **Step 5**	Go to **Step 6**
5	1. Inspect and repair the following areas of the vehicle for cold air leaks: • The cowl • The recirculation door • The HVAC module case 2. Perform the necessary repairs. Are the repairs complete?	Go to **Step 10**	-
6	1. Inspect the temperature door operation. Refer to **Diagnostic System Check - Vehicle** . 2. Perform any necessary repairs. Are the repairs complete?	Go to **Step 10**	-

Step	Action	Yes	No
7	1. Turn OFF the engine. 2. Backflush the heater core. 3. Start the engine. 4. Select the FLOOR mode. 5. Select the minimum blower speed. 6. Select the warmest temperature setting. 7. Feel the temperature of the inlet and outlet heater hoses at the heater core. Does the inlet heater hose feel warmer than the outlet heater hose?	Go to **Step 8**	Go to **Step 10**
8	Replace the heater core. Refer to **Heater Core Replacement**. Is the repair complete?	Go to **Step 10**	-
9	Repair the low engine temperature concern. Refer to **Engine Fails To Reach Normal Operating Temperature** . Is the repair complete?	Go to **Step 10**	-
10	Operate the system in order to verify the repair. Did you find and correct the condition?	System OK	Go to **Step 2**

DEFROSTING INSUFFICIENT

Step	Action	Yes	No
DEFINITION: Time required to defrost the windshield is longer than usual.			
1	Were you sent here from Symptoms or another diagnostic table?	Go to **Step 2**	Go to **Symptoms - HVAC Systems - Manual**
2	1. Start the engine. 2. Select the DEFROST mode. 3. Select the maximum blower speed. Does sufficient air flow from the defroster outlets?	Go to **Step 3**	Go to **Step 10**
3	Measure the engine operating temperature. Does the engine reach normal operating temperature?	Go to **Step 4**	Go to **Step 8**
4	1. Select the minimum blower speed. 2. Select the warmest temperature setting. **WARNING:** **Refer to Moving Parts and Hot Surfaces Warning .**	Go to **Step 11**	Go to **Step 5**

Step	Action	Yes	No
	3. Feel the temperature of the inlet and outlet heater hoses at the heater core. Does the inlet heater hose feel warmer than the outlet heater hose?		
5	Test the operation of the A/C compressor clutch. Does the A/C compressor clutch engage?	Go to **Step 7**	Go to **Step 6**
6	Repair the A/C compressor clutch. Refer to **Air Conditioning Compressor Malfunction** . Is the repair complete?	Go to **Step 14**	-
7	Perform the A/C system performance test. Refer to **Air Conditioning (A/C) System Performance Test (LFX)**. Is the A/C system operating within the specifications?	Go to **Step 9**	Go to **Step 12**
8	Repair the low engine temperature concern. Refer to **Engine Fails To Reach Normal Operating Temperature** . Is the repair complete?	Go to **Step 14**	-
9	Inspect for correct operation of the recirculation door. Is the recirculation door operating correctly?	Go to **Step 14**	Go to **Step 13**
10	Repair the air delivery concern. Refer to **Diagnostic Starting Point - Vehicle** . Is the repair complete?	Go to **Step 14**	-
11	Repair the heating concern. Refer to **Heating Performance Diagnostic**. Is the repair complete?	Go to **Step 14**	-
12	Repair the A/C performance concern. Refer to **Air Conditioning (A/C) System Performance Test (LFX)**. Is the repair complete?	Go to **Step 14**	-
13	Repair the recirculation door concern. Is the repair complete?	Go to **Step 14**	-
14	Operate the system in order to verify the repair. Did you find and correct the condition?	System OK	Go to **Step 2**

NOISE DIAGNOSIS - BLOWER MOTOR

Step	Action	Yes	No
DEFINITION: Noise originating from the blower motor.			
1	Were you sent here from Symptoms or another diagnostic table?	Go to **Step 2**	Go to **Symptoms - HVAC Systems - Manual**
2	Inspect the air inlet grille for debris. Is debris present?	Go to **Step 8**	Go to **Step 3**
3	1. Sit inside the vehicle. 2. Close the vehicle doors and windows. 3. Turn ON the ignition, with the engine OFF.	Go to **Step 4**	Go to **Step 11**

Step	Action	Yes	No
	4. Cycle the blower motor through all of the speeds in order to determine where and when the noise occurs. Did you hear a noise during the blower operation?		
4	Inspect for excessive vibration at each blower motor speed by feeling the blower case. Is excess vibration present?	Go to **Step 6**	Go to **Step 5**
5	Listen to the blower motor at each blower speed. Is the blower motor making a squeaking or chirping noise?	Go to **Step 9**	Go to **Step 11**
6	1. Remove the blower motor. Refer to **Blower Motor Replacement**. 2. Inspect the blower motor impeller for deposits of foreign material. 3. Inspect the blower motor for deposits of foreign material. Did you find any foreign material on the blower motor or blower motor impeller?	Go to **Step 8**	Go to **Step 7**
7	Inspect the blower motor for the following conditions: 1. Cracked blades 2. A loose impeller retainer 3. Improper impeller alignment Did you find any of these conditions?	Go to **Step 9**	Go to **Step 10**
8	Remove the foreign material. Is the action complete?	Go to **Step 10**	-
9	Replace the blower motor. Refer to **Blower Motor Replacement**. Is the repair complete?	Go to **Step 11**	-
10	Install the blower motor. Refer to **Blower Motor Replacement**. Is the action complete?	Go to **Step 11**	-
11	Operate the system in order to verify the repair. Did you find and correct the condition?	System OK	Go to **Step 2**

AIR CONDITIONING COMPRESSOR OIL DIAGNOSIS

Condition	Corrective Action
NOTE: **To avoid repeat**	

Condition	Corrective Action
compressor failure, always inspect the condition of the refrigerant oil and take the appropriate corrective action before installing the replacement compressor.	
Clean Oil no debris present	No corrective action necessary.
Clean Oil with debris present	• Inspect the suction port of the replacement compressor for presence of a suction screen. If the replacement compressor does NOT contain a suction screen, install suction screen in the line. • Replace desiccant or component containing the desiccant. • Replace desiccant filter if applicable. • Remove and inspect high pressure side filter (if applicable). • Remove, inspect, clean, or replace orifice tube. • If the system has a front orifice tube and is equipped with a filter in the rear auxiliary line, remove, inspect, clean, or replace the filter.
Dark brown/black and/or pungent/unusual odor with no debris present	• Replace desiccant or component containing the desiccant. • Replace desiccant filter if applicable. • Flush refrigerant system.
Dark brown/black and/or pungent/unusual odor with debris present	• Replace desiccant or component containing the desiccant. • Replace desiccant filter if applicable. • Flush refrigerant system. • Inspect the suction port of the replacement compressor for presence of a suction screen. If the replacement compressor does NOT contain a suction screen, install suction screen. • Remove and inspect high pressure side filter (if applicable). • Remove, inspect, clean, or replace orifice tube. • If the system has a front orifice tube and is equipped with a filter in the rear auxiliary line, remove, inspect, clean, or replace the filter.

Condition	Corrective Action
Oil Overcharge	Flush refrigerant system.
Refrigerant Contamination	Flush refrigerant system.
Hybrid Polyolester Refrigerant Oil (POE) Contamination	• Flush refrigerant system. • Replace desiccant or component containing the desiccant. • Replace desiccant filter if applicable.

NOISE DIAGNOSIS - AIR CONDITIONING (A/C) SYSTEM

Step	Action	Yes	No
DEFINITION: Noise originating from the A/C compressor, drive belt or the A/C lines.			
1	Were you sent here from Symptoms or another diagnostic table?	Go to **Step 2**	Go to **Symptoms - HVAC Systems - Manual**
2	1. A/C system noises can be generally categorized into 3 areas: • Screeching, squealing or chirping noises • Moaning noises • Vibration/rattle noises 2. Start the engine. 3. Ensure that the A/C is ON. Is a screeching or squealing noise heard when the A/C is engaged?	Go to **Step 3**	Go to **Step 9**
3	With the engine OFF, inspect the drive belt for excessive wear. Refer to **Drive Belt Falls Off and Excessive Wear Diagnosis** Is the drive belt excessively worn?	Go to **Step 18**	Go to **Step 4**
4	Inspect the drive belt tension. Refer to **Drive Belt Tensioner Diagnosis** Is the drive belt tension correct?	Go to **Step 5**	Go to **Step 19**
5	Inspect the drive belt for excessive oil coverage. Is the drive belt covered with oil?	Go to **Step 17**	Go to **Step 6**
6	1. Start the engine. 2. Ensure that the A/C is ON. 3. Inspect the compressor and the clutch. Is the A/C compressor locked up?	Go to **Step 24**	Go to **Step 7**
7	Is the A/C compressor clutch slipping?	Go to **Step 23**	Go to **Step 8**
8	**WARNING:** **Refer to Moving Parts and**	Go to **Step 15**	Go to **Step 10**

Step	Action	Yes	No
	Hot Surfaces Warning . Using a stethoscope, listen to the A/C compressor for any abnormal noise.Is the compressor causing an abnormal noise?		
9	Does a moaning noise exist when the A/C clutch is engaged?	Go to **Step 10**	Go to **Step 12**
10	Listen to the A/C compressor components and mounting for noise concerns using a stethoscope. Are any of these components loose, damaged or excessively worn?	Go to **Step 20**	Go to **Step 11**
11	1. Idle the engine. 2. Engage the A/C compressor clutch. 3. Using a stethoscope, move around the entire refrigerant plumbing system. Listen for any abnormal noises caused by a component of the A/C system touching another component. Are any of the A/C components grounding out and causing a vibration noise?	Go to **Step 22**	Go to **Step 13**
12	Does a vibration or rattle noise exist when the A/C clutch is engaged?	Go to **Step 13**	Go to **Step 14**
13	Does the noise stop when the A/C clutch is disengaged?	Go to **Step 15**	Go to **Step 25**
14	1. Idle the engine in PARK with the A/C compressor clutch engaged. 2. Using a stethoscope, move around the entire A/C system testing for any abnormal noises caused by a component. Do any of the A/C components cause an abnormal noise?	Go to **Step 21**	Go to **Step 25**
15	Verify that the A/C system is properly charged. Refer to **Refrigerant System Specifications**. Is the A/C system properly charged?	Go to **Step 26**	Go to **Step 16**
16	Recharge the A/C system to specification. Refer to **Refrigerant Recovery and Recharging**. Is the abnormal compressor noise still present?	Go to **Step 24**	Go to **Step 26**
17	Repair the oil leak. Is the action complete?	Go to **Step 26**	-
18	Replace the drive belt. Refer to **Drive Belt Replacement** Is the action complete?	Go to **Step 26**	-
19	Replace the drive belt tensioner. Refer to **Drive Belt Tensioner Replacement** Is the action complete?	Go to **Step 26**	-

Step	Action	Yes	No
20	Repair or replace the A/C compressor mounting component. Is the action complete?	Go to **Step 26**	-
21	Repair or replace the component which is causing the moaning concern as needed. Is the action complete?	Go to **Step 26**	-
22	Correctly route or insulate the A/C component. Is the action complete?	Go to **Step 26**	-
23	Replace the A/C compressor clutch. Refer to **Air Conditioning Clutch Assembly Replacement**. Is the action complete?	Go to **Step 26**	-
24	Replace the A/C compressor. Refer to **Air Conditioning Compressor Replacement**. Is the action complete?	Go to **Step 26**	-
25	The concern may be caused by an engine related component. Refer to **Vibration Analysis - Engine** . Did you find and correct the condition?	Go to **Step 26**	-
26	Operate the system in order to verify the repair. Did you find and correct the condition?	System OK	Go to **Step 2**

NOISE DIAGNOSIS - HVAC MODULE

Step	Action	Yes	No
DEFINITION: Noise originating from the HVAC module.			
1	Were you sent here from Symptoms or another diagnostic table?	Go to **Step 2**	Go to **Symptoms - HVAC Systems - Manual**
2	1. Start the engine. 2. Cycle through all of the following: • Blower motor speeds • HVAC modes • Temperature control settings 3. Determine the type of noise: • Scrape, Chirping or groaning • Tick/click or Pop • Air rush/whistle Is a tick/click, chirping, groaning, air rush/whistle or scraping noise present, but decreases as blower motor speed is decreased?	Go to **Noise Diagnosis - Blower Motor**	Go to **Step 3**
3	Is a scrape, chirping, or groaning noise evident when selecting modes or temperature settings?	Go to **Step 8**	Go to **Step 4**
4	Is a tick/click or pop noise present?	Go to **Step 5**	Go to **Step 6**

Step	Action	Yes	No
5	Inspect any visible or easily accessible actuators. Are the actuators operating properly?	Go to **Step 9**	Go to **Step 14**
6	Is a air rush/whistle noise evident in all modes, but not all temperature settings?	Go to **Step 9**	Go to **Step 7**
7	Is an air rush/ whistle noise evident only in defrost or floor mode?	Go to **Step 8**	Go to **Step 1**
8	Inspect any visible or easily accessible ducts for obstructions or foreign materials. • Air Inlet • Defroster Vent • Panel Vents • Floor Vents Were any obstructions or foreign materials found?	Go to **Step 12**	Go to **Step 9**
9	Remove the lower trim panel. Refer to **Instrument Panel Lower Trim Panel Replacement** . 1. Inspect the ducts for obstructions or foreign materials. 2. Inspect the HVAC module for obstructions or foreign materials. Is the repair complete?	Go to **Step 12**	Go to **Step 10**
10	Inspect the mode valve assembly, temperature doors, and air inlet door for the following conditions. • Warping • Cracking • Sticking • Ripped seals Did you find any of these conditions?	Go to **Step 11**	Go to **Step 13**
11	Replace the appropriate door and/or seal. Is the action complete?	Go to **Step 15**	-
12	Remove any obstructions or foreign materials found. Is the action complete ?	Go to **Step 15**	-
13	Inspect the mode, temperature, and air inlet door actuators. Are the actuators operating properly?	Go to **Step 15**	Go to **Step 14**
14	Replace appropriate actuator. Is the action complete?	Go to **Step 15**	-

Step	Action	Yes	No
15	If removed, install the lower trim panel. Refer to **Instrument Panel Lower Trim Panel Replacement** . Is the action complete?	Go to **Step 16**	-
16	Operate the system to verify the repair. Did you find and correct the condition?	System OK	Go to **Step 2**

ODOR DIAGNOSIS

Step	Action	Yes	No
DEFINITION: Odor originating or noticed through the HVAC system.			
1	Were you sent here from Symptoms or another diagnostic table?	Go to **Step 2**	Go to **Symptoms - HVAC Systems - Manual**
2	1. Sit inside the vehicle. 2. Close all of the doors and windows. 3. Start the engine. 4. Allow the engine idle at normal operating temperature. 5. Select the maximum blower speed. 6. Select the PANEL air outlet mode. 7. Select the coldest temperature setting. 8. Cycle through all of the blower speeds, modes and temperatures to define what type of odor is present. • Musty smell • Coolant smell • Oil smell Does the odor have a musty smell?	Go to **Step 3**	Go to **Step 8**
3	Inspect the HVAC air inlet grille for debris. Is debris present?	Go to **Step 4**	Go to **Step 5**
4	Remove any debris. Is the action complete?	Go to **Step 15**	-
5	Inspect for wet carpeting. Is the carpet wet?	Go to **Step 6**	Go to **Step 14**
6	Inspect for the following conditions: • Water leaks around the windshield • Blockage of the HVAC module drain • Leaks around the door seals Is a leak present?	Go to **Step 7**	Go to **Step 14**

Step	Action	Yes	No
7	Repair the leak as necessary. Is the action complete?	Go to **Step 15**	-
8	Does the odor have a coolant smell?	Go to **Step 9**	Go to **Step 12**
9	Inspect the cooling system for leaks. Refer to **Loss of Coolant** . Is a leak present?	Go to **Step 10**	Go to **Step 12**
10	Inspect for coolant leaking inside the vehicle or for a film build-up on the windshield. Is the condition present?	Go to **Step 11**	Go to **Step 15**
11	Replace the heater core. Refer to **Heater Core Replacement**. Is the action complete?	Go to **Step 15**	-
12	Does the odor have an oily smell?	Go to **Step 13**	Go to **Step 15**
13	1. Inspect the engine compartment for any leaks. Refer to the following procedures: • **Oil Leak Diagnosis** for the 3.6L engine • **Fluid Leak Diagnosis** for the 6T70 transmission 2. Repair any oil leaks. Is the action complete?	Go to **Step 15**	-
14	A musty odor can be caused by mold or mildew build-up on the evaporator or the heater core or inside of the HVAC module. Refer to **Odor Correction**. Is the action complete?	Go to **Step 15**	-
15	Operate the system in order to verify the repair. Did you find and correct the condition?	System OK	Go to **Step 2**

REPAIR INSTRUCTIONS

ODOR CORRECTION

Eliminating Air Conditioning Odor

Odors may be emitted from the air conditioning system primarily at start up in hot, humid climates. The following conditions may cause the odor:

- Debris is present in the HVAC module.
- Microbial growth on the evaporator core

When the blower motor fan is turned on, the microbial growth may release an unpleasant musty odor into the passenger compartment. To remove odors of this type, the microbial growth must be eliminated. Perform the following procedure:

Deodorize the evaporator core using Deodorizing Aerosol Kit.

Perform the following steps in order to deodorize the A/C system:

1. Ensure that the plenum which draws outside air into the HVAC module is clear of debris.
2. Disable the A/C compressor clutch operation by disconnecting the clutch coil electrical connector.
3. Dry the evaporator core by performing the following steps:
    1. Start the engine.
    2. Select the warmest temperature setting.
    3. Select the recirculation mode.
    4. Run the blower motor on high for 10 minutes.
4. Locate an area in the air conditioning duct between the blower motor and the evaporator core downstream of the blower motor.
5. Drill a 3.175 mm (0.125 in) hole where the hole will not interfere with or damage the following components:
    - The blower motor
    - The evaporator core
    - Any other operating part the of system
6. Wear safety goggles and latex gloves in order to perform the following actions:
    1. Select the maximum blower speed.
    2. Insert the deodorizer extension tube into the hole to the mark on the extension tube.
    3. Use short spray bursts and vary the direction of spray for a 2-3 minute period of time.
7. Shut the engine OFF. Allow the vehicle to sit for 3-5 minutes.
8. Seal the 3.175 mm (0.125 in) hole with body sealer or RTV gasket compound.
9. Start the engine.
10. Operate the blower motor on high for 15-20 minutes to dry.
11. Reconnect the A/C compressor clutch coil electrical connector.
12. Verify proper clutch operation.

REFRIGERANT RECOVERY AND RECHARGING

Special Tools

- **J 43600** ACR 2000 Air Conditioning Service Center
- **J 45037** A/C Oil Injector

For equivalent region tools, refer to **Special Tools**.

WARNING: To prevent personal injury, avoid breathing A/C Refrigerant and lubricant vapor or mist. Work in a well ventilated area. To remove refrigerant from the A/C System, use service equipment designed for recovery that is certified to meet the requirements of the appropriate SAE Standards. If an accidental system discharge occurs, ventilate the work area before continuing service. Additional health and safety information may be obtained from the refrigerant, refrigerant recovery, and lubricant manufacturers.

WARNING: For personal protection, goggles and lint-free gloves should be worn and a clean cloth wrapped around fittings, valves, and connections when doing work that

includes opening the refrigerant system. If refrigerant comes in contact with any part of the body severe frostbite and personal injury can result. The exposed area should be flushed immediately with cold water and prompt medical help should be obtained.

CAUTION: **You must replace the desiccant if the A/C refrigerant system has been open to atmosphere for more than four hours, or if the A/C refrigerant oil has been contaminated. Failure to replace the desiccant will result in damage to the A/C refrigerant system.**

CAUTION: **R-134a is the only approved refrigerant for use in this vehicle. The use of any other refrigerant may result in poor system performance or component failure.**

CAUTION: **To avoid system damage use only R-134a dedicated tools when servicing the A/C system.**

CAUTION: **Use only Polyalkylene Glycol Synthetic Refrigerant Oil (PAG) for internal circulation through the R-134a A/C system and only 525 viscosity mineral oil on fitting threads and O-rings. If lubricants other than those specified are used, compressor failure and/or fitting seizure may result.**

CAUTION: **R-12 refrigerant and R-134a refrigerant must never be mixed, even in the smallest of amounts, as they are incompatible with each other. If the refrigerants are mixed, compressor failure is likely to occur. Refer to the manufacturer instructions included with the service equipment before servicing.**

NOTE: **For access to the left hand service port, removal of the air cleaner assembly will be necessary. Refer to Air Cleaner Assembly Replacement .**

The **J 43600** ACR 2000 Air Conditioning Service Center is a complete air conditioning service center for R-134a. The ACR 2000 recovers, recycles, evacuates and recharges A/C refrigerant quickly, accurately and automatically. The unit has a display screen that contains the function controls and displays prompts that will lead the technician through the recover, recycle, evacuate and recharge operations. R-134a is recovered into and charged out of an internal storage vessel. The ACR 2000 automatically replenishes this vessel from an external source tank in order to maintain a constant 5.45-6.82 kg (12-15 lbs) of A/C refrigerant.

The ACR 2000 has a built in A/C refrigerant identifier that will test for contamination, prior to recovery and will notify the technician if there are foreign gases present in the A/C system. If foreign gases are present, the ACR 2000 will not recover the refrigerant from the A/C system.

The ACR 2000 also features automatic air purge, single pass recycling and an automatic oil drain.

Refer to the **J 43600** ACR 2000 Air Conditioning Service Center ACR 2000 manual for operation and setup instruction. Always recharge the A/C System with the proper amount of R-134a. Refer to **Refrigerant System Specifications** for the correct amount.

A/C Refrigerant System Oil Charge Replenishing

If oil was removed from the A/C system during the recovery process or due to component replacement, the oil must be replenished. Oil can be injected into a charged system using **J 45037** A/C Oil Injector. For the proper

quantities of oil to add to the A/C refrigerant system, refer to **Refrigerant System Specifications**.

FLUSHING

Special Tools

- **J 41447** Leak Detection Dye
- **J 42220** Universal 12V Leak Detection Lamp
- **J 43600** ACR 2000 Air Conditioning Service Center
- **J 45268** Flush Adapter Kit

NOTE: **Flushing with the ACR 2000 is not intended to remove metal from the A/C system.**

Flushing is intended to remove the following:

- Contaminated PAG oil
- Desiccant, following a desiccant bag failure
- Overcharge of PAG oil
- Refrigerant contamination

NOTE: **Warmer engine or ambient temperature decreases the refrigerant recovery time during the A/C flush procedure.**

1. Recover the refrigerant. Refer to **Refrigerant Recovery and Recharging**.
2. Remove the A/C refrigerant filter. Refer to **Air Conditioning (AC) Refrigerant Filter Replacement**.
3. Remove the thermal expansion valve (TXV). Refer to **Air Conditioning Evaporator Thermal Expansion Valve Replacement**.
4. Install the stud for the **J 45268** Flush Adapter Kit kit onto the J 45268-115.
5. Install the J 45268-115 in place of the TXV.

CAUTION: **Refer to Fastener Caution .**

6. Install the TXV mounting bolts and tighten to 7 N.m (62 lb in).
7. Connect the evaporator line to the J 45268-115.
8. Install the TXV block fitting nut and tighten to 17 N.m (12.5 lb ft).
9. Remove the A/C compressor. Refer to **Air Conditioning Compressor Replacement**.
10. Install J 45268-10 to the A/C compressor hose assembly.
11. Install the nut and bolt from the **J 45268** Flush Adapter Kit kit to the J 45268-10 and compressor hose assembly and tighten the bolts to 17 N.m (12.5 lb ft).
12. Forward flow refrigerant flushing is recommended for contaminated refrigerant or PAG oil.

    Perform the following procedure:

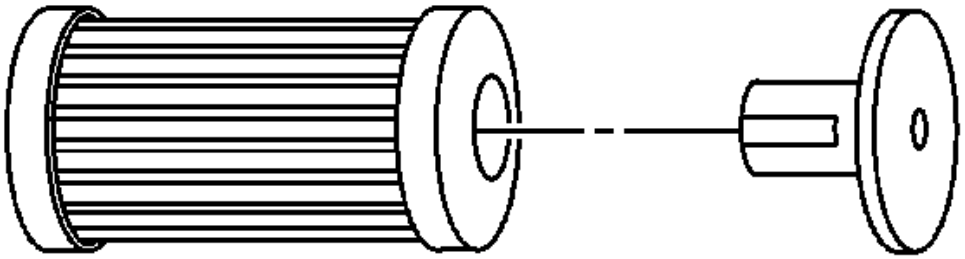

Fig. 1: View Of A/C Filter & Check Valve
Courtesy of GENERAL MOTORS COMPANY

NOTE: **The filter inside J 45268-1 is serviceable. Remove and discard the check valve from the filter.**

1. Service the filter with ACDelco P/N GF 470, before each flush.
2. Install the port plugs J 45268-9 onto the J 45268-10.
3. Install the fitting J 45268-7 onto the J 45268-10.
4. Install the fitting J 45268-8 onto the J 45268-10.
5. Connect J 45268-1 flush filter to the suction port of J 45268-7 flush adapter.
6. Connect the blue hose from the **J 43600** ACR 2000 Air Conditioning Service Center to the J 45268-1 flush filter adapter.
7. Connect the red hose from the **J 43600** ACR 2000 Air Conditioning Service Center to the J 45268-8 flush adapter.

13. Reverse flow refrigerant flush is recommended for desiccant bag failure. Replace the A/C condenser when the A/C flush is complete and perform the following procedure:

NOTE: **The filter inside J 45268-1 is serviceable. Remove and discard the**

check valve from the filter.

1. Service the filter with ACDelco P/N GF 470, before each flush.
2. Install the port plugs J 45268-9 onto the J 45268-10.
3. Install the fitting J 45268-7 onto the J 45268-10.
4. Install the fitting J 45268-8 onto the J 45268-10.
5. Connect J 45268-1 flush filter to the discharge port of J 45268-7 flush adapter.
6. Connect the blue hose from **J 43600** ACR 2000 Air Conditioning Service Center to the J 45268-1 flush filter adapter.
7. Connect the red hose from **J 43600** ACR 2000 Air Conditioning Service Center to the J 45268-8 flush adapter.

NOTE: **Close the valve on the external refrigerant tank, before starting the flush process.**

14. Flush the A/C system. Follow the instructions supplied with the **J 43600** ACR 2000 Air Conditioning Service Center.
15. Disconnect the red hose on the **J 43600** ACR 2000 Air Conditioning Service Center from the J 45268-10.
16. Disconnect the blue hose on the **J 43600** ACR 2000 Air Conditioning Service Center from the J 45268-1.
17. Remove J 45268-1 from the J 45268-10.
18. Remove the J 45268-10 from the A/C compressor hose assembly.

NOTE: **Flushing will remove all the PAG oil from the A/C system.**

The A/C system must be replenished with the correct amount of PAG oil.

19. If you will reinstall the removed A/C compressor, perform the following procedure:
    1. Remove the A/C compressor drain plug.
    2. Drain the PAG oil from the A/C compressor. Rotate the compressor input shaft to assist in draining the PAG oil from the compressor.
    3. Install the A/C compressor drain plug and tighten to 16 N.m (12 lb ft).
    4. Add the total system capacity of PAG oil to the A/C compressor. Refer to **Refrigerant System Specifications**.
20. If you will replace the A/C compressor after flushing the system, perform the following procedure:
    1. Determine if the new service compressor is shipped with PAG oil. Refer to the **Refrigerant System Specifications**.
    2. If the service compressor is shipped with PAG oil, DO NOT drain the new PAG oil from the compressor.
    3. Deduct the amount of PAG oil shipped with the service compressor from the amount of PAG oil listed in the capacities table. Refer to **Refrigerant System Specifications**.
    4. Add the calculated amount to the compressor, as needed.

NOTE: **Flushing will remove the fluorescent leak detection dye from the A/C system.**

21. Add one bottle of **J 41447** Leak Detection Dye directly to the A/C Compressor.

22. Install the A/C compressor. Refer to **Air Conditioning Compressor Replacement**.
23. Remove J 45268-115.
24. Inspect the TXV for debris. Clean or replace as needed.
25. Install the TXV. Refer to **Air Conditioning Evaporator Thermal Expansion Valve Replacement**.
26. Install the A/C refrigerant filter. Refer to **Air Conditioning (AC) Refrigerant Filter Replacement**.
27. Evacuate and recharge the A/C system. Refer to **Refrigerant Recovery and Recharging**.
28. Leak test the fittings using **J42220** Universal 12V Leak Detection Lamp.

AIR CONDITIONING COMPRESSOR OIL BALANCING

Draining Procedure

NOTE: **Drain and measure as much of the refrigerant oil as possible from the removed compressor.**

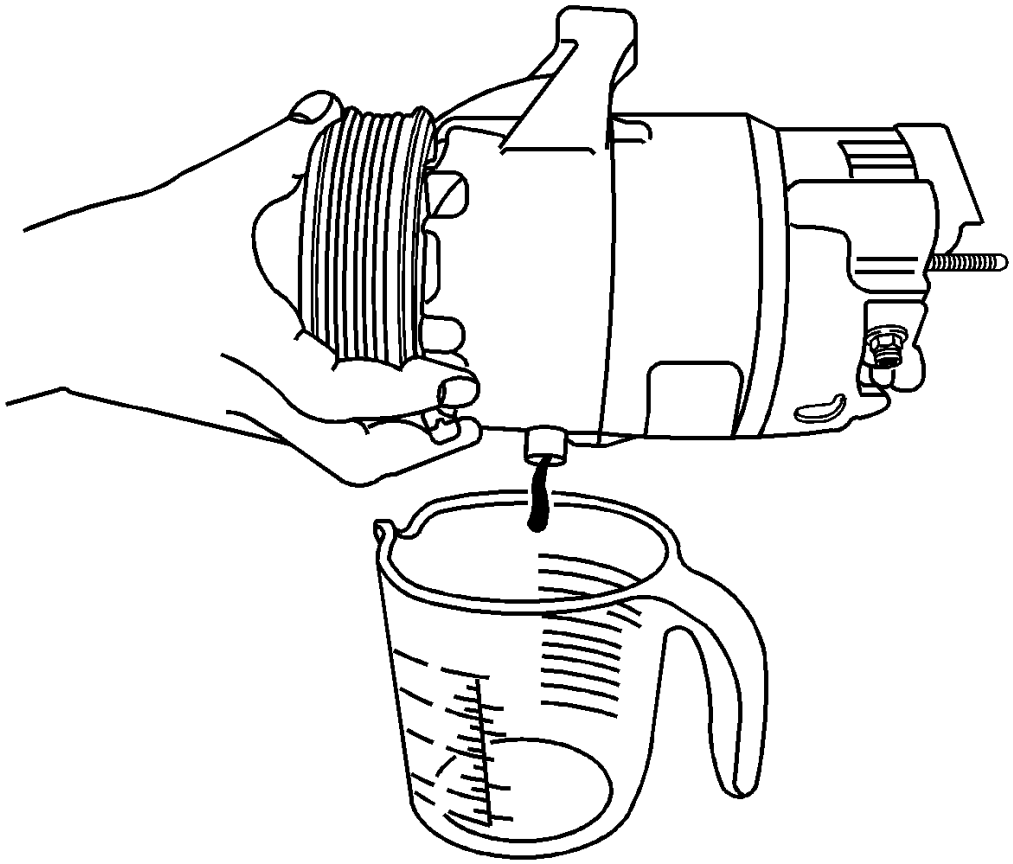

Fig. 2: Draining Oil From Compressor
Courtesy of GENERAL MOTORS COMPANY

1. Remove the compressor crankcase oil drain plug and drain the crankcase into a clean, graduated container.
2. Drain the oil from both the suction and discharge ports of the removed compressor into the same container.

Rotate the compressor shaft to assist in draining the compressor.

3. Measure and record the amount of oil drained from the removed compressor.

   This measurement will be used during installation of the replacement compressor.

4. Inspect the oil drained from the compressor. Refer to **Air Conditioning Compressor Oil Diagnosis**.
5. Properly discard the used refrigerant oil.

Balancing Procedure

NOTE: **The refrigerant oil in the A/C system must be balanced during compressor replacement.**

1. The replacement compressor is shipped with the total system capacity of refrigerant oil.

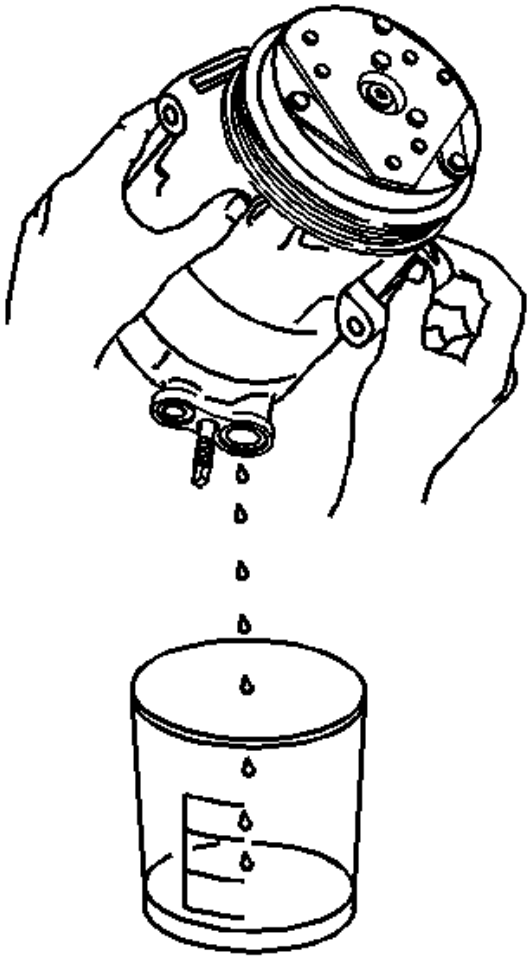

Fig. 3: Draining A/C Refrigerant Oil From Compressor
Courtesy of GENERAL MOTORS COMPANY

2. Before installing the compressor, the refrigerant oil may have to be partially drained:
   1. Refer to the amount of refrigerant oil recorded during the compressor removal.
   2. Subtract the amount recorded from the total system capacity. Refer to **Refrigerant System**

Specifications.

The difference between the total system capacity and the recorded amount is the calculated amount to be drained from the replacement compressor.

3. Drain the calculated amount of refrigerant oil from the replacement compressor.

AIR CONDITIONING COMPRESSOR REPLACEMENT

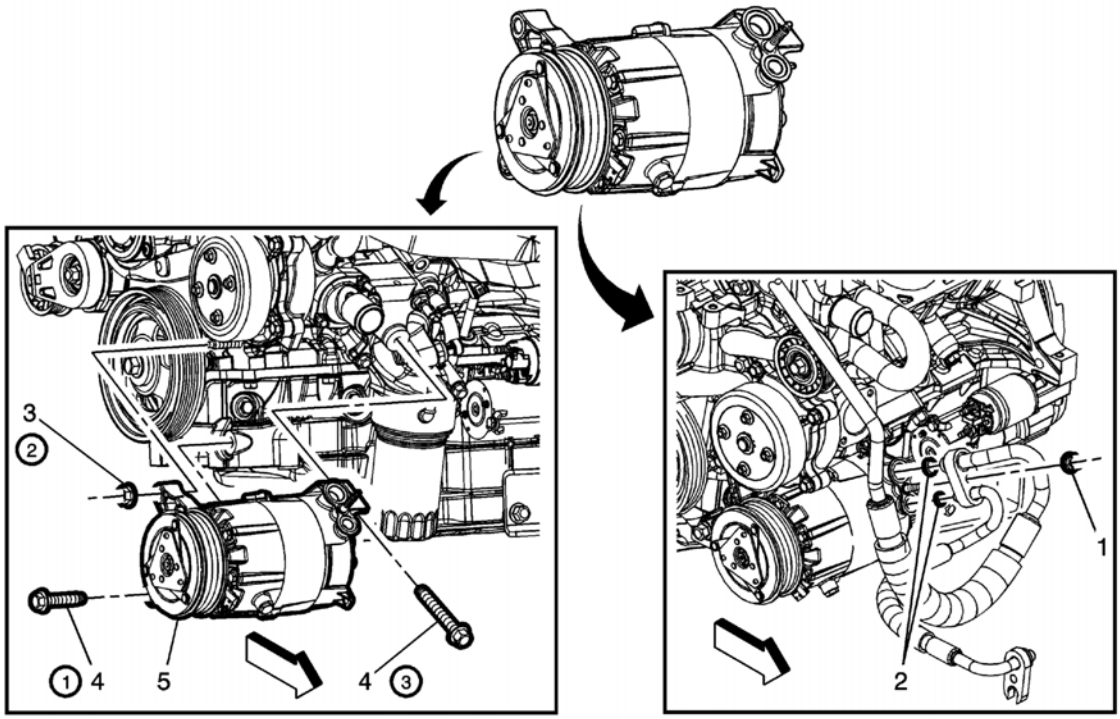

Fig. 4: Air Conditioning Compressor Components
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedures 1. Remove the air cleaner assembly. Refer to **Air Cleaner Assembly Replacement** . 2. Recover the refrigerant. Refer to **Refrigerant Recovery and Recharging**. 3. Remove the drive belt. Refer to **Drive Belt Replacement** . 4. Raise and support the vehicle. Refer to **Lifting and Jacking the Vehicle** . 5. Remove the radiator air lower baffle and deflector. Refer to **Radiator Air Lower Baffle and Deflector Replacement** . 6. Disconnect the electrical connector.	
1	A/C Compressor Hose Nut **CAUTION:**

Callout	Component Name
	Refer to Fastener Caution . **Procedure** Remove the A/C compressor hose from the A/C compressor and cap hose. **Tighten** 17 N.m (12.5 lb ft)
2	Sealing Washer **Procedure** Remove and discard sealing washers. Refer to **Air Conditioning System Seal Replacement**.
3	A/C Compressor Nut **Procedure** Tighten in sequence with A/C compressor mounting bolts. **Tighten** 50 N.m (37 lb ft)
4	A/C Compressor Bolt **Procedure** Tighten the A/C compressor mounting bolts and nut in sequence. **Tighten** 50 N.m (37 lb ft)
5	A/C Compressor Assembly **Procedure** 1. Use a low viscosity, polyalkylene glycol (PAG) oil. Use of the incorrect oil can result in compressor failure. 2. When replacing the A/C compressor, balance the compressor oil. Refer to **Air Conditioning Compressor Oil Balancing**. 3. Using **J 39400** Electronic Halogen Leak Detector , leak test A/C compressor fittings. **Special Tools** **J 39400** Electronic Halogen Leak Detector For equivalent region tools, refer to **Special Tools**.

AIR CONDITIONING CLUTCH ASSEMBLY REPLACEMENT

Special Tools

- **J 6083** Snap Ring Pliers
- **J 37872** Compressor Clutch Holding Tool
- **J 39400-A** Halogen Leak Detector

Removal Procedure

1. Remove the compressor. Refer to **Air Conditioning Compressor Replacement**.

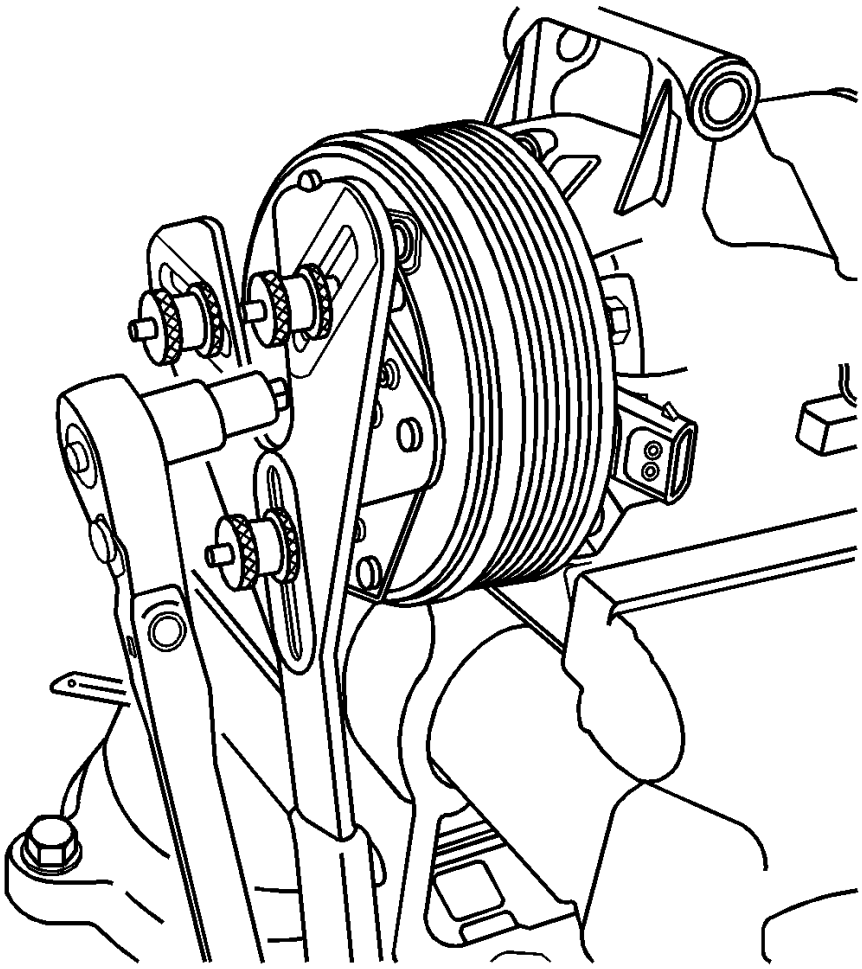

Fig. 5: Identifying Compressor Clutch Plate Bolt
Courtesy of GENERAL MOTORS COMPANY

NOTE: **Remove the three adjustable dowels from the J 37872 Compressor Clutch Holding Tool.**

Install three 5/16 x 1 inch bolts in place of the dowels.

2. Remove and discard the compressor clutch plate bolt.

   Use the **J 37872** Compressor Clutch Holding Tool to hold the compressor clutch plate from turning.

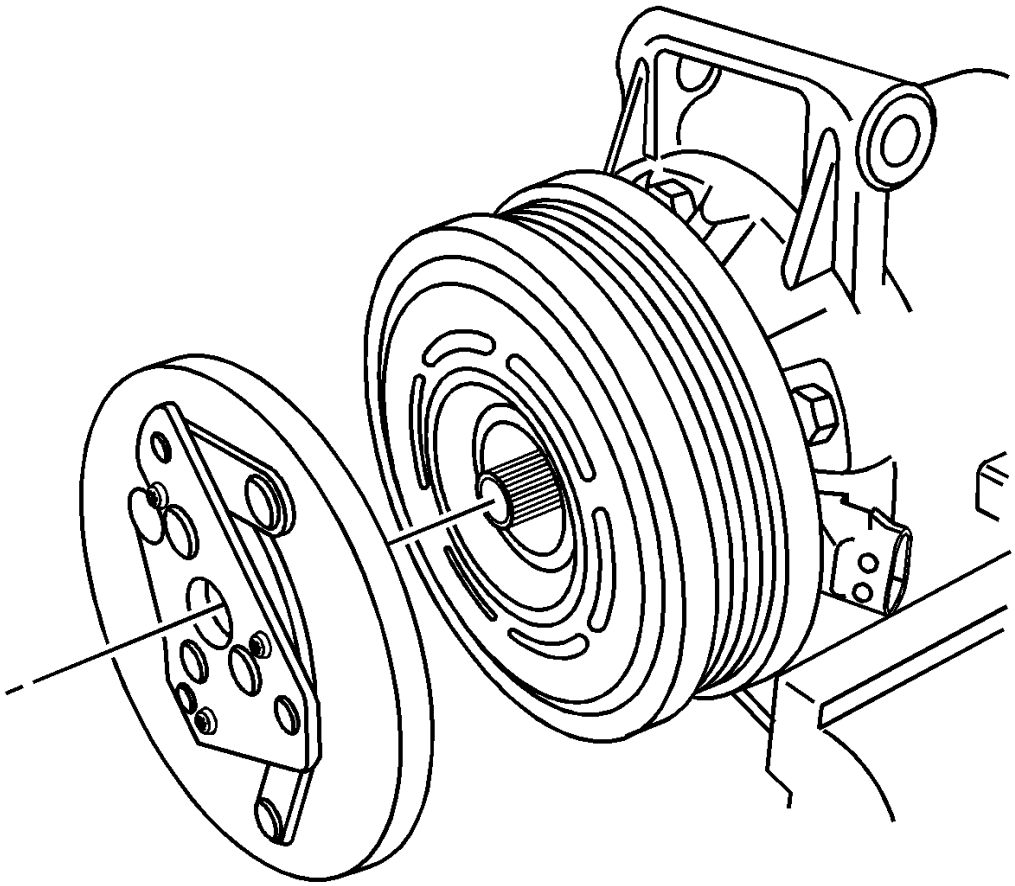

Fig. 6: Identifying Compressor Clutch Plate
Courtesy of GENERAL MOTORS COMPANY

3. Remove the compressor clutch plate from the compressor.

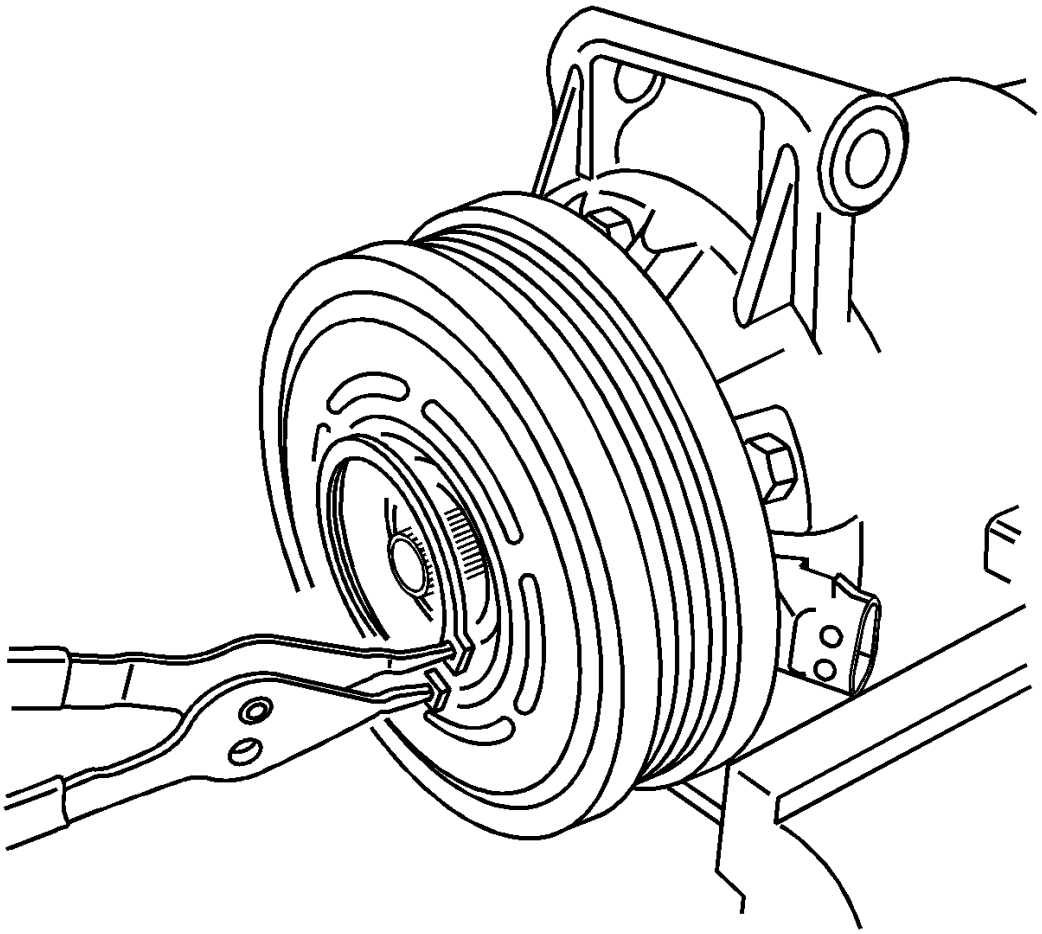

Fig. 7: View Of Compressor Pulley Snap Ring
Courtesy of GENERAL MOTORS COMPANY

4. Remove the compressor pulley snap ring using the **J 6083** Snap Ring Pliers.

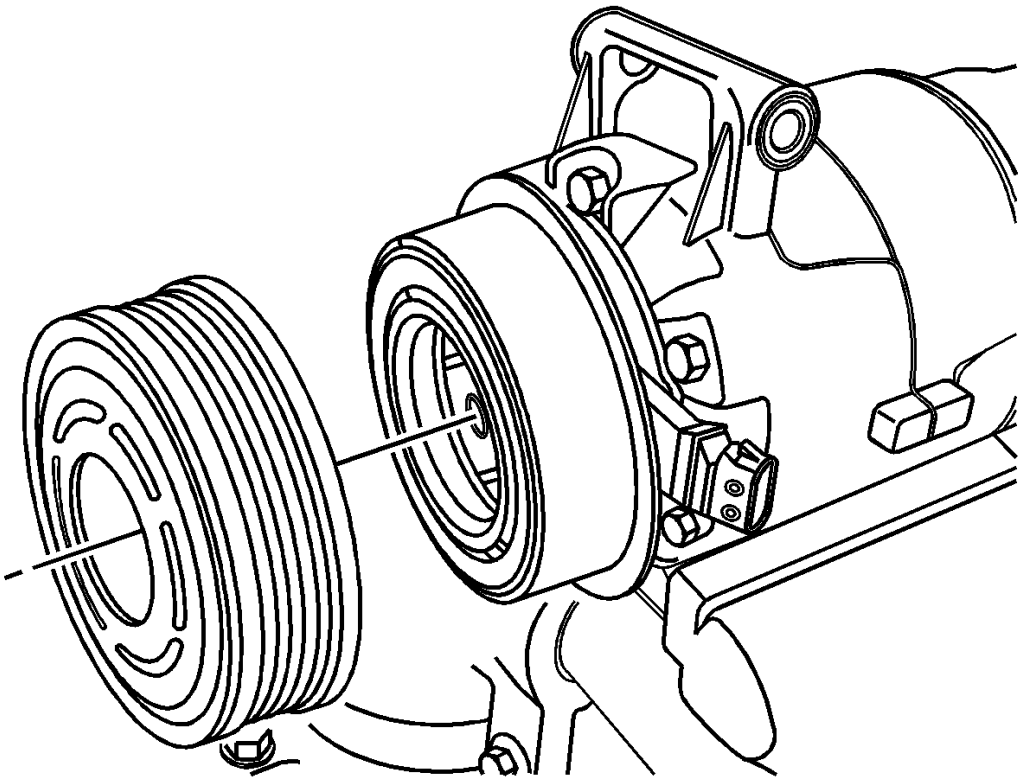

Fig. 8: Identifying Compressor Pulley
Courtesy of GENERAL MOTORS COMPANY

5. Remove the compressor pulley from the compressor.

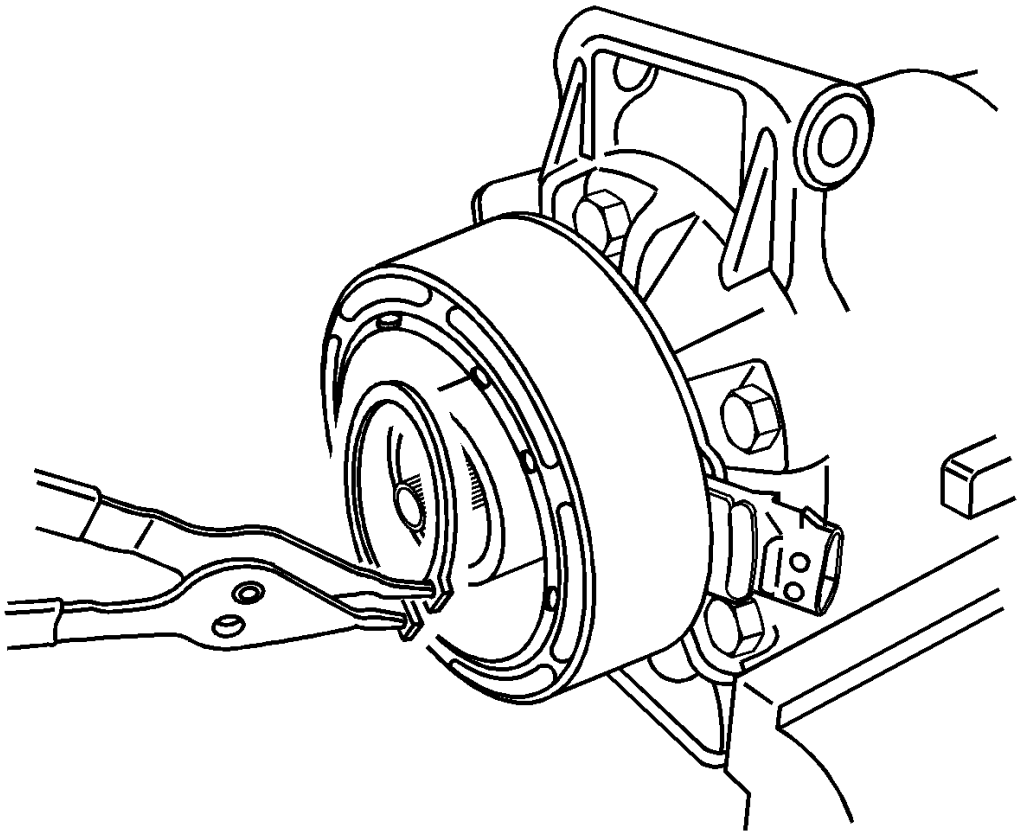

Fig. 9: Identifying Compressor Clutch Coil And Snap Ring
Courtesy of GENERAL MOTORS COMPANY

6. Remove the compressor clutch coil snap ring using the **J 6083** Snap Ring Pliers.

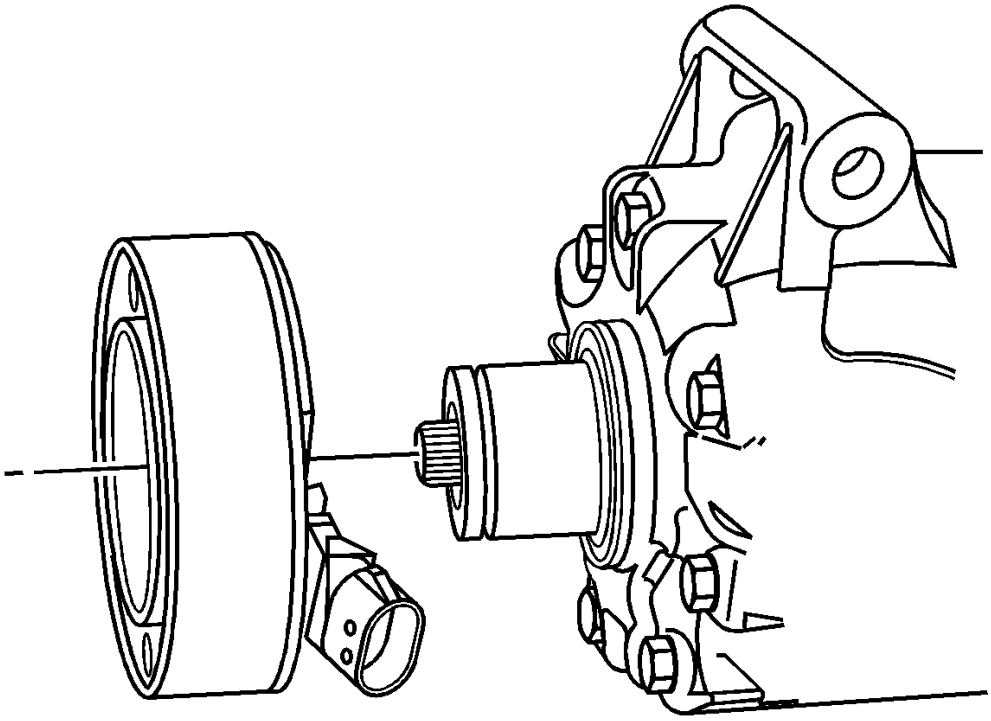

Fig. 10: Identifying Compressor Clutch Coil To Compressor
Courtesy of GENERAL MOTORS COMPANY

7. Remove the compressor clutch coil from the compressor.

Installation Procedure

1. Carefully clean the clutch plate bolt threads with a M6x1.0 tap. Carefully blow out debris with compressed air.

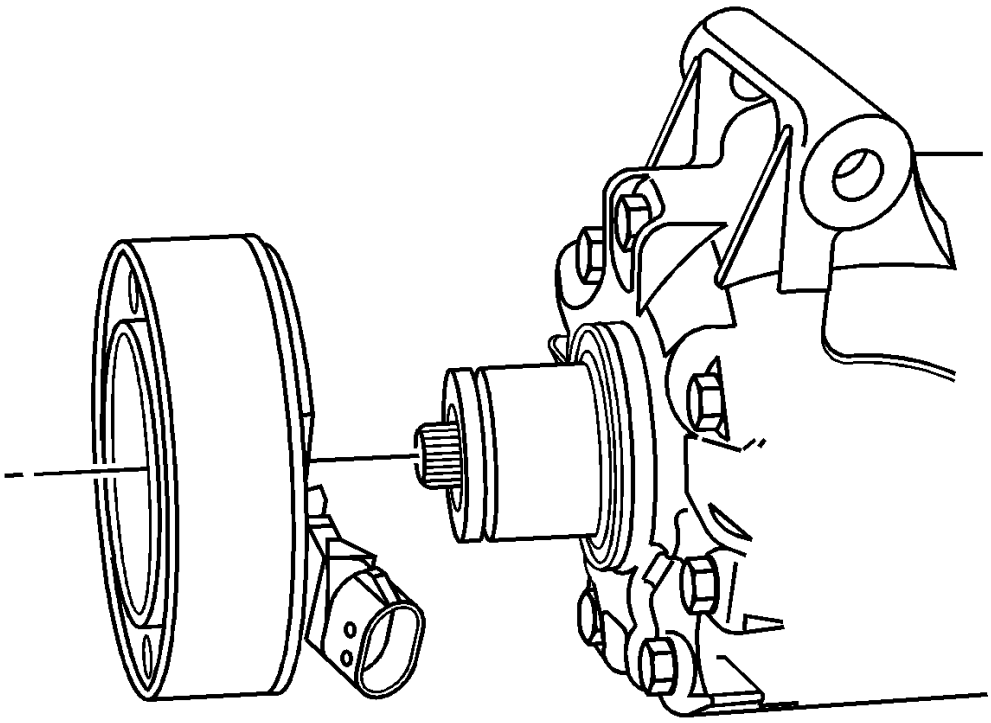

Fig. 11: Identifying Compressor Clutch Coil To Compressor
Courtesy of GENERAL MOTORS COMPANY

2. Install the compressor clutch coil to the compressor.

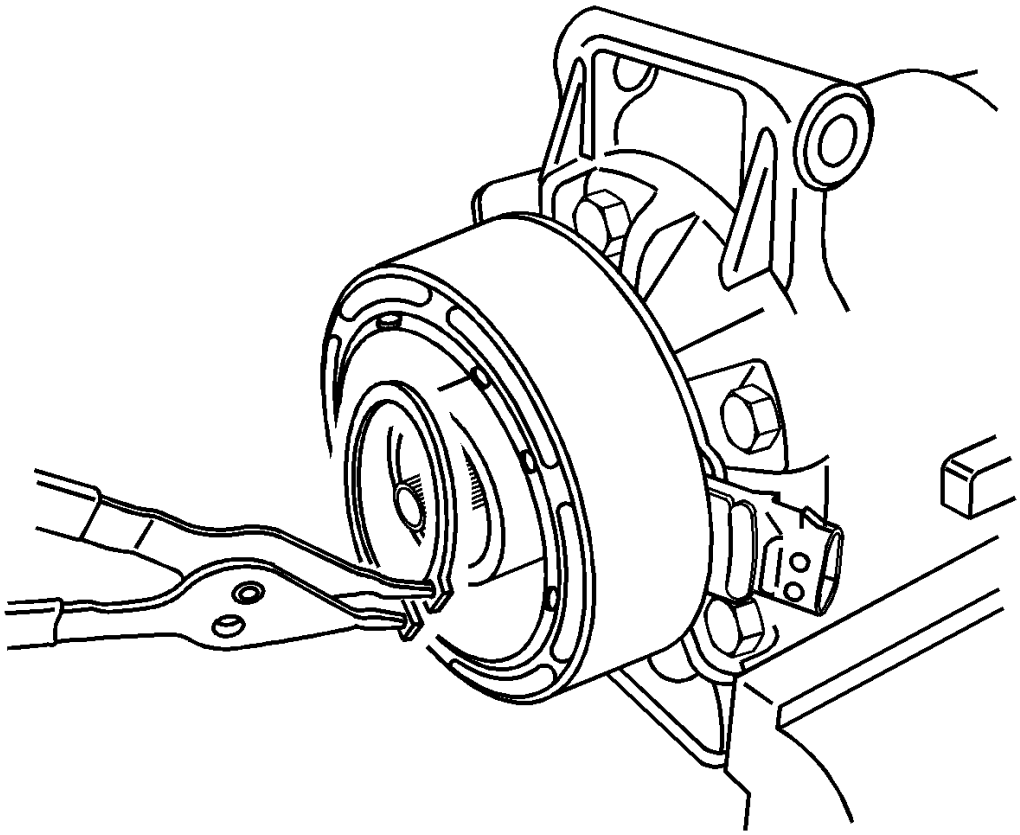

Fig. 12: Identifying Compressor Clutch Coil And Snap Ring
Courtesy of GENERAL MOTORS COMPANY

3. Install the compressor clutch coil snap ring using the **J 6083** Snap Ring Pliers.

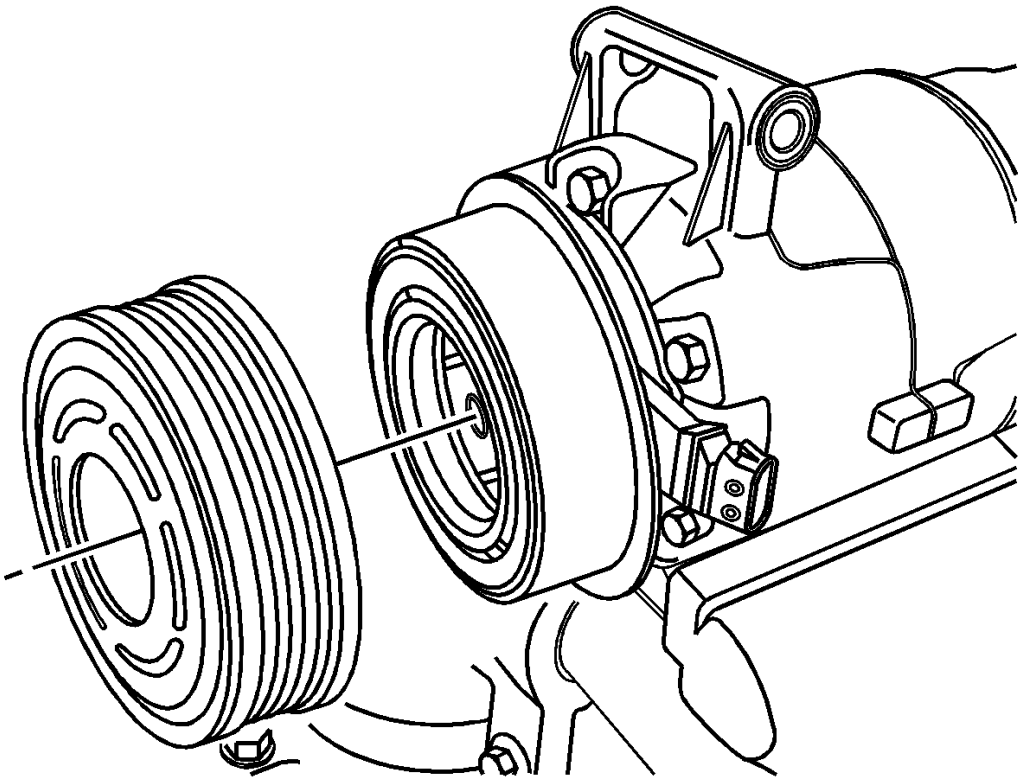

Fig. 13: Identifying Compressor Pulley
Courtesy of GENERAL MOTORS COMPANY

4. Install the compressor pulley to the compressor.

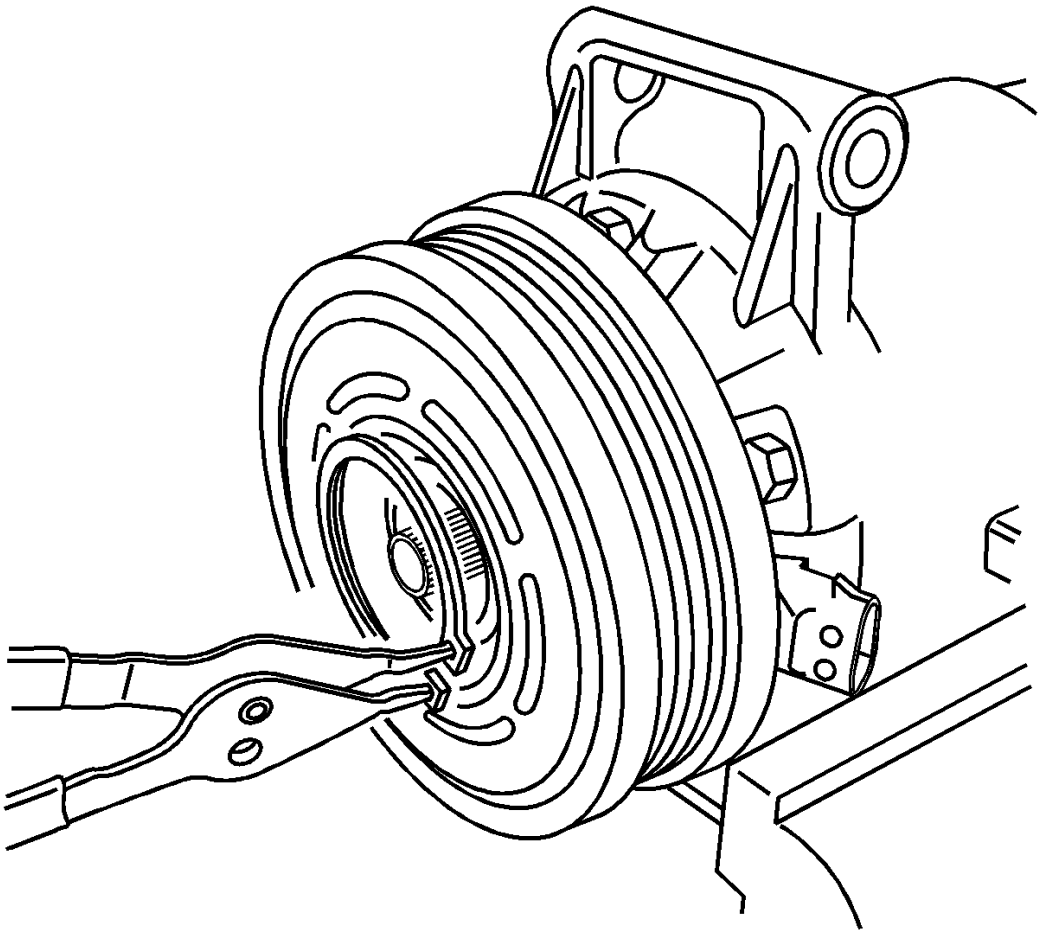

Fig. 14: View Of Compressor Pulley Snap Ring
Courtesy of GENERAL MOTORS COMPANY

5. Install the compressor pulley snap ring using the **J 6083** Snap Ring Pliers.
6. Place a small amount of oil on the 0.4 mm (0.016 in) air gap shim and place inside the clutch drive plate.

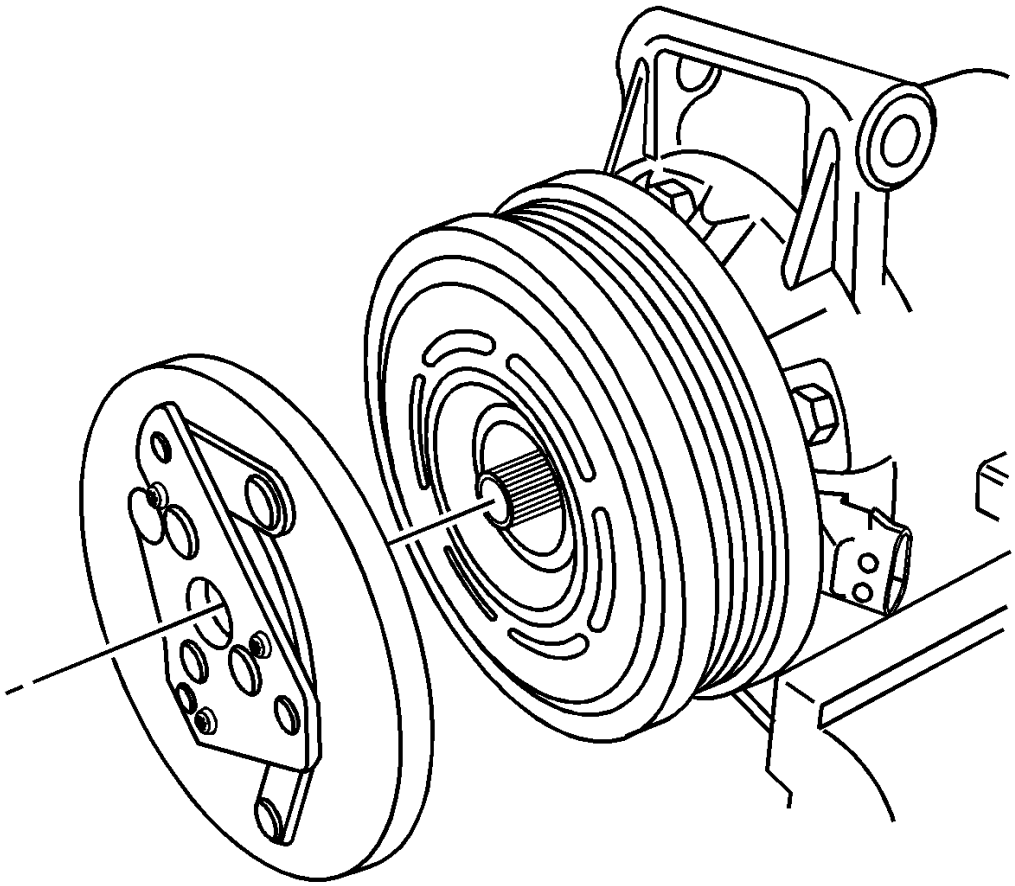

Fig. 15: Identifying Compressor Clutch Plate
Courtesy of GENERAL MOTORS COMPANY

7. Install the compressor clutch plate to the compressor.

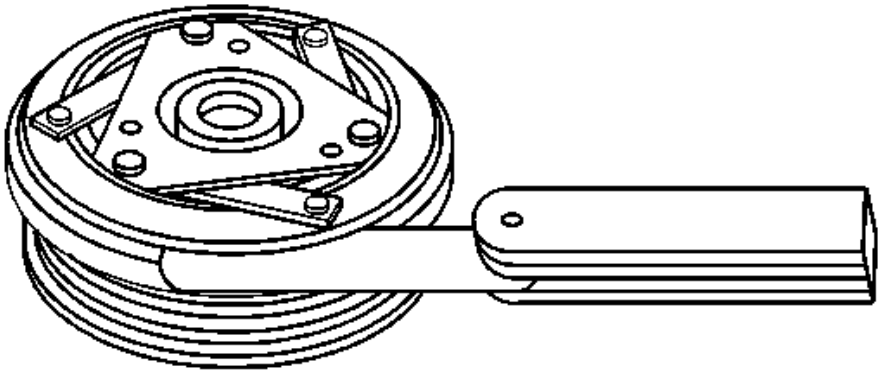

Fig. 16: Measuring Air Gap Between Pulley & Drive Plate
Courtesy of GENERAL MOTORS COMPANY

NOTE: **Make certain that the drive plate does not drag against the pulley when the pulley is rotated.**

8. Measure the air gap between the pulley and the drive plate. Adjust the shims to achieve a 0.3-0.6 mm (0.012-0.024 in) air gap.

CAUTION: **Refer to Fastener Caution .**

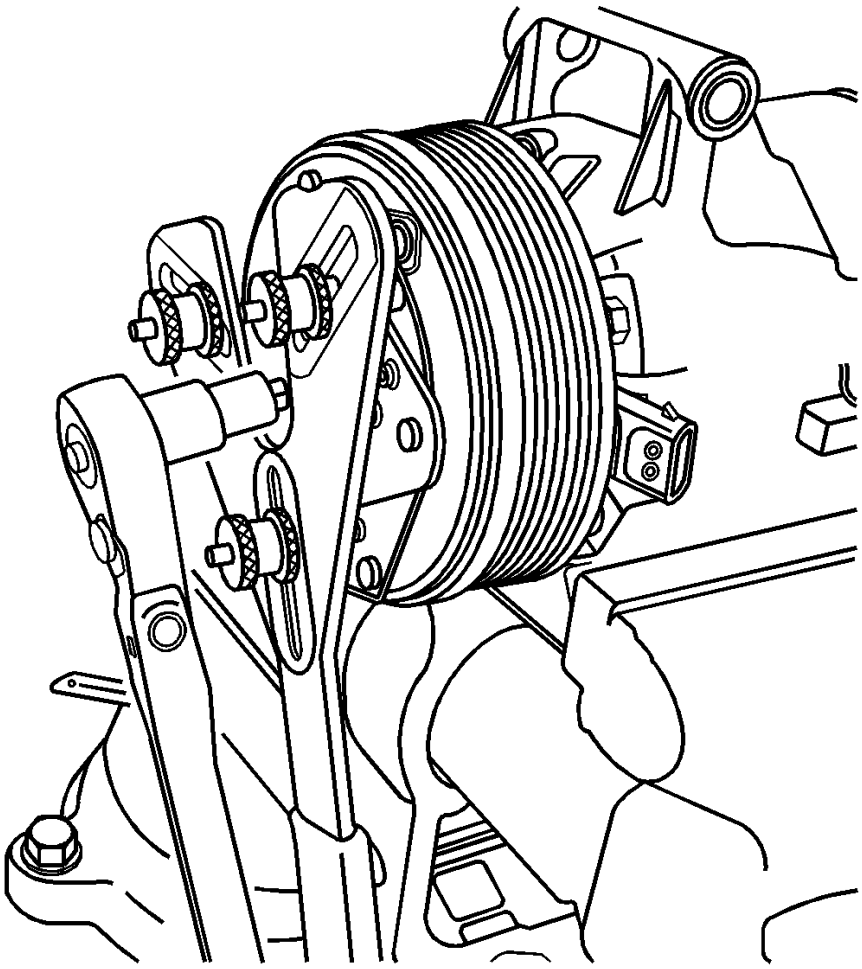

Fig. 17: Identifying Compressor Clutch Plate Bolt
Courtesy of GENERAL MOTORS COMPANY

NOTE: **Make certain that the new drive plate bolt has colored adhesive on at least 5 threads.**

9. Install the clutch drive plate bolt.
10. Tighten the compressor clutch drive plate bolt to 12 N.m (106 lb in).

    Use the **J 37872** Compressor Clutch Holding Tool to hold the compressor clutch plate from turning.

11. Install the compressor. Refer to **Air Conditioning Compressor Replacement**.
12. Leak test the fittings using the **J 39400-A** Halogen Leak Detector.

COMPRESSOR PRESSURE RELIEF VALVE REPLACEMENT

Special Tools

J 39400-A Halogen Leak Detector

Removal Procedure

1. Recover the refrigerant. Refer to **Refrigerant Recovery and Recharging**.
2. Raise and support the vehicle. Refer to **Lifting and Jacking the Vehicle** .

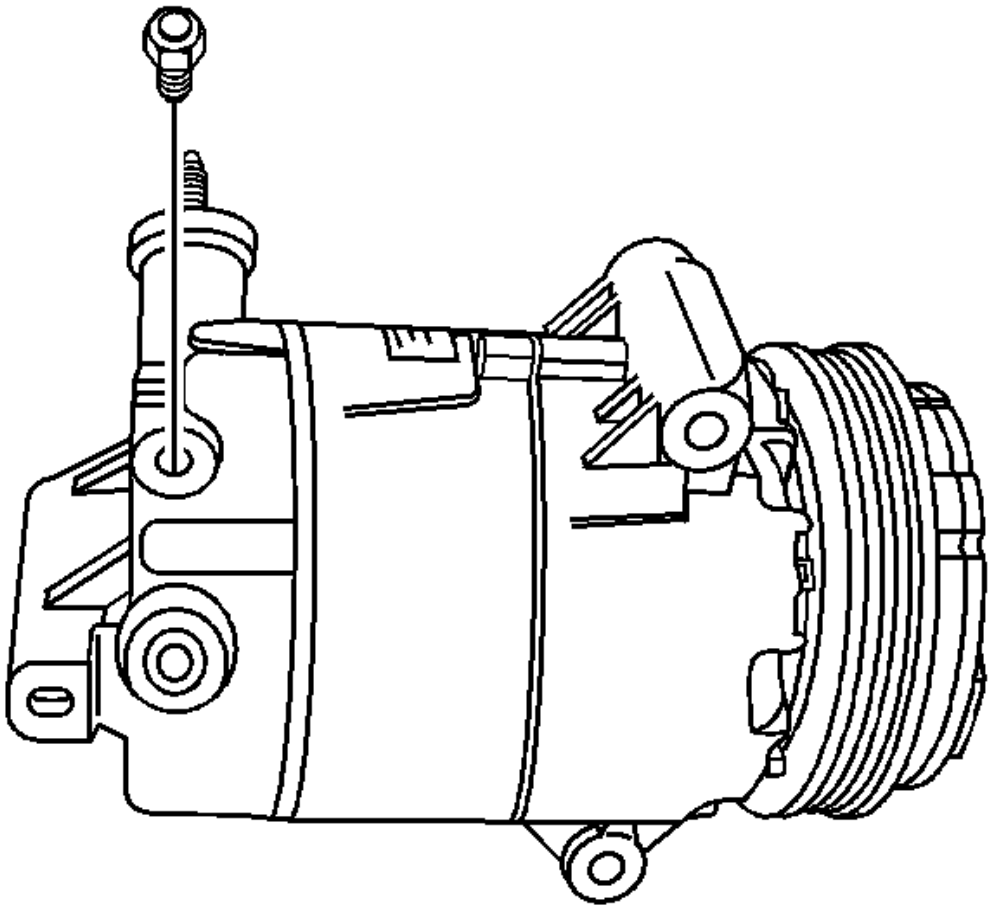

Fig. 18: Identifying Compressor Pressure Relief Valve
Courtesy of GENERAL MOTORS COMPANY

NOTE: **Cap or tape the open A/C components immediately to prevent system contamination.**

3. Remove the high pressure relief valve.
4. Cap or tape the A/C compressor.

Installation Procedure

1. Remove the cap or tape from the A/C compressor.
2. Lubricate the O-ring on the high pressure relief valve. Refer to **Air Conditioning O-Ring Seal Replacement**.

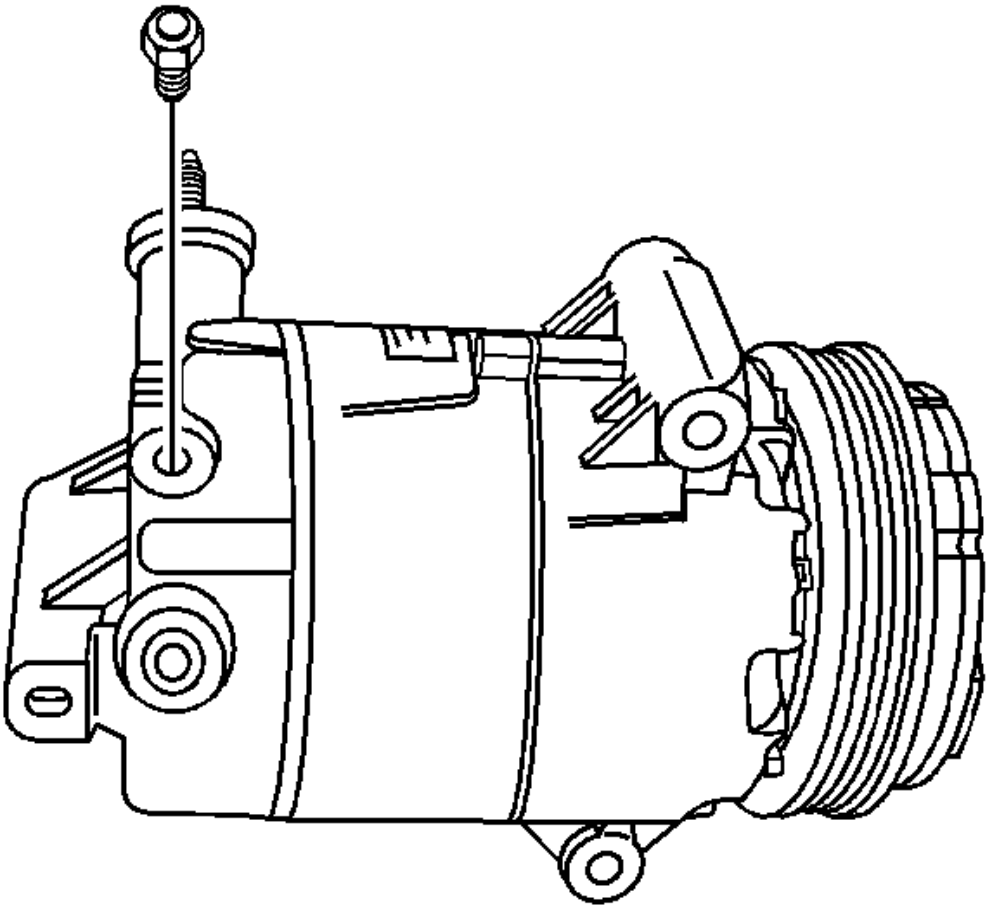

Fig. 19: Identifying Compressor Pressure Relief Valve
Courtesy of GENERAL MOTORS COMPANY

CAUTION: Refer to Fastener Caution .

3. Install the high pressure relief valve and tighten to 8 N.m (70 lb in).
4. Lower the vehicle.
5. Evacuate and recharge the refrigerant system. Refer to **Refrigerant Recovery and Recharging**.
6. Leak test the fittings of the component using **J 39400-A** Halogen Leak Detector.

AIR CONDITIONING SYSTEM SEAL REPLACEMENT

Removal Procedure

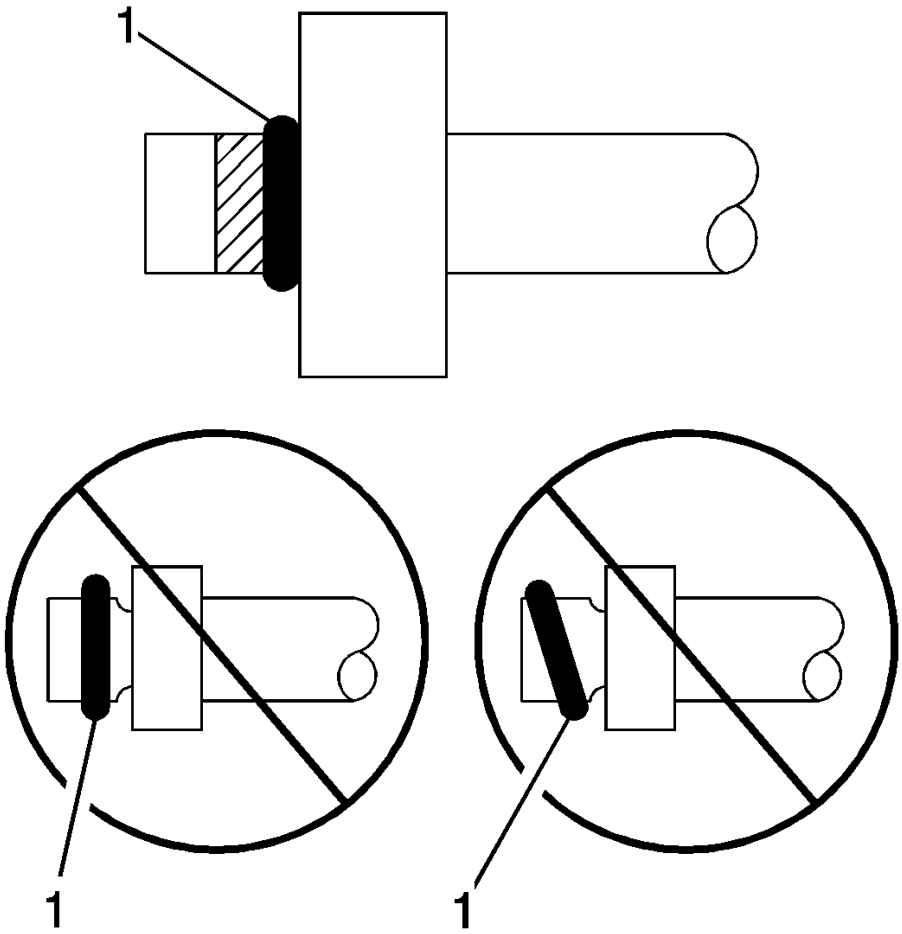

Fig. 20: Identifying Good & Bad Sealing Washer Positions
Courtesy of GENERAL MOTORS COMPANY

1. Remove the seal washer from the A/C refrigerant component.

NOTE: **Cap or tape the open A/C refrigerant components immediately to prevent system contamination.**

2. Inspect the seal washer for signs of damage to help determine the root cause of the failure.
3. Inspect the A/C refrigerant components for damage or burrs. Repair if necessary.

NOTE: **DO NOT reuse sealing washer.**

4. Discard the sealing washer.

Installation Procedure

NOTE: **Flat washer type seals do not require lubrication.**

1. Inspect the new seal washer for any signs of cracks, cuts, or damage.

   Do not use a damaged seal washer.

2. Remove the cap or tape from the A/C refrigerant components.

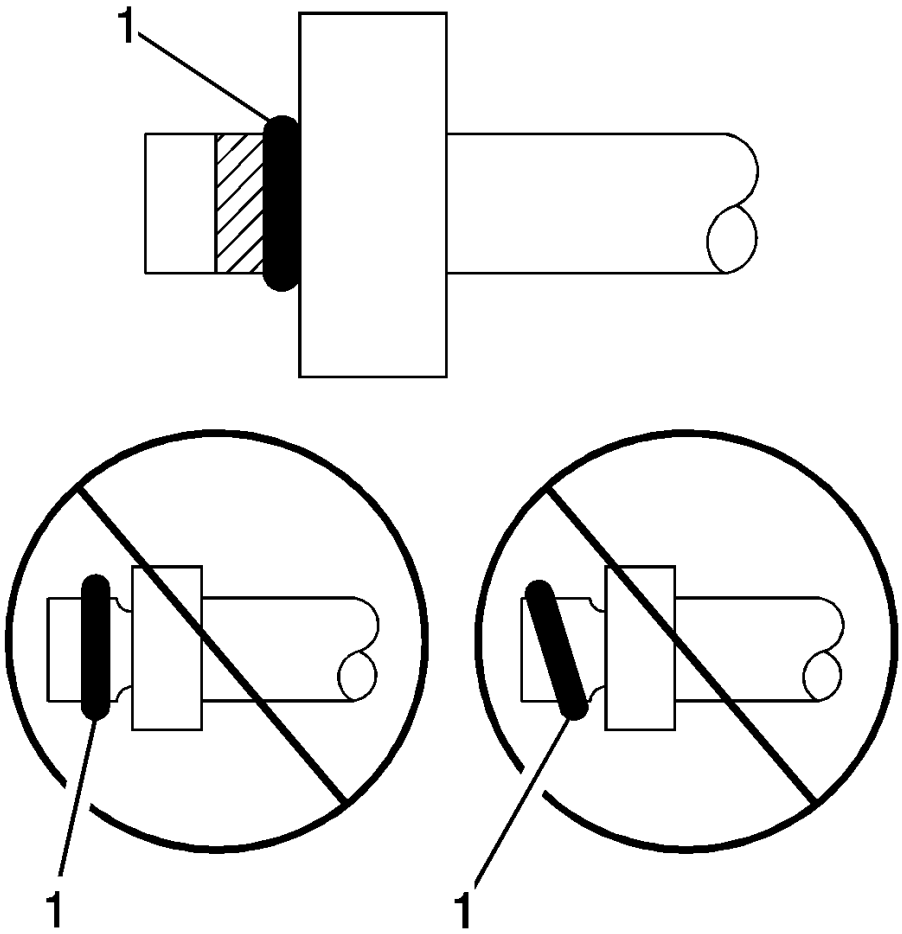

Fig. 21: Identifying Good & Bad Sealing Washer Positions
Courtesy of GENERAL MOTORS COMPANY

3. Using a lint-free clean, dry cloth, clean the sealing surfaces of the A/C refrigerant components.
4. Carefully install the new seal washer onto the A/C refrigerant component.

   The washer must completely bottom against the surface of the fitting.

   NOTE: After tightening the A/C components, there should be a slight sealing washer gap of approximately 1.2 mm (3/64 in) between the A/C line and the A/C component.

5. Assemble the remaining A/C refrigerant components. Refer to the appropriate repair procedure.

AIR CONDITIONING O-RING SEAL REPLACEMENT

Removal Procedure

1. Disassemble the A/C refrigerant components. Refer to the appropriate repair procedure.

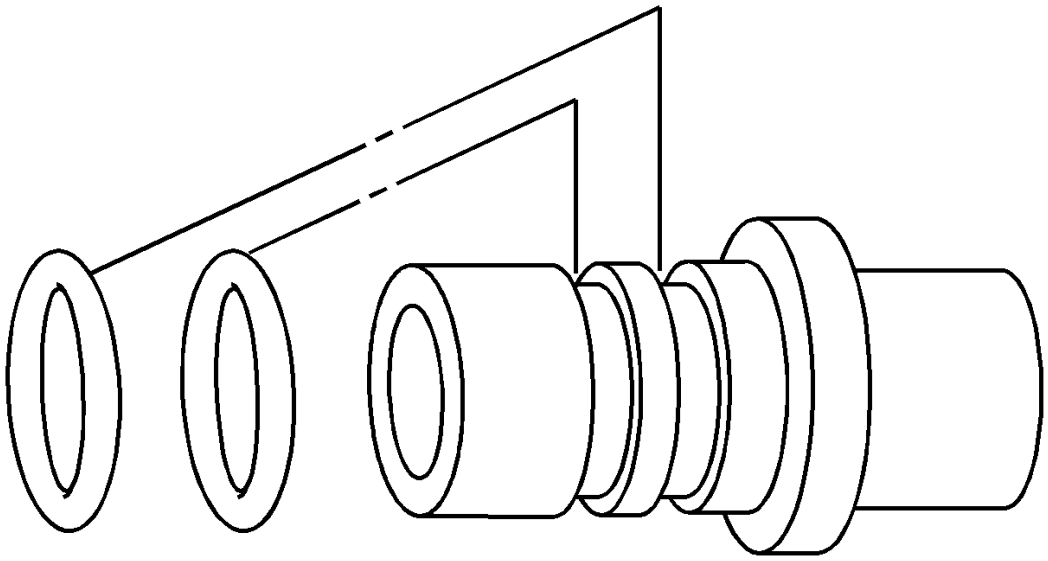

Fig. 22: Identifying O-Ring Seals & A/C Refrigerant Component
Courtesy of GENERAL MOTORS COMPANY

2. Remove the O-ring seals from the A/C refrigerant component.
3. Inspect the O-ring seals for signs of damage.
4. Inspect the A/C refrigerant components for damage or burrs. Repair if necessary.

NOTE: **Cap or tape the open A/C refrigerant components immediately to prevent system contamination.**

5. Cap or tape the A/C refrigerant components.
6. Discard the O-ring seals.

Installation Procedure

1. Inspect the new O-ring seals for any sign or cracks, cuts, or damage. Replace if necessary.
2. Remove the cap or tape from the A/C refrigerant components.
3. Using a lint-free clean, dry cloth, carefully clean the sealing surfaces of the A/C refrigerant components.

NOTE: **DO NOT allow any of the mineral base 525 viscosity refrigerant oil on the**

new O-ring seal to enter the refrigerant system.

4. Lightly coat the new O-ring seals with mineral base 525 viscosity refrigerant oil.

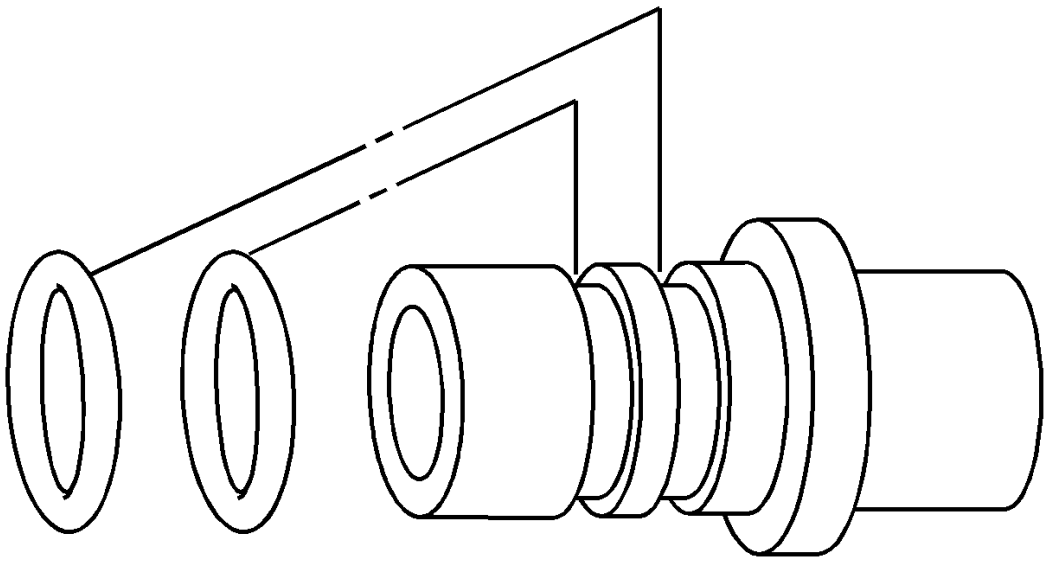

Fig. 23: Identifying O-Ring Seals & A/C Refrigerant Component
Courtesy of GENERAL MOTORS COMPANY

NOTE: **DO NOT reuse O-ring seals.**

5. Carefully slide the new O-ring seals onto the A/C refrigerant component.
6. The O-ring seals must be fully seated.
7. Assemble the A/C components.

Refer to the appropriate repair procedure.

AIR CONDITIONING LINE/TUBE CONNECTOR REMOVAL/REPLACEMENT

Special Tools

J 39400-A Halogen Leak Detector

Removal Procedure

1. Recover the refrigerant from the A/C system. Refer to **Refrigerant Recovery and Recharging**.

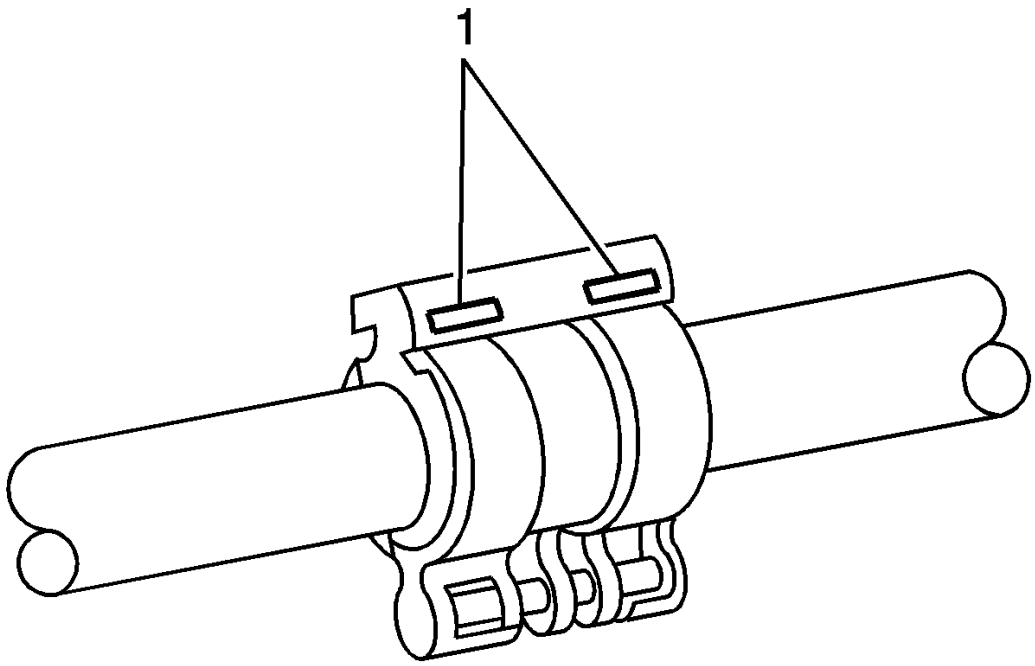

Fig. 24: A/C Coupling Assembly Locking Tab Access Slots
Courtesy of GENERAL MOTORS COMPANY

2. Locate the A/C coupling assembly's locking tab access slots (1).

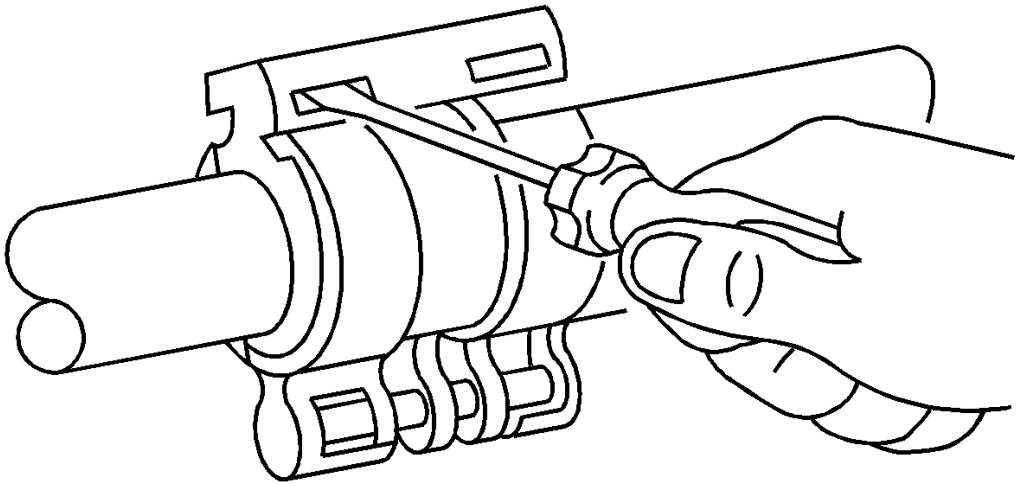

Fig. 25: Releasing First Locking Tab
Courtesy of GENERAL MOTORS COMPANY

NOTE: **When separating the A/C coupling assembly, apply light pressure between the two halves of the coupling to prevent the locking tabs from reengaging.**

3. Carefully insert a small flat bladed screwdriver into the first locking tab access slot and gently lift the locking tab to release the lock.

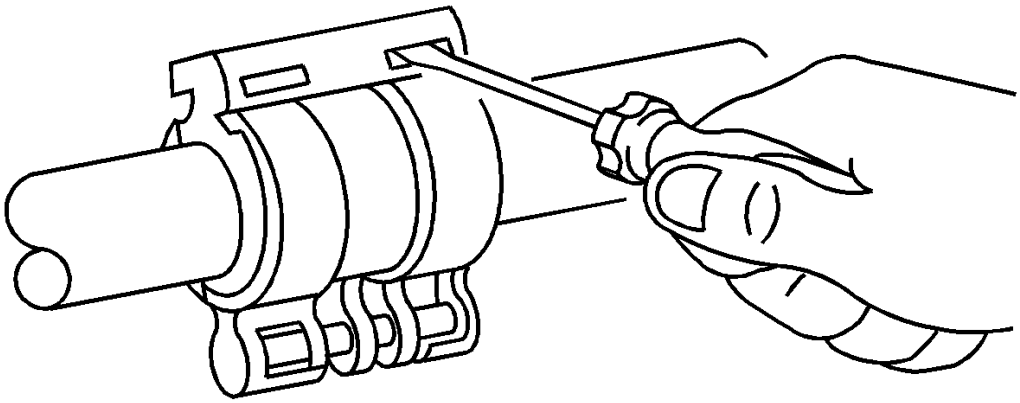

Fig. 26: Releasing Second Locking Tab
Courtesy of GENERAL MOTORS COMPANY

4. Carefully insert a small flat bladed screwdriver into the second locking tab access slot and gently lift the locking tab to release the lock.

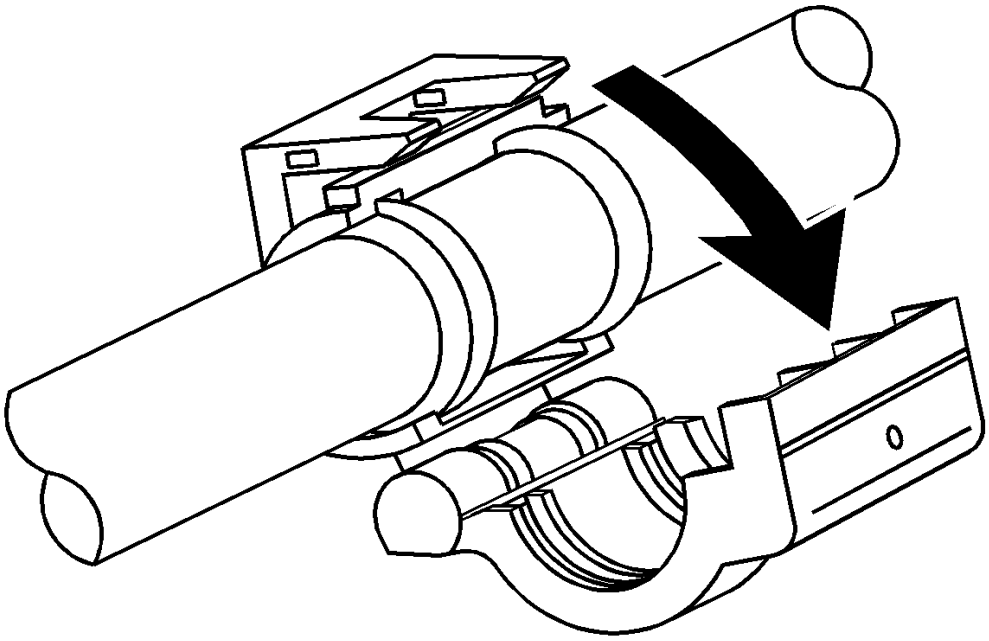

Fig. 27: A/C Coupling Assembly & A/C Refrigerant Component
Courtesy of GENERAL MOTORS COMPANY

5. Open and remove the A/C coupling assembly from the A/C refrigerant component.

Installation Procedure

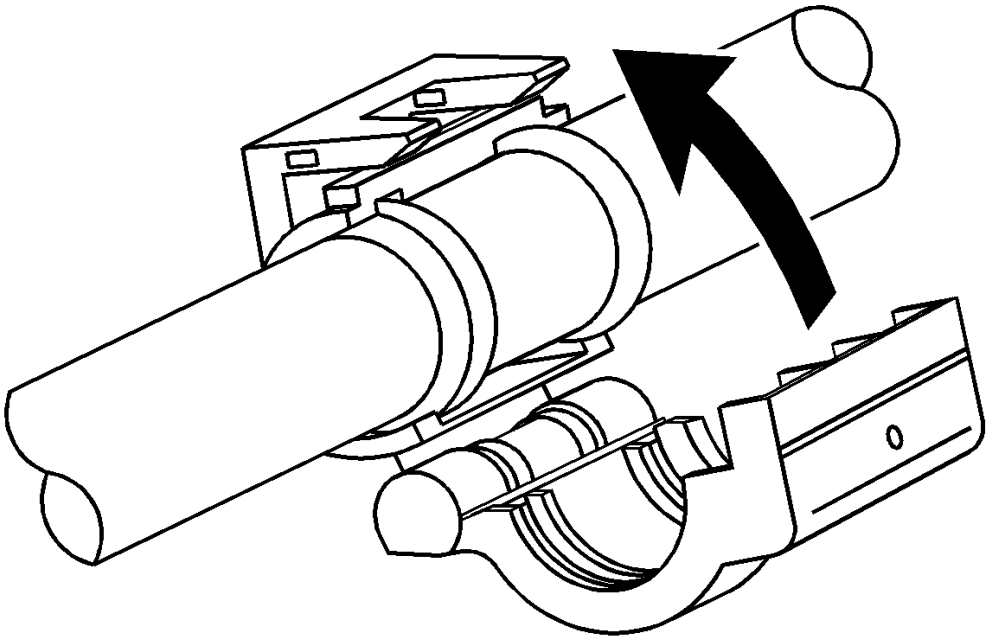

Fig. 28: Installing A/C Coupling Assembly
Courtesy of GENERAL MOTORS COMPANY

NOTE: **Inspect the A/C coupling assembly locking tabs for damage or wear. Replace the A/C coupler assembly if any conditions exist.**

1. Install the A/C coupling assembly to the A/C refrigerant component.

NOTE: **Ensure that the A/C coupling assembly is latched securely to the A/C refrigerant component.**

2. Close the A/C coupling assembly.
3. Evacuate and recharge the A/C system. Refer to **Refrigerant Recovery and Recharging**.
4. Leak test the fittings of the component using **J 39400-A** Halogen Leak Detector.

AIR CONDITIONING COMPRESSOR HOSE REPLACEMENT

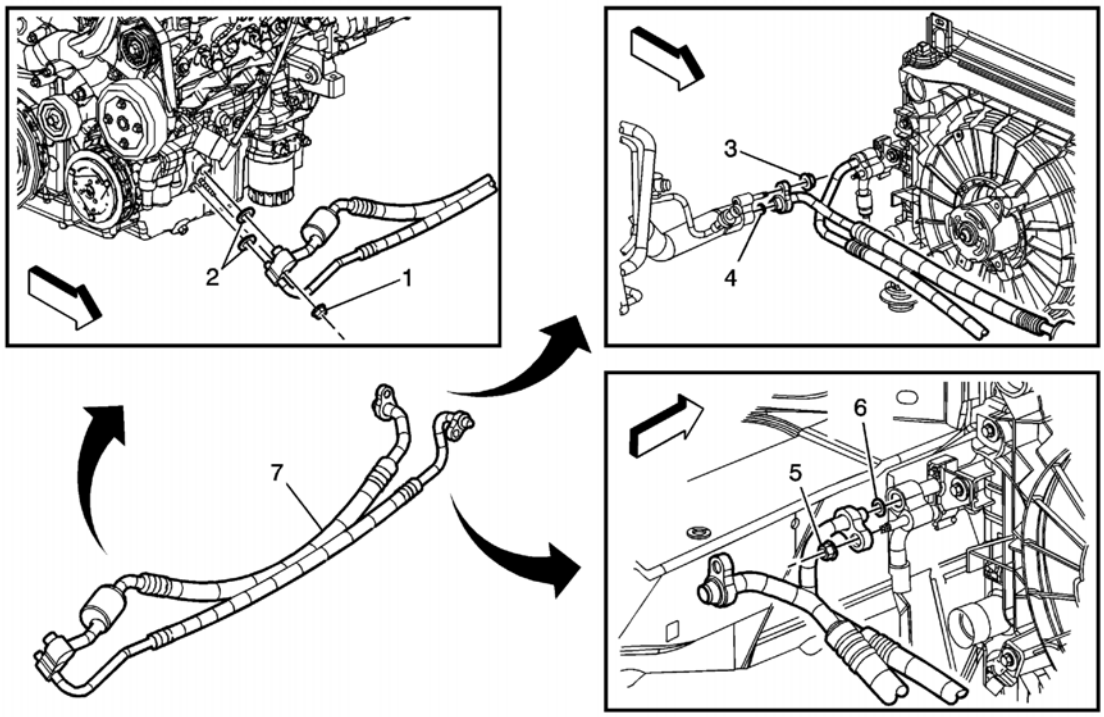

Fig. 29: Compressor Hose Assembly
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure Recover the refrigerant. Refer to **Refrigerant Recovery and Recharging**.	
1	A/C Compressor Hose Nut **CAUTION:** **Refer to** **Fastener Caution** **.** **Tighten** 17 N.m (12.5 lb in)
2	Sealing Washer **Procedure** Remove and discard sealing washers. Refer to **Air Conditioning System Seal Replacement**.
3	A/C Compressor Nut and Evaporator Tube **Tighten** 17 N.m (12.5 lb in)
4	Sealing Washer **Procedure** Remove and discard sealing washers. Refer to **Air Conditioning System Seal Replacement**.
5	A/C Compressor Nut and Condenser **TIP:** Use a 20 mm wrench or pliers to hold the A/C condenser block fitting, this will prevent

Callout	Component Name
	the A/C line from twisting while torquing the A/C line nut. **Tighten** 17 N.m (12.5 lb in)
6	Sealing Washer **Procedure** Remove and discard sealing washers. Refer to **Air Conditioning System Seal Replacement**.
7	A/C Compressor Hose Assembly **Procedure** Leak test the fittings. Refer to **Leak Testing**.

AIR CONDITIONING EVAPORATOR THERMAL EXPANSION VALVE TUBE REPLACEMENT

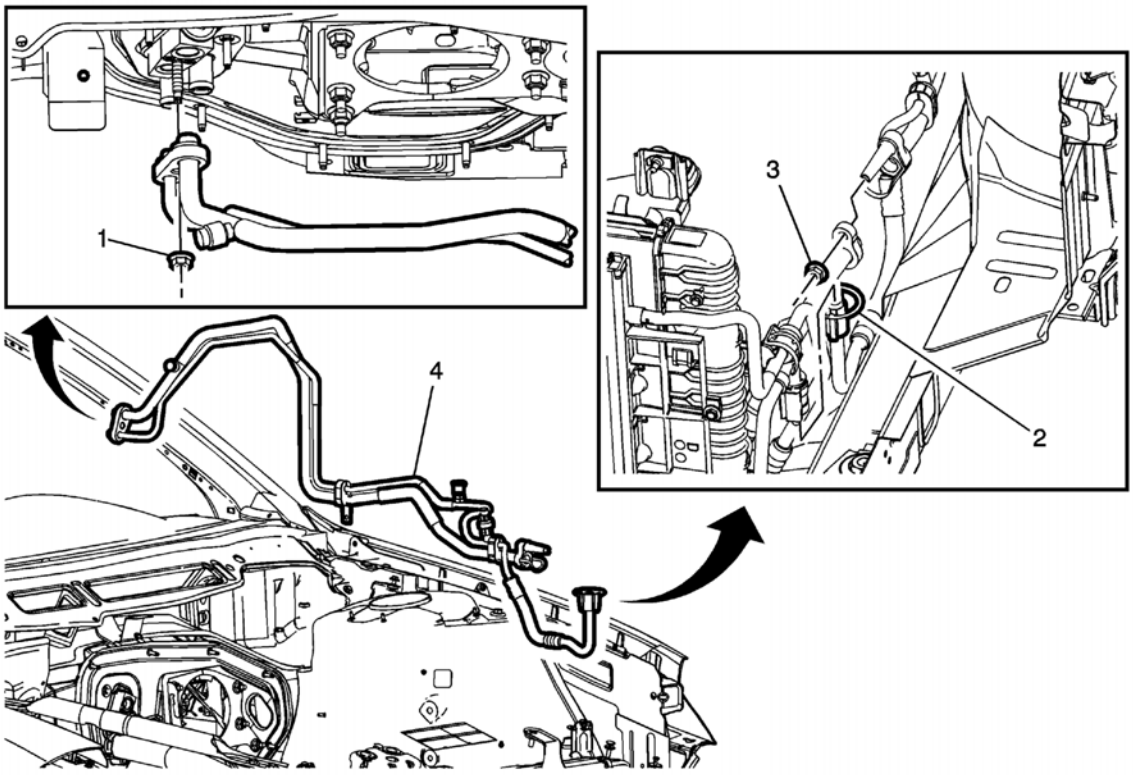

Fig. 30: Air Conditioning Evaporator Thermal Expansion Valve Tube Components
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedures 1. **Refrigerant Recovery and Recharging** 2. **Air Cleaner Bracket Replacement** 3. **Brake Pressure Modulator Valve Replacement** 4. **Brake Pressure Modulator Valve Bracket Replacement**	
1	A/C Compressor Nut and Evaporator Tube **CAUTION:**

Callout	Component Name
	Refer to Fastener Caution . **Tighten** 17 N.m (13 lb ft)
2	Sealing Washer **Procedure** Remove and discard the sealing washers. Air Conditioning System Seal Replacement.
3	A/C Condenser Bolt and A/C Evaporator Tube Clamp **Tighten** 10 N.m (89 lb in)
4	A/C Evaporator TXV Tube Assembly

AIR CONDITIONING (AC) REFRIGERANT FILTER REPLACEMENT

Special Tools

J 39400-A Halogen Leak Detector

Removal Procedure

1. Recover the refrigerant. Refer to **Refrigerant Recovery and Recharging**.
2. Remove the air cleaner assembly. Refer to **Air Cleaner Assembly Replacement**
3. Remove the A/C line coupling from the evaporator tube to condenser tube. Refer to **Air Conditioning Line/Tube Connector Removal/Replacement**.

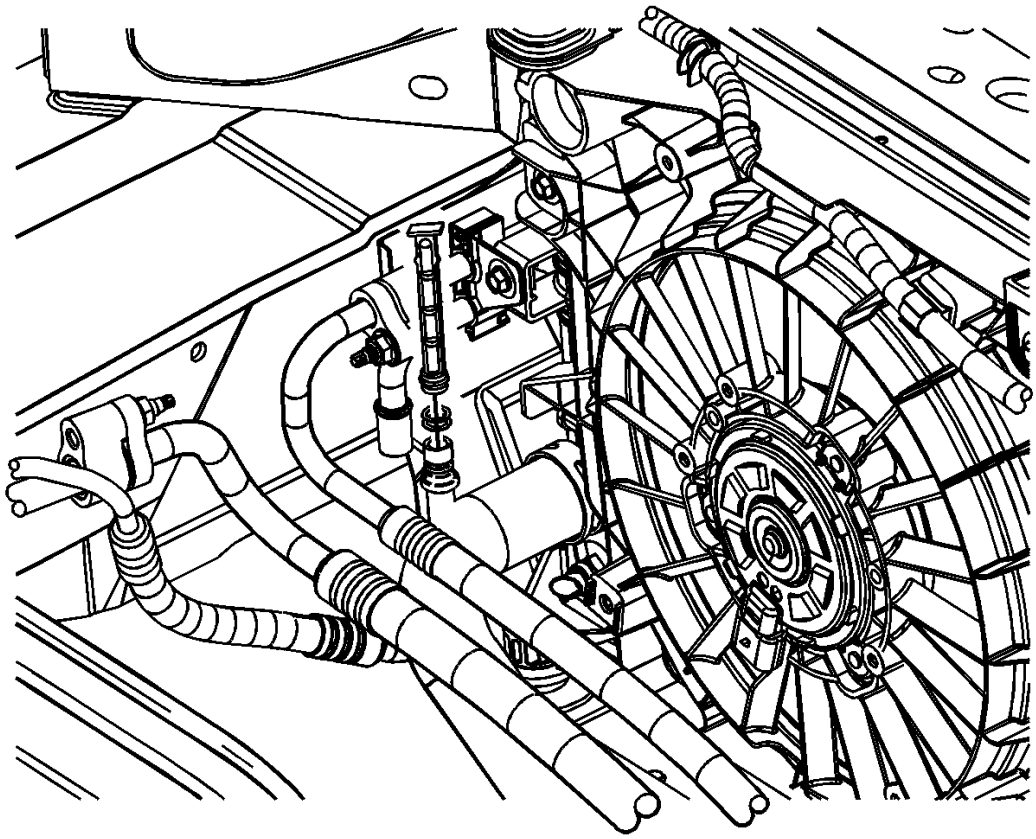

Fig. 31: Locating Air Conditioning (A/C) Refrigerant Filter
Courtesy of GENERAL MOTORS COMPANY

4. Disconnect the evaporator tube from the condenser.
5. Remove and discard the O-ring seals. Refer to **Air Conditioning O-Ring Seal Replacement**.
6. Remove the refrigerant filter from the evaporator tube.

Installation Procedure

1. Replace the O-ring seals on the evaporator tube. Refer to **Air Conditioning O-Ring Seal Replacement**.

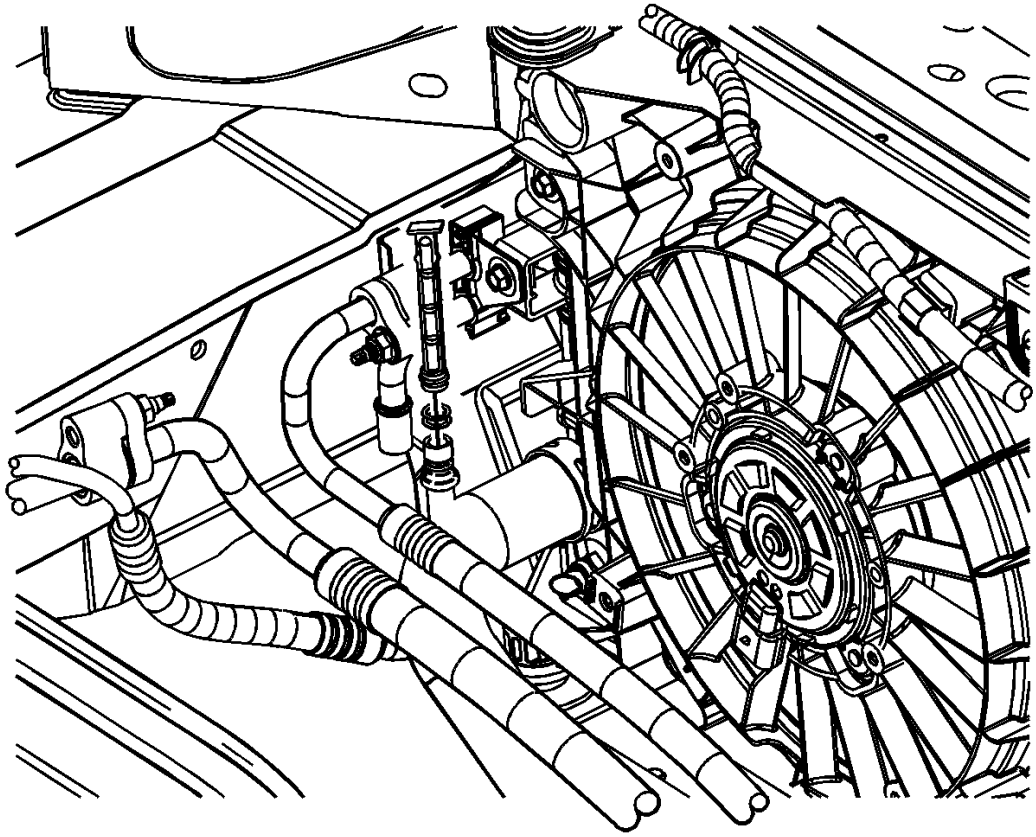

Fig. 32: Locating Air Conditioning (A/C) Refrigerant Filter
Courtesy of GENERAL MOTORS COMPANY

2. Install a new refrigerant filter to the evaporator tube.
3. Connect the evaporator tube to the condenser.
4. Install the A/C line coupling to the evaporator tube and condenser tube. Refer to **Air Conditioning Line/Tube Connector Removal/Replacement**.
5. Install the air cleaner assembly. Refer to **Air Cleaner Assembly Replacement**
6. Evacuate and recharge the A/C system. Refer to **Refrigerant Recovery and Recharging**.
7. Leak test the fittings of the component using **J 39400-A** Halogen Leak Detector.

AIR CONDITIONING COMPRESSOR SUCTION SCREEN REPLACEMENT

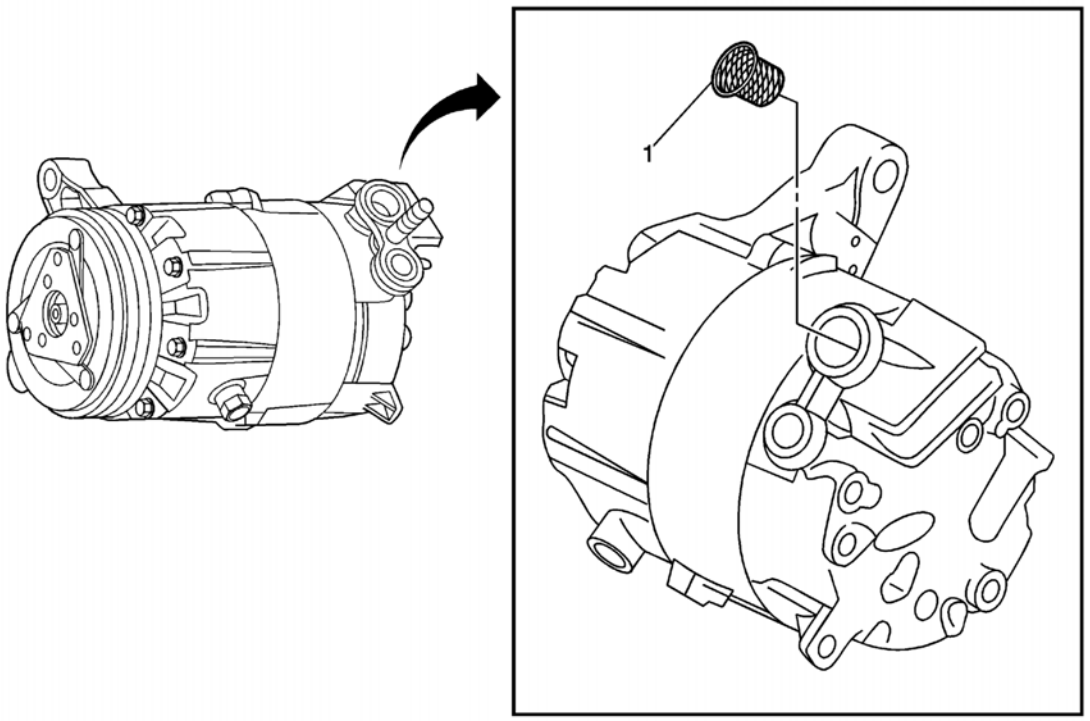

Fig. 33: Suction Screen
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure Remove the A/C compressor. Refer to **Air Conditioning Compressor Replacement**.	
1	Suction Screen **TIP:** Remove the suction screen from the A/C compressor suction port using a flat bladed tool or pick.

SERVICE PORTS REPLACEMENT

Special Tools

J 39037 Charge Valve Octagon Socket

Removal Procedure

1. Remove the service port cap.
2. Recover the refrigerant. Refer to **Refrigerant Recovery and Recharging**.

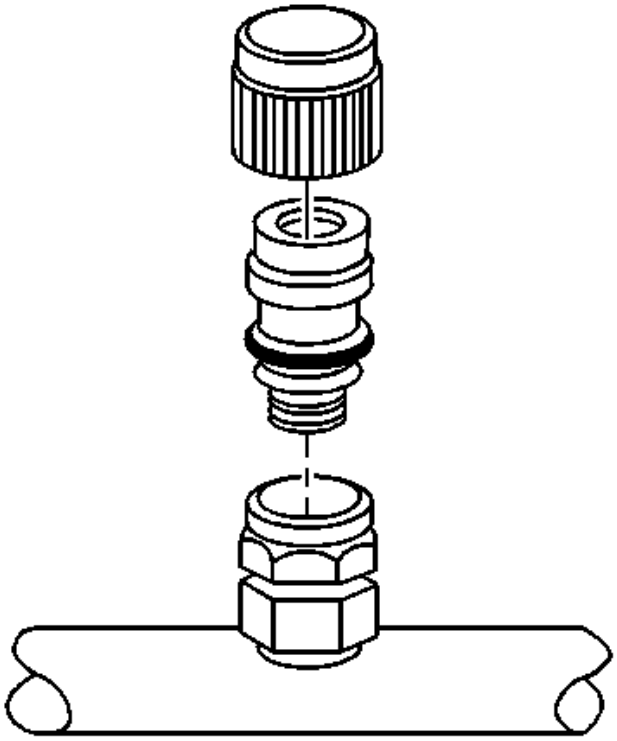

Fig. 34: View Of Service Port
Courtesy of GENERAL MOTORS COMPANY

3. Use the **J 39037** Charge Valve Octagon Socket to remove the service port.

Installation Procedure

1. Replace the O-ring. Refer to **Air Conditioning O-Ring Seal Replacement**.

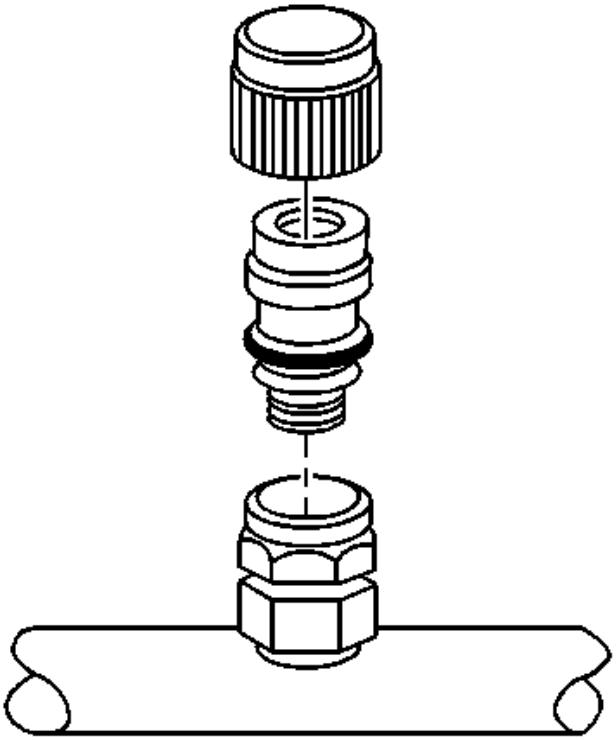

Fig. 35: View Of Service Port
Courtesy of GENERAL MOTORS COMPANY

CAUTION: Refer to Fastener Caution .

2. Install the service port valve and tighten to 11 N.m (98 lb in).
3. Evacuate and charge the system. Refer to **Refrigerant Recovery and Recharging**.
4. Leak test the A/C service port. Refer to **Leak Testing**.
5. Install the service port cap.

AIR CONDITIONING EVAPORATOR THERMAL EXPANSION VALVE REPLACEMENT

Special Tools

J 39400-A Halogen Leak Detector

Removal Procedure

1. Recover the refrigerant from the A/C system. Refer to **Refrigerant Recovery and Recharging**.

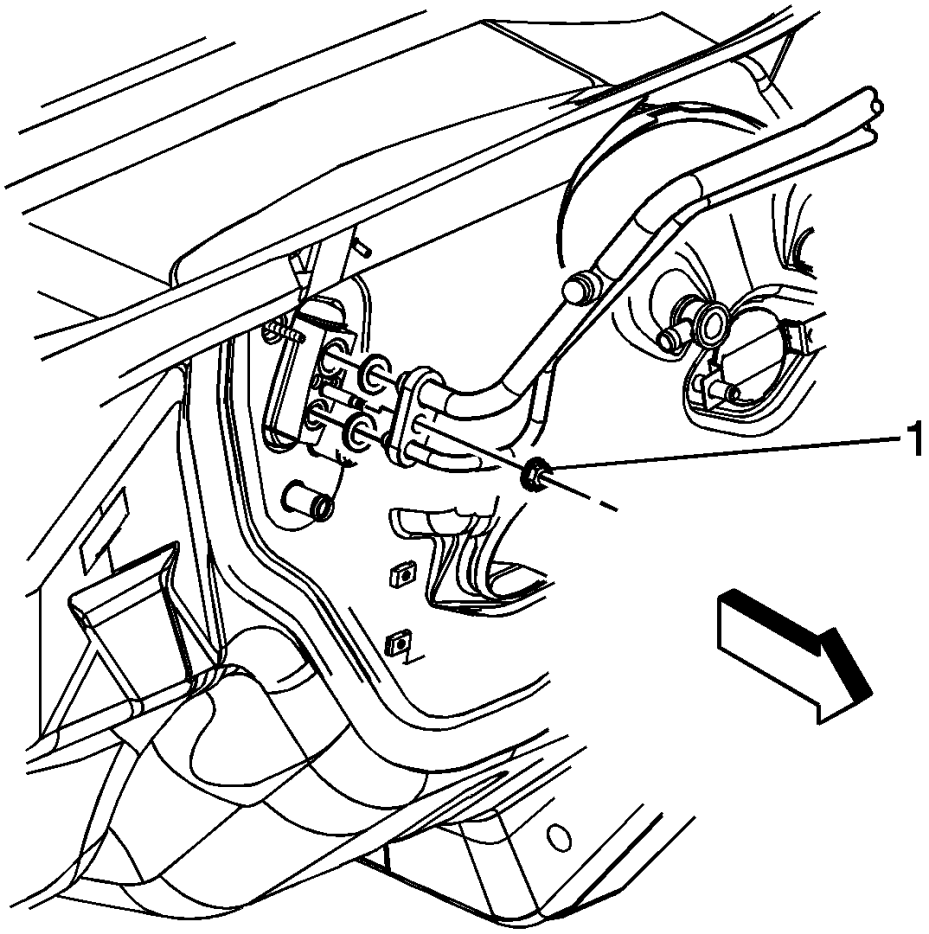

Fig. 36: Evaporator Tube And Thermostatic Expansion Valve (TXV) Nut
Courtesy of GENERAL MOTORS COMPANY

2. Remove the evaporator tube to thermal expansion valve (TXV) nut (1).
3. Disconnect the evaporator outlet and inlet tube from the TXV.
4. Remove and discard the sealing washers.

NOTE: **Cap or tape the open evaporator inlet and outlet tubes immediately to prevent contamination of the refrigerant system.**

5. Cap off the evaporator inlet and outlet tube.

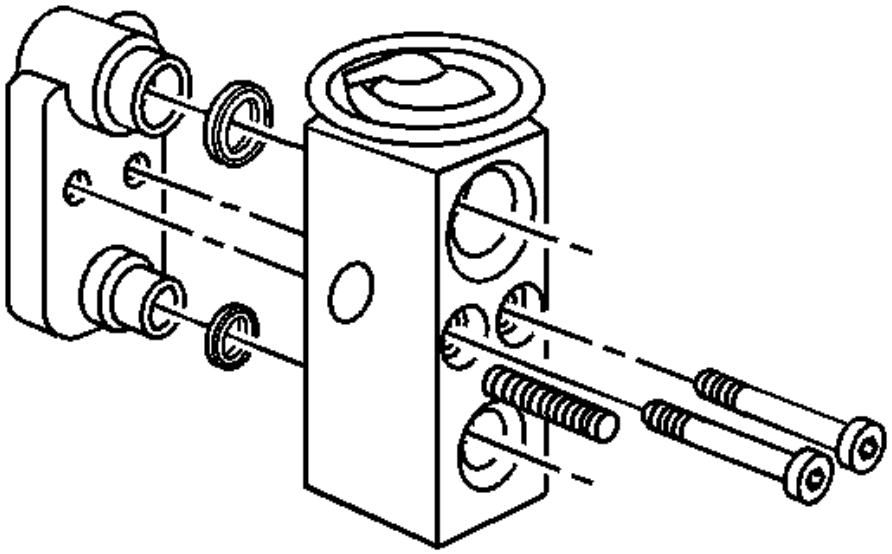

Fig. 37: View Of TXV
Courtesy of GENERAL MOTORS COMPANY

6. Remove the TXV to evaporator bolts.
7. Remove the TXV from the evaporator core.
8. Remove and discard the sealing washers.

Installation Procedure

1. Install the new sealing washers onto the evaporator core. Refer to **Air Conditioning System Seal Replacement**.

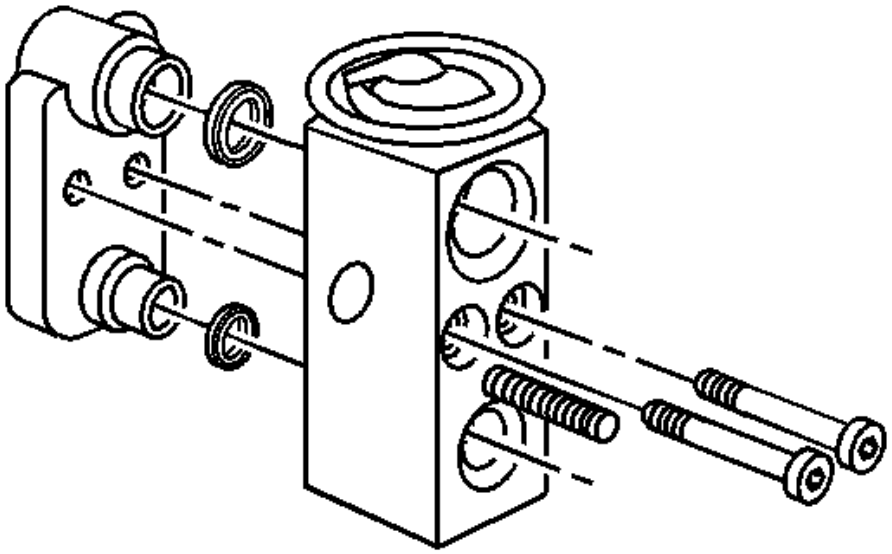

Fig. 38: View Of TXV
Courtesy of GENERAL MOTORS COMPANY

2. Install the TXV to the evaporator core.

CAUTION: Refer to Fastener Caution .

3. Install the TXV to evaporator bolts and tighten to 7 N.m (62 lb in).
4. Remove the cap or tape from the evaporator inlet and outlet tubes.
5. Install the new sealing washers onto the evaporator inlet and outlet tubes. Refer to **Air Conditioning System Seal Replacement**.
6. Install the evaporator outlet and inlet tube to the TXV.

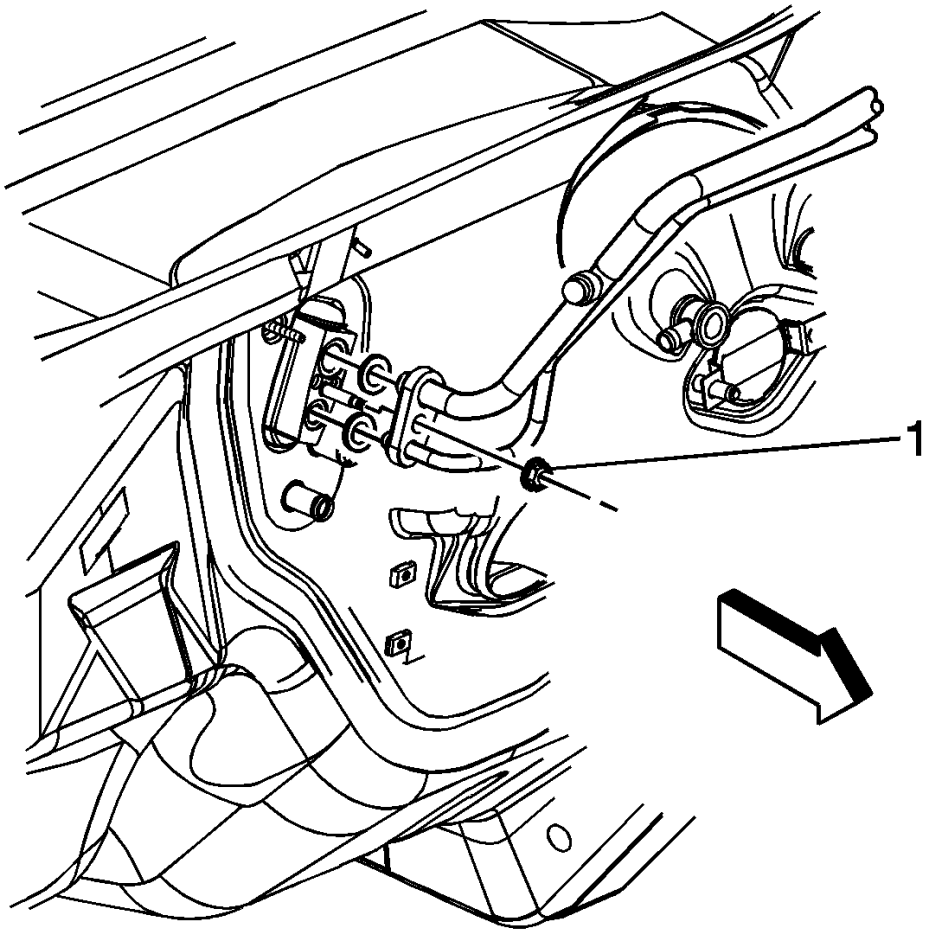

Fig. 39: Evaporator Tube And Thermostatic Expansion Valve (TXV) Nut
Courtesy of GENERAL MOTORS COMPANY

7. Install the evaporator tube nut (1) and tighten to 17 N.m (13 lb ft).
8. Evacuate and recharge the A/C system. Refer to **Refrigerant Recovery and Recharging**.
9. Leak test the fittings of the component using **J 39400-A** Halogen Leak Detector.

AIR CONDITIONING (A/C) REFRIGERANT PRESSURE SENSOR REPLACEMENT

Special Tools

J 39400-A Halogen Leak Detector

Removal Procedure

1. Remove the air cleaner assembly. Refer to **Air Cleaner Assembly Replacement**
2. Disconnect the electrical connector from the A/C refrigerant pressure sensor.

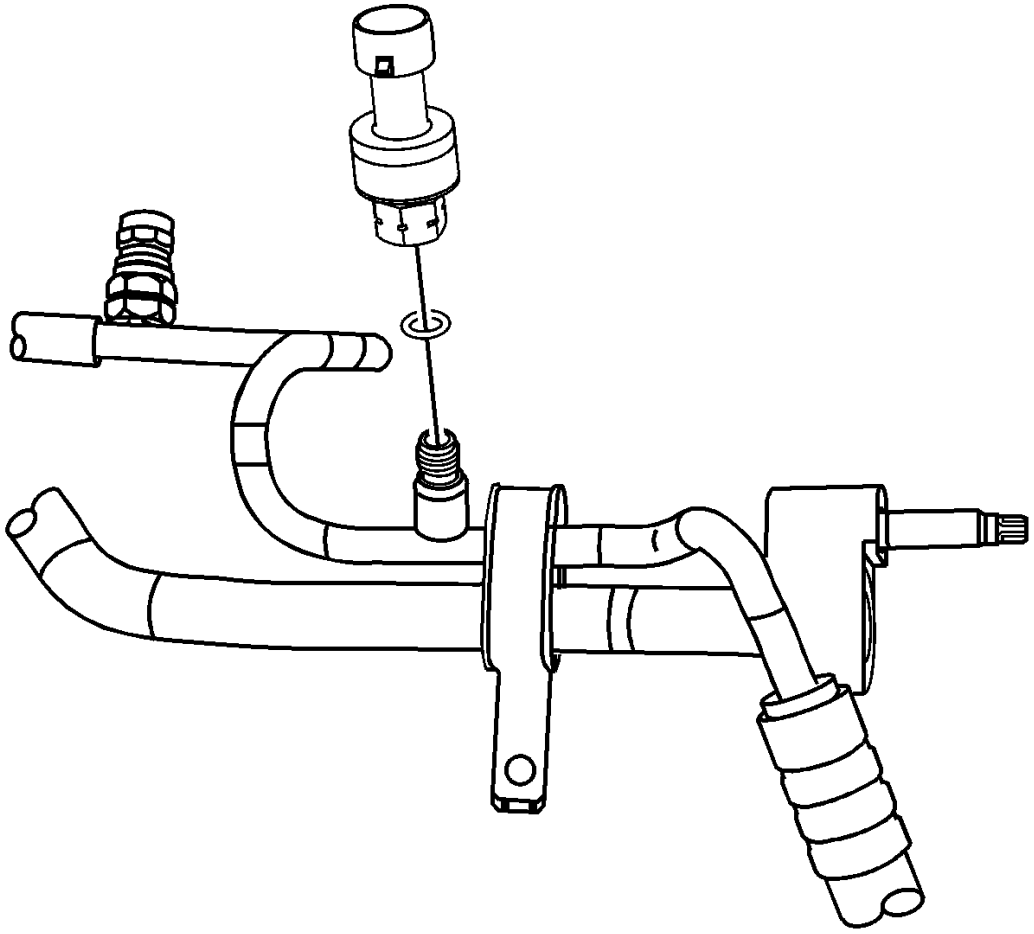

Fig. 40: Identifying Refrigerant Pressure Sensor
Courtesy of GENERAL MOTORS COMPANY

3. Remove the A/C refrigerant pressure sensor from the evaporator tube.

Installation Procedure

1. Replace the O-ring seal for the A/C refrigerant pressure sensor. Refer to **Air Conditioning O-Ring Seal Replacement**.

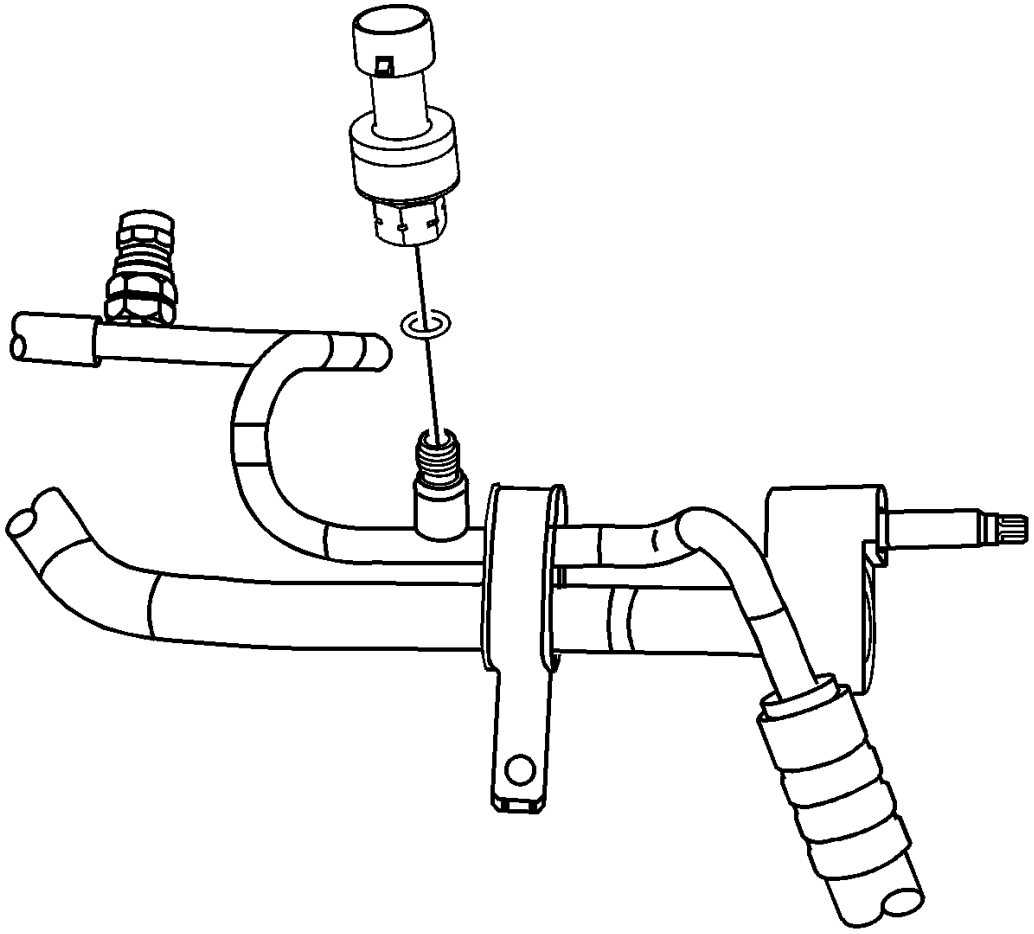

Fig. 41: Identifying Refrigerant Pressure Sensor
Courtesy of GENERAL MOTORS COMPANY

CAUTION: Refer to Fastener Caution .

2. Install the A/C refrigerant pressure sensor to the evaporator tube and tighten to 4.7 N.m (41 lb in).
3. Connect the electrical connector to the A/C refrigerant pressure sensor.
4. Install the air cleaner assembly. Refer to **Air Cleaner Assembly Replacement**
5. Leak test the fittings of the component using **J 39400-A** Halogen Leak Detector.

EVAPORATOR AIR TEMPERATURE SENSOR REPLACEMENT

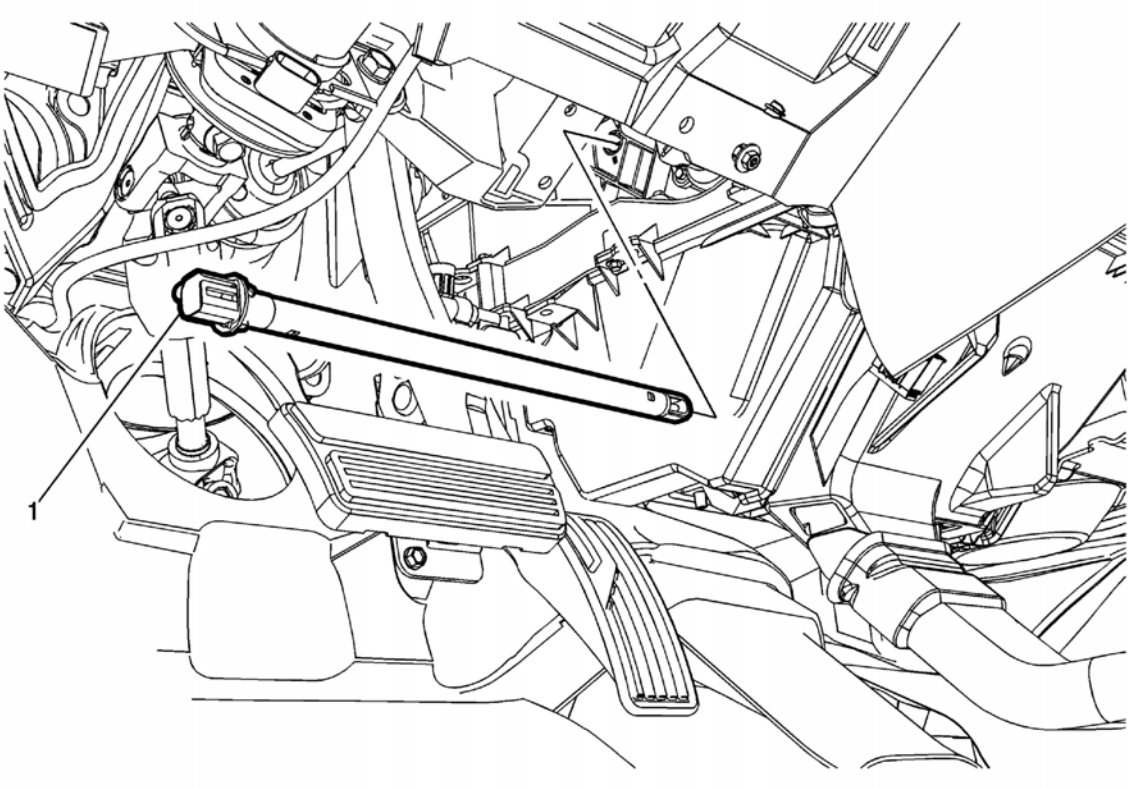

Fig. 42: Evaporator Air Temperature Sensor
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure Remove the left side Instrument Panel Insulator Panel. Refer to **Instrument Panel Insulator Panel Replacement - Left Side** .	
1	Air Conditioning Evaporator Air Temperature Sensor **Procedure** 1. Disconnect the air conditioning evaporator air temperature sensor connector. 2. Rotate the air conditioning evaporator air temperature sensor 1/4 of a turn counterclockwise to remove.

AIR CONDITIONING CONDENSER REPLACEMENT

Special Tools

J 39400-A Halogen Leak Detector

Removal Procedure

1. Recover the refrigerant. Refer to **Refrigerant Recovery and Recharging**.
2. Remove the radiator. Refer to **Radiator Replacement** .

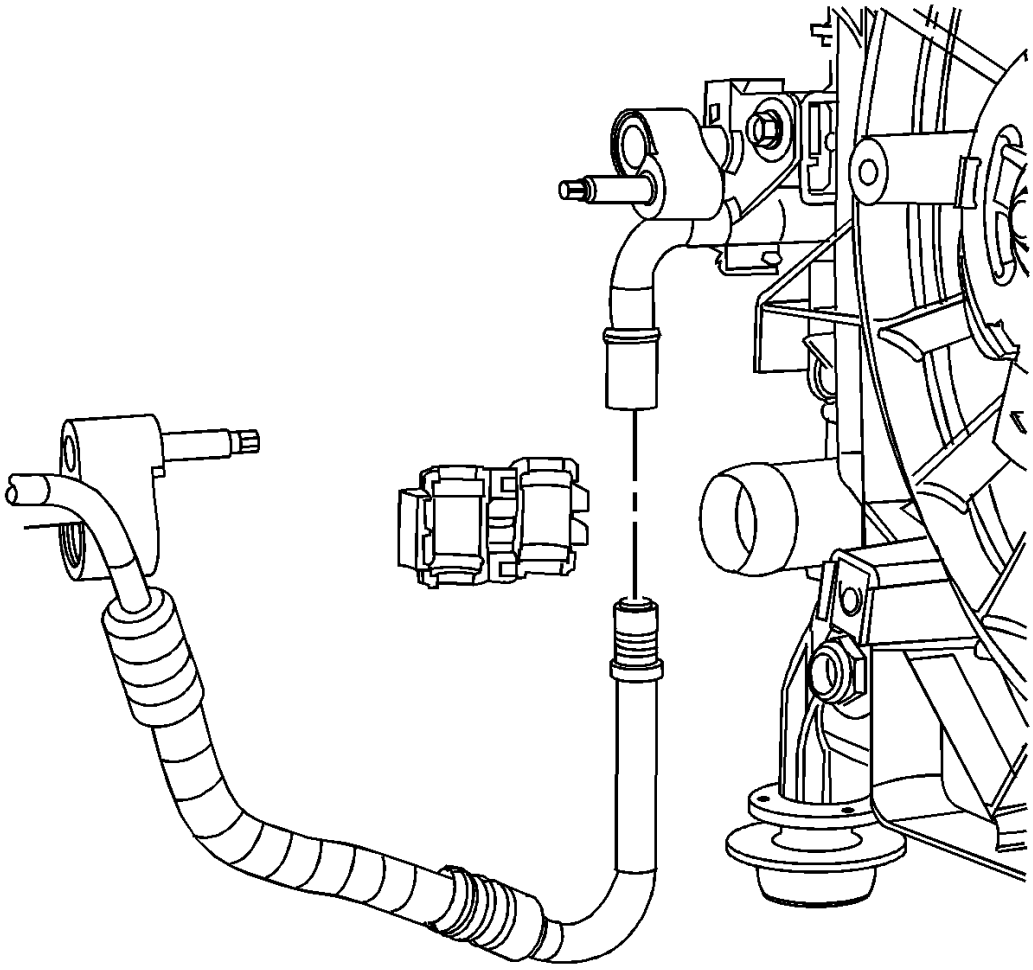

Fig. 43: View Of A/C Line Coupling At Condenser Tube
Courtesy of GENERAL MOTORS COMPANY

3. Remove the A/C line coupling from the condenser tube to evaporator tube. Refer to **Air Conditioning Line/Tube Connector Removal/Replacement**.

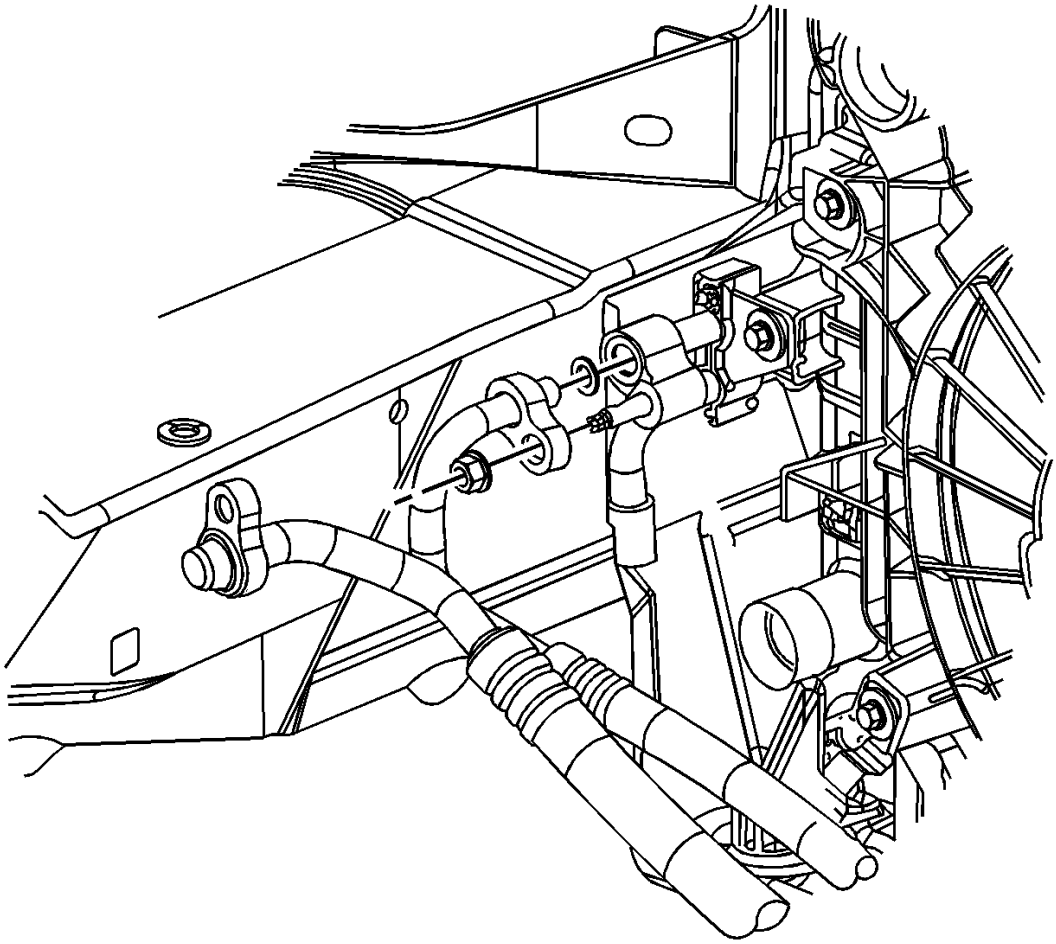

Fig. 44: Identifying A/C Compressor Hose Nut
Courtesy of GENERAL MOTORS COMPANY

4. Remove the A/C compressor line nut from the condenser and position the A/C compressor line aside.
5. Remove the condenser from the vehicle.
6. Remove and discard the O-ring seals and seal washer.

Installation Procedure

1. If replacing the condenser, add refrigerant oil to the condenser. Refer to **Refrigerant System Specifications** for system capacity information.
2. Install the condenser to the vehicle.
3. Install a new seal washer onto the A/C compressor hose. Refer to **Air Conditioning System Seal Replacement**.
4. Install new O-ring seals onto the evaporator tube. Refer to **Air Conditioning O-Ring Seal Replacement**.
5. Install the radiator. Refer to **Radiator Replacement** .

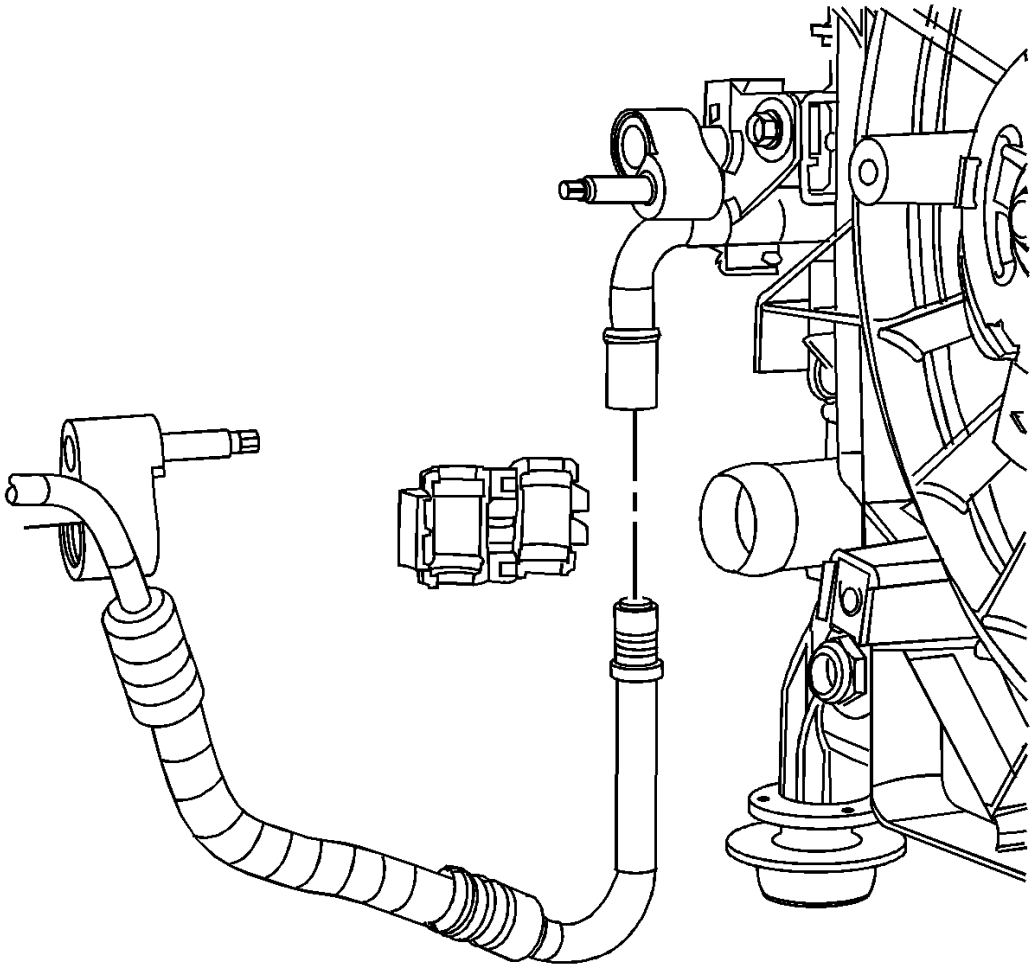

Fig. 45: View Of A/C Line Coupling At Condenser Tube
Courtesy of GENERAL MOTORS COMPANY

6. Install the evaporator tube to the condenser.
7. Install the A/C line coupling to the evaporator tube and condenser tube. Refer to **Air Conditioning Line/Tube Connector Removal/Replacement**.

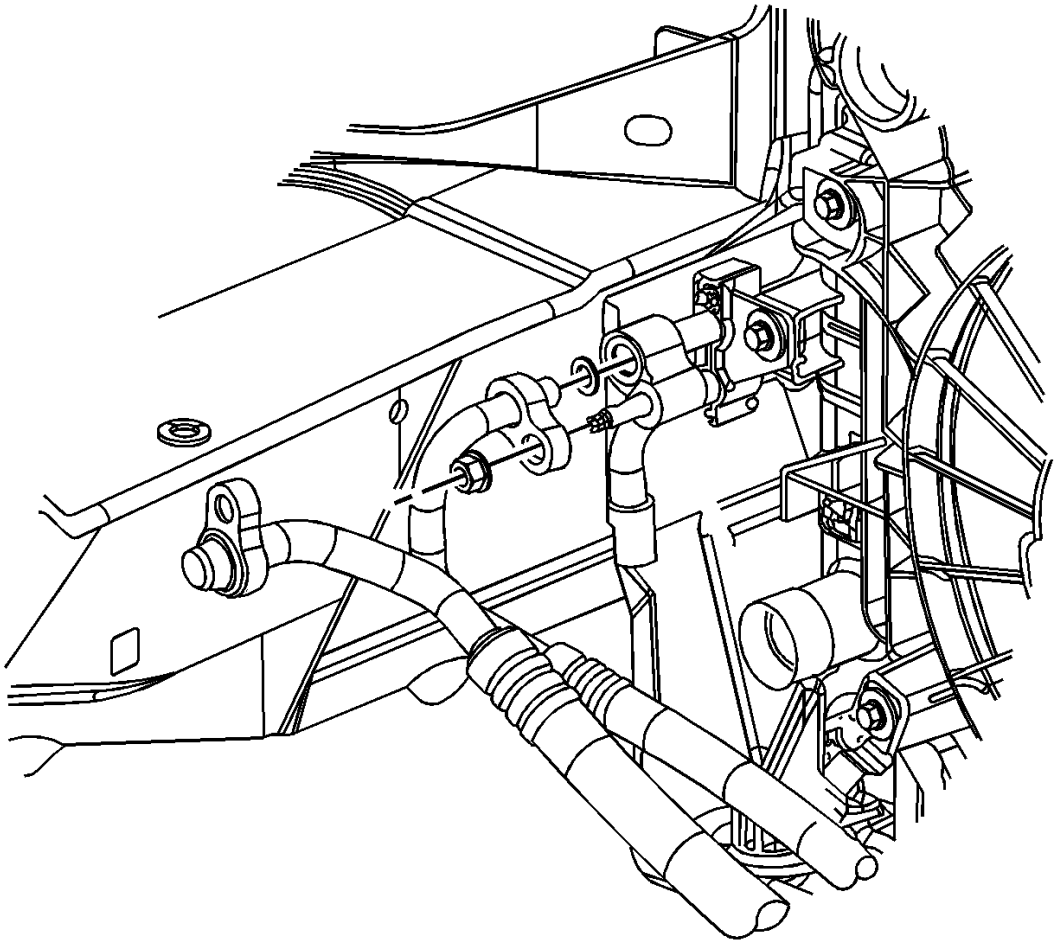

Fig. 46: Identifying A/C Compressor Hose Nut
Courtesy of GENERAL MOTORS COMPANY

8. Install the A/C compressor hose to the condenser.

CAUTION: **Refer to Fastener Caution .**

NOTE: **Use a 20 mm wrench or pliers to hold the A/C condenser block fitting, this will prevent the A/C line from twisting while torquing the A/C line nut.**

9. Install the A/C compressor hose block fitting nut to the condenser and tighten to 17 N.m (12.5 lb ft).
10. Evacuate and recharge the A/C system. Refer to **Refrigerant Recovery and Recharging**.
11. Leak test the fittings of the component using **J 39400-A** Halogen Leak Detector.

AIR CONDITIONING (A/C) EVAPORATOR CASE ASSEMBLY REPLACEMENT

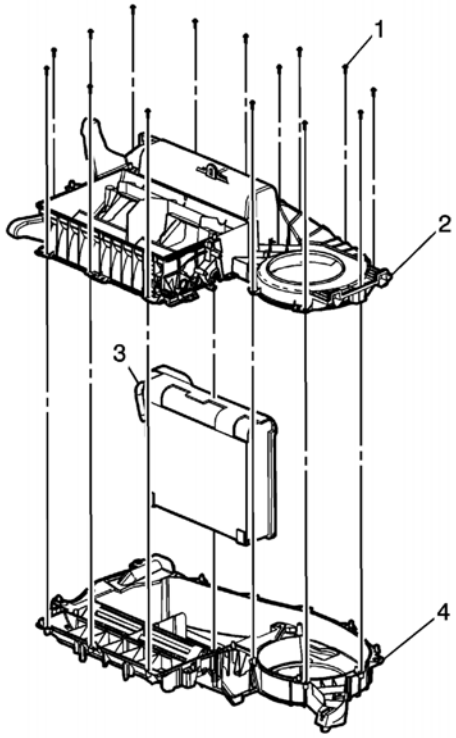

Fig. 47: Air Conditioning (A/C) Evaporator Case Assembly
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure 1. Remove the HVAC module. Refer to **Air Conditioning and Heater Module Assembly Removal and Installation**. 2. Remove the mode valve assembly. Refer to **Mode Valve Assembly Replacement**. 3. Remove the heater core. Refer to **Heater Core Replacement**.	
1	Evaporator Case Assembly Screw (Qty: 17) **CAUTION:** **Refer to Fastener Caution .** **TIP:** Remove the heat stakes that secure the HVAC module assembly upper case to the HVAC module lower case using a small chisel. **Tighten** 1.5 N.m (13 lb in)
2	Evaporator - Upper Case
3	Air Conditioning Evaporator
4	Evaporator - Lower Case

AIR CONDITIONING AND HEATER MODULE ASSEMBLY REMOVAL AND INSTALLATION

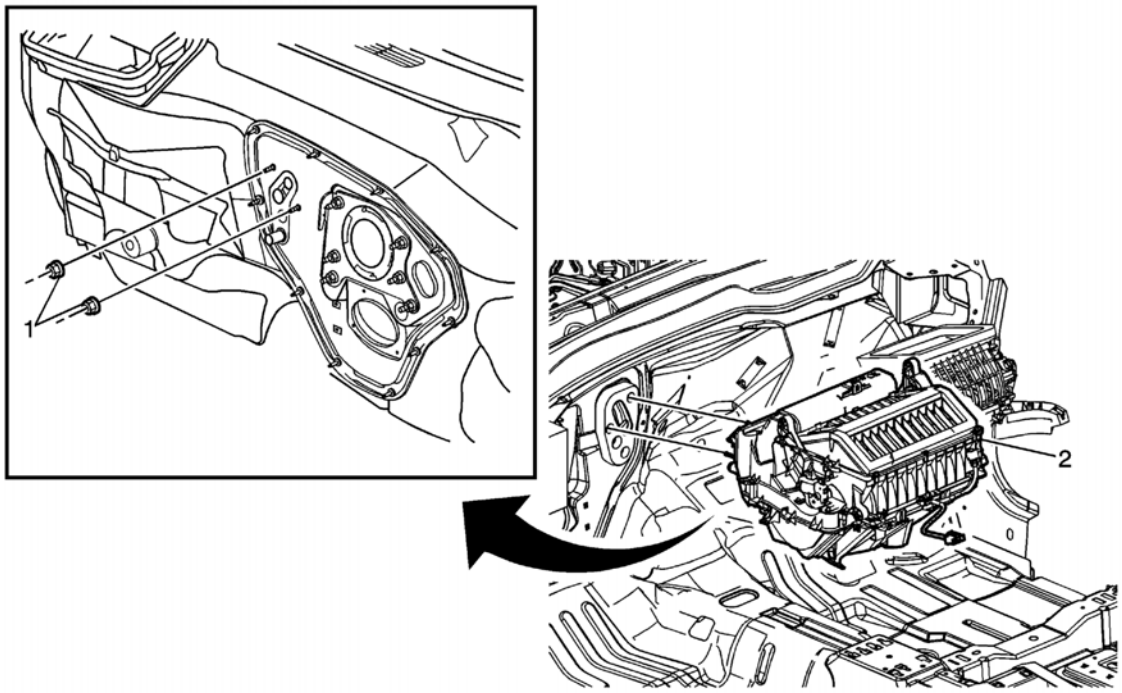

Fig. 48: HVAC Module Assembly
Courtesy of GENERAL MOTORS COMPANY

Call out	Component Name
WARNING: **Refer to** **Battery Disconnect Warning .** **CAUTION:** **Refer to** **HVAC Module Drain Tube Caution .** **Preliminary Procedure** 1. **Battery Negative Cable Disconnection and Connection** 2. **Refrigerant Recovery and Recharging** 3. **Cooling System Draining and Filling** 4. **Heater Inlet Hose Replacement** 5. **Heater Outlet Hose Replacement** 6. **Air Conditioning Evaporator Thermal Expansion Valve Tube Replacement** 7. Remove the evaporator drain tube from the evaporator case.	

Call out	Component Name
8. Instrument Panel Carrier Replacement	
1	Heater and Air Conditioning Module Nut **CAUTION:** **Refer to Fastener Caution .** **Tighten** 10 N.m (89 lb in)
2	Heater and Air Conditioning Evaporator Module Assembly

AIR CONDITIONING EVAPORATOR CORE REPLACEMENT

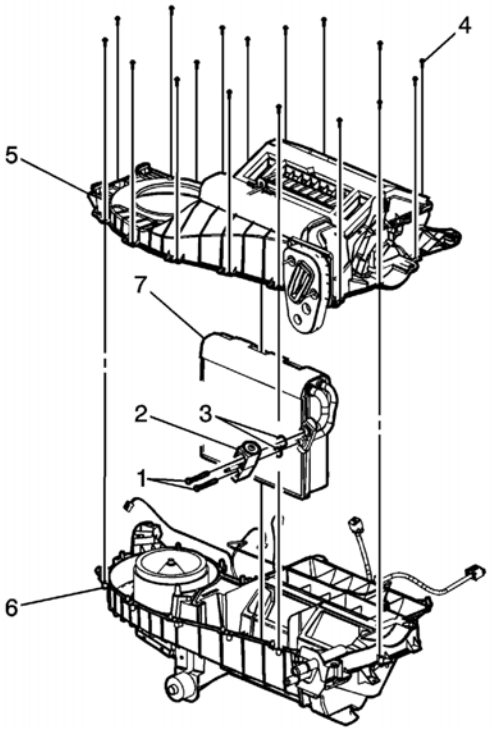

Fig. 49: Evaporator Core
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure	
1. Remove the HVAC module. Refer to **Air Conditioning and Heater Module Assembly Removal and Installation**. **NOTE:**	

Callout	Component Name
Leave the left temperature actuator attached to the air inlet assembly. 2. Remove the air inlet assembly. Refer to **Air Inlet Assembly Replacement**.	
1	Thermal Expansion Valve Bolt (Qty: 2) **CAUTION:** **Refer to Fastener Caution .** **Tighten** 7 N.m (62 lb in)
2	Thermal Expansion Valve
3	Sealing Washer **TIP:** Remove and discard sealing washers. Refer to **Air Conditioning System Seal Replacement**
4	Evaporator Case Assembly Screw (Qty: 17) **TIP:** Remove the heat stakes that secure the HVAC module assembly upper case to the HVAC module lower case using a small chisel. **Tighten** 1.5 N.m (13 lb in)
5	Evaporator - Upper Case
6	Evaporator - Lower Case
7	Air Conditioning Evaporator

HEATER INLET HOSE REPLACEMENT

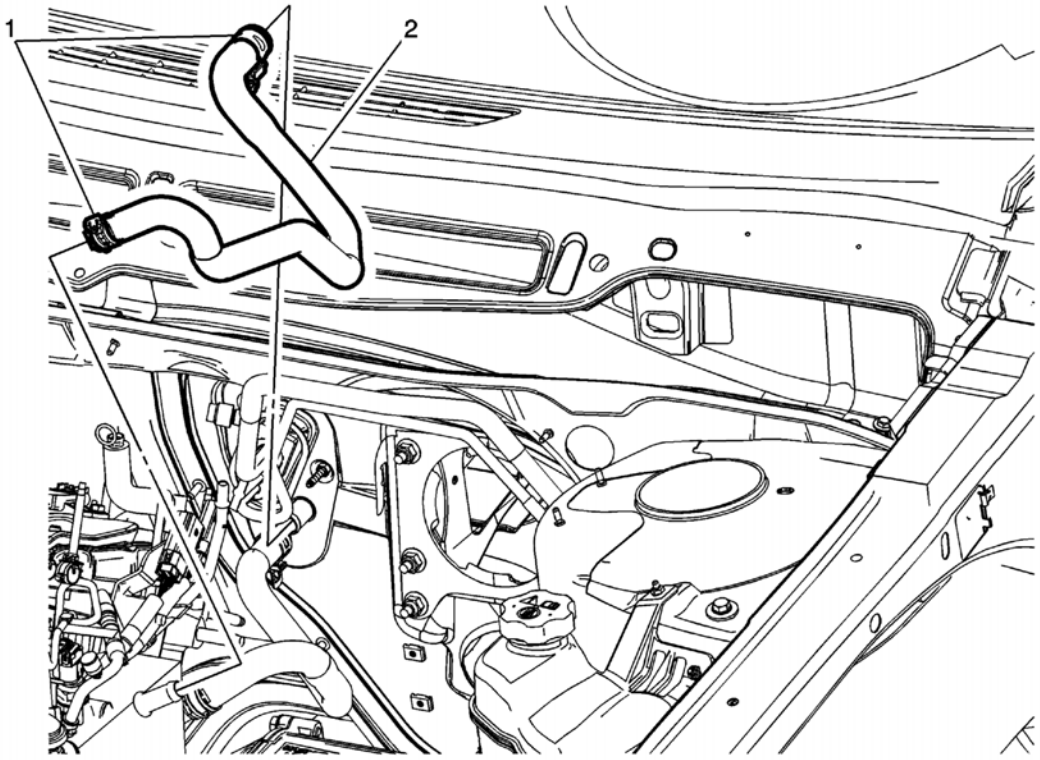

Fig. 50: Heater Inlet Hose
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedures 1. Drain the cooling system. Refer to **Cooling System Draining and Filling** . 2. Remove the manifold cover replacement . Refer to **Intake Manifold Cover Replacement** . 3. Remove air cleaner assembly. Refer To **Air Cleaner Assembly Replacement** .	
1	Heater Inlet Hose Clamp (Qty: 2) **Procedure** Reposition the heater inlet hose clamp using **BO-38185** Hose Clamp Pliers. **Special Tools** **BO-38185** Hose Clamp Pliers For equivalent regional tools. Refer to **Special Tools**.
2	Heater Inlet Hose

HEATER OUTLET HOSE REPLACEMENT

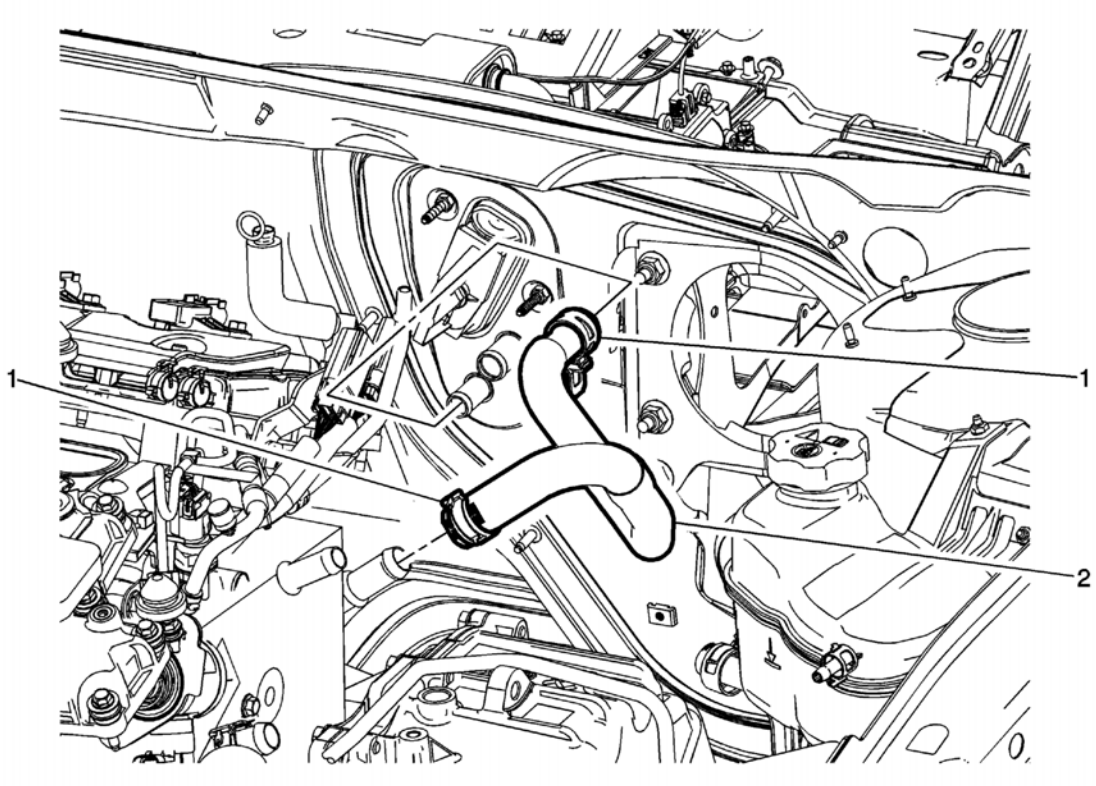

Fig. 51: Heater Outlet Hose
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedures 1. Drain the cooling system. Refer to **Cooling System Draining and Filling** . 2. Remove the manifold cover. Refer to **Intake Manifold Cover Replacement** . 3. Remove air cleaner assembly. Refer to **Air Cleaner Assembly Replacement** .	
1	Heater Outlet Hose Clamp (Qty: 2) **Procedure** Reposition the heater inlet hose clamp using **BO-38185** Hose Clamp Pliers. **Special Tools** **BO-38185** Hose Clamp Pliers For equivalent regional tools. Refer to **Special Tools**.
2	Heater Outlet Hose

PASSENGER COMPARTMENT AIR FILTER REPLACEMENT

Removal Procedure

1. Reposition rear hood seal halfway to the center. Refer to **Hood Rear Seal Replacement** .
2. Remove the washer hose from the right air inlet grill panel and position aside.

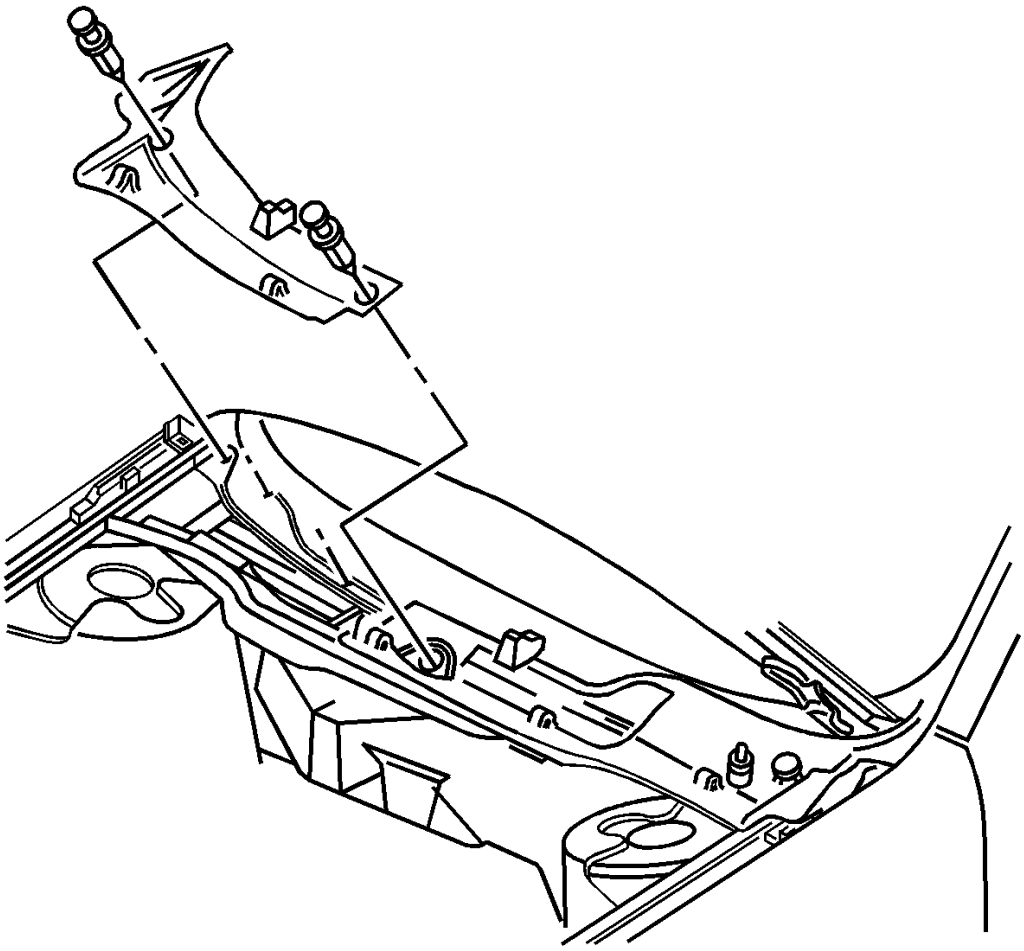

Fig. 52: Right Air Inlet Grill Panel Retainers
Courtesy of GENERAL MOTORS COMPANY

3. Remove the 2 push pin retainers from the right air inlet grill panel.

IMPORTANT: Do not remove the third push pin retainer from the right air inlet grill panel.

4. Reposition the right air inlet grill panel on to the windshield.
5. Remove the water deflector cover.

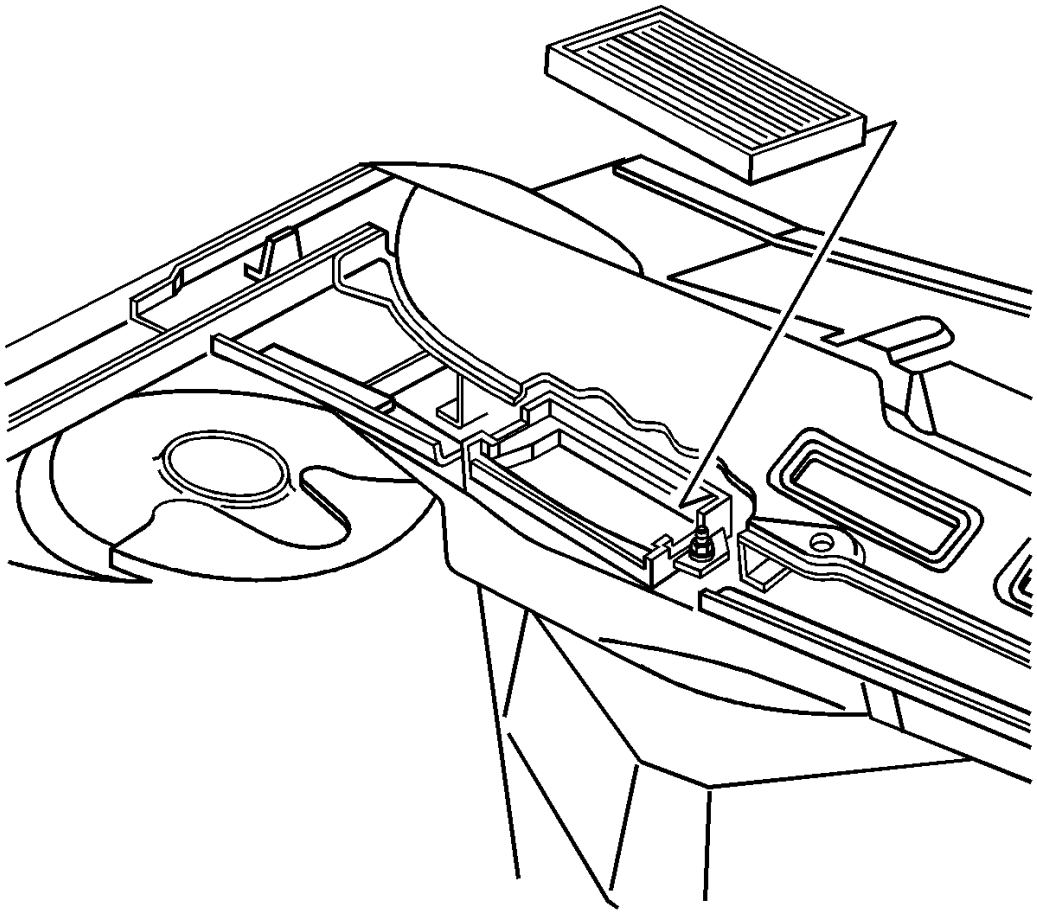

Fig. 53: View Of Passenger Compartment Air Filter
Courtesy of GENERAL MOTORS COMPANY

6. Remove the passenger compartment air filter.

Installation Procedure

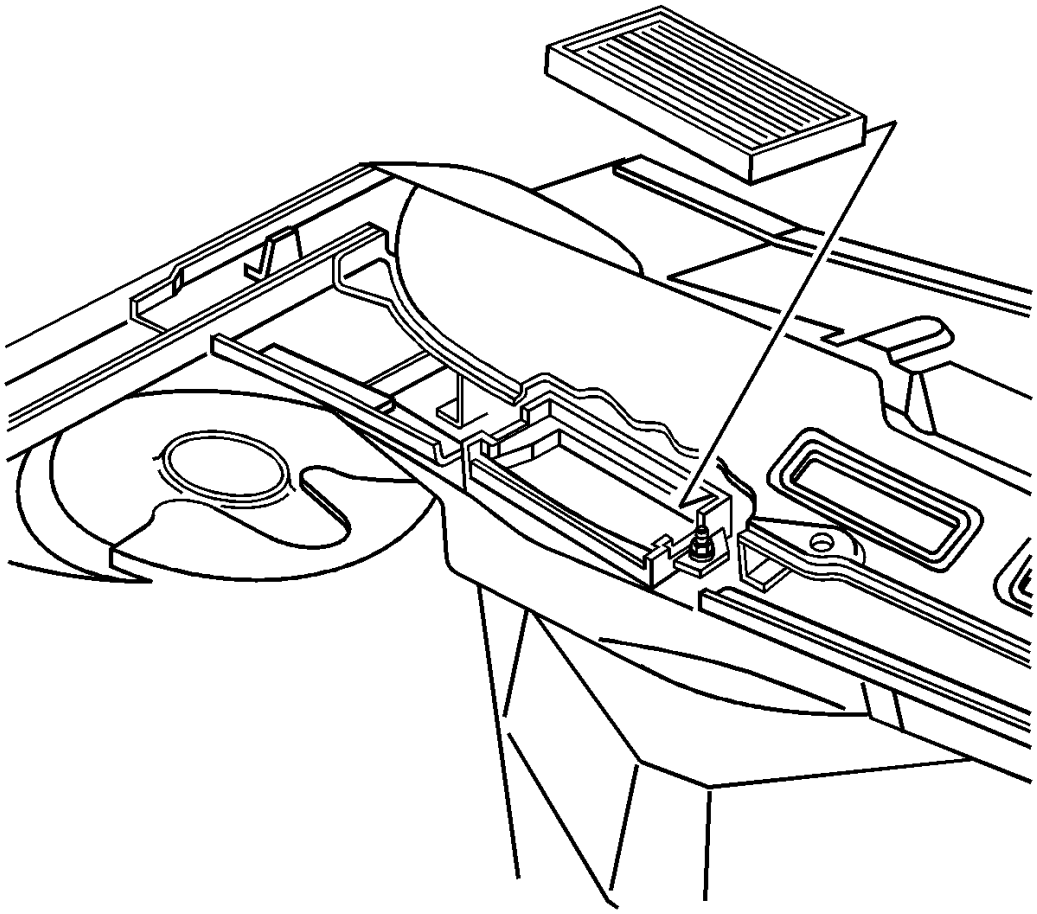

Fig. 54: View Of Passenger Compartment Air Filter
Courtesy of GENERAL MOTORS COMPANY

1. Install the passenger compartment air filter.
2. Install the water deflector cover. Ensure the three tabs of the water deflector engage the rear cowl edge.

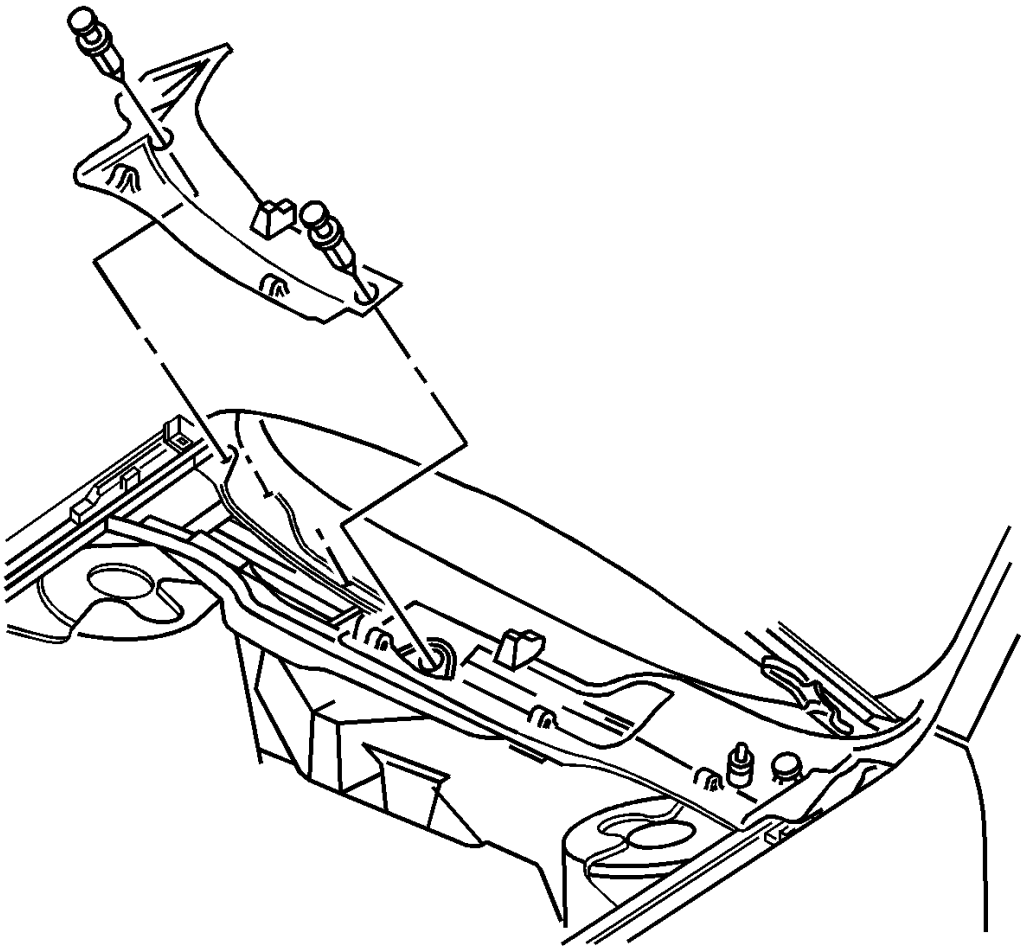

Fig. 55: Right Air Inlet Grill Panel Retainers
Courtesy of GENERAL MOTORS COMPANY

3. Install the air inlet grill panel .
4. Install the air inlet grill panel push pin retainers .
5. Install the washer hose through the right air inlet grill panel clips.
6. Install the rear hood seal. Refer to **Hood Rear Seal Replacement** .

AIR INLET ASSEMBLY REPLACEMENT

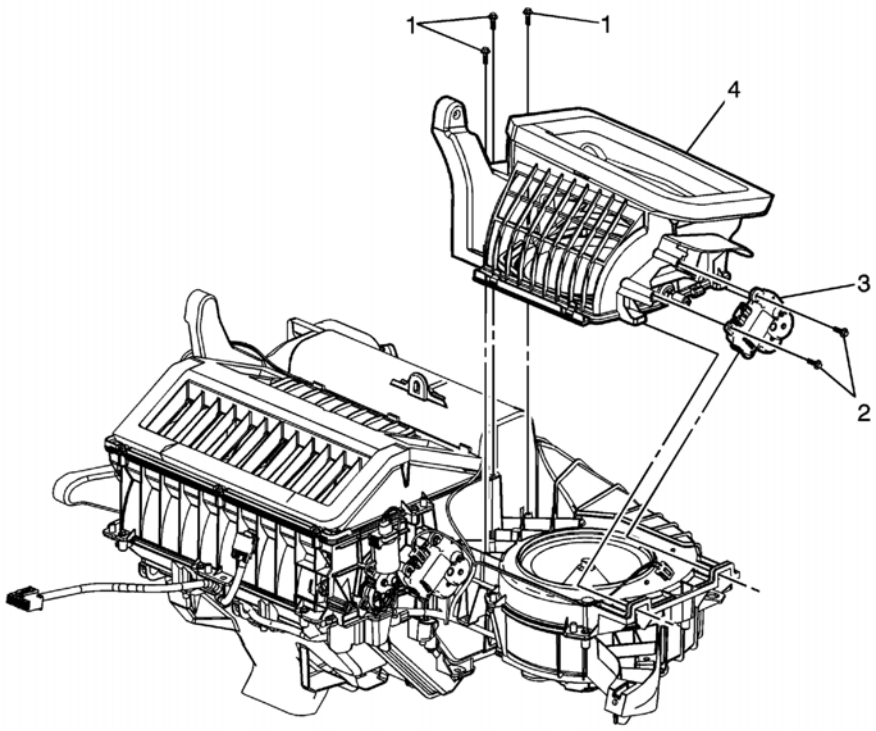

Fig. 56: Air Inlet Assembly
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure 1. Remove the HVAC module. Refer to **Air Conditioning and Heater Module Assembly Removal and Installation**. 2. Disconnect the electrical connector from the recirculation actuator.	
1	Air Inlet Assembly Screw (Qty: 3) **CAUTION:** **Refer to Fastener Caution .** **Tighten** 1.5 N.m (13 lb in)
2	Recirculation Actuator Screw (Qty: 2) **Tighten** 1.5 N.m (13 lb in)
3	Recirculation Actuator
4	Air Inlet Housing Assembly

BLOWER MOTOR CONTROL MODULE REPLACEMENT

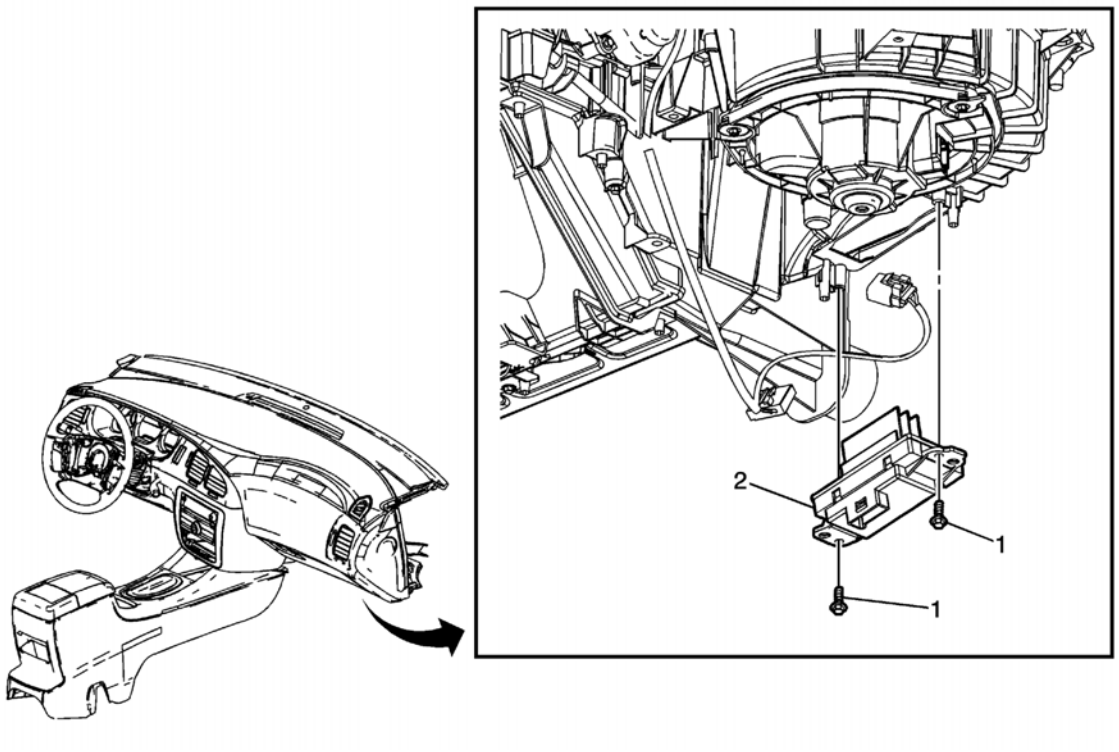

Fig. 57: Blower Control Module
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure 1. Remove the right closeout insulator. Refer to **Instrument Panel Insulator Panel Replacement - Right Side** . 2. Disconnect the blower motor resistor electrical connector.	
1	Blower Motor Resistor Screw (Qty: 2) **CAUTION:** **Refer to Fastener Caution .** **TIP:** Remove the heat stakes that secure the blower motor resistor to the HVAC module assembly using a small chisel. **Tighten** 1.5 N.m (13 lb in)
2	Blower Motor Resistor Refer to **Control Module References** for programming and setup information.

BLOWER MOTOR REPLACEMENT

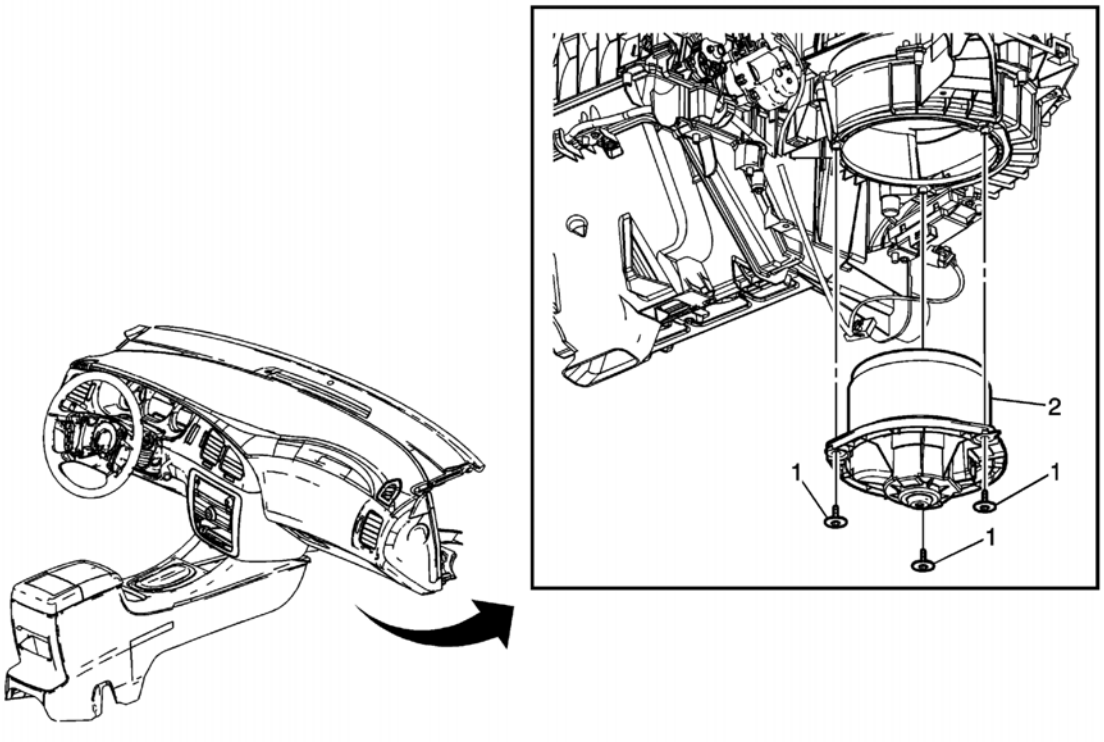

Fig. 58: Blower Motor
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure 1. Remove the right closeout insulator. Refer to **Instrument Panel Insulator Panel Replacement - Right Side** . 2. Disconnect the blower motor electrical connector.	
1	Blower Motor Screw (Qty: 2) **CAUTION:** **Refer to** **Fastener Caution** . **Tighten** 1.5 N.m (13 lb in)
2	Blower Motor

AIR DISTRIBUTOR DUCT REPLACEMENT

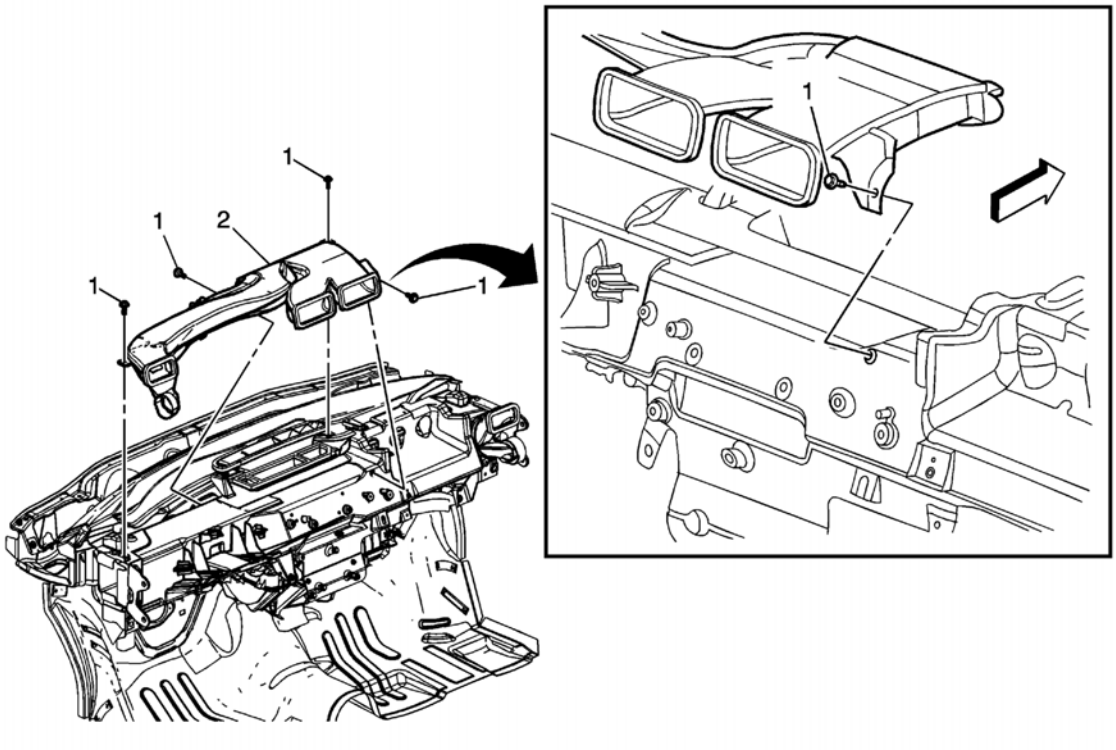

Fig. 59: Air Distributor Duct
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure Remove the lower instrument panel trim pad. Refer to **Instrument Panel Lower Trim Panel Replacement** .	
1	Air Distributor Assembly Bolt **CAUTION:** **Refer to** **Fastener Caution** . **Tighten** 10 N.m (89 lb in)
2	Air Distributor Assembly

INSTRUMENT PANEL OUTER AIR OUTLET REPLACEMENT - RIGHT SIDE

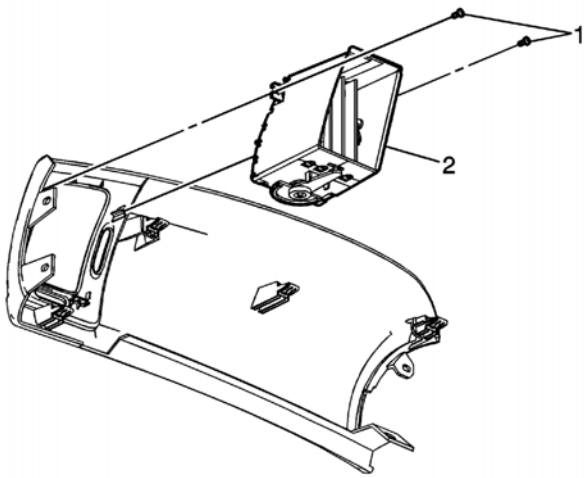

Fig. 60: Identifying Air Outlet - Instrument Panel - Right
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure Remove the instrument panel trim plate. Refer to **Instrument Panel Trim Plate Replacement** .	
1	Instrument Panel Outer Air Outlet Deflector Screw (Qty: 2) **CAUTION:** **Refer to** **Fastener Caution** . **Tighten** 1.5 N.m (14 lb in)
2	Instrument Panel Outer Air Outlet Deflector - RH

INSTRUMENT PANEL OUTER AIR OUTLET UPPER DUCT REPLACEMENT - RIGHT SIDE

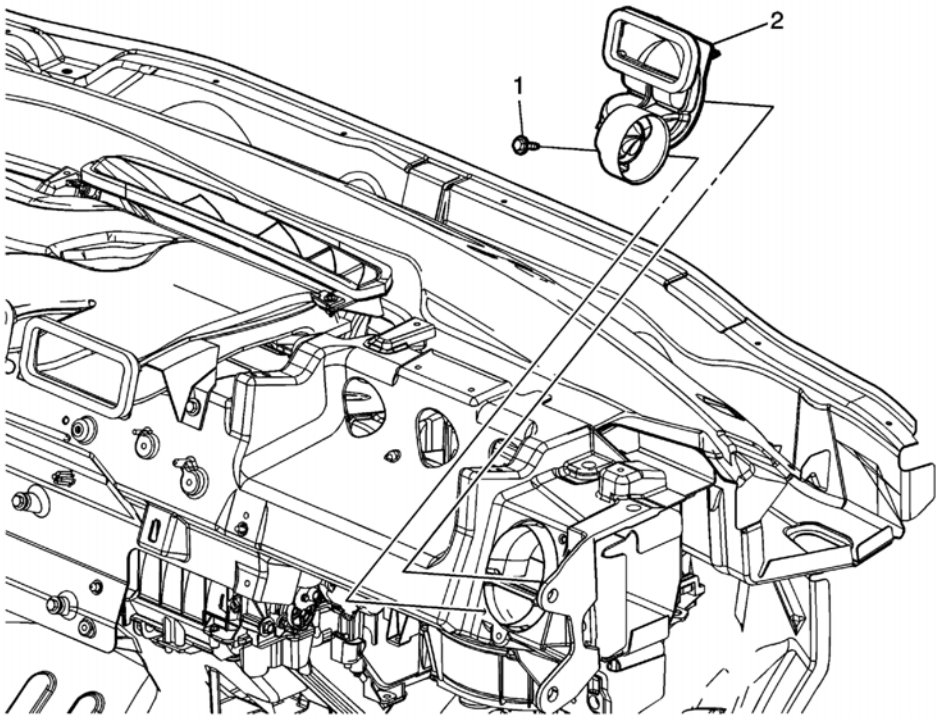

Fig. 61: Upper Right Air Outlet Duct
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure Remove the lower instrument panel trim pad. Refer to **Instrument Panel Lower Trim Panel Replacement** .	
1	Air Distributor Right Hand Extension Duct Assembly Bolt **CAUTION:** **Refer to** **Fastener Caution** . **Tighten** 16 N.m (12 lb ft)
2	Air Distributor Right Hand Extension Duct Assembly

REAR FLOOR AIR OUTLET REPLACEMENT

Removal Procedure

1. Remove the floor carpet. Refer to **Floor Panel Carpet Replacement (Impala)** .

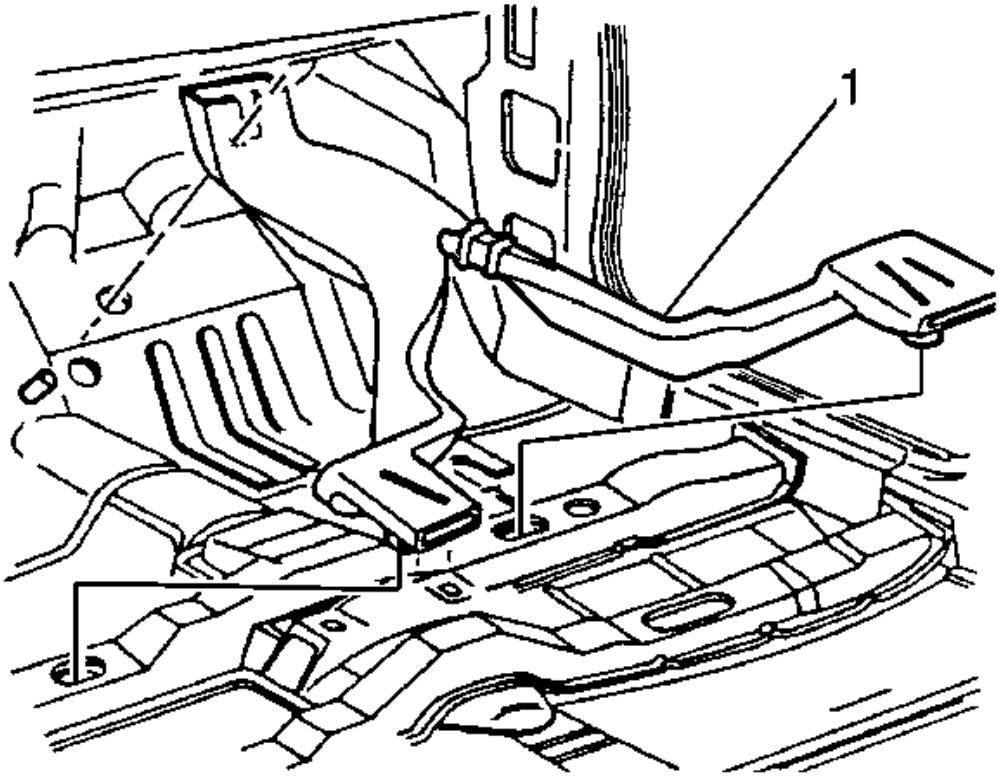

Fig. 62: Locating Rear Floor Air Outlet Duct
Courtesy of GENERAL MOTORS COMPANY

2. Remove the rear floor air outlet duct (1) from the holes in the floor reinforcement.
3. Disconnect the rear floor air outlet duct from the heater outlet cover.
4. Remove the rear floor air outlet duct.

Installation Procedure

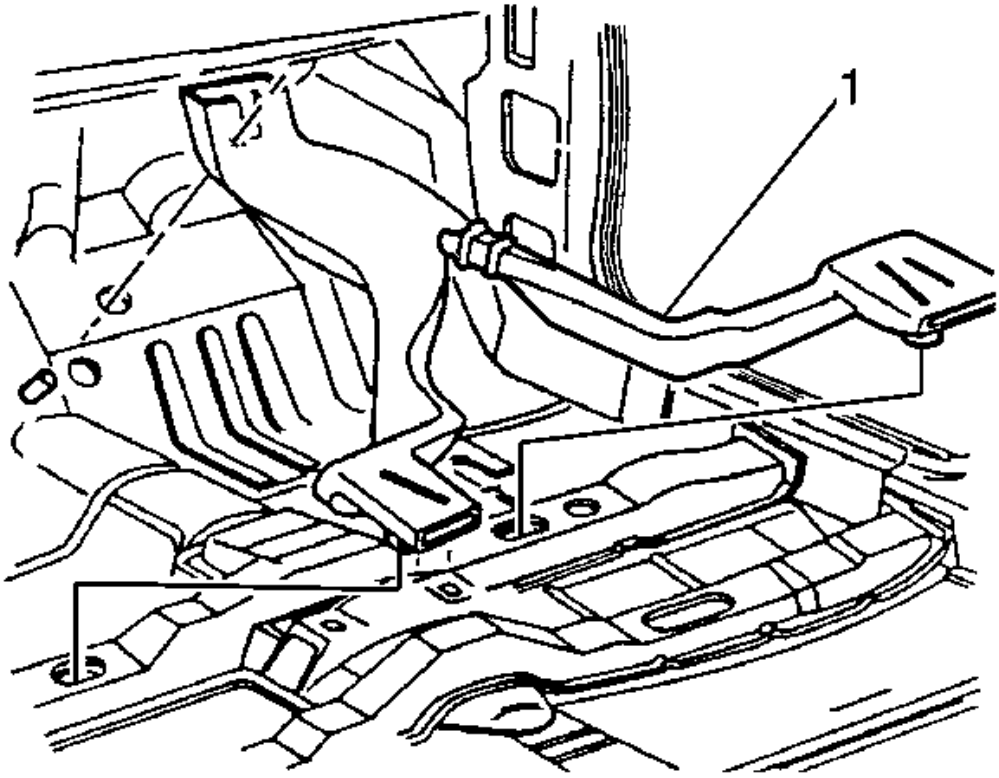

Fig. 63: Locating Rear Floor Air Outlet Duct
Courtesy of GENERAL MOTORS COMPANY

1. Install the rear floor air outlet duct.
2. Connect the rear floor air outlet duct to the heater outlet cover.
3. Position the rear floor air outlet duct (1) into the holes in the floor reinforcement.
4. Install the floor carpet. Refer to **Floor Panel Carpet Replacement (Impala)** .

DEFROSTER AIR OUTLET DUCT REPLACEMENT

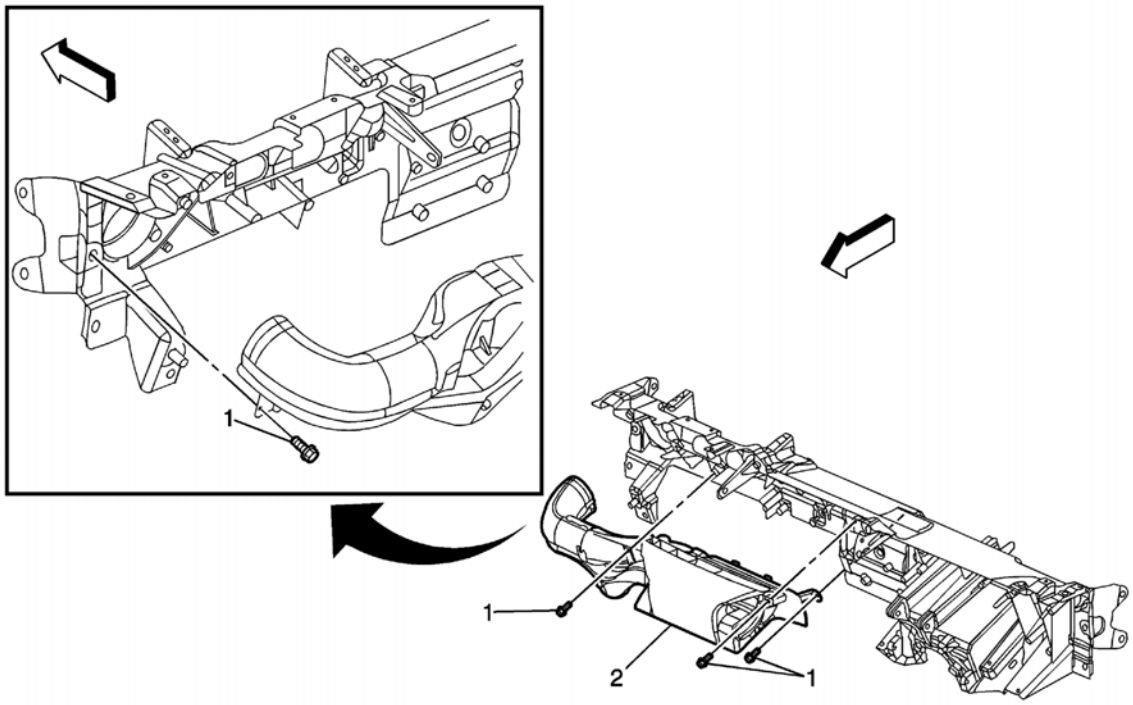

Fig. 64: Defroster Air Outlet Duct
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure Remove the instrument panel carrier. Refer to **Instrument Panel Carrier Replacement** .	
1	Air Distributor Assembly - Windshield Defroster Nozzle Bolt (Qty: 4) **CAUTION:** **Refer to** **Fastener Caution** . **Tighten** 10 N.m (89 lb in).
2	Distributor Assembly - Windshield Defroster Nozzle and Air

AIR TEMPERATURE DOOR REPLACEMENT

Removal Procedure

1. Remove the HVAC module assembly. Refer to **Air Conditioning and Heater Module Assembly Removal and Installation**.
2. Remove the screws that secure the recirculation housing to the HVAC module assembly.

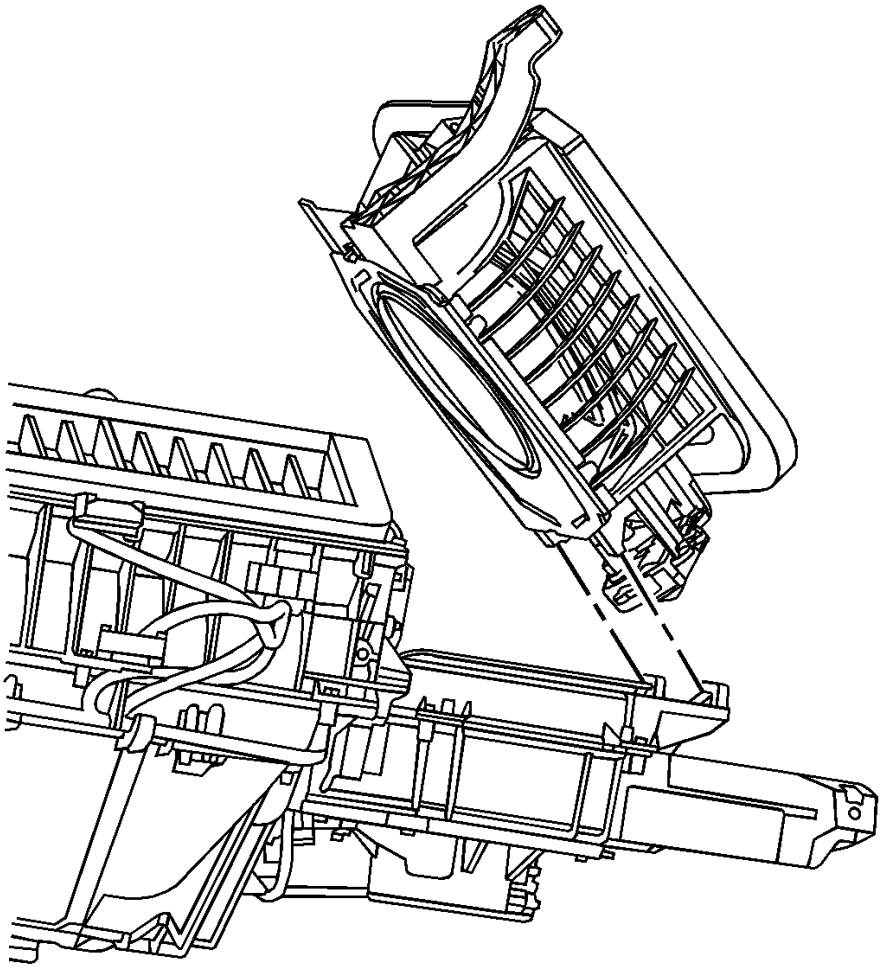

Fig. 65: Identifying Recirculation Housing
Courtesy of GENERAL MOTORS COMPANY

3. Remove the recirculation housing from the HVAC module assembly.
4. Remove the screws that secure the mode actuator to the HVAC module assembly.
5. Remove the mode actuator from the HVAC module assembly.
6. Remove the screws that secure HVAC module assembly upper case to the HVAC module assembly lower case.
7. Remove the heat stakes that secure the HVAC module assembly upper case to the HVAC module lower case using a small chisel.

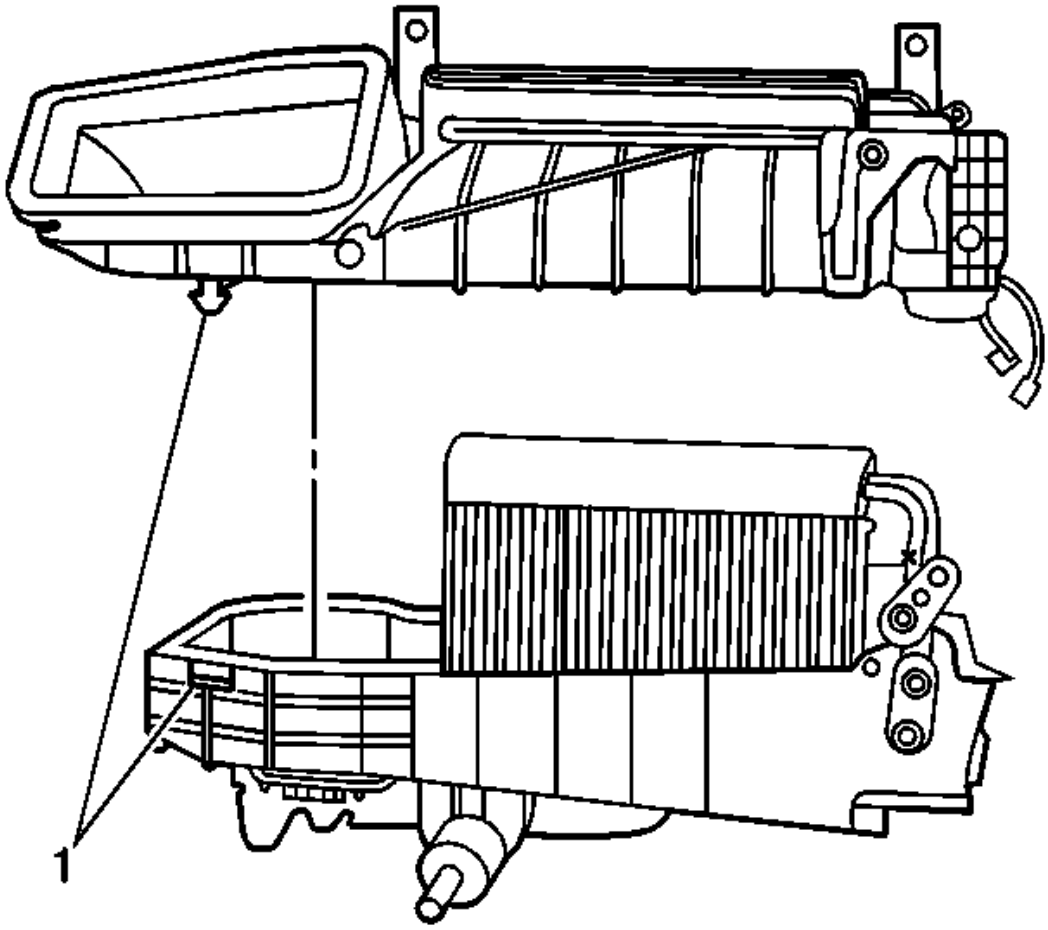

Fig. 66: View Of Upper & Lower HVAC Module Assembly Case
Courtesy of GENERAL MOTORS COMPANY

8. Separate the HVAC module assembly case (1).
9. Remove the screws that secure the air temperature actuator to the HVAC module assembly upper case.
10. Remove the air temperature actuator from the HVAC module assembly upper case.

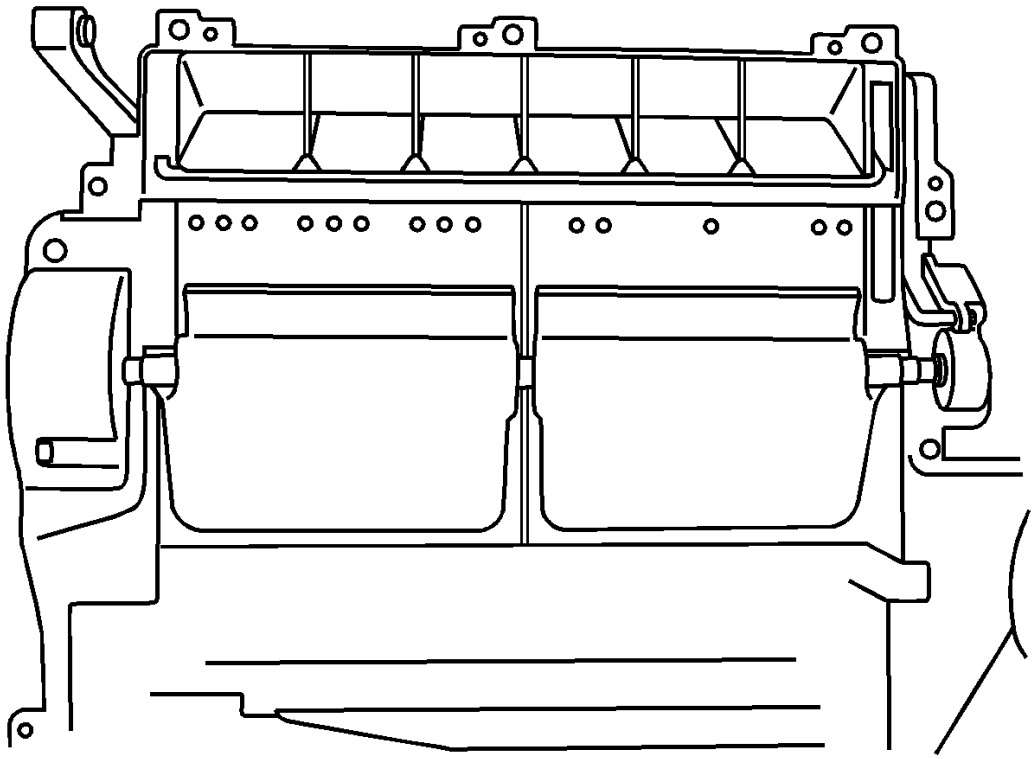

Fig. 67: Air Temperature Door - Right
Courtesy of GENERAL MOTORS COMPANY

11. Remove the air temperature door from the HVAC module assembly upper case.

Installation Procedure

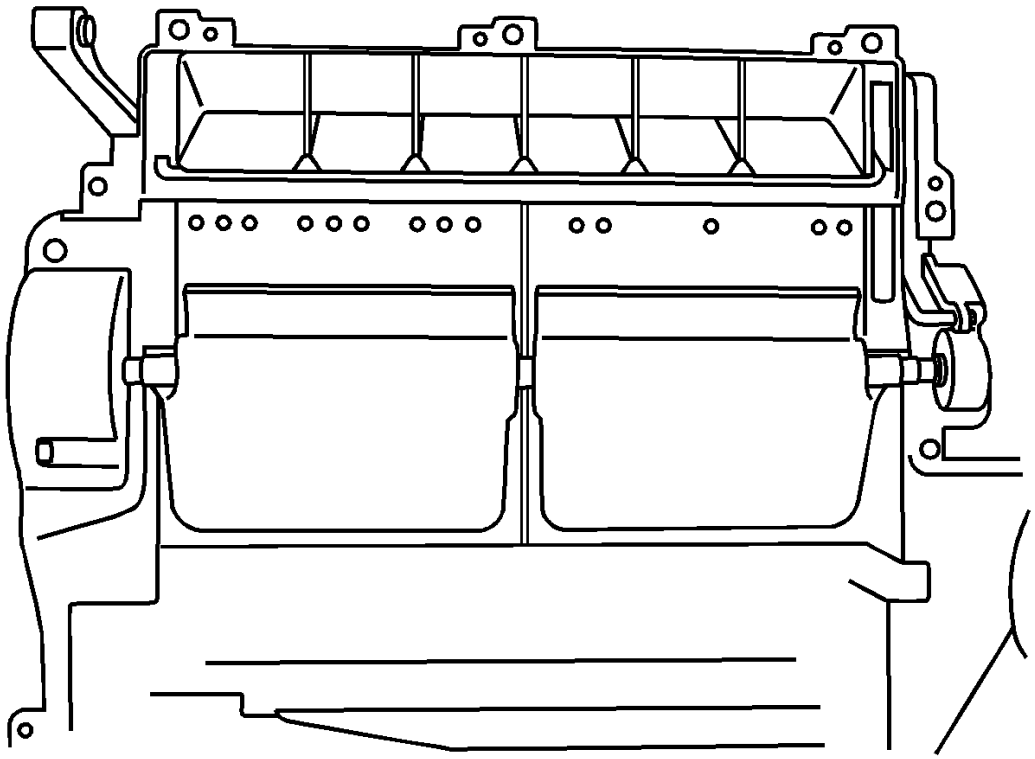

Fig. 68: Air Temperature Door - Right
Courtesy of GENERAL MOTORS COMPANY

1. Install the air temperature door to the HVAC module assembly upper case.
2. Install the air temperature actuator to the HVAC module assembly upper case.

CAUTION: Refer to Fastener Caution .

3. Install the screws that secure the air temperature actuator to the HVAC module assembly upper case.

Tighten

Tighten the screws to 1.5 N.m (13 lb in).

4. From the inside of the upper case, drill the dimples adjacent to the heat stakes using a 5.5 mm (7/32 in) drill bit.

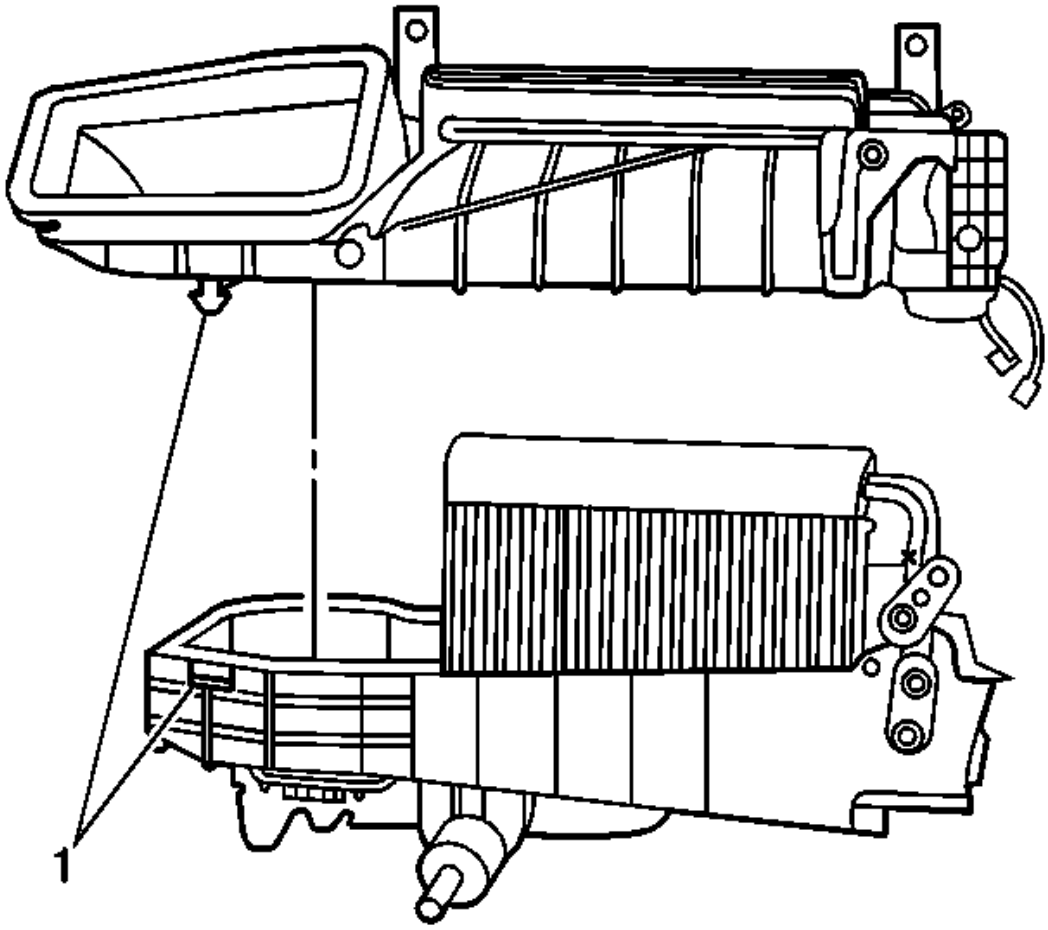

Fig. 69: View Of Upper & Lower HVAC Module Assembly Case
Courtesy of GENERAL MOTORS COMPANY

5. Align and attach the upper and lower HVAC module assembly case.
6. Install the removed screws that secure the HVAC module assembly upper case to the HVAC module assembly lower case to their original position.

   Tighten

   Tighten the screws to 1.5 N.m (13 lb in).

7. Install new screws that will secure the HVAC module assembly upper case to the HVAC module assembly lower case in the locations adjacent to the heat stakes.

   Tighten

   Tighten the screws to 1.5 N.m (13 lb in).

8. Install the mode actuator.
9. Install the screws that secure the mode actuator to the HVAC module assembly.

Tighten

Tighten the screws to 1.5 N.m (13 lb in).

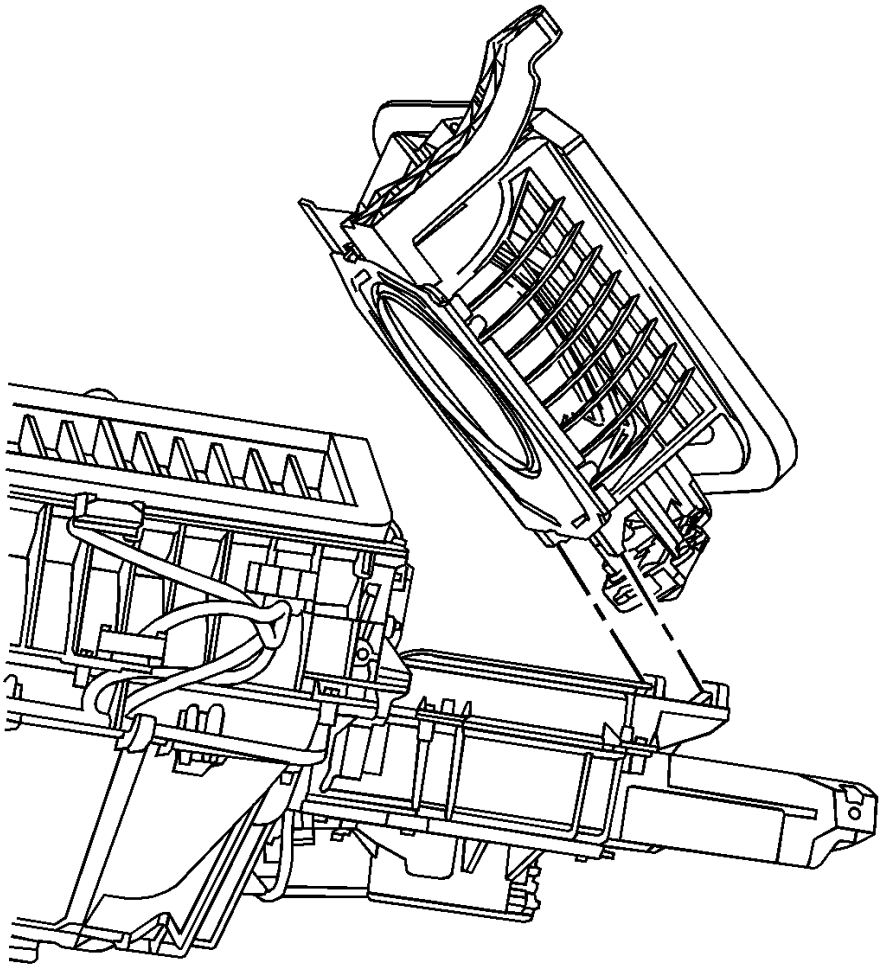

Fig. 70: Identifying Recirculation Housing
Courtesy of GENERAL MOTORS COMPANY

10. Install the recirculation housing to the HVAC module assembly.
11. Install the screws that secure the recirculation housing to the HVAC module assembly.

Tighten

Tighten the screws to 1.5 N.m (13 lb in).

12. Install the HVAC module assembly. Refer to **Air Conditioning and Heater Module Assembly Removal and Installation**.

MODE VALVE ASSEMBLY REPLACEMENT

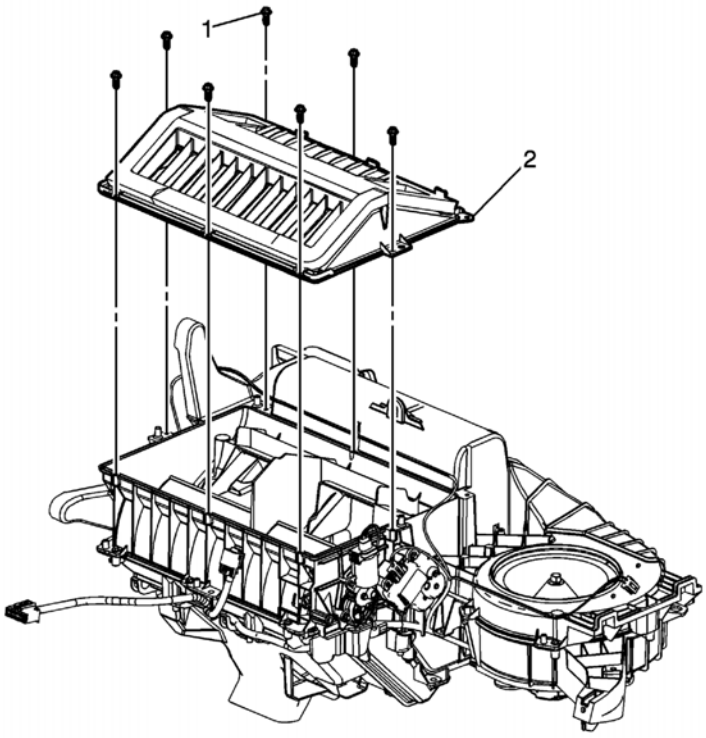

Fig. 71: Mode Valve Assembly
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure 1. Remove the HVAC module. Refer to **Air Conditioning and Heater Module Assembly Removal and Installation**. **NOTE:** **Leave the left temperature actuator attached to the air inlet assembly.** 2. Remove the air inlet assembly. Refer to **Air Inlet Assembly Replacement**.	
1	Mode Valve Assembly Screw (Qty: 7) **CAUTION:** **Refer to Fastener Caution .**

Callout	Component Name
	TIP: Remove the heat stakes that secure the mode valve assembly to the HVAC module assembly upper case using a small chisel. **Tighten** 1.5 N.m (13 lb in)
2	Mode Valve Assembly

HEATER CORE COVER REPLACEMENT

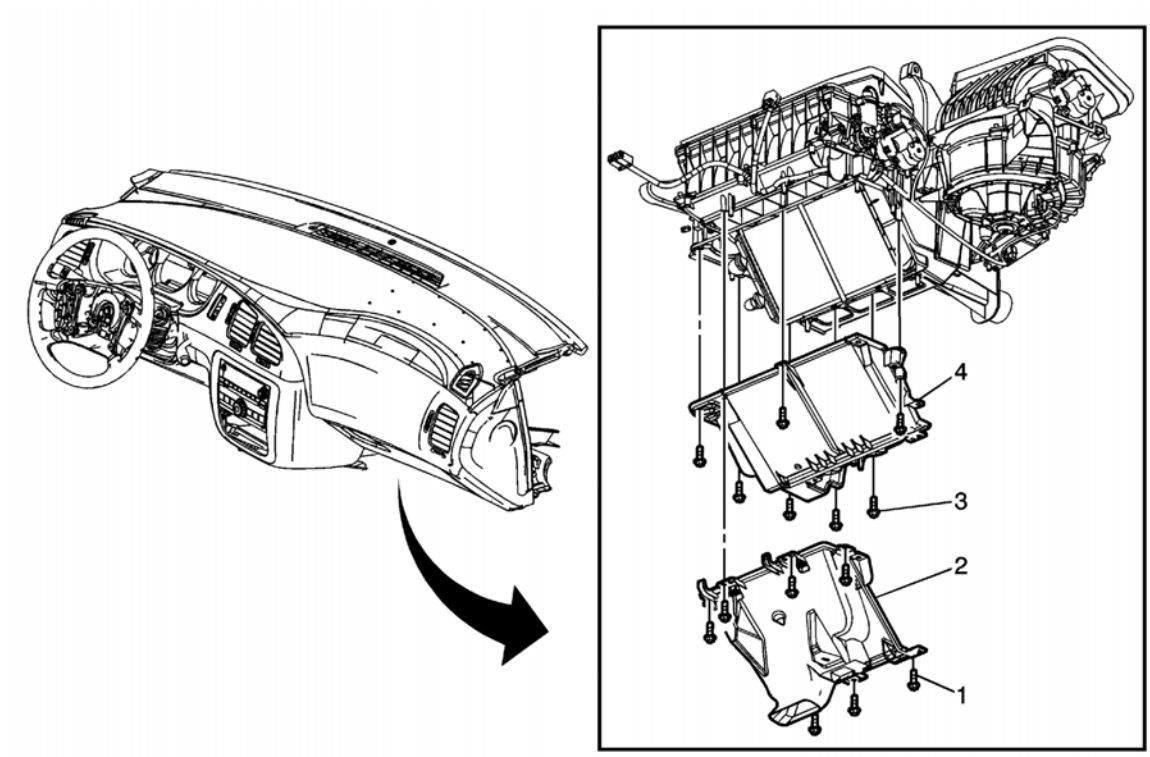

Fig. 72: Heater Core Cover
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure 1. Remove the right closeout panel. Refer to **Instrument Panel Insulator Panel Replacement - Right Side** . 2. Remove the left closeout panel. Refer to **Instrument Panel Insulator Panel Replacement - Left Side** . 3. Remove the rear floor air outlet duct. Refer to **Rear Floor Air Outlet Replacement**.	
1	Floor Air Outlet Cover Screw (Qty: 7) **CAUTION:** **Refer to Fastener Caution .**

Callout	Component Name
	TIP: Remove the heat stakes that secure the HVAC module assembly upper case to the HVAC module lower case using a small chisel. **Tighten** 1.5 N.m (13 lb in)
2	Floor Air Outlet Cover
3	Heater Core Cover Screw (Qty: 7) **TIP:** Remove the heat stakes that secure the HVAC module assembly upper case to the HVAC module lower case using a small chisel. **Tighten** 1.5 N.m (13 lb in)
4	Heater Core Cover

HEATER CORE REPLACEMENT

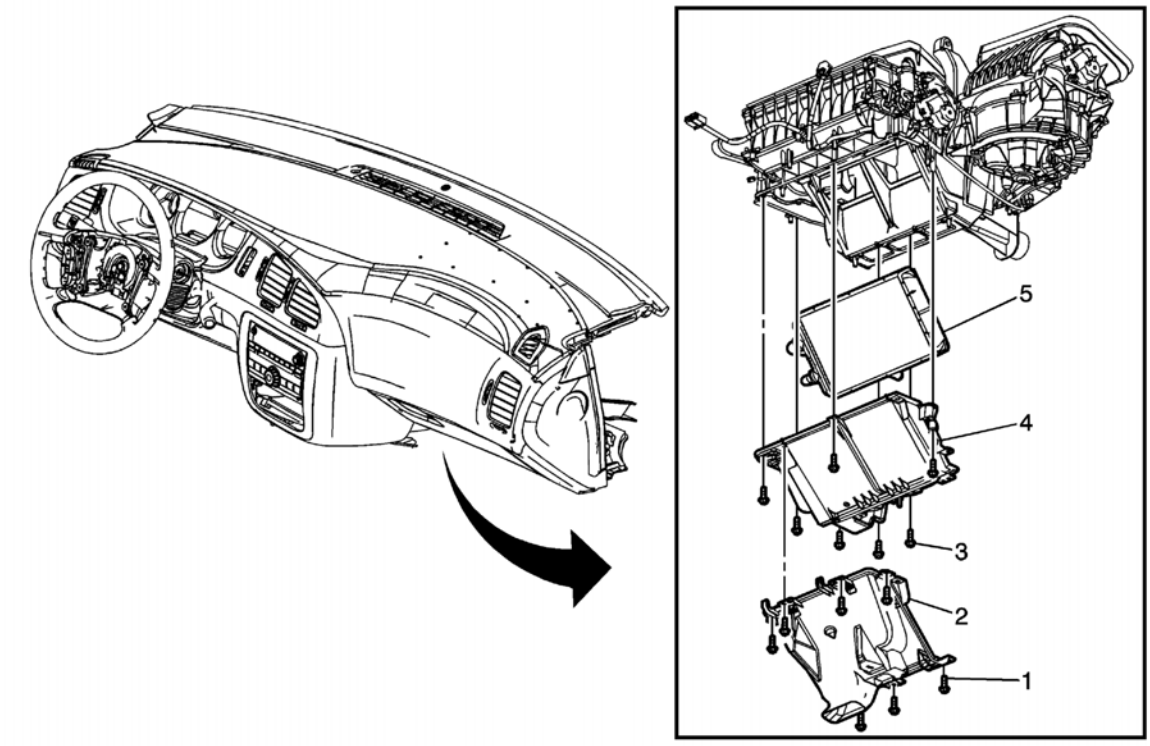

Fig. 73: Heater Core
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure 1. Remove the right closeout panel. Refer to **Instrument Panel Insulator Panel Replacement - Right Side** . 2. Remove the left closeout panel. Refer to **Instrument Panel Insulator Panel Replacement - Left Side** . 3. Remove the rear floor air outlet duct. Refer to **Rear Floor Air Outlet Replacement**.	

Callout	Component Name
1	Floor Air Outlet Cover Screws (Qty: 7) **CAUTION:** **Refer to** **Fastener Caution .** **TIP:** Remove the heat stakes that secure the HVAC module assembly upper case to the HVAC module lower case using a small chisel. **Tighten** 1.5 N.m (13 lb in)
2	Floor Air Outlet Cover
3	Heater Core Cover Screws (Qty: 7) **TIP:** Remove the heat stakes that secure the HVAC module assembly upper case to the HVAC module lower case using a small chisel. **Tighten** 1.5 N.m (13 lb in)
4	Heater Core Cover
5	Heater Core

DESCRIPTION AND OPERATION

HEATING AND AIR CONDITIONING SYSTEM DESCRIPTION AND OPERATION

Engine Coolant

Engine coolant is the key element of the heating system. The engine thermostat controls the normal engine operating coolant temperature. The thermostat also creates a restriction for the cooling system that promotes a positive coolant flow and helps prevent cavitation. Coolant enters the heater core through the inlet heater hose, in a pressurized state. The heater core is located inside the HVAC module. The ambient air drawn through the HVAC module absorbs the heat of the coolant flowing through the heater core. The HVAC module distributes heated air to the passenger compartment for consistent passenger comfort. Opening or closing the HVAC module temperature door controls the amount of heat delivered to the passenger compartment. The coolant exits the heater core through the return heater hose and is recirculated back through the engine cooling system.

A/C Cycle

Refrigerant is the key element in an air conditioning system. R-134a is presently the only EPA approved refrigerant for automotive use. R-134a is an very low temperature gas that can transfer the undesirable heat and moisture from the passenger compartment to the outside air.

The A/C compressor is belt driven and operates when the magnetic clutch is engaged. The compressor builds pressure on the vapor refrigerant. Compressing the refrigerant also adds heat to the refrigerant. The refrigerant is discharged from the compressor, through the discharge hose, and forced to flow to the condenser and then through the balance of the A/C system. The A/C system is mechanically protected with the use of a high pressure relief valve. If the high pressure switch were to fail or if the refrigerant system becomes restricted and refrigerant pressure continued to rise, the high pressure relief will pop open and release refrigerant from the system.

Compressed refrigerant enters the condenser in a high temperature, high pressure vapor state. As the refrigerant flows through the condenser, the heat of the refrigerant is transferred to the ambient air passing through the condenser. Cooling the refrigerant causes the refrigerant to condense and change from a vapor to a liquid state.

The condenser is located in front of the radiator for maximum heat transfer. The condenser is made of aluminum and aluminum cooling fins, which allows rapid heat transfer for the refrigerant. The semi-cooled liquid refrigerant exits the condenser and flows through the liquid line, to the thermal expansion valve.

The thermal expansion valve is located in the liquid line between the condenser and the evaporator. The thermal expansion valve is the dividing point for the high and the low pressure sides of the A/C system. As the refrigerant passes through the thermal expansion valve, the pressure of the refrigerant is lowered. Due to the pressure differential of the liquid refrigerant, the refrigerant will begin to vaporize at the thermal expansion valve. The thermal expansion valve also meters the amount of liquid refrigerant that can flow into the evaporator.

Refrigerant exiting the thermal expansion valve flows into the evaporator core in a low pressure, liquid state. Ambient air is drawn through the HVAC module and passes through the evaporator core. Warm and moist air will cause the liquid refrigerant boil inside of the evaporator core. The boiling refrigerant absorbs heat from the ambient air and draws moisture onto the evaporator. The refrigerant exits the evaporator back through the thermal expansion valve and into the suction line and back to the compressor, in a vapor state completing the A/C cycle of heat removal. At the compressor, the refrigerant is compressed again and the cycle of heat removal is repeated.

The conditioned air is distributed through the HVAC module for passenger comfort. The heat and moisture removed from the passenger compartment will also change form, or condense, and is discharged from the HVAC module as water under the vehicle.

DIAGNOSTIC INFORMATION AND PROCEDURES

DTC B0158: OUTSIDE AIR TEMPERATURE SENSOR

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptors

DTC B0158 13

Outside Air Temperature Sensor Circuit Voltage low

DTC B0158 14

Outside Air Temperature Sensor Circuit Voltage high

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Ambient Air Temperature Sensor Signal	B0158 13	B0158 13	B0158 14	B0158 13,14
Low Reference	-	B0158 14	B0158 13	B0158 13,14

Circuit/System Description

The HVAC control module supplies the ambient air temperature sensor with a low reference circuit and 5-volt signal circuit. The HVAC control module determines the voltage drop across the sensor, which is proportional to temperature. As the air temperature increases, the sensor resistance decreases and the voltage signal decreases. As the air temperature decreases, the sensor resistance increases and the voltage signal increases.

Conditions for Running the DTC

The ignition is turned ON.

Conditions for Setting the DTC

The HVAC control module detects the ambient air temperature sensor signal circuit is less than -36Â°C (-38Â°F) or more than 215Â°C (419Â°F) for more than 15 seconds.

Action Taken When the DTC Sets

- The HVAC control module will display dashes for outside air temperature.
- The DIC will display SERVICE A/C SYSTEM.
- The system operates using a default value.

Conditions for Clearing the DTC

- The DTC will become history if the HVAC control module no longer detects the condition that set the DTC.
- The history DTC will clear after 50 fault-free ignition cycles.

Circuit/System Testing

IMPORTANT: An instant OAT update must be performed by pressing the A/C and Recirc buttons at the same time after the system has been repaired to convert the A/C permission from out of range to normal.

1. Ignition OFF, disconnect the harness connector at the outside air temperature sensor.
2. Ignition OFF, test for less than 10 ohms of resistance between the low reference circuit terminal B and ground.
   - If greater than the specified range, test the low reference circuit for an open/high resistance. If the circuit tests normal, replace the HVAC control module.
3. Ignition ON, verify the scan tool Ambient Air Temperature sensor parameter is less than -35Â°F (-37Â°C).
   - If greater than the specified range, test the signal circuit terminal A for a short to ground. If the circuit tests normal, replace the HVAC control module.
4. Install a 3A fused jumper wire between the signal circuit terminal A and the low reference circuit terminal B. Verify the scan tool Ambient Air Temperature sensor parameter is greater than 180Â°F (82Â°C).
   - If less than the specified range, test the signal circuit for a short to voltage or an open/high resistance. If the circuit tests normal, replace the HVAC control module.
5. If all circuits test normal, test or replace the ambient air temperature sensor.

Circuit/System Description

The actuator is an electronic stepper motor. The HVAC control module supplies power and ground to the actuator. The HVAC control module controls the direction of the actuator by changing the polarity of the control circuits. When the actuator reaches its desired position, both circuits are fixed to the same value 0 volts. The HVAC control module determines the door position by counting pulses, voltage fluctuations, caused by the brush to commutator action generated during normal motor operation. The HVAC control module monitors a voltage drop across an internal resistance to detect the pulses. The HVAC control module converts the pulses to counts with a range of 0-255 counts.

Conditions for Running the DTC

- The ignition is ON.
- Ignition voltage is between 9-16 volts.
- The HVAC module is ON.

Conditions for Setting the DTC

The actual door position differs from the commanded door position by more than 4 counts or the HVAC control module detects the door position signal circuit is shorted to ground shorted to voltage or open.

Action Taken When the DTC Sets

Driver A and driver B circuits are deactivated for the appropriate actuator.

Conditions for Clearing the DTC

- The DTC becomes history when the HVAC control module no longer detects the condition that set the DTC.
- The history DTC will clear after 50 fault-free ignition cycles.
- The DTC can be cleared with a scan tool.

Circuit/System Testing

1. Ignition OFF, disconnect the harness connector at the appropriate actuator.
2. Ignition ON, connect a test lamp between the control circuit terminal A and control circuit terminal B or terminal C for the mode actuator. Command the actuator in each direction. The test lamp should briefly illuminate when commanding the actuator in one direction to the other direction.
    - If the test lamp is always OFF, test the appropriate control circuit for a short to ground or an open/high resistance. If the circuit tests normal, replace the HVAC control module.
    - If the test lamp continuously illuminates, test the appropriate control circuit for a short to B+. If the circuit tests normal, replace the HVAC control module.
3. If all circuits test normal, replace the appropriate actuator.

DTC B3933: AIR CONDITIONING EVAPORATOR TEMPERATURE SENSOR

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptors

DTC B3933 02

Air Conditioning Evaporator Temperature Sensor Circuit Short to Ground

DTC B3933 05

Air Conditioning Evaporator Temperature Sensor Circuit High Voltage/Open

DTC B3933 13

Air Conditioning Evaporator Temperature Sensor Circuit High Temperature

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Signal	B3933 02	B3933 05	B3933 05	1
Low Reference	-	B3933 05	B3933 05	-
1. Air Temperature Malfunction				

Circuit/System Description

The evaporator air temperature sensor is 2-wire negative temperature co-efficient thermistor.

A signal and low reference circuit enables the sensor to operate. As the air temperature surrounding the sensor increases, the sensor resistance decreases. The sensor signal voltage decreases as the resistance decreases. The sensor operates within a temperature range between -40 to +85Â°C (-40 to +185Â°F). The sensor signal varies between 0-5 V. As the air temperature increases the sensor voltage will decrease. If the HVAC control module detects a malfunctioning sensor, then the control module software will use a default air temperature value. The default action ensures that the HVAC system can adjust the inside air temperature near the desired temperature

until the condition is corrected.

Conditions for Running the DTC

- Ignition ON
- The HVAC control module is ON.

Conditions for Setting the DTC

The HVAC control module detects the sensor signal out of range. The signal voltage is less than 0.1 V or greater than 4.9 V for more than 50 ms.

Action Taken When the DTC Sets

The system operates using a default value.

Conditions for Clearing the DTC

The sensor signal is within specified range between 0.1-4.9 V.

Circuit/System Testing

1. Ignition OFF and all vehicle systems OFF, disconnect the harness connector at the B39 Evaporator Temperature Sensor. It may take up to 2 minutes for all vehicle systems to power down.
2. Test for less than 10 Ω between the low reference circuit terminal B and ground.

- **If 10 Ω or greater**

1. Ignition OFF, disconnect the harness connector at the K33 HVAC control module.
2. Test for less than 2 Ω in the low reference circuit end to end.
    - If 2 Ω or greater, repair the open/high resistance in the circuit.
    - If less than 2 Ω, replace the K33 HVAC control module.

- **If less than 10 Ω**

3. Ignition ON.
4. Verify the A/C Evaporator Temperature Sensor scan tool parameter is less than -37Â°C (-35Â°F).
    - **If -37Â°C (-35Â°F) or greater**

    1. Ignition OFF, disconnect the harness connector at the K33 HVAC control module.
    2. Test for infinite resistance between the signal circuit terminal A and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance, replace the K33 HVAC control module.

    - **If less than -37Â°C (-35Â°F)**

5. Install a 3 A fused jumper wire between the signal circuit and the low reference circuit terminal B.
6. Verify the A/C Evaporator Temperature Sensor scan tool parameter is greater than 115Â°C (239Â°F).
    - **If 115Â°C (239Â°F) or less**

    1. Ignition OFF, disconnect the harness connector at the K33 HVAC control module, ignition ON.
    2. Test for less than 1 V between the signal circuit and ground.
        - If 1 V or greater, repair the short to voltage on the circuit.
        - If less than 1 V

    3. Ignition OFF
    4. Test for less than 2 Ω in the signal circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the K33 HVAC control module.

    - **If greater than 115Â°C (239Â°F)**

7. Test or replace the B39 Evaporator Temperature Sensor.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- **Evaporator Air Temperature Sensor Replacement**
- **Control Module References** for HVAC control module replacement, programming, and setup.

DTC B393B: AIR CONDITIONING COMPRESSOR VALVE

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

DTC B393B 04

Air Conditioning Compressor Valve Control Circuit Open

DTC B393B 0B

Air Conditioning Compressor Valve Control Circuit High Current

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Electric Variable Displacement B+	B393B 0B	B393B 04	-	-
Electric Variable Displacement Control	B393B 04	B393B 04	B393B 0B	-

Circuit/System Description

This A/C system uses a conventional clutch to engage and mechanically turn the compressor and a variable displacement solenoid valve to alter the amount of displacement created by the turning of the compressor. The HVAC control module provides both switched battery voltage and a pulse width modulated ground to the variable displacement solenoid valve. When the A/C switch is pressed, the HVAC control module grounds the variable displacement solenoid using a (PWM) signal in order to determine the amount of compressor displacement. The performance of the A/C compressor is based on adjusted interior temperature and engine load.

Conditions for Running the DTC

- Ignition ON.
- The HVAC control module is ON.

Conditions for Setting the DTC

B393B 04

A PWM greater than 10% is sent but no current is read back.

B393B 0B

Measured current is above threshold of 815 mA.

Action Taken When the DTC Sets

B393B 04

The A/C compressor is disabled.

B393B 0B

- The A/C compressor is disabled.
- Output will be switched off for hardware protection.

Conditions for Clearing the DTC

The condition for setting the DTC is no longer present.

Circuit/System Testing

1. Ignition OFF, disconnect the harness connector at the Q46 A/C Compressor Solenoid Valve and disconnect the X1 harness connector at the K33 HVAC Control Module, ignition ON.
2. Test for less than 1 V between each control circuit listed below and ground:
    - Solenoid terminal 1
    - Solenoid terminal 2
    - **If 1 V or greater**

      Repair the short to voltage on the circuit.

    - **If less than 1 V**
3. Ignition OFF.
4. Test for infinite resistance between each control circuit listed below and ground:
    - Solenoid terminal 1
    - Solenoid terminal 2

- **If less than infinite resistance**

  Repair the short to ground on the circuit.

- **If infinite resistance**

5. Test for infinite resistance between the control circuits listed below:
   - Solenoid terminal 1
   - Solenoid terminal 2
   - **If less than infinite resistance**

     Repair the short on the circuit.

   - **If infinite resistance**
6. Test for less than 2 Ω in each control circuit end to end.
   - **If 2 Ω or greater**

     Repair the open/high resistance in the circuit.

   - **If less than 2 Ω**
7. Test the Q46 A/C Compressor Solenoid Valve or replace the G1 A/C Compressor.
8. Verify the DTC or symptom is corrected while operating the HVAC system under the Conditions for Running the DTC.
   - **If the DTC or symptom is not corrected**

     Replace the K33 HVAC Control Module.

   - **If the DTC or symptom is corrected**
9. All OK.

Component Testing

Static Test

1. Ignition OFF, disconnect the harness connector at the Q46 A/C Compressor Solenoid Valve.
2. Test for 7-15 Ω between B+ terminal 2 and control terminal 1.
   - **If less than 7 Ω or greater than 15 Ω**

     Replace the G1 A/C Compressor.

   - **If between 7-15 Ω**
3. Test for infinite resistance between each terminal and the Q46 A/C Compressor Solenoid Valve housing/case.
   - **If less than infinite resistance**

     Replace the G1 A/C Compressor.

   - **If infinite resistance**

4. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

DTC P0532 OR P0533: AIR CONDITIONING A/C REFRIGERANT PRESSURE SENSOR

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptors

DTC P0532

Air Conditioning A/C Refrigerant Pressure Sensor Circuit Low Voltage

DTC P0533

Air Conditioning A/C Refrigerant Pressure Sensor Circuit High Voltage

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage
5-Volt Reference Circuit	P0532	P0532	P0533
A/C Refrigerant Pressure Sensor Signal Circuit	P0532	P0533	P0532
Low Reference Circuit	-	P0532	P0533

Circuit/System Description

The engine control module (ECM) monitors the high side refrigerant pressure through the A/C refrigerant pressure sensor. The ECM supplies a 5-volt reference and a low reference to the sensor. Changes in the A/C refrigerant pressure cause the A/C refrigerant pressure sensor signal to the ECM to vary. When the pressure is low, the signal voltage is low. When the pressure is high, the ECM commands the cooling fans on. When pressure is too high or too low, the ECM will not allow the A/C compressor clutch to engage.

Conditions for Running the DTC

The Engine is running.

Conditions for Setting the DTC

- The ECM detects that the A/C pressure is less than 1 psi (0.01 volt).
- The ECM detects that the A/C pressure is more than 425 psi (4.90 volts).

Action Taken When the DTC Sets

- The ECM will not illuminate the malfunction indicator lamp (MIL).
- The ECM stores the failure records.
- The A/C compressor clutch is disabled.

Conditions for Clearing the DTC

- The history DTC will clear after 40 consecutive ignition cycles have occurred without a malfunction.
- The DTC will become history if the ECM no longer detects a failure.

Diagnostic Aids

A malfunction within the refrigerant system causing high pressure can cause this DTC to set.

Scan Tool Reference

Control Module References for scan tool information

Circuit/System Verification

Ignition ON, observe the scan tool A/C Refrigerant Pressure Sensor parameter. The reading should be between 0.1 volt (1 psi) and 4.90 volts (425 psi) and change with A/C refrigerant pressure changes.

Circuit/System Testing

1. Ignition OFF, disconnect the harness connector at the A/C refrigerant pressure sensor.
2. Ignition OFF, test for less than 10 ohms between the low reference circuit terminal 1 and ground.
    - If greater than the specified range, test the low reference circuit for an open/high resistance. If the circuit tests normal, replace the PCM.
3. Ignition ON, test for 4.8-5.2 volts between the 5-volt reference circuit terminal 2 and ground.
    - If less than the specified range, test the 5-volt reference circuit for a short to ground or an open/high resistance. If the circuit tests normal, replace the PCM.
    - If greater than the specified range, test the 5-volt reference circuit for a short to voltage. If the

circuit tests normal, replace the PCM.

4. Verify the scan tool A/C High Side Pressure Sensor parameter is less than 0.1 volts (1 psi).
    - If greater than the specified range, test the signal circuit terminal 3 for a short to voltage. If the circuit tests normal, replace the PCM.
5. Install a 3A fused jumper wire between the signal circuit terminal 3 and the 5-volt reference circuit terminal 2. Verify the scan tool A/C Refrigerant High Side Pressure Sensor parameter is greater than 4.90 volts (425 psi).
    - If less than the specified range, test the signal circuit for short to ground or an open/high resistance. If the circuit tests normal, replace the PCM.
6. If all circuits test normal, test or replace the A/C refrigerant pressure sensor.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the diagnostic procedure.

DTC P0645, P0646, OR P0647: AIR CONDITIONING (A/C) COMPRESSOR CLUTCH RELAY

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

DTC P0645

Air Conditioning (A/C) Compressor Clutch Relay Control Circuit

DTC P0646

Air Conditioning (A/C) Compressor Clutch Relay Control Circuit Low Voltage

DTC P0647

Air Conditioning (A/C) Compressor Clutch Relay Control Circuit High Voltage

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
A/C Relay Coil Ignition	2	2	-	-
A/C Relay Switch B+	2	2	-	-
A/C Relay Control	P0645	P0645	P0645	-
A/C Clutch Control	2	2	1	-

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
A/C Compressor Clutch Ground	-	2	2	-
1. A/C Clutch Always Engaged 2. A/C Clutch Inoperative				

Circuit Description

When the A/C switch is pressed, the HVAC control assembly sends a GMLAN message to the engine control module (ECM) for an A/C request. This input will request the ECM to ground the A/C compressor clutch relay control circuit, which will switch the A/C CMPRSR relay. With the relay contacts closed, battery voltage is supplied to the A/C compressor clutch assembly.

Conditions for Running the DTC

- The ignition voltage is between 11-18 volts.
- The engine speed is less than 600 RPM.
- The ECM driver transitions from ON to OFF or from OFF to ON.

Conditions for Setting the DTCs

The ECM detects an open on the control circuit of the A/C compressor clutch relay when commanded off with the engine in crank or run status.

Action Taken When the DTC Sets

The ECM will store conditions which were present when the DTC set as Failure Records data only. This information will not be stored as Freeze Frame data.

Conditions for Clearing the DTC

- A History DTC clears after 40 consecutive warm-up cycles have occurred without a malfunction.
- The DTC can be cleared by using a scan tool.

Circuit/System Testing

1. Ignition OFF, disconnect the A/C CMPRSR relay.
2. Ignition ON, verify that a test lamp does not illuminate between the control circuit terminal 86 and ground.
    - If the test lamp illuminates, test the control circuit for a short to ground.
3. Verify that a test lamp illuminates between the ignition circuit terminal 85 and ground.
    - If the test lamp does not illuminate, test the ignition circuit for a short to ground or an open/high resistance. If the circuit tests normal and ignition circuit fuse is open, test or replace the relay.
4. Connect a test lamp between the ignition circuit terminal 85 and thecontrol circuit terminal 86.
5. Command the A/C relay ON and OFF with a scan tool. The test lamp should turn ON and OFF when changing between the commanded states.
    - If the test lamp is always ON, test the control circuit for a short to ground. If the circuit tests normal, replace the ECM.
    - If the test lamp is always OFF, test the control circuit for a short to voltage, or an open/high resistance. If the circuit tests normal, replace the ECM.
6. If all circuits test normal, test or replace the A/C CMPRSR relay.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the diagnostic procedure.

SYMPTOMS - HVAC SYSTEMS - MANUAL

IMPORTANT:

Review the system operation in order to familiarize yourself with the system functions. Refer to:

- **Air Delivery Description and Operation**
- **Air Temperature Description and Operation**

Visual/Physical Inspection

- Inspect for aftermarket devices which could affect the operation of the HVAC System. Refer to **Checking Aftermarket Accessories** .

- Inspect the easily accessible or visible system components for obvious damage or conditions which could cause the symptom.
- Verify the A/C compressor clutch turns freely and is not seized.
- The A/C compressor will not operate in cold outside air temperatures. Refer to **Air Temperature Description and Operation**.
- The following conditions may cause window fogging:
  - Wet carpet or mats
  - High humidity
  - Interior water leak
  - Blocked A/C evaporator drain tube
  - Maximum passenger capacity
  - Blocked body pressure relief valves
- Inspect the air distribution system for causes of reduced air flow:
  - Obstructed or dirty passenger compartment air filter, if equipped
  - Blocked or damaged air inlet or outlet vents

Intermittent

Faulty electrical connections or wiring may be the cause of intermittent conditions. Refer to **Testing for Intermittent Conditions and Poor Connections** .

Symptom List

Refer to a symptom diagnostic procedure from the following list in order to diagnose the symptom:

- **Air Conditioning Compressor Malfunction**
- **Blower Motor Malfunction**

HVAC SYSTEM MALFUNCTION

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

Diagnostic Aids

Check the following mechanical fault sources:

- Air distribution box
- Air distribution hoses/air distribution ducts

J43600 ACR Air Conditioning Service Center

Circuit/System Verification

NOTE: **Check for bulletins before proceeding.**

1. Verify the blower motor operates properly with the blower motor switch in each speed position.
   - **If the blower motor does not operate in each speed position**

     Refer to **Blower Motor Malfunction**

   - **If the blower motor operates properly in each speed position**
2. Verify all HVAC doors move when pressing the appropriate switch.
   - Temperature
   - Bi-Level mode
   - Recirculation
   - **If any HVAC door does not move**

     Refer to **DTC B0223, B0233, B0248, B0268, B0408, B0418, or B0428**.

   - **If all HVAC doors move**
3. Install the **J43600** ACR Air Conditioning Service Center.
4. Verify the high side pressure reading on the Air Conditioning Service Center is within 10% of the scan tool A/C High Side Pressure Sensor parameter.

- **If the reading is not within 10%**

  Refer to **DTC P0532 or P0533**.

- **If the reading is within 10%**

5. Verify the A/C High Side Pressure Sensor parameter is between 269-2929 kPa (39-425 PSI).
   - **If the reading is not between 269-2929 kPa (39-425 PSI)**

     Refer to **Air Conditioning (A/C) System Performance Test (LFX)** .

   - **If the reading is between 269-2929 kPa (39-425 PSI)**
6. Engine ON, A/C system ON.
7. Verify cool air flows from the ducts with the temperature control in the coldest position.
   - **If the air is not cool**

     Verify the compressor clutch is engaged.

   - If the compressor clutch is not engaged

     Refer to **DTC P0645, P0646, or P0647**.

   - If the compressor clutch is engaged

     Refer to **Air Conditioning (A/C) System Performance Test (LFX)** , and **DTC B393B**.

   - **If the air is cool**
8. Verify warm air flows from the ducts with the temperature control in the warmest position.
   - **If the air is not warm**

     Refer to **Heating Performance Diagnostic** .

   - **If the air is warm**
9. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- **Control Module References** for HVAC control module replacement, programming, and setup

AIR CONDITIONING COMPRESSOR MALFUNCTION

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
A/C Relay Coil Ignition	2	2	-	-
A/C Relay Switch B+	2	2	-	-
A/C Relay Control	P0645	P0645	P0645	-
A/C Clutch Control	2	2	1	-
A/C Compressor Clutch Ground	-	2	2	-
1. A/C Clutch Always Engaged 2. A/C Clutch Inoperative				

Circuit/System Description

When the A/C switch is pressed, the HVAC control module grounds the A/C request signal circuit. This input will request the ECM to ground the A/C compressor clutch relay control circuit, which will switch the A/C CMPRSR relay. With the relay contacts closed, battery voltage is supplied to the A/C compressor clutch assembly.

Diagnostic Aids

The following conditions must be met in order for the ECM to turn on the compressor clutch:

- Battery voltage is between 9-18 volts.
- Engine coolant temperature (ECT) is less than 123Â°C (253Â°F).
- Engine speed is less than 4760 RPM.
- Engine speed is more than 600 RPM.
- A/C high side pressure is between 2929-269 kPa (425-39 psi).
- Throttle position is less than 100 percent.
- Evaporator temperature is greater than 0Â°C (32Â°F)
- ECM does not detect excessive torque load
- ECM does not detect insufficient idle quality.

Circuit/System Testing

1. Ignition OFF, disconnect the A/C CMPRSR relay.
2. Ignition ON, verify that a test lamp does not illuminate between the control circuit terminal and ground.
    - If the test lamp illuminates, test the control circuit for a short to voltage.
3. Verify that a test lamp illuminates between the ignition circuit terminal and ground.
    - If the test lamp does not illuminate, test the ignition circuit for a short to ground or an open/high resistance. If the circuit tests normal and the ignition circuit fuse is open, test or replace the A/C CMPRSR relay.
4. Verify that a test lamp illuminates between the B+ circuit terminal and ground.
    - If the test lamp does not illuminate, test the B+ circuit for a short to ground or an open/high resistance. If the circuit tests normal and the B+ circuit fuse is open, test the control circuit terminal for a short to ground.
5. Disconnect the harness connector at the A/C compressor clutch.
6. Test for less than 1.0 ohm of resistance between the A/C compressor clutch ground circuit terminal A and ground.
    - If greater than the specified range, test the ground circuit for an open/high resistance.
7. Connect the harness connector at the A/C compressor clutch.
8. Connect a 10A fused jumper wire between the B+ circuit terminal and the control circuit terminal. Verify the A/C compressor clutch is activated.
    - If the A/C compressor clutch does not activate, test the control circuit for an open/high resistance. If the circuit tests normal, test or replace the A/C compressor clutch.
9. Connect a test lamp between the ignition circuit terminal and the control circuit terminal.
10. Command the A/C relay ON and OFF with a scan tool. The test lamp should turn ON and OFF when changing between the commanded states.
    - If the test lamp is always ON, test the control circuit for a short to ground. If the circuit tests normal, replace the ECM.
    - If the test lamp is always OFF, test the control circuit for a short to voltage or an open/high resistance. If the circuit tests normal, replace the ECM.
11. If all circuits test normal, test or replace the A/C CMPRSR relay.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the diagnostic procedure.

1. Blower Motor Inoperative 2. Blower Motor Always On				

Circuit/System Description

Blower Motor Control Processor

The blower motor control module is an interface between the HVAC control module and the blower motor. The blower motor speed control, battery positive and ground circuits enable the control module to operate. The HVAC control module provides a variable voltage signal to the blower motor control module to request the selected blower speed. The blower motor control module provides a pulse width modulation (PWM) ground signal to the blower motor in order to control the blower motor speed. The module supplies 12 volts to the blower motor through the blower motor voltage supply circuit.

Diagnostic Aids

Be sure the blower motor housing is not shorted to a grounded surface causing the blower motor to always be on in high speed.

Prior to motor replacement connect a direct independent B+ and ground to verify operation.

Inspect the motor shaft for rust or other foreign material which may prohibit proper motor operation.

If the motor operates properly please reinstall it, check for PIs or TSBs, and refer to Testing for Intermittent Conditions and Poor Connections in the Electrical Information Reference section of this document.

Circuit/System Testing

1. Ignition OFF, disconnect the harness connector at the blower motor control module.
2. Test for less than 1.0 ohm between the ground circuit terminal A and ground.
    - If greater than the specified range, test the ground circuit for an open/high resistance.
3. Ignition ON, verify that a test lamp illuminates between the B+ circuit terminal C and ground.
    - If the test lamp does not illuminate, test the B+ circuit for a short to ground or an open/high resistance. If the circuit tests normal and the B+ circuit fuse (BATT 4 30-amp) in the underhood fuse block is open, test all components connected to the B+ circuit and replace as necessary.
4. Connect a DMM between the control circuit terminal B and B+.
5. Cycle the blower motor from OFF to HIGH. The voltage should increase while changing between the commanded states.
    - If voltage remains greater than 11.5V while changing between the commanded states, test the control circuit for a short to voltage. If the circuit test normal, replace the HVAC control module.
    - If voltage remains less than 1.0V while changing between the commanded states, test the control circuit for a short to ground or an open/high resistance. If the circuit tests normal, replace the HVAC control module.
    - If voltage is between 1.0V or 11.5V and does not increase when changing between the commanded states, replace the HVAC control module.
6. Ignition OFF, reconnect the harness connector at the blower motor control module. Disconnect the harness connector at the blower motor.
7. Ignition ON, verify that a test lamp illuminates between the B+ circuit terminal A of the blower motor control module and ground.
    - If the test lamp does not illuminate, test the B+ circuit for a short to ground or an open/high

resistance. If the circuit tests normal, replace the blower motor control module.

8. Connect a test lamp between the control circuit terminal B and the B+ circuit terminal A.
9. Turn the blower motor on high speed then to low speed. The test lamp intensity should be bright when in high speed and very dim or off when the blower is on low speed.
    - If the test lamp intensity does not vary, test the control circuit for a short to voltage, short to ground, or an open/high resistance. If the circuit tests normal, replace the blower motor control module.
10. If all circuits test normal, test or replace the blower motor.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the diagnostic procedure.

- **Blower Motor Control Module Replacement**
- **Blower Motor Replacement**
- **Control Module References** for ECM, and HVAC control module setup, replacement, and programming

ACTUATOR RECALIBRATION

Calibration Procedure

Use the following steps to perform the calibration update:

1. Install a scan tool.
2. Turn ON the ignition, with the engine OFF.
3. Select HVAC Control Module
4. Select Special Functions
5. Select recalibrate All Motors
6. Select ON, wait 60 seconds.

REPAIR INSTRUCTIONS

HEATER AND AIR CONDITIONING CONTROL REPLACEMENT

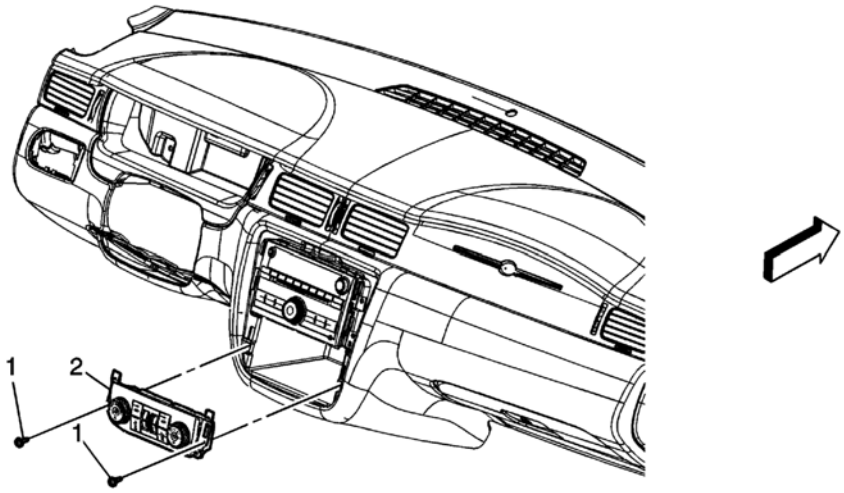

Fig. 4: HVAC Control Assembly
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure Remove the accessory trim plate. Refer to **Instrument Panel Accessory Trim Plate Replacement** .	
1	Heater and A/C Control Assembly Screw (Qty: 2) **CAUTION:** **Refer to** **Fastener** **Caution** . **TIP:** Disconnect the HVAC control assembly electrical connector. **Tighten** 1.5 N.m (13 lb in)
2	Heater and Air Conditioning Control Assembly Refer to **Control Module References** for programming and setup information.

TEMPERATURE VALVE ACTUATOR REPLACEMENT - RIGHT SIDE

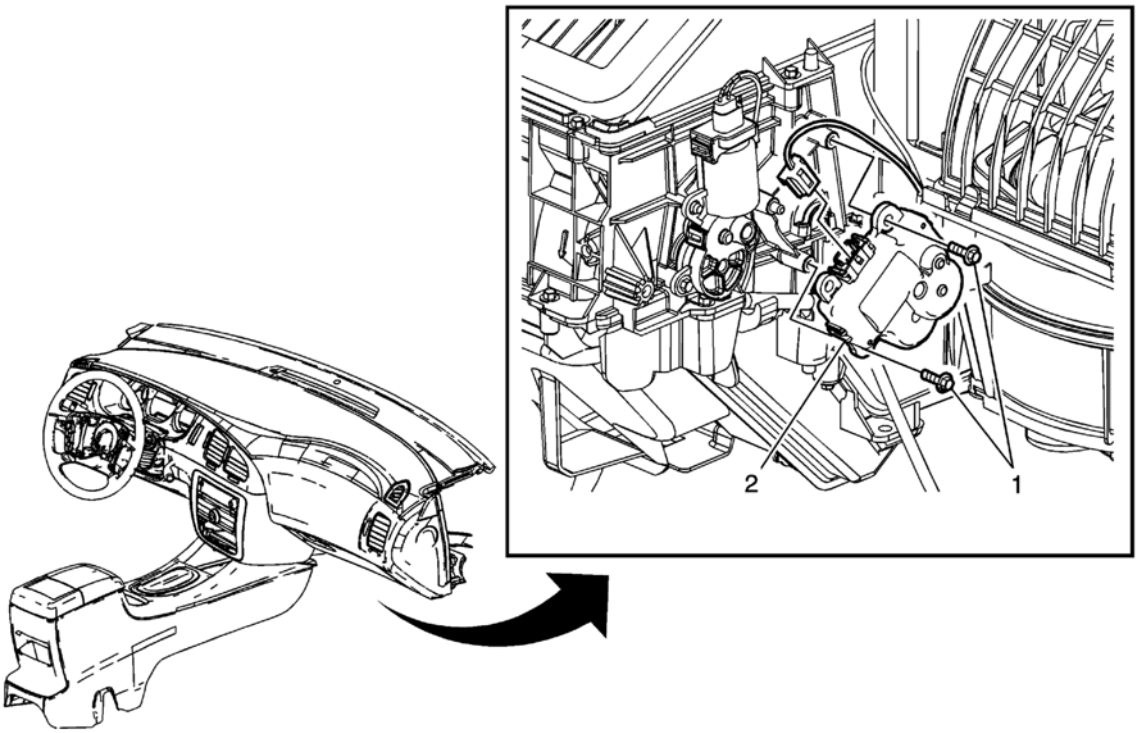

Fig. 5: Right Air Temperature Actuator

Callout	Component Name
Preliminary Procedure 1. Remove the instrument panel (I/P) inner panel. Refer to **Instrument Panel Compartment Inner Panel Replacement** . 2. Disconnect the mode actuator electrical connector.	

AIR INLET VALVE ACTUATOR REPLACEMENT

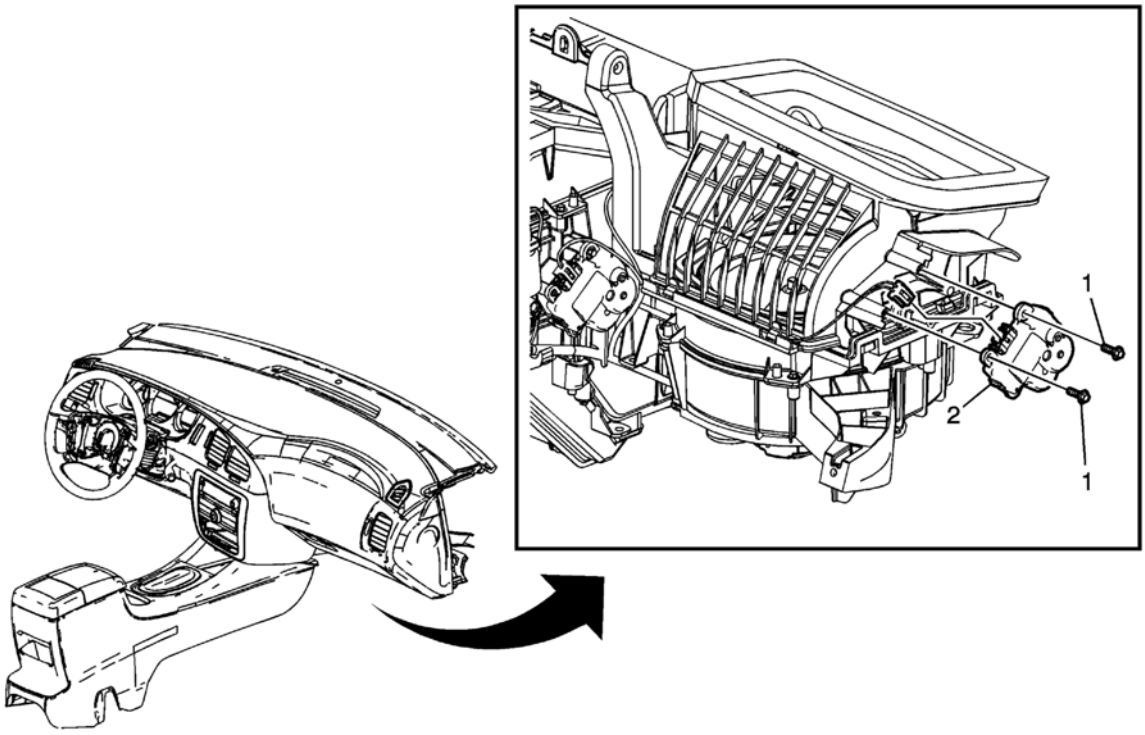

Fig. 8: Recirculation Actuator
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure 1. Remove the right closeout panel. Refer to **Instrument Panel Insulator Panel Replacement - Right Side** . 2. Disconnect the recirculation actuator electrical connector.	
1	Recirculation Actuator Screw (Qty: 2) **CAUTION:** **Refer to Fastener Caution .** **Tighten** 1.5 N.m (13 lb in)
2	Recirculation Actuator **TIP:** Refer to **Control Module References** for programming and setup information.

DESCRIPTION AND OPERATION

AIR DELIVERY DESCRIPTION AND OPERATION

The air delivery controls are divided into 4 areas:

- HVAC Control Components
- Air Speed
- Air Distribution
- Recirculation Operation

HVAC Control Components

HVAC Control Module

The HVAC control module is a GMLAN device that interfaces between the operator and the HVAC system to maintain air temperature and distribution settings. The battery positive voltage circuit provides power that the control module uses for keep alive memory (KAM). If the battery positive voltage circuit loses power, all HVAC DTCs and settings will be erased from KAM. The control module supports the following features:

Feature	Availability
Afterblow	Optional
Purge	No
Personalization	No
Actuator Calibration	Yes

Mode/Recirculation Actuator

The mode/recirculation actuator is a 2 wire bi-directional electric motor. Two control circuits enable the actuator to operate. The control circuits use either a 0 or 12-volt value to coordinate the actuator movement. When the actuator is at rest, both control circuits have a value of 0 volts. In order to move the actuator, the HVAC control module grounds the appropriate control circuit for the commanded direction. The HVAC control module reverses the polarity of the control circuits to move the actuator in the opposite direction.

The HVAC control module determines the door position by counting motor pulses on one of the control circuits. These pulses are small voltage fluctuations that occur when the brush is shorted across 2 commutator contacts as the motor rotates. As the actuator shaft rotates, the HVAC control module monitors the voltage drop across an internal resistance to detect the pulses. The HVAC control module converts the pulses to counts with a range of 0-255 counts. The HVAC control module uses a range of 0-255 counts to index the actuator position.

Mode Valve Assembly

The film valve system has several operating characteristics:

- The cycle time for a mode change will vary based on the starting point of the film valve relative to the requested mode position.
- The maximum time to achieve a mode change occur when the film valve travels between vent and defrost.
- Mode change times may very slightly based on variations in system airflow, temperature and voltage.
- The amount of air rush noise heard when a mode change is requested that causes the film valve to move

through 3 or more primary modes is dependent on blower speed.

- Recalibration will typically occur when the engine is OFF. The actuator noise heard during recalibration may be more noticeable than during normal operation.

Blower Motor Control Processor

The blower motor control module is an interface between the HVAC control module and the blower motor. The blower motor speed control, battery positive and ground circuits enable the control module to operate. The HVAC control module provides a variable voltage signal to the blower motor control module to request the selected blower speed. The blower motor control module provides a pulse width modulation (PWM) ground signal to the blower motor in order to control the blower motor speed. The module supplies 12 volts to the blower motor through the blower motor voltage supply circuit.

Air Speed

The blower motor forces air to circulate within the vehicles interior. The vehicle operator determines the blower motors speed by placing the blower motor switch in a desired speed position. The blower motor will only operate if the blower motor switch is in any position other than OFF, and the ignition switch is in the RUN position, with the exception of afterblow.

Once a blower speed is selected, the blower speed remains constant, until a new speed is selected. When OnStarÂ® System is activated the blower speed will be reduced.

Afterblow

Afterblow is a feature that dries the evaporator core by operating the blower motor after the engine is turned OFF. This reduces the amount of microbial growth that can create undesirable odors.

The following conditions must be met for afterblow to operate:

- The A/C compressor operated for more than 15 minutes.
- The system voltage is at least 11 volts to start and 10 volts to continue to run.
- The ignition has been in the OFF position for at least 20 minutes.
- The outside air temperature is greater than 11Â°C (52Â°F).

Once the above conditions have been met, the blower will turn ON for 5 minutes and run at 30 percent blower speed.

Air Distribution

The HVAC control module controls the mode actuator in order to distribute airflow to a desired outlet. The mode switch provides the vehicle operator with the ability to override the automatic setting. When the mode switch is moved to heater through Defrost positions, the A/C compressor clutch engages and the recirculation actuator will be moved to the Outside Air position. When VENT is pressed, the following will occur:

- The mode valve will be moved to the Panel position.
- The recirculation actuator will follow user request if the blower is ON and the power mode is in Run.
- The A/C compressor will follow user request if the blower is ON and the power mode is in Run.

Recirculation Operation

The HVAC control module controls the air intake through the recirculation actuator. Recirculation is not available when the mode is in heater through defrost. The recirculation LED will flash 3 times indicating recirculation is not available. The operator must activate the blower for Recirculation operation. The A/C compressor will engage while in the recirculation position. Every time the vehicle or HVAC system is turned off, the system will default to outside air unless the mode is in heater through defrost position.

Remote Start

Remote Start Activation

The following describes the HVAC control head functionality upon receiving the remote start active serial data message and a power mode status is set to off/awake. The OAT sensor on manual systems, is utilized to determine the moding of the following features: Blower Mode (Bi-level, Floor, Defrost, Recirc and Rear Defrost. These features are determined by the OAT during activation sequence and are maintained for the duration of engine run time. Calibratable temperatures are utilized to provide low, mid and high temperature ranges for the selectable feature . Blower and mode have the range to select any valid feature positions. When the remote start active serial data is received, ignition-OFF loop HVAC algorithms will act the same as if a run power mode was received, i.e. re-calibration, afterblow, ignition-OFF motor positioning etc. The OFF timer and the ignition ON timer have the functionality as in the Run mode.

Remote Start De-activation

When the remote start is exited, GMLAN power mode equals run mode or remote start engine. In the case of manual settings, the displays will revert to the actual state of operation of the features, on the basis of their normal control algorithms.

AIR TEMPERATURE DESCRIPTION AND OPERATION

The air temperature controls are divided into 4 areas:

- HVAC Control Components
- Heating and A/C Operation
- Engine Coolant
- A/C Cycle

HVAC Control Components

HVAC Control Module

The HVAC control module is a GMLAN device that interfaces between the operator and the HVAC system to maintain air temperature and distribution settings. The battery positive voltage circuit provides power that the control module uses for keep alive memory (KAM). If the battery positive voltage circuit loses power, all HVAC DTCs and settings will be erased from KAM. The control module supports the following features:

Feature	Availability
Afterblow	Optional
Purge	No

Feature	Availability
Personalization	No
Actuator Calibration	Yes

Air Temperature Actuator

The air temperature actuator is a 2-wire bi-directional electric motor. Two control circuits enable the actuator to operate. The control circuits use either a 0-volt or 12-volt value to coordinate the actuator movement. When the actuator is at rest, both control circuits have a value of 0 volts. In order to move the actuator, the HVAC control module grounds the appropriate control circuit for the commanded direction. The HVAC control module reverses the polarity of the control circuits to move the actuator in the opposite direction.

The HVAC control module determines the door position by counting motor pulses on one of the control circuits. These pulses are small voltage fluctuations that occur when the brush is shorted across 2 commutator contacts as the motor rotates. As the actuator shaft rotates, the HVAC control module monitors the voltage drop across an internal resistance to detect the pulses. The HVAC control module converts the pulses to counts with a range of 0-255 counts. The HVAC control module uses a range of 0-255 counts to index the actuator position.

The HVAC control module supplies battery voltage to the A/C compressor. When the A/C switch is pressed, the HVAC control module provides a pulse width modulation (PWM) signal to the A/C compressor in order to command the performance of the A/C compressor. The performance of the A/C compressor is regulated according to adjusted interior temperature on the basis of characteristic lines. Therefore the HVAC control module grounds the A/C compressor with the PWM signal.

A/C Compressor

This A/C system uses a conventional clutch to engage and mechanically turn the compressor, and a variable displacement solenoid valve to alter the amount of displacement created by the turning of the compressor. The HVAC control module supplies battery voltage to the variable displacement solenoid valve. When the A/C switch is pressed, the HVAC control module provides a pulse width modulated (PWM) signal to the variable displacement solenoid valve in order to determine the amount of compressor displacement. The performance of the A/C compressor is regulated according to adjusted interior temperature on the basis of characteristic lines. Therefore the HVAC control module grounds the A/C compressor with the PWM signal.

The A/C compressor is belt driven and operates when the magnetic clutch is engaged. When the A/C switch is pressed, the HVAC control module sends an A/C request message to the ECM via CAN-Bus. The ECM then grounds the A/C compressor clutch relay control circuit, which will switch the A/C compressor clutch relay. Battery voltage is then supplied to the A/C compressor clutch, and the A/C compressor clutch is activated.

A/C Refrigerant Pressure Sensor

The A/C refrigerant pressure sensor is a 3-wire piezoelectric pressure transducer. A 5-volt reference, low reference, and signal circuits enable the sensor to operate. The A/C pressure signal can be between 0-5 volts. When the A/C refrigerant pressure is low, the signal value is near 0 volts. When the A/C refrigerant pressure is high, the signal value is near 5 volts.

The A/C refrigerant pressure sensor protects the A/C system from operating when an excessively high or low pressure condition exists. The powertrain control module (PCM) disables the compressor clutch under the following conditions:

- A/C pressure is more than 3034 kPa (440 psi). The clutch will be enabled after the pressure decreases to less than 2068 kPa (300 psi).
- A/C pressure is less than 241 kPa (35 psi). The clutch will be enabled after the pressure increases to more than 248 kPa (36 psi).

Outside Air Temperature Sensor

The air temperature sensor is a 2-wire negative temperature co-efficient thermistor. A signal and low reference circuit enables the sensor to operate. As the air temperature surrounding the sensor increases, the sensor resistance decreases. The sensor signal decreases as the resistance decreases. The sensor signal varies between 0-5 volts. The HVAC control module converts the signal to a range between 0-255 counts.

The ambient sensor operates within a temperature range between -30 to +51Â°C (-22 to +123.8Â°F). The driver information center (DIC) displays the ambient air temperature that it receives from the HVAC control module through a GMLAN message. If the HVAC control module has determined that the ambient temperature sensor has failed the DIC will display 86Â°C (186Â°F) if shorted to ground and -40Â°C (-40Â°F) if open or shorted to voltage.

The HVAC module controls the temperature displayed on the DIC and the instant update feature as follows:

Condition	Display
When the HVAC module A/C and RECIRCULATION buttons are pressed simultaneously.	Updates temperature display instantly.
At start up with the engine OFF more than 3 hours	Displays actual outside temperature
At start up with the engine OFF less than 3 hours	Displays last stored temperature unless temperature has decreased. The temperature reading is always instantly up dated if ambient air temperature has decreased.
Vehicle moving above 16 km/h (10 mph) for 5 minutes	Updates temperature display at a slow filtered rate.
Vehicle moving at 51 km/h (32 mph) or greater for 2.5 minutes	Updates temperature display rapidly.
When the ambient air decreases.	Updates temperature display rapidly.

Heating and A/C Operation

The purpose of the heating and A/C system is to provide heated and cooled air to the interior of the vehicle. The A/C system will also remove humidity from the interior and reduce windshield fogging. The vehicle operator can determine the passenger compartment temperature by adjusting the air temperature switch. Regardless of the temperature setting, the following can affect the rate that the HVAC system can achieve the desired temperature:

- Recirculation actuator setting
- Difference between inside and desired temperature
- Difference between ambient and desired temperature
- Blower motor speed setting

- Mode setting

The A/C system can be engaged by either pressing the A/C switch or by selecting the following modes:

- Max A/C
- Heater
- Mix-Blend
- Front Defrost

The A/C LED will not illuminate unless the driver presses the A/C request switch on the HVAC control module. Otherwise, the A/C system may be running without the A/C LED indicator illuminated while in Defrost mode. The following conditions must be met in order for the powertrain control module (PCM) to turn ON the compressor clutch:

- The ambient air temperature is above 4Â°C (40Â°F).
- The engine coolant temperature (ECT) is less than 124Â°C (255Â°F).
- The A/C pressure is between 241-3034 kPa (35-440 psi).

Once engaged, the compressor clutch will be disengaged for the following conditions:

- The throttle position is 100 percent.
- The A/C pressure is more than 3034 kPa (440 psi).
- The A/C pressure is less than 241 kPa (35 psi).
- The engine coolant temperature (ECT) is more than 124Â°C (255Â°F).
- The engine speed is more than 5480 RPM for at least 409 seconds.
- A transmission shift has occurred.
- The PCM detects excessive torque load.
- The PCM detects insufficient idle quality.
- The PCM detects a hard launch condition.
- Outside air temperature is detected to be below 38Â° F by the OAT sensor if equipped.
- The blower switch is turned OFF.

When the A/C compressor clutch is disengaged for any of these reasons, the A/C indicator LED will flash indicating A/C is not functioning. When the compressor clutch disengages, the compressor clutch diode protects the electrical system from a voltage spike.

Remote Start

Remote Start Activation

The following describes the HVAC control head functionality upon receiving the remote start active serial data message and a power mode status is set to OFF/awake. Outside ambient temperature, is utilized to determine the moding of the following features: Blower Mode (Bi-level, Floor, Defrost, Recirc and Rear Defrost. These features are determined by the OAT during activation sequence and are maintained for the duration of engine run time. Calibratable temperatures are utilized to provide low, mid and high temperature ranges for the selectable feature. Blower and mode have the range to select any valid feature positions. When the remote start

active serial data is received, ignition-OFF loop HVAC algorithms will act the same as if a run power mode was received, i.e. re-calibration, afterblow, ignition-OFF motor positioning etc. The OFF timer and the ignition ON timer have the functionality as in the Run mode.

Remote Start De-activation

When the remote start is exited, class 2 power mode equals run mode or remote start engine. In the case of manual settings, the displays will revert to the actual state of operation of the features, on the basis of their normal control algorithms.

I/P Dimmer Switch Signal	B3600 03	B3600 03	1	-
1. Interior Backlighting Malfunction				

Circuit/System Description

The instrument panel (I/P) lamp dimmer switch is used to increase and decrease the brightness of the interior backlighting components. The I/P dimmer switch provides a voltage signal that will increase as the brightness of the lights are increased and decrease as the brightness of the lights are decreased. The body control module (BCM) provides a low reference signal and a B+ voltage reference to the I/P dimmer switch. When the I/P dimmer switch is placed in the desired position, the dimmed voltage setting is applied from the I/P dimmer switch through the I/P dimmer switch signal circuit to the BCM. The BCM interprets the signal and applies a pulse width modulated (PWM) voltage to the I/P lamps supply voltage circuit and the interior backlighting components dim to the requested level.

Conditions for Running the DTC

Battery voltage must be between 9-16 volts.

Conditions for Setting the DTC

B1395 03

The DTC will set for the following conditions:

- The BCM detects a short to ground in the I/P dimmer switch voltage reference circuit.
- The BCM detects a short to ground or an open/high resistance in the INT LTS/PNL DIM fuse B+ circuit.

B1395 07

The DTC will set when the BCM detects a short to voltage in the I/P dimming voltage reference circuit or the vehicles system voltage exceeds the normal operating range of 16 volts.

Actions Taken When the DTC Sets

- The I/P dimmer switch will not operate.
- The I/P dimming lamps will not illuminate.

Conditions for Clearing the DTC

- The condition responsible for setting the DTC no longer exists.
- A history DTC will clear once 100 consecutive malfunction-free ignition cycles have occurred.

Scan Tool Reference

Control Module References for scan tool information

Circuit/System Verification

Ignition ON, observe the scan tool Dimming Control Reference voltage. The reading should display 2.5 volts or greater.

- If less than the specified range, refer to I/P Dimming Control Malfunction.
- If within the specified range, refer to I/P Dimmer Switch Malfunction.

Circuit/System Testing

I/P Dimmer Switch Malfunction

1. Ignition OFF, disconnect the harness connector at the headlamp switch.
2. Ignition OFF, verify that a test lamp illuminates between B+ and the ground circuit terminal 8.
    - If the test lamp does not illuminate, test the ground circuit for an open/high resistance.
3. Ignition ON, test for B+ between the voltage reference circuit terminal 15 and ground.
    - If less than the specified value, test the voltage reference circuit for a short to ground or an open/high resistance. If the circuit tests normal, replace the BCM.
4. Install a 3A fused jumper wire between the signal circuit terminal 13 and the voltage reference circuit terminal 15. Verify the scan tool Dimming Control Signal parameter is greater than 2.5 volts.
    - If less than the specified range, test the signal circuit for a short to ground or an open/high resistance. If the circuit tests normal, replace the BCM.
5. If all circuits test normal, test or replace the headlamp switch.

I/P Dimming Control Malfunction

1. Ignition OFF, disconnect the X3 harness connector at the BCM.
2. Ignition ON, verify that a test lamp illuminates between the B+ circuit terminal 3 and ground.
    - If the test lamp does not illuminate, test the B+ circuit for a short to ground or an open/high resistance.
3. If all circuit tests normal, replace the BCM.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the diagnostic procedure.

Fog Lamp Control	1	1	1	-
Fog Lamp - LF Ground	-	1	-	-
Fog Lamp - RF Ground	-	1	-	-
Headlamp Switch Ground	-	2	-	-
1. Front Fog Lamps Malfunction 2. Front Fog Lamp Switch Malfunction				

Circuit/System Description

The fog lamp relay is supplied with battery voltage at all times. The fog lamp switch signal circuit is grounded momentarily by pressing the fog lamp switch. The body control module (BCM) energizes the fog lamp relay by applying ground to the fog lamp relay control circuit. When the fog lamp relay is energized, the relay switch contacts close and battery voltage is applied through the FOG LAMPS fuse to the fog lamp supply voltage circuit which illuminates the fog lamps.

Conditions for Running the DTC

- Battery voltage must be between 9-16 volts.
- Fog lamps ON.

Conditions for Setting the DTC

The BCM detects a short to voltage in the fog lamp relay control circuit.

Actions Taken When the DTC Sets

When the DTC is present, the fog lamps will not operate when the park lamps are ON and the front fog lamp switch is active.

Conditions for Clearing the DTC

- The condition responsible for setting the DTC no longer exists.
- A history DTC will clear once 100 consecutive malfunction-free ignition cycles have occurred.

DTC Descriptor

DTC B2545 00

Backup Lamps Circuit

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Body Control Module (BCM) B+ Terminal 2 X2	B2545 00, B2652 00	B2652 00	-	-
Body Control Module (BCM) B+ Terminal 4 X4	B2545 00, B2652 00	B2545 00	-	-
Backup Lamps Control	B2545 00	1	1	-
Backup Lamp - Left Ground	-	1	-	-
Backup Lamp - Right Ground	-	1	-	-
1. Backup Lamps Malfunction				

Circuit/System Description

When the transmission is placed in the REVERSE position, the transmission control module (TCM) sends a serial data message to the body control module (BCM). The message indicates that the gear selector is in the REVERSE position. The BCM applies battery voltage to the backup lamps and inside rearview mirror. Once the driver moves the gear selector out of the REVERSE position, a message is sent by the TCM via serial data requesting the BCM to remove battery voltage from the backup lamp control circuit. The engine may need to be running for the backup lamps to function.

Conditions for Running the DTC

Battery voltage must be between 9-16 V.

Conditions for Setting the DTC

DTC B2545 00 will set when one of the following conditions exits:

- The BCM detects a short to ground in the backup lamps control circuit.
- The BCM detects a short to ground or an open/high resistance in the BCM B+ circuit terminal 4 X4.

Actions Taken When the DTC Sets

When the DTC is present, the backup lamps will not operate.

Conditions for Clearing the DTC

- The condition responsible for setting the DTC no longer exists.
- A history DTC will clear once 100 consecutive malfunction-free ignition cycles have occurred.

Circuit/System Testing

With DD6

1. Ignition OFF, disconnect the X2 harness connector at the BCM.
2. Ignition ON, verify that a test lamp illuminates between the B+ circuit terminal 2 and ground.
    - If the test lamp does not illuminate, test the B+ circuit for a short to ground or an open/high resistance.
3. Ignition OFF, connect the X2 harness connector at the BCM.

4. Disconnect the X4 harness connector at the BCM.
5. Ignition ON, verify that a test lamp illuminates between the B+ circuit terminal 4 and ground.
    - If the test lamp does not illuminate, test the B+ circuit for a short to ground or an open/high resistance.
6. Ignition OFF, connect the X4 harness connector at the BCM.
7. Disconnect the harness connector at the inside rearview mirror.
8. Connect a test lamp between the control circuit terminal 9 and ground.
9. Command the backup lamps ON and OFF with a scan tool. The test lamp should turn ON and OFF when changing between the commanded states.
    - If the test lamp is always ON, test the control circuit for a short to voltage. If the circuit tests normal, replace the BCM.
    - If the test lamp is always OFF, test the control circuit for a short to ground or an open/high resistance. If the circuit tests normal, replace the BCM.
10. Ignition OFF, connect the harness connector at the inside rearview mirror.
11. Disconnect the harness connector at the inoperative backup lamp.
12. Ignition OFF, exterior lamps OFF, test for less than 5 Ω between the ground circuit terminal B and ground.
    - If greater than the specified range, test the ground circuit for an open/high resistance.
13. Connect a test lamp between the control circuit terminal A and ground.
14. Command the Backup Lamps ON and OFF with a scan tool. The test lamp should turn ON and OFF when changing between the commanded states.
    - If the test lamp is always ON, test the control circuit for a short to voltage. If the circuit tests normal, replace the BCM.
    - If the test lamp is always OFF, test the control circuit for a short to ground or an open/high resistance. If the circuit tests normal, replace the BCM.
15. If all circuits test normal, test or replace the inoperative backup lamp.

Without DD6

1. Ignition OFF, disconnect the X2 harness connector at the BCM.
2. Ignition ON, verify that a test lamp illuminates between the B+ circuit terminal 2 and ground.
    - If the test lamp does not illuminate, test the B+ circuit for a short to ground or an open/high resistance.
3. Ignition OFF, connect the X2 harness connector at the BCM.
4. Disconnect the X4 harness connector at the BCM.
5. Ignition ON, verify that a test lamp illuminates between the B+ circuit terminal 4 and ground.
    - If the test lamp does not illuminate, test the B+ circuit for a short to ground or an open/high resistance.
6. Ignition OFF, connect the X4 harness connector at the BCM.
7. Disconnect the harness connector at the inoperative backup lamp.
8. Ignition OFF, exterior lamps OFF, test for less than 5 Ω between the ground circuit terminal B and

ground.

- If greater than the specified range, test the ground circuit for an open/high resistance.

9. Connect a test lamp between the control circuit terminal A and ground.
10. Command the Backup Lamps ON and OFF with a scan tool. The test lamp should turn ON and OFF when changing between the commanded states.
    - If the test lamp is always ON, test the control circuit for a short to voltage. If the circuit tests normal, replace the BCM.
    - If the test lamp is always OFF, test the control circuit for a short to ground or an open/high resistance. If the circuit tests normal, replace the BCM.
11. If all circuits test normal, test or replace the inoperative backup lamp.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the diagnostic procedure.

1. Headlamps Malfunction				

Circuit/System Description

When the headlamp switch is placed in the headlamp position, ground is applied to the body control module (BCM) through the headlamp low beam signal circuit. The BCM then applies ground to the headlamp low beam relay control circuit which energizes the low beam relay. With the low beam relay energized, the switch contacts close allowing battery voltage to flow through the LO BEAM fuses to the low beam headlamps.

Conditions for Running the DTC

- Battery voltage must be between 9-16 volts.
- Headlamps ON.

Conditions for Setting the DTC

The BCM detects a short to voltage in the headlamp low beam relay control circuit.

Action Taken When the DTC Sets

The low beam headlamps will not operate.

Conditions for Clearing the DTC

- The condition responsible for setting the DTC no longer exists.
- A history DTC will clear once 100 consecutive malfunction-free ignition cycles have occurred.

Turn Signal/Multifunction Switch Ground	-	1	-	-
1. Headlamps Malfunction				

Circuit/System Description

When the headlamp switch is placed in the AUTO position, the body control module (BCM) receives a ground signal through the headlamp switch headlamps OFF signal circuit. The headlamp switch headlamps ON signal circuit and the park lamp switch signal circuit are both open and have no ground signal. When the headlamp switch is placed in the PARK or HEAD position, the BCM will receive a ground signal through the headlamp switch headlamps ON signal circuit and the park lamp switch signal circuit. The headlamp switch headlamps OFF signal circuit will be open and have no ground signal

Conditions for Running the DTC

Battery voltage must be between 9-16 volts.

Conditions for Setting the DTC

The BCM receives a mismatched signal between the headlamps OFF signal circuit, the headlamp switch headlamps ON signal circuit, and the park lamp switch ON signal circuit.

Action Taken When the DTC Sets

The BCM disregards the headlamp switch input and defaults to automatic headlamp function.

Conditions for Clearing the DTC

- The condition responsible for setting the DTC no longer exists.
- A history DTC will clear once 100 consecutive malfunction-free ignition cycles have occurred.

Turn Signal/Multifunction Switch Ground	-	1	-	-
1. Headlamps Malfunction				

Circuit/System Description

When the turn signal/multifunction switch is placed in the headlamps high or flash to pass (FTP) position, ground is applied to the body control module (BCM) through the headlamp high beam signal circuit or the flash to pass switch signal circuit. The BCM applies ground to the headlamp high beam relay control circuit which energizes the high beam relay. With the high beam relay energized, the switch contacts close allowing battery voltage to flow through the HI BEAM fuses to the high beam headlamps.

Conditions for Running the DTC

- Battery voltage must be between 9-16 volts.
- Headlamps ON.

Conditions for Setting the DTC

The BCM detects a short to voltage in the headlamp high beam relay control circuit.

Actions Taken When the DTC Sets

The high beam headlamps and flash to pass (FTP) will not operate.

Conditions for Clearing the DTC

- The condition responsible for setting the DTC no longer exists.
- A history DTC will clear once 100 consecutive malfunction-free ignition cycles have occurred.

Headlamp Switch Ground	-	1	-	-
1. Park, License, and/or Tail Lamps Malfunction				

Circuit/System Description

Battery positive voltage is applied at all times to both the coil and switched sides of the PARK LP Relay. When the headlamp switch is placed in either the HEAD or PARK position, ground is applied to the park lamp signal circuit to the body control module (BCM). The BCM responds by applying ground to the park lamp relay control circuit. This energizes the park lamp relay coil causing the relay switch contacts to close allowing

battery voltage to flow through the LT PARK and RT PARK fuses to all of the park, tail, license, and marker lamps.

Conditions for Running the DTC

- Battery voltage must be between 9-16 volts.
- Park lamps ON.

Conditions for Setting the DTC

The BCM detect a short to voltage in the park lamp relay control circuit.

Action Taken When the DTC Sets

The park lamps will not operate.

Conditions for Clearing the DTC

- The condition responsible for setting the DTC no longer exists.
- A history DTC will clear once 100 consecutive malfunction-free ignition cycles have occurred.

LF Headlamp Ground	-	1	-	-
RF Headlamp Ground	-	1	-	-
1. Headlamps Malfunction 2. Daytime Running Lamps Malfunction				

Circuit Description

The ambient light sensor is a light sensitive transistor that varies the voltage signal to the body control module (BCM) based on outside lighting conditions. When the ambient light sensor indicates daytime conditions, the body control module (BCM) grounds the DRL relay control circuit energizing the DRL relay. With the DRL

relay energized, the switch contacts close and voltage is applied to the DRL 1 and DRL 2 fuses to the left and right low beam headlamps. Any function or condition that turns on the headlamps will cancel DRL operation.

Conditions for Running the DTCs

Battery voltage must be between 9-16 volts.

Conditions for Setting the DTC

The BCM detect a short to voltage in the DRL relay control circuit.

Action Taken When the DTC Sets

The BCM will deactivate the DRL relay for the remainder of the ignition cycle.

Conditions for Clearing the DTC

- The condition responsible for setting the DTC no longer exists.
- A history DTC will clear once 100 consecutive malfunction-free ignition cycles have occurred.

DTC Descriptor

DTC B261A 00

Passenger Compartment Dimming 4 Circuit Short to Ground

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Accent Lamp Control	B261A 00	2	1	-
Accent Lamp Ground	-	2	-	-
1. Interior Accent Lighting Always ON 2. Interior Accent Lighting Always OFF				

Circuit/System Description

The instrument panel (I/P) dimmer switch is used to increase and decrease the brightness of the interior backlighting components. The I/P dimmer switch provides a voltage signal that will increase as the brightness of the light are increased and decrease as the brightness of the lights are decreased. The body control module (BCM) provides a low reference signal and a B+ voltage reference to the I/P dimmer switch. When the I/P dimmer switch is placed in the desired position, the dimmed voltage setting is applied from the I/P dimmer switch through the I/P dimmer switch signal circuit to the BCM. The BCM interprets the signal and applies the dimmed voltage to the individual accent lamps via the accent lamps control circuit.

Conditions for Running the DTC

- Battery voltage must be between 9-16 V.

- Park lamps ON.

Conditions for Setting the DTC

The BCM detects a short to ground in the accent lamp control circuit.

Actions Taken When the DTC Sets

The BCM will not illuminate the accent lamps supplied by the accent lamp control circuit.

Conditions for Clearing the DTC

- The condition responsible for setting the DTC no longer exists.
- A history DTC will clear once 100 consecutive malfunction-free ignition cycles have occurred.

Circuit/System Testing

NOTE: **Each back lighted component may need to be disconnected to isolate a short to voltage or short to ground. Use the schematic to identify the following:**

- **Back lighted components the vehicle is equipped with.**
- **Component locations on the back lighting dimming control circuit.**
- **Each components control and ground circuit terminals.**

1. Ignition OFF, disconnect the harness connector at any component with inoperative backlighting.

2. Ignition OFF, scan tool disconnected, interior lamps OFF, doors CLOSED, test for less than 5 Ω between the ground circuit and ground.
    - If greater than the specified value, test the ground circuit for an open/high resistance.
3. Connect a test lamp between the control circuit and ground.
4. Command the Incandescent Dimming Control ON and OFF with a scan tool. The test lamp should turn ON and OFF when changing between the commanded states.
    - If the test lamp is always OFF, test the control circuit for a short to ground or an open/high resistance. If the circuit tests normal, replace the BCM.
    - If the test lamp is always ON, test the control circuit for a short to voltage. If the circuit tests normal, replace the BCM.
5. If all circuits test normal, test or replace the component with the inoperative backlighting.

DTC Descriptor

DTC B2610 00

Passenger Compartment Dimming 1 Circuit

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
LED Dimming Control	B2610 00	1	1	-
1. Interior Backlighting Malfunction				

Circuit/System Description

The body control module (BCM) supplies a voltage reference through the instrument panel (I/P) dimming voltage reference circuit to the interior lamp dimmer switch, which is part of the headlamp switch. When the dimmer switch is placed in a desired brightness position, reference voltage is applied through the dimmer switch rheostat and the I/P lamps dimmer switch signal circuit to the BCM. The BCM interprets this voltage signal, then applies a pulse width modulated (PWM) voltage through the LED dimming supply circuit illuminating the components listed below:

- Radio

- HVAC control module
- Driver information center (DIC) switch
- Steering wheel controls

Conditions for Running the DTC

- Battery voltage must be between 9-16 volts.
- Park lamps ON.

Conditions for Setting the DTC

The BCM detects a short to ground on the LED dimming control circuit.

Action Taken When the DTC Sets

The BCM does not attempt to illuminate the LED lamps.

Conditions for Clearing the DTC

- The condition for setting the DTC is no longer present.
- A history DTC will clear once 100 consecutive malfunction-free ignition cycles have occurred.

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Body Control Module (BCM) B+ terminal 2 X4	B2615 00	B2615 00	-	-
Courtesy Lamps Control	B2615 00	1	1	-
1. Courtesy Lamps Malfunction				

Circuit/System Description

Battery voltage for the courtesy lamps is supplied at all times, from the INT LIGHTS Fuse located in the underhood fuse block, to the body control module (BCM). When the BCM receives a signal to command the courtesy lamps ON, it applies voltage through the courtesy lamps supply voltage circuits to the courtesy lamps listed below.

- The left and right I/P courtesy lamps

- Dome lamp
- Right front turn signal

Conditions for Running the DTC

Battery voltage must be between 9-16 volts.

Conditions for Setting the DTC

DTC B2615 00 will set for the following conditions:

- The BCM detects a short to ground in the courtesy lamps control circuit.
- The BCM detects a short to ground or an open/high resistance in the INT LIGHTS fuse B+ circuit terminal 2 X4.

Actions Taken When the DTC Sets

The BCM will not illuminate any courtesy lamps supplied by the courtesy lamps control circuit.

Conditions for Clearing the DTC

- The condition responsible for setting the DTC no longer exists.
- A history DTC will clear once 100 consecutive malfunction-free ignition cycles have occurred.

DTC B2645: AMBIENT LIGHT SENSOR

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptors

DTC B2645 03

Ambient Light Sensor Circuit Voltage Below Threshold

DTC B2645 07

Ambient Light Sensor Circuit Voltage Above Threshold

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Ambient Light Sensor Signal	B2645 03	B2645 07	B2645 07	-
Ambient Light Sensor Ground	-	B2645 07	-	-

Circuit/System Description

The ambient light sensor is used to monitor outside lighting conditions. The body control module (BCM) provides a 5-volt reference signal to the ambient light sensor. The sensor is a variable resistor, it's resistance changes as outside lighting conditions change. With the headlamp switch in the AUTO position, the BCM monitors the sensor signal circuit to determine if the outside lighting conditions are correct for either daytime running lamps (DRL) or headlamp low beam operation. In daylight conditions, the BCM will command the DRLs ON. In low light conditions, the BCM will command the low beam headlamps ON.

Conditions for Running the DTC

Battery voltage must be between 9-16 volts.

Conditions for Setting the DTC

B2645 03

The DTC will set when the BCM detects a short to ground in the ambient light sensor signal circuit.

B2645 07

The DTC will set when the BCM detects a short to voltage or an open/high resistance in the ambient light sensor signal circuit.

Action Taken When the DTC Sets

- Automatic lamp control (ALC) is inoperative.
- The BCM defaults to low light status and commands the low beam headlamps ON.

Conditions for Clearing the DTC

- The condition responsible for setting the DTC no longer exists.
- A history DTC will clear once 100 consecutive malfunction-free ignition cycles have occurred.

- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

DTC B2652 00

Passenger Compartment Dimming 3 Circuit

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Body Control Module (BCM) B+ Terminal 2 X2	B2545 00, B2652 00	B2652 00	-	-
Body Control Module (BCM) B+, Terminal 4 X4	B2545 00, B2652 00	B2545 00	-	-
Instrument Panel Lamps Control	B2652 00	1	1	-
1. Interior backlighting Malfunction				

Circuit/System Description

The body control module (BCM) supplies a voltage reference through the instrument panel (I/P) dimming voltage reference circuit to the interior lamp dimmer switch, which is part of the headlamp switch. When the dimmer switch is placed in a desired position, reference voltage is applied through the dimmer switch rheostat and the I/P lamps dimmer switch signal circuit to the BCM. The BCM interprets this voltage signal, then applies a pulse width modulated (PWM) voltage from the CHMSL/BCK-UP fuse through the instrument panel lamp control circuit and the interior backlighting components dim to the requested level.

Conditions for Running the DTC

- Battery voltage must be between 9-16 volts.
- Park lamps ON.

Conditions for Setting the DTC

DTC B2652 00 will set for the following conditions:

- The BCM detects a short to ground in the instrument panel lamps control circuit.
- The BCM detects a short to ground or an open/high resistance in the BCM B+ circuit terminal 2 X2 or the BCM B+ circuit terminal 4 X4.

Action Taken When the DTC Sets

The BCM will not DIM or illuminate any I/P lamps supplied by the I/P lamps dimmer switch.

Conditions for Clearing the DTC

- The condition responsible for setting the DTC no longer exists.
- A history DTC will clear once 100 consecutive malfunction-free ignition cycles have occurred.

Instrument Panel Lamps Dimmer Switch Signal	B3600 03	B3600 03	1	-
1. Interior Backlighting Malfunction				

Circuit/System Description

The instrument panel (I/P) dimmer switch is used to increase and decrease the brightness of the interior backlighting components. The body control module (BCM) supplies a voltage reference through the instrument panel (I/P) dimming voltage reference circuit to the interior lamp dimmer switch, which is part of the headlamp switch. When the dimmer switch is placed in a desired brightness position, reference voltage is applied through the dimmer switch rheostat and the I/P lamps dimmer switch signal circuit to the BCM. The BCM interprets this voltage signal, then applies a pulse width modulated (PWM) voltage through the I/P lamps supply voltage circuit and the LED dimming supply circuit to all related interior lamps, illuminating them to the desired level of brightness.

Conditions for Running the DTC

Battery voltage must be between 9-16 volts.

Conditions for Setting the DTC

- The BCM detects a short to ground or open in the I/P dimming voltage reference circuit.

- The BCM detects a short to ground or open in the instrument panel lamps dimming signal circuit.

Actions Taken When the DTC Sets

The I/P lamps are not illuminated.

Conditions for Clearing the DTC

- The condition responsible for setting the DTC no longer exists.
- A history DTC will clear once 100 consecutive malfunction-free ignition cycles have occurred.

Circuit/System Description

The brake pedal position sensor is used to sense the action of the driver application of the brake pedal. The brake pedal position sensor provides an analog voltage signal that will increase as the brake pedal is applied. The body control module (BCM) provides a low reference signal and a 5-volt reference voltage to the brake pedal position sensor. When the variable signal reaches a voltage threshold indicating the brakes have been applied, the BCM will apply battery voltage to the stop lamps, center high mounted stop lamp (CHMSL), transmission control module (TCM), and engine control module (ECM).

Conditions for Running the DTC

- Battery voltage must be between 9-16 volts.
- Brakes APPLIED.

Conditions for Setting the DTC

C0277 06

This DTC will set for the following conditions:

- The BCM detects a short to ground or an open/high resistance in the brake pedal position sensor signal circuit.

- The BCM detects a short to ground or an open/high resistance in the brake pedal position sensor 5-volt reference circuit.

C0277 07

This DTC will set for the following conditions:

- The BCM detects a short to battery voltage in the brake pedal position sensor signal circuit.
- The BCM detects a short to battery voltage in the brake pedal position sensor 5-Volt Reference circuit.

C0277 09

The BCM detects the brake pedal position sensor signal is changing faster than possible under normal operating conditions.

C0277 4B

The DTC will set when the brake pedal position sensor home position is not learned.

C0890 03

The BCM detects a short to ground in the brake pedal position sensor voltage reference circuit.

C0890 07

The BCM detects a short to battery voltage in the brake pedal position sensor voltage reference circuits.

Actions Taken When the DTC Sets

- The Service Vehicle Soon indicator is commanded ON.
- If the DTC sets while the vehicle is running, the BCM will activate the brake lights when the vehicles transmission is not in the PARK position and the vehicle is not accelerating.

Conditions for Clearing the DTC

- The condition responsible for setting the DTC no longer exists.
- For DTC C0277 07 the ignition must be cycled before the code can be cleared.
- For DTC C0277 4B a successful brake pedal position sensor calibration has been performed.
- A history DTC will clear once 50 malfunction-free ignition cycles have occurred.
- DTC will not clear the current status until the next ignition cycle.

Circuit/System Testing

C0277 06, C0277 07, C0890 03, and C0890 07

1. Ignition OFF, disconnect the harness connector at the brake pedal position sensor.
2. Ignition OFF, verify that a test lamp illuminates between B+ and the low reference circuit terminal 1.
    - If the test lamp does not illuminate, test the low reference circuit for short to voltage or an open/high resistance. If the circuit tests normal, replace the BCM.
3. Ignition ON, test for 4.8-5.2 volts between the 5-volt reference circuit terminal 2 and ground.
    - If less than the specified range, test the 5-volt reference circuit for a short to ground or an open/high resistance. If the circuit tests normal, replace the BCM.
    - If greater than the specified range, test the 5-volt reference circuit for a short to voltage. If the circuit tests normal, replace the BCM.
4. Verify the scan tool BPP Sensor parameter is less than 100 counts.
    - If greater than the specified range, test the signal circuit terminal 3 for a short to voltage. If the circuit tests normal, replace the BCM.
5. Install a 3A fused jumper wire between the signal circuit terminal 3 and the 5-volt reference circuit terminal 2. Verify the scan tool BPP Sensor parameter is greater than 400 counts.
    - If less than the specified range, test the signal circuit for short to ground or an open/high resistance. If the circuit tests normal, replace the BCM.
6. If all circuits test normal, test or replace the brake pedal position sensor.

C0277 09

1. Replace the brake pedal position sensor.
2. Perform the brake pedal position sensor recalibration procedure. Refer to **Brake Pedal Position Sensor Calibration**.
3. Operate the vehicle within the Conditions for Running and Setting the DTC and verify the DTC does not reset.
    - If the DTC resets, replace the BCM.

C0277 4B

1. Verify that the DTC sets under the Conditions for Running and Setting.
2. Perform the brake pedal position sensor recalibration procedure. Refer to **Brake Pedal Position Sensor Calibration**.
3. Operate the vehicle within the Conditions for Running and Setting the DTC and verify the DTC does not reset.
    - If the DTC resets, replace the brake pedal position sensor.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the diagnostic procedure.

- **Brake Pedal Position Sensor Replacement**
- **Brake Pedal Position Sensor Calibration**
- **Control Module References** for BCM replacement, setup, and programming

DTC C0297: BRAKE APPLIED OUTPUT CIRCUIT

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

1. Stop Lamps Malfunction - Left 2. Stop Lamps Malfunction - Right 3. Center High Mounted Stop Lamp (CHMSL) Malfunction 4. Cruise Control Malfunction				

Circuit/System Description

The brake pedal position sensor is used to sense the action of the driver application of the brake pedal. The brake pedal position sensor provides an analog voltage signal that will increase as the brake pedal is applied. The body control module (BCM) provides a low reference signal and a 5-volt reference voltage to the brake pedal position sensor. When the variable signal reaches a voltage threshold indicating the brakes have been applied, the BCM will apply battery ltage to the stop lamps, center high mounted stop lamp (CHMSL), transmission control module (TCM), and engine control module (ECM).

Conditions for Running the DTC

- Battery voltage must be between 9-16 volts.
- Brakes APPLIED.

Conditions for Setting the DTC

The BCM detects a short to ground in the brake applied signal circuit.

Actions Taken When the DTC Sets

- The BCM stores the DTC to memory.
- The Service Vehicle Soon indicator is commanded ON.

Conditions for Clearing the DTC

- The condition responsible for setting the DTC no longer exists.
- A history DTC will clear once 50 malfunction-free ignition cycles have occurred.

Circuit/System Testing

1. Ignition OFF, disconnect the X1 harness connector at the ECM.
2. Connect a test lamp between the appropriate signal circuit terminal listed below and ground.
    - Brake applied signal terminal 7 - with LS4
    - Brake applied signal terminal 9 - with LZE, LZ4, or LZ8
3. Ignition ON, command the stop lamps ON and OFF by applying and releasing the brake pedal. The test lamp should turn ON and OFF when changing between the commanded states.
    - If the test lamp is always ON, test the signal circuit for a short to voltage. If the circuit test normal, replace the BCM.
    - If the test lamp is always OFF, test the signal circuit for a short to ground or an open/high resistance. If the circuit test normal, replace the BCM.
4. Ignition OFF, connect a test lamp between the appropriate signal circuit terminal listed below at the ECM harness connector and the connector terminal at the ECM.
    - Brake applied signal terminal 7 - with LS4
    - Brake applied signal terminal 9 - with LZE, LZ4, or LZ8
5. Ignition ON, command the stop lamps ON and OFF by applying and releasing the brake pedal. The test lamp should turn ON and OFF when changing between the commanded states.
    - If the test lamp does not turn ON and OFF when commanded, replace the ECM.
6. Ignition OFF, connect the harness connector at the ECM.
7. Disconnect the harness connector at the TCM.
8. Connect a test lamp between the signal circuit terminal 42 and ground.
9. Ignition ON, command the stop lamps ON and OFF by applying and releasing the brake pedal. The test lamp should turn ON and OFF when changing between the commanded states.
    - If the test lamp is always ON, test the signal circuit for a short to voltage. If the circuit test normal, replace the BCM.
    - If the test lamp is always OFF, test the signal circuit for a short to ground or an open/high resistance. If the circuit test normal, replace the BCM.
10. If all circuits test normal, replace the TCM.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the diagnostic procedure.

SYMPTOMS - LIGHTING

NOTE: **The following steps must be completed before doing the Symptom tables.**

1. Perform the **Diagnostic System Check - Vehicle** .
    - No DTCs are set.
    - The control modules can communicate via the serial data link.
2. Review the system operation in order to familiarize yourself with the system functions. Refer to the following:
    - **Exterior Lighting Systems Description and Operation**
    - **Interior Lighting Systems Description and Operation**

Visual/Physical Inspection

- Inspect for aftermarket devices which could affect the operation of the lighting system. Refer to **Checking Aftermarket Accessories** .
- Inspect the easily accessible or visible system components for obvious damage or conditions which could cause the symptom.

Intermittent

Faulty electrical connections or wiring may be the cause of intermittent conditions. Refer to **Testing for Intermittent Conditions and Poor Connections** .

Symptom List

Refer to a symptom diagnostic procedure from the following list in order to diagnose the symptom:

- **Backup Lamps Malfunction**
- **Courtesy Lamps Malfunction**
- **Daytime Running Lamps Malfunction**
- **Front Fog Lamps Malfunction**
- **Hazard Lamps Malfunction**
- **Headlamps Malfunction**
- **Interior Backlighting Malfunction**
- **Park, License, and/or Tail Lamps Malfunction**
- **Stop Lamps Malfunction**
- **Turn Signal Lamps and/or Indicators Malfunction**

BACKUP LAMPS MALFUNCTION

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Body Control Module (BCM) B+ Terminal 4 X4	B2545 00, B2652 00	B2545 00	-	-
Backup Lamps Control	B2545 00	1	1	-
Backup Lamp - Left Ground	-	1	-	-
Backup Lamp - Right Ground	-	1	-	-
1. Backup Lamps Malfunction				

Circuit/System Description

When the transmission is placed in the REVERSE position, the transmission control module (TCM) sends a serial data message to the body control module (BCM). The message indicates that the gear selector is in the REVERSE position. The BCM applies battery voltage to the backup lamps and inside rearview mirror. Once the driver moves the gear selector out of the REVERSE position, a message is sent by the TCM via serial data requesting the BCM to remove battery voltage from the backup lamp control circuit. The engine may need to be running for the backup lamps to function.

Circuit/System Verification

Command the Backup Lamps ON and OFF with a scan tool. The backup lamps should turn ON and OFF when commanded.

Circuit/System Testing

1. Ignition OFF, disconnect the harness connector at the appropriate backup lamp.
2. Ignition OFF, exterior lamps OFF, test for less than 5 Ω between the ground circuit terminal B and ground.
    - If greater than the specified range, test the ground circuit for an open/high resistance.
3. Connect a test lamp between the control circuit terminal A and ground.
4. Command the Backup Lamps ON and OFF with a scan tool. The test lamp should turn ON and OFF when changing between the commanded states.
    - If the test lamp is always ON, test the control circuit for a short to voltage. If the circuit tests normal, replace the BCM.
    - If the test lamp is always OFF, test the control circuit for a short to ground or an open/high resistance. If the circuit tests normal, BCM.
5. If all circuits test normal, test or replace the backup lamp.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the diagnostic procedure.

- **Backup Lamp Bulb Replacement**
- **Tail Lamp Replacement (Impala Limited)**

1. Dome Lamps Malfunction 2. IP Courtesy Lamps Malfunction 3. Dome Lamp Switch Malfunction 4. Door Open Switch Malfunction-Driver 5. Door Open Switch Malfunction-Passenger 6. Inadvertent Power Courtesy Lamps Malfunction 7. Interior Backlighting Malfunction				

Circuit/System Description

The INT LIGHTS fuse supplies battery voltage to the body control module (BCM). The BCM applies battery voltage to the courtesy lamps through the courtesy lamp supply voltage circuit. When any door is opened, the door open switch contacts close and the BCM receives a door-open input. If the BCM receives a door lock or unlock input, the BCM will activate the courtesy lamp supply voltage circuit, providing battery voltage to the dome lamp and instrument panel (I/P) courtesy lamps. The courtesy lamps can be manually activated by placing the interior lamp switch in the DOME position. For more detailed information concerning courtesy lamp operation refer to **Interior Lighting Systems Description and Operation**.

Inadvertent power courtesy lamp feature provides a similar function for the interior lamps as a retained accessory power feature. The BCM will energize the courtesy lamps supply voltage circuit when the BCM is in the active state (awake). When the inadvertent power courtesy lamps supply voltage circuit is energized, it supplies voltage to all the interior lights listed below. The BCM will continue to supply voltage to the interior lamps after the ignition is turned OFF so that the interior lamps may be operated.

- Dome/Reading Lamp
- Vanity Mirror Lamps
- Reading Lamp Assembly
- Inside Rearview Mirror
- Rear Compartment Courtesy Lamp

In the event that any of these lamps were to remain illuminated for a period of more than 20 minutes with the

ignition switch in the OFF position and no BCM input activity, the BCM will deactivate the inadvertent power supply voltage circuit to prevent a total battery discharge condition.

Scan Tool Reference

Control Module References for scan tool information

Circuit/System Verification

1. Ignition ON, observe the scan tool Door Ajar Switch parameter while opening and closing each vehicle door. The parameter should change between Door Ajar and Door Closed.
    - If the parameter does not change between the selected states, refer to **Door Ajar Indicator Malfunction** .
2. Observe the scan tool Rear Closure Ajar Sw. parameter while opening and closing the trunk. The parameter should change between Active and Inactive.
    - If the parameter does not change between the selected states, refer to **Trunk Release Malfunction** .
3. Command the Courtesy Lamps ON and OFF with a scan tool. The courtesy lamps should turn ON and OFF when changing between the commanded states.
    - If the courtesy lamps do not turn ON and OFF when commanded, refer to Dome Lamp Malfunction.
4. Turn the individual reading lamps ON and OFF with their respective switches. The reading lamps should turn ON and OFF when changing between the selected states.
    - If any reading lamp does not turn ON and OFF when selected, refer to Inadvertent Power Courtesy Lamps Malfunction.
5. Turn the left and right vanity mirror lamps ON and OFF with their respective switches. The vanity mirror lamps should turn ON and OFF when changing between the selected states.

- If any reading lamp does not turn ON and OFF when selected, refer to Inadvertent Power Courtesy Lamps Malfunction.

6. Turn the rear compartment courtesy lamp ON and OFF by opening and closing the trunk. The rear compartment courtesy lamp should turn ON and OFF when changing between the selected states.
    - If the rear compartment courtesy lamp does not turn ON and OFF when selected, refer to Inadvertent Power Courtesy Lamps Malfunction.

Circuit/System Testing

Dome Lamp Malfunction

1. Ignition OFF, disconnect the harness connector at the dome lamp.
2. Verify that a test lamp illuminates between the ground circuit terminal B and B+.
    - If the test lamp does not illuminate, test the ground circuit for an open/high resistance.
3. Connect a test lamp between the control circuit terminal A and ground.
4. Command the Courtesy Lamp ON and OFF with a scan tool. The test lamp should turn ON and OFF when changing between the commanded states.
    - If the test lamp is always ON, test the control circuit for a short to voltage. If the circuit tests normal, replace the BCM.
    - If the test lamp is always OFF, test the control circuit for a short to ground or an open/high resistance. If the circuit tests normal, replace the BCM.
5. If all circuits test normal, test or replace the dome lamp.

Inadvertent Power Courtesy Lamps Malfunction

1. Ignition OFF, disconnect the X3 harness connector at the BCM.
2. Ignition ON, verify that a test lamp illuminates between the B+ circuit terminal 2 and ground.
    - If the test lamp does not illuminate, test the B+ circuit for a short to ground or an open/high resistance.
3. Ignition OFF, connect the X3 harness connector at the BCM and disconnect the harness connector at the appropriate courtesy lamp.
4. Verify that a test lamp illuminates between the appropriate ground circuit terminal listed below and B+.
    - Dome/Reading Lamp - terminal B
    - Left or Right Vanity Mirror - terminal B
    - Reading Lamp Assembly - terminal B
    - Inside Rearview Mirror - terminal 7 (w/o UE1)
    - Inside Rearview Mirror - terminal 8 (with UE1)
    - Rear Compartment Courtesy Lamp - terminal B
    - If the test lamp does not illuminate, test the ground circuit for an open/high resistance.
5. Ignition ON, verify that a test lamp illuminates between the appropriate inadvertent power courtesy lamp circuit terminal listed below and ground.
    - Dome/Reading Lamp - terminal B
    - Left or Right Vanity Mirror - terminal B

- Reading Lamp Assembly - terminal A
- Inside Rearview Mirror - terminal 2 (w/o UE1)
- Inside Rearview Mirror - terminal 6 (with UE1)
- Rear Compartment Courtesy Lamp - terminal A
- If the test lamp does not illuminate, test the control circuit for a short to ground or an open/high resistance. If the circuit tests normal, replace the BCM.

6. If all circuits test normal, test or replace the courtesy lamp.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the diagnostic procedure.

- **Headlamp Switch Replacement (Impala Limited)**
- **Reading Lamp Bulb Replacement**
- **Instrument Panel Courtesy Lamp Bulb Replacement**
- **Sunshade Illuminated Mirror Lamp Bulb Replacement**

LF Headlamp Ground	-	1	-	-
RF Headlamp Ground	-	1	-	-
1. Headlamps Malfunction 2. Daytime Running Lamps Malfunction				

Circuit Description

The ambient light sensor is a light sensitive transistor that varies the voltage signal to the body control module (BCM) based on outside lighting conditions. When the ambient light sensor indicates daytime conditions, the body control module (BCM) grounds the DRL relay control circuit energizing the DRL relay. With the DRL relay energized, the switch contacts close and voltage is applied to the DRL 1 and DRL 2 fuses to the left and right low beam headlamps. Any function or condition that turns on the headlamps will cancel DRL operation.

Circuit/System Verification

1. Ignition ON, with a scan tool command the Low Beams ON and OFF. The low beam headlamps should turn ON and OFF when changing between the commanded states.
    - If the low beam headlamps do not turn ON and OFF when commanded, refer to **Headlamps Malfunction**.
2. Ignition ON, park brake released, verify with a scan tool the Park Brake Switch parameter displays Released.
    - If not the specified value, refer to **Brake Warning Indicator Malfunction (Without UJ1)** .

3. Ignition ON, with a scan tool command the DRL ON and OFF. The low beam headlamps should turn ON and OFF when changing between the commanded states.
    - If the low beam headlamps turn ON and OFF when commanded, refer to Ambient Light Sensor Malfunction.
    - If the low beam headlamps do not turn ON and OFF when commanded, refer to Daytime Running Lamps Malfunction.

Circuit/System Testing

Ambient Light Sensor Malfunction

1. Ignition OFF, disconnect the harness connector at the ambient light sensor.
2. Ignition OFF, test for less than 5 Ω between the ground circuit terminal B and ground.
    - If greater than the specified range, test the ground circuit for an open/high resistance.
3. Ignition ON, verify the scan tool Ambient Light Sensor parameter is greater than 4.65 V.
    - If less than the specified range, test the signal circuit terminal A or a short to ground. If the circuit tests normal, replace the BCM
4. Install a 3 A fused jumper wire between the signal circuit terminal A and ground. Verify the scan tool Ambient Light Sensor parameter is less than 1.96 V.
    - If greater than the specified range, test the signal circuit for a short to voltage or an open/high resistance. If the circuit tests normal, replace the BCM.
5. If all circuits test normal, test or replace the ambient light sensor.

Daytime Running Lamps Malfunction

1. Ignition OFF, disconnect the X4 harness connector at the underhood fuse block.
2. Connect a test lamp between B+ and the control circuit terminal H2.
3. Command the DRL ON and OFF with a scan tool. The test lamp should turn ON and OFF when changing between the commanded states.
    - If the test lamp is always ON, test the control circuit for a short to ground. If the circuit tests normal, replace the BCM.
    - If the test lamp is always OFF, test the control circuit for a short to voltage or an open/high resistance. If the circuit tests normal, replace the BCM.
4. Ignition OFF, connect the X4 harness connector at the underhood fuse block.
5. Disconnect the X3 harness connector at the underhood fuse block.
6. Connect a test lamp between the control circuit terminal B2 and ground.
7. Command the DRL ON and OFF with a scan tool. The test lamp should turn ON and OFF when changing between the commanded states.
    - If the test lamp is always ON, test the control circuit for a short to voltage. If the circuit tests normal, replace the underhood fuse block.
    - If the test lamp is always OFF, test the control circuit for a short to ground or an open/high resistance. If the circuit tests normal, replace the underhood fuse block.
8. If all circuits test normal, replace the underhood fuse block.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the diagnostic procedure.

- **Accessory Wiring Junction Block Replacement**
- **Daytime Running Lamp (DRL) Ambient Light Sensor Replacement**
- **Control Module References** for BCM replacement, setup, and programming

FRONT FOG LAMPS MALFUNCTION

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Fog Lamp Switch Signal	2	2	2	-
Fog Lamp Relay Control	1	1	B2530 00	-
Fog Lamp Control	1	1	1	-
Fog Lamp - LF Ground	-	1	-	-
Fog Lamp - RF Ground	-	1	-	-
Headlamp Switch Ground	-	2	-	-
1. Front Fog Lamps Malfunction 2. Front Fog Lamp Switch Malfunction				

Circuit/System Description

The fog lamp relay is supplied with battery voltage at all times. The fog lamp switch signal circuit is grounded momentarily by pressing the fog lamp switch. The body control module (BCM) energizes the fog lamp relay by applying ground to the fog lamp relay control circuit. When the fog lamp relay is energized, the relay switch contacts close and battery voltage is applied through the FOG LAMPS fuse to the fog lamp supply voltage circuit which illuminates the fog lamps.

Control Module References for scan tool information

Circuit/System Verification

1. Ignition ON, observe the scan tool Front Fog Lamp Switch parameter while activating the fog lamp switch. The parameter should change between Active and Inactive.
    - If the parameter does not change between the commanded states, refer to Fog Lamp Switch Malfunction.
2. Turn the fog lamps ON and OFF with the fog lamps switch. The fog lamps should turn ON and OFF as selected.
    - If the fog lamps do not change between the selected states, refer to Fog Lamp Malfunction.
3. Command the Display Test ON and OFF with a scan tool. The fog lamps indicator should turn ON and OFF when changing between the commanded states.
    - It the fog lamps indicator illuminates during the test, replace the BCM.
    - If the fog lamps indicator odes not illuminate during the test or remains illuminated at all times, replace the instrument cluster.

Circuit/System Testing

Fog Lamp Switch Malfunction

1. Ignition OFF, disconnect the harness connector at the headlamp switch.
2. Ignition OFF, verify that a test lamp illuminates between B+ and the ground circuit terminal 8.
    - If the test lamp does not illuminate, test the ground circuit for an open/high resistance.
3. Ignition ON, verify the scan tool Front Fog Lamp Switch parameter is Inactive.
    - If not the specified value, test the signal circuit terminal 6 for a short to ground. If the circuit tests normal, replace the BCM.
4. Install a 3 A fused jumper wire between the signal circuit terminal 6 and the ground circuit terminal 8. Verify the scan tool Front Fog Lamp Switch parameter is Active.
    - If not the specified value, test the signal circuit for a short to voltage or and open/high resistance. If the circuit tests normal, replace the BCM.
5. If all circuits test normal, test or replace the headlamp switch.

Fog Lamps Malfunction

1. Ignition OFF, disconnect the X2 harness connector at the underhood fuse block.
2. Connect a test lamp between B+ and the control circuit terminal H5.
3. Command the Fog Lamps ON and OFF with a scan tool. The test lamp should turn ON and OFF when changing between the commanded states.
    - If the test lamp is always ON, test the control circuit for a short to ground. If the circuit tests normal, replace the BCM.
    - If the test lamp is always OFF, test the control circuit for a short to voltage or an open/high resistance. If the circuit tests normal, replace the BCM.
4. Ignition OFF, connect the X2 harness connector at the underhood fuse block.
5. Disconnect the harness connector at the appropriate fog lamp.
6. Ignition OFF, test for less than 5 Ω between the ground circuit terminal B and ground.
    - If greater than the specified range, test the ground circuit for an open/high resistance.
7. Connect a test lamp between the control circuit terminal A and ground.
8. Command the Fog Lamps ON and OFF with a scan tool. The test lamp should turn ON and OFF when changing between the commanded states.
    - If the test lamp is always ON, test the control circuit for a short to voltage. If the circuit tests normal, replace the underhood fuse block.
    - If the test lamp is always OFF, test the control circuit for a short to ground or an open/high resistance. If the circuit tests normal, replace the underhood fuse block.
9. If all circuits test normal, test or replace the fog lamp.

Fog Lamp Indicator Malfunction

Ignition ON, with a scan tool perform the Display Test for the instrument panel cluster (IPC) and observe the front fog lamp indicator.

- If the front fog lamp indicator illuminates during the test, replace the BCM.
- If the front fog lamp indicator does not illuminate during the test or remains illuminated at all times, replace the IPC.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the diagnostic procedure.

- **Accessory Wiring Junction Block Replacement**
- **Headlamp Switch Replacement (Impala Limited)**
- **Front Fog Lamp Bulb Replacement**
- **Front Fog Lamp Replacement**
- **Control Module References** for BCM or IPC replacement, setup, and programming

HAZARD LAMPS MALFUNCTION

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.

- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Hazard Switch Signal	1	1	1	-
Hazard Switch Ground	-	1	1	-
1. Hazard Lamps Malfunction				

Circuit/System Description

The hazard flashers may be activated in any power mode. The hazard switch is located on the turn signal/multifunction switch and is permanently grounded. When the hazard switch is placed in the ON position, ground is applied through the hazard switch signal circuit to the body control module (BCM). The BCM supplies battery voltage to all four turn signal lamps in an ON and OFF duty cycle. When the hazard switch is activated, the BCM sends a serial data message to the instrument panel cluster (IPC) requesting both turn signal indicators to be cycled ON and OFF.

Circuit/System Testing

1. Ignition OFF, disconnect the X1 harness connector at the turn signal/multifunction switch.
2. Ignition OFF, verify that a test lamp illuminates between B+ and the ground circuit terminal H.

- If the test lamp does not illuminate, test the ground circuit for an open/high resistance.

3. Ignition ON, verify the scan tool Hazard Lamp Switch parameter is Inactive.
   - If not the specified value, test the signal circuit terminal C for a short to ground. If the circuit tests normal, replace the BCM.
4. Install a 3 A fused jumper wire between the signal circuit terminal C and ground. Verify the scan tool Hazard Lamp Switch parameter is Active.
   - If not the specified value, test the signal circuit for a short to voltage or and open/high resistance. If the circuit tests normal, replace the BCM.
5. If all circuits test normal, test or replace the turn signal/multifunction switch.

Circuit/System Description

The vehicle headlamps are controlled by the body control module (BCM) based on inputs from the headlamp switch and the turn signal/multifunction switch. The headlamp switch has four positions: Off, Auto, Park, and Headlamps. The default headlamp switch position is Auto, in which the BCM uses the ambient light sensor to determine when headlamps are needed. The Off portion of the headlamp switch is a momentary switch which overrides the automatic headlamps and will turn off the vehicle headlamps. When in the Off position, the headlamp switch grounds the headlamp switch headlamps off signal circuit, prompting the BCM to turn off the headlamps. The Park position of the headlamp switch will only illuminate the vehicle parking lamps. The Headlamp position of the headlamp switch will illuminate both the parking lamps, as well has the headlamps. With the headlamp switch in the Headlamp position, the headlamp switch headlamps on signal circuit is grounded, prompting the BCM to turn on the headlamps, regardless of other factors such as ambient light.

The headlamp high beams are controlled through the flash to pass switch and the headlamp dimmer switch, both located in the turn signal/multifunction switch. The flash to pass switch is a momentary type switch, designed to illuminate the high beams as long as the switch is held. With the switch closed, the flash to pass switch signal circuit is grounded, prompting the BCM to turn on the high beam lamps. The headlamp dimmer switch allows the operator to select between full time high or low beam operation. Unlike the flash to pass switch, it is not a momentary switch. When the headlamp dimmer switch is in the high beam position, the headlamp dimmer switch high beam signal circuit is grounded. This prompts the BCM to turn on the high beam lamps.

The BCM controls the headlamps based on the inputs explained above. When a low beam request is received, the BCM grounds the headlamp low beam relay control circuit. This energizes the coil in the LOW BEAM PCB relay, causing the relay switch to close. This then applies B+ to both low beam headlamps through the LT LO BEAM and RT LO BEAM fuses, illuminating the low beam headlamps. When a high beam request is received, the BCM grounds the headlamp high beam relay control circuit. This energizes the coil in the HIGH BEAM PCB relay, causing the relay switch to close. This then applies B+ to both high beam headlamps through the LT HI BEAM and RT HI BEAM fuses, illuminating the high beam headlamps.

Scan Tool Reference

Control Module References for scan tool information

Circuit/System Verification

1. Ignition ON, observe the scan tool Headlamp Switch parameter while turning the headlamp switch ON and OFF. The reading should change between Active and Inactive.
    - If the reading does not change between the specified values, refer to Headlamp Switch Malfunction.
2. Ignition ON, observe the scan tool Auto Hdlp. Disable Sw. parameter while turning the headlamp switch ON and OFF. The reading should change between Active and Inactive.
    - If the reading does not change between the specified values, refer to Headlamp Switch Malfunction.
3. Observe the scan tool Flash to Pass Switch parameter while applying and releasing the turn signal/multifunction switch. The reading should toggle between Active and Inactive.
    - If the reading does not change between the specified values, refer to Turn Signal/Multifunction Switch Malfunction.
4. Observe the scan tool High Beam Select Switch parameter while applying and releasing the high beam select switch. The reading should toggle between Active and Inactive.
    - If the reading does not change between the specified values, refer to Turn Signal/Multifunction Switch Malfunction.
5. Command the Low Beams ON and OFF with a scan tool. The low beam headlamps should turn ON and OFF when commanded.
    - If the low beam headlamps do not turn ON and OFF when commanded, refer to Headlamps Malfunction - Low Beam.
6. Command the High Beams ON and OFF with a scan tool. The high beam headlamps should turn ON and OFF when commanded.
    - If the high beam headlamps do not turn ON and OFF when commanded, refer to Headlamps Malfunction - High Beam.
7. Command the Display Test ON and OFF with a scan tool. The high beam indicator should turn ON and OFF when changing between the commanded states.
    - If the high beam indicator illuminates during the test, replace the BCM.
    - If the high beam indicator does not illuminate during the test or remain illuminated at all times,

replace the instrument cluster.

Circuit/System Testing

Headlamp Switch Malfunction

1. Ignition OFF, disconnect the harness connector at the headlamp switch.
2. Ignition OFF, verify that a test lamp illuminates between B+ and the ground circuit terminal 8.
    - If the test lamp does not illuminate, test the ground circuit for an open/high resistance.
3. Ignition ON, verify the scan tool Headlamp Switch parameter is Inactive.
    - If not the specified value, test the signal circuit terminal 1 for short to ground. If the circuit tests normal, replace the BCM.
4. Verify the scan tool Auto Hdlp. Disable Sw. parameter is Inactive.
5. If not the specified value, test the signal circuit terminal 3 for short to ground. If the circuit tests normal, replace the BCM.
6. Install a 3 A fused jumper wire between the signal circuit terminal 1 and ground. Verify the scan tool Headlamp Switch parameter is Active.
    - If not the specified value, test the signal circuit for a short to voltage or an open/high resistance. If the circuit tests normal, replace the BCM.
7. Install a 3 A fused jumper wire between the signal circuit terminal 3 and ground. Verify the scan tool Auto Hdlp. Disable Sw. parameter is Active.
    - If not the specified value, test the signal circuit for a short to voltage or an open/high resistance. If the circuit tests normal, replace the BCM.
8. If all circuits test normal, test or replace the headlamp switch.

Turn Signal/Multifunction Switch Malfunction

1. Ignition OFF, disconnect the X2 harness connector at the turn signal/multifunction switch.
2. Ignition OFF, verify that a test lamp illuminates between B+ and the ground circuit terminal D.
    - If the test lamp does not illuminate, test the ground circuit for an open/high resistance.
3. Ignition ON, verify the scan tool Flash to Pass Switch parameter is Inactive.
    - If not the specified value, test the signal circuit terminal A for a short to ground. If the circuit tests normal, replace the BCM.
4. Verify the scan tool High Beam Select Switch parameter is Inactive.
    - If not the specified value, test the signal circuit terminal E for a short to ground. If the circuit tests normal, replace the BCM.
5. Install a 3 A fused jumper wire between the signal circuit terminal A and ground. Verify the scan tool Flash to Pass Switch parameter is Active.
    - If not the specified value, test the signal circuit for a short to voltage or and open/high resistance. If the circuit tests normal, replace the BCM.
6. Install a 3 A fused jumper wire between the signal circuit terminal E and ground. Verify the scan tool High Beam Select Switch parameter is Active.
    - If not the specified value, test the signal circuit for a short to voltage or and open/high resistance. If

the circuit tests normal, replace the BCM.

7. If all circuits test normal, test or replace the turn signal/multifunction switch.

Headlamps Malfunction - Low Beam

1. Ignition OFF, disconnect the X2 harness connector at the underhood fuse block.
2. Connect a test lamp between B+ and the control circuit terminal A5.
3. Command the Low Beams ON and OFF with a scan tool. The test lamp should turn ON and OFF when changing between the commanded states.
    - If the test lamp is always ON, test the control circuit for a short to ground. If the circuit tests normal, replace the BCM.
    - If the test lamp is always OFF, test the control circuit for a short to voltage or an open/high resistance. If the circuit tests normal, replace the BCM.
4. Ignition OFF, disconnect the harness connector at the appropriate low beam headlamp.
5. Ignition OFF, scan tool OFF, exterior lamps OFF, test for less than 5 Ω between the ground circuit terminal B and ground.
    - If greater than the specified range, test the ground circuit for an open/high resistance.
6. Connect a test lamp between the control circuit terminal A and ground.
7. Command the Low Beams ON and OFF with a scan tool. The test lamp should turn ON and OFF when changing between the commanded states.
    - If the test lamp is always ON, test the control circuit for a short to voltage. If the circuit tests normal, replace the underhood fuse block.
    - If the test lamp is always OFF, test the control circuit for a short to ground or an open/high resistance. If the circuit tests normal, replace the underhood fuse block.
8. If all circuits test normal, test or replace the low beam headlamp.

Headlamps Malfunction - High Beam

1. Ignition OFF, disconnect the X2 harness connector at the underhood fuse block.
2. Connect a test lamp between B+ and the control circuit terminal C6.
3. Command the High Beams ON and OFF with a scan tool. The test lamp should turn ON and OFF when changing between the commanded states.
    - If the test lamp is always ON, test the control circuit for a short to ground. If the circuit tests normal, replace the BCM.
    - If the test lamp is always OFF, test the control circuit for a short to voltage or an open/high resistance. If the circuit tests normal, replace the BCM.
4. Ignition OFF, disconnect the harness connector at the appropriate high beam headlamp.
5. Ignition OFF, scan tool OFF, exterior lamps OFF, test for less than 5 Ω between the ground circuit terminal B and ground.
    - If greater than the specified range, test the ground circuit for an open/high resistance.
6. Connect a test lamp between the control circuit terminal A and ground.
7. Command the High Beams ON and OFF with a scan tool. The test lamp should turn ON and OFF when changing between the commanded states.

- If the test lamp is always ON, test the control circuit for a short to voltage. If the circuit tests normal, replace the underhood fuse block.
- If the test lamp is always OFF, test the control circuit for a short to ground or an open/high resistance. If the circuit tests normal, replace the underhood fuse block.

8. If all circuits test normal, test or replace the high beam headlamp.

Headlamp Switch Ground	-	3	-	-
1. Instrument Panel Lamps Malfunction 2. LED Malfunction 3. Headlamps and Dimmer Switch Malfunction				

Circuit/System Description

The body control module (BCM) supplies a voltage reference through the instrument panel (I/P) dimming voltage reference circuit to the interior lamp dimmer switch, which is part of the headlamp switch. When the dimmer switch is placed in a desired brightness position, reference voltage is applied through the dimmer switch rheostat and the I/P lamps dimmer switch signal circuit to the BCM. The BCM interprets this voltage signal, then applies a pulse width modulated (PWM) voltage from the CHMSL/BCK-UP fuse through the

instrument panel lamp supply voltage circuit, the backlight lamp control circuit, and the LED dimming supply circuit illuminating the LED and I/P panel lamps.

Scan Tool Reference

Control Module References for scan tool information

Circuit/System Verification

1. Ignition ON, observe the scan tool Dimming Control Signal parameter while operating the dimmer switch from high to low. The parameter should change from a high percent to a low percent as the switch is rotated.
    - If the parameter does not change, refer to Dimmer Switch Circuit Test.
2. If the scan tool dimmer control operates normal, refer to Interior Backlighting Circuit Test.

Circuit/System Testing

Dimmer Switch Circuit Test

1. Ignition OFF, disconnect the harness connector at the headlamp switch.
2. Ignition OFF, verify that a test lamp illuminates between the ground circuit terminal 8 and B+.
    - If the test lamp does not illuminate, test the ground circuit for an open/high resistance.
3. Ignition ON, verify the scan tool Dimming Control Signal parameter is less than 0.2 volts.
    - If greater than the specified range, test the signal circuit terminal 13 for a short to voltage. If the circuit tests normal, replace the BCM.
4. Ignition ON, test for B+ between the voltage reference circuit terminal 15 and ground.
    - If less than the specified value, test the voltage reference circuit for a short to ground or an

open/high resistance. If the circuit tests normal, replace the BCM.

5. Install a 3A fused jumper wire between the signal circuit terminal 13 and the voltage reference circuit terminal 15. Verify the scan tool Dimming Control Signal parameter is greater than 2.6 volts.
    - If less than the specified range, test the signal circuit for a short to ground or an open/high resistance. If the circuit tests normal, replace the BCM.
6. If all circuits test normal, test or replace the headlamp switch.

Interior Backlighting Circuit Test

1. Ignition OFF, disconnect the X3 harness connector at the BCM.
2. Ignition ON, verify that a test lamp illuminates between the B+ circuit terminal 2 and ground.
    - If the test lamp does not illuminate, test the B+ circuit for a short to ground or an open/high resistance.
3. Ignition OFF, connect the X3 harness connector at the BCM and disconnect the harness connector at the component with the inoperative backlighting.
4. Verify that a test lamp illuminates between the appropriate ground circuit terminal listed below and B+.
    - Headlamp Switch terminal 8
    - Instrument Panel Cluster (IPC) terminal 6
    - Driver Window Switch terminal B X1
    - Driver Door Lock Switch terminal B
    - Outside Rearview Mirror Switch terminal B
    - Passenger Window Switch terminal C
    - Passenger Door Lock Switch terminal B
    - Radio terminal 8 X1
    - HVAC Control Module terminal 10 X1
    - Driver Information Display Switch terminal 5
    - Left Steering Wheel Controls terminal 8
    - Right Steering Wheel Controls terminal 1
    - If the test lamp does not illuminate, test the ground circuit for an open/high resistance.
5. Connect a test lamp between the appropriate control circuit terminal listed below and ground.

    Incandescent Dimming

    - Headlamp Switch terminal 7
    - Instrument Panel Cluster (IPC) terminal 8
    - Driver Window Switch terminal F X2
    - Driver Door Lock Switch terminal A
    - Outside Rearview Mirror Switch terminal E
    - Passenger Window Switch terminal B
    - Passenger Door Lock Switch terminal A

    LED Dimming

- Radio terminal 7 X1
- HVAC Control Module terminal 1 X1
- Driver Information Display Switch terminal 4
- Left Steering Wheel Controls terminal 6
- Right Steering Wheel Controls terminal 2

6. Ignition ON, command the appropriate Incandescent Dimming or LED Dimming ON and OFF with a scan tool. The test lamp should turn ON and OFF when changing between the commanded states.
    - If the test lamp is always OFF, test the control circuit for a short to ground or an open/high resistance. If the circuit tests normal, replace the BCM
    - If the test lamp is always ON, test the control circuit for a short to voltage. If the circuit tests normal, replace the BCM.
7. If all circuits test normal, test or replace the component with the inoperative backlighting.

* Internal damage to the headlamp switch may occur if shorted to B+ 1. All park lamps inoperative 2. All park lamps always on 3. Left park lamps malfunction 4. Right park lamps malfunction				

Circuit/System Description

The vehicle park, license, and tail lamps are controlled by the body control module (BCM) based on an input from the headlamp switch. The headlamp switch has four positions: Off, Auto, Park, and Headlamps. The default headlamp switch position is Auto, in which the BCM uses the ambient light sensor to determine when exterior lamps are needed. The Off portion of the headlamp switch is a momentary switch which overrides the automatic lamps and will turn off the vehicle lamps. The Park position of the headlamp switch will only illuminate the vehicle parking lamps. The Headlamp position of the headlamp switch will illuminate both the parking lamps, as well as the headlamps. With the headlamp switch in the Park position, the park lamp switch on signal circuit is grounded prompting the BCM to turn ON the exterior lamps, regardless of other factors such as ambient light.

When a park lamp request is received, the BCM grounds the park lamp relay control circuit. This energizes the PARK LP PCB relay. Battery voltage is then applied through the switch side of the relay, the LT PARK and RT PARK fuses illuminating the front park, license, tail, and marker lamps.

Scan Tool Reference

Control Module References for scan tool information

Circuit/System Verification

1. Ignition ON, observe the scan tool BCM Parklamp Switch parameter while cycling the headlamp switch between the Park and Auto positions. The parameter should change between Active and Inactive.
    - If the parameter does not change between the specified values, refer to Headlamp Switch Malfunction.
2. Command the Parking Lamps ON and OFF with a scan tool. The front park, license, and tail lamps should turn ON and OFF when changing between the commanded states.
    - If all of the lamps are always OFF or remain ON, refer to the Park Lamp Relay Malfunction.
    - If one or more of the lamps is always OFF, refer to Park Lamps Malfunction.

Circuit/System Testing

Headlamp Switch Malfunction

1. Ignition OFF, disconnect the harness connector at the headlamp switch.
2. Ignition OFF, verify that a test lamp illuminates between the ground circuit terminal 8 and B+.
    - If the test lamp does not illuminate, test the ground circuit for an open/high resistance.
3. Ignition ON, verify the scan tool Parklamp Switch parameter is Inactive.
    - If not the specified value, test the signal circuit terminal 2 for a short to ground. If the circuit tests normal, replace the BCM.
4. Install a 3 A fused jumper wire between the signal circuit terminal 2 and ground. Verify the scan tool Parklamp Switch parameter is Active.
    - If not the specified value, test the signal circuit for a short to voltage or and open/high resistance. If the circuit tests normal, replace the BCM.
5. If all circuits test normal, test or replace the headlamp switch.

Park Lamp Relay Malfunction

1. Ignition OFF, disconnect the harness connector X2 at the underhood fuse block.
2. Connect a test lamp between the control circuit terminal K2 and B+.
3. Ignition ON, command the Park Lamps ON and OFF with a scan tool. The test lamp should turn ON and OFF when changing between the commanded states.
    - If the test lamp is always ON, test the control circuit for a short to ground. If the circuit tests normal, replace the BCM.
    - If the test lamp is always OFF, test the control circuit for a short to voltage or an open/high resistance. If the circuit tests normal, replace the BCM.
4. If the circuit tests normal, replace the underhood fuse block.

Park Lamps Malfunction

1. Ignition OFF, disconnect the harness connector at the appropriate exterior lamp.
2. Ignition OFF, test for less than 5.0 Ω between the ground circuit terminal listed below and ground.
    - Marker Lamps terminal B
    - Tail Lamps terminal B
    - License Lamp terminal B

- Tail/Stop/Turn Signal Lamps terminal G
- Front Park/Turn Signal Lamps terminal G
- If greater than the specified range, test the ground circuit for an open/high resistance.

3. Connect a test lamp between the control circuit terminal listed below and ground.
   - Marker Lamps terminal A
   - Tail Lamps terminal A
   - License Lamp terminal A
   - Tail/Stop/Turn Signal Lamps terminal B
   - Front Park/Turn Signal Lamps terminal B
4. Ignition ON, command the Park Lamps ON and OFF with a scan tool. The test lamp should turn ON and OFF when changing between the commanded states.
   - If the test lamp is always ON, test the control circuit for a short to voltage. If the circuit tests normal, replace the underhood fuse block.
   - If the test lamp is always OFF, test the control circuit for a short to ground or an open/high resistance. If the circuit tests normal, replace the underhood fuse block.
5. If all circuits test normal, test or replace the park lamp.

Component Testing

Headlamp Switch

NOTE: **If the switch tests open in any switch position other than Auto, test the switch signal circuits for a short to voltage before replacing the switch.**

1. Ignition OFF, disconnect the harness connector at the headlamp switch.
2. Test for infinite resistance between the signal terminal 1 and the ground terminal 8 with the switch in the Auto position.
   - If not the specified value, replace the headlamp switch.
3. Test for less than 2.0 Ω between the signal terminal 1 and the ground terminal 8 with the switch in the Headlamp ON position.
   - If greater than the specified value, replace the headlamp switch.
4. Test for infinite resistance between the signal terminal 2 and the ground terminal 8 with the switch in the Auto position.
   - If not the specified value, replace the headlamp switch.
5. Test for less than 2.0 Ω between the signal terminal 2 and the ground terminal 8 with the switch in the Park position.
   - If greater than the specified value, replace the headlamp switch.
6. Test for infinite resistance between the signal terminal 3 and the ground terminal 8 with the switch in the Auto position.
   - If not the specified value, replace the headlamp switch.
7. Test for less than 2.0 Ω between the signal terminal 3 and the ground terminal 8 with the switch in the Off position.

- If greater than the specified value, replace the headlamp switch.

Circuit/System Description

The brake pedal position sensor is used to sense the action of the driver application of the brake pedal. The brake pedal position sensor provides an analog voltage signal that will increase as the brake pedal is applied. The body control module (BCM) provides a low reference signal and a 5 V If the left and right turn signal indicators do not illuminate during the test or remain illuminated at all times, replace the instrument cluster. reference voltage to the brake pedal position sensor. When the variable signal reaches a voltage threshold indicating the brakes have been applied, the BCM will apply battery voltage to the stop lamps, center high mounted stop lamp (CHMSL), transmission control module (TCM), and engine control module (ECM).

Scan Tool Reference

Control Module References for scan tool information

Circuit/System Verification

1. Ignition ON, observe the scan tool Brake Applied Output Signal parameter as you apply and unapply the brake pedal. The reading should cycle between OFF and ON as the brake pedal is applied and released.

- If the reading does not change as the brake pedal is applied and released, refer to Brake Pedal Position Sensor Malfunction.

2. With a scan tool, command the LR Turn Signal ON and OFF. The LR turn signal should turn ON and OFF when changing between the commanded states.
    - If the LR turn signal does not illuminate when commanded, refer to Stop Lamps Malfunction.
3. With a scan tool, command the RR Turn Signal ON and OFF. The RR turn signal should turn ON and OFF when changing between the commanded states.
    - If the RR turn signal does not illuminate when commanded, refer to Stop Lamps Malfunction.

Circuit/System Testing

Brake Pedal Position Sensor Malfunction

1. Ignition OFF, disconnect the harness connector at the brake pedal position sensor.
2. Ignition ON, verify that a test lamp does not illuminate between the low reference circuit terminal 1 and ground.
    - If the test lamp illuminates, test the low reference circuit for a short to voltage. If the circuit tests normal, replace the BCM.
3. Ignition ON, test for 4.8-5.2 V between the 5 V reference circuit terminal 2 and ground.
    - If less than the specified range, test the 5 V reference circuit for a short to ground or an open/high resistance. If the circuit/connections test normal, replace the BCM.
    - If greater than the specified range, test the 5 V reference circuit for a short to voltage. If the circuit test normal, replace the BCM.
4. If all circuits test normal, replace the brake pedal position sensor.

Stop Lamps Malfunction

1. Ignition OFF, disconnect the X4 harness connector at the BCM.
2. Verify that a test lamp illuminates between the B+ circuit terminal 1 and ground.
    - If the test lamp does not illuminate, test the B+ circuit for a short to ground or an open/high resistance.
3. Verify that a test lamp illuminates between the B+ circuit terminal 3 and ground.
    - If the test lamp does not illuminate, test the B+ circuit for a short to ground or an open/high resistance.
4. Ignition OFF, connect the X4 harness connector at the BCM.
5. Disconnect the harness connector at the appropriate stop lamp.
6. Ignition OFF, exterior lamps OFF, test for less than 5 Ω between the ground circuit terminal G and ground.
    - If greater than the specified range, test the ground circuit for an open/high resistance.
7. Connect a test lamp between the control circuit terminal A and ground.
8. Ignition ON, command the stop lamp ON and OFF by commanding the appropriate Rear Turn Signal parameter ON and OFF with a scan tool. The test lamp should turn ON and OFF when changing between the commanded states.

- If the test lamp is always ON, test the control circuit for a short to voltage. If the circuit tests normal, replace the BCM.
- If the test lamp is always OFF, test the control circuit for a short to ground or an open/high resistance. If the circuit tests normal, replace the BCM.

9. If all circuits test normal, replace the stop lamp.

Center High Mounted Stop Lamp Malfunction

1. Ignition OFF, disconnect the harness connector at the center high mount stop lamp.
2. Ignition OFF, exterior lamps OFF, test for less than 5 Ω between the ground circuit terminal A and ground.
   - If greater than the specified range, test the ground circuit for an open/high resistance.
3. Connect a test lamp between the control circuit terminal B and the ground circuit terminal A.
4. Ignition ON, command the stop lamps ON and OFF by applying and releasing the brake pedal. The test lamp should turn ON and OFF when changing between the commanded states.
   - If the test lamp is always ON, test the control circuit for a short to voltage. If the circuit tests normal, replace the BCM.
   - If the test lamp is always OFF, test the control circuit for a short to ground or an open/high resistance. If the circuit tests normal, replace the BCM.
5. If all circuits test normal, test or replace the center high mount stop lamp.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the diagnostic procedure.

- **Brake Pedal Position Sensor Calibration**
- **Brake Pedal Position Sensor Replacement**
- **High Mount Stop Lamp Replacement (Impala Limited)**
- **Rear Turn Signal Lamp Bulb Replacement**
- **Tail Lamp Replacement (Impala Limited)**
- **Control Module References** for BCM replacement, setup, and programming

TURN SIGNAL LAMPS AND/OR INDICATORS MALFUNCTION

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category

1. All turn signals inoperative 2. Left turn signals malfunction 3. Right turn signals malfunction 4. Left front turn signal malfunction 5. Right front turn signal malfunction 6. Left rear stop/turn signal malfunction 7. Right rear stop/turn signal malfunction				

Circuit/System Description

The body control module (BCM) controls the vehicle turn signals based on inputs from the turn signal/multifunction switch. With the turn signal/multifunction switch in the left turn position, a ground path is provided on the left turn signal switch signal circuit, indicating a left turn signal request. With the turn signal/multifunction switch in the right turn position, a ground path is provided on the right turn signal switch signal circuit, indicating a right turn signal request. When the specific request is seen, the BCM will pulse the respective turn signal lamp supply voltage circuits, illuminating the turn signal lamps.

When a turn signal request is seen by the BCM, a serial data message is sent to the instrument panel cluster (IPC) requesting the respective turn signal indicator be pulsed.

Scan Tool Reference

Control Module References for scan tool information

Circuit/System Verification

1. Ignition ON, observe the scan tool Right Turn Signal Switch and Left Turn Signal Switch parameters while cycling the turn signal switch between the right and left positions. The readings should change between Active and Inactive.
    - If the parameters do not change between the selected states, refer to Turn Signal Switch Malfunction.
2. Ignition ON, observe the right and left turn signal lamps while cycling the turn signal switch between the right and left positions. Verify the turn signal lamps turn ON and OFF.
    - If the turn signal lamps do not cycle between the selected states, refer to Turn Signal Lamp Malfunction.
3. Command the Display Test ON and OFF with a scan tool. The left and right turn signal indicators should turn ON and OFF when changing between the commanded states.
    - If the left and right turn signal indicators illuminate during the test, replace the BCM.
    - If the left and right turn signal indicators do not illuminate during the test or remain illuminated at all times, replace the instrument cluster.

Circuit/System Testing

Turn Signal Switch Malfunction

1. Ignition OFF, disconnect the harness connector X1 at the turn signal/multifunction switch.
2. Verify that a test lamp illuminates between the ground circuit terminal E and B+.
    - If the test lamp does not illuminate, test the ground circuit for an open/high resistance.
3. Ignition ON, verify the scan tool Left Turn Signal Switch parameter is Inactive.
    - If not the specified value, test the signal circuit terminal D for a short to ground. If the circuit tests normal, replace the BCM.
4. Verify the scan tool Right Turn Signal Switch parameter is Inactive.
    - If not the specified value, test the signal circuit terminal F for a short to ground. If the circuit tests normal, replace the BCM.
5. Install a 3 A fused jumper wire between the signal circuit terminal D and the ground circuit terminal E. Verify the scan tool Left Turn Signal Switch parameter is Active.

- If not the specified value, test the signal circuit for a short to voltage or and open/high resistance. If the circuit tests normal, replace the BCM.

6. Install a 3 A fused jumper wire between the signal circuit terminal F and the ground circuit terminal E. Verify the scan tool Right Turn Signal Switch parameter is Active.
    - If not the specified value, test the signal circuit for a short to voltage or and open/high resistance. If the circuit tests normal, replace the BCM.
7. If all circuits test normal, test or replace the turn signal/multifunction switch.

Turn Signal Lamp Malfunction

1. Ignition OFF, disconnect the harness connect X4 at the BCM.
2. Ignition ON, verify a test lamp illuminates between the B+ circuits listed below and ground.
    - B+ terminal 1
    - B+ terminal 2
    - B+ terminal 3
    - If the test lamp does not illuminate, test the B+ circuit for a short to ground or an open/high resistance. If the circuit tests normal and the fuse is open, test the appropriate control circuit(s) listed below for a short to ground.
    - LT T/SIG Fuse - terminal 1 X5 and terminal 4 X5
    - RT T/SIG Fuse - terminal 2 X5
    - INT LIGHTS Fuse - terminal 5 X4
3. Ignition OFF, disconnect the harness connector at the appropriate turn signal lamp.
4. Verify that a test lamp illuminates between the ground circuit terminal G and B+.
    - If the test lamp does not illuminate, test the ground circuit for an open/high resistance.
5. Connect a test lamp between the control circuit terminal A and the ground circuit terminal G.
6. Ignition ON, command the appropriate turn signal ON and OFF with a scan tool. The test lamp should turn ON and OFF when changing between the commanded states.
    - If the test lamp is always ON, test the control circuit for a short to voltage. If the circuit tests normal, replace the BCM.
    - If the test lamp is always OFF, test the control circuit for a short to ground or an open/high resistance. If the circuit tests normal, replace the BCM.
7. If all circuits test normal, test or replace the turn signal lamp.

Component Testing

Turn Signal/Multifunction Switch

1. Ignition OFF, disconnect the X1 harness connector at the turn signal/multifunction switch.
2. Test for infinite resistance between the signal terminals listed below and the ground circuit terminal E with the switch in the neutral position.
    - Signal terminal D
    - Signal terminal F
    - If not the specified value, replace the turn signal/multifunction switch.

NOTE: **If the switch tests open in any switch position other than Off, test the switch signal circuits for a short to voltage before replacing the switch.**

3. Test for less than 2.0 Ω between the signal terminal D and the ground terminal E with the switch in the left turn position.
    - If greater than the specified range, replace the turn signal/multifunction switch.
4. Test for less than 2.0 Ω between the signal terminal F and the ground terminal E with the switch in the left turn position.
    - If greater than the specified range, replace the turn signal/multifunction switch.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the diagnostic procedure.

- **Headlamp Bulb Replacement**
- **Rear Turn Signal Lamp Bulb Replacement**
- **Turn Signal Multifunction Switch Replacement**
- **Control Module References** for BCM and IPC replacement, setup, and programming

REPAIR INSTRUCTIONS

BRAKE PEDAL POSITION SENSOR CALIBRATION

NOTE: **Brake system does not use a brake switch, stoplight switch or brakelight switch. System uses a Brake Pedal Position Sensor to control these functions.**

Calibration Criteria

NOTE: **Do not apply the brake pedal during the brake pedal position sensor calibration procedure. Any movement of the brake pedal during this procedure will cause the calibration procedure to fail. If this occurs, the brake pedal position sensor calibration must be repeated.**

Brake pedal position sensor calibration must be performed after the brake pedal position sensor, body control module (BCM), engine control module (ECM), or hybrid powertrain control module have been serviced. The calibration procedure will set the brake pedal position sensor home value. This value is used by the BCM and ECM/HPCM to determine the action of the driver applying the brake system and to provide this information to the vehicle subsystems via serial data.

Calibration Procedure

1. Apply the parking brake.
2. Ignition ON, engine OFF, place the transmission in the PARK position for automatic transmission or NEUTRAL position for manual transmission.
3. Install a scan tool.
4. Clear all DTCs before proceeding.
5. Navigate to the Configuration/Reset Functions menu of the BCM.

6. Select the Brake Pedal Position Sensor Learn procedure and follow the directions displayed on the screen.
7. Navigate to the Configuration/Reset Functions menu of the ECM/HPCM.
8. Select the Learn Functions menu.
9. Select the Brake Pedal Position Sensor Learn procedure and follow the directions displayed on the screen.

BRAKE PEDAL POSITION SENSOR REPLACEMENT

NOTE: **Brake system does not use a brake switch, stoplight switch or brakelight switch. System uses a Brake Pedal Position Sensor to control these functions.**

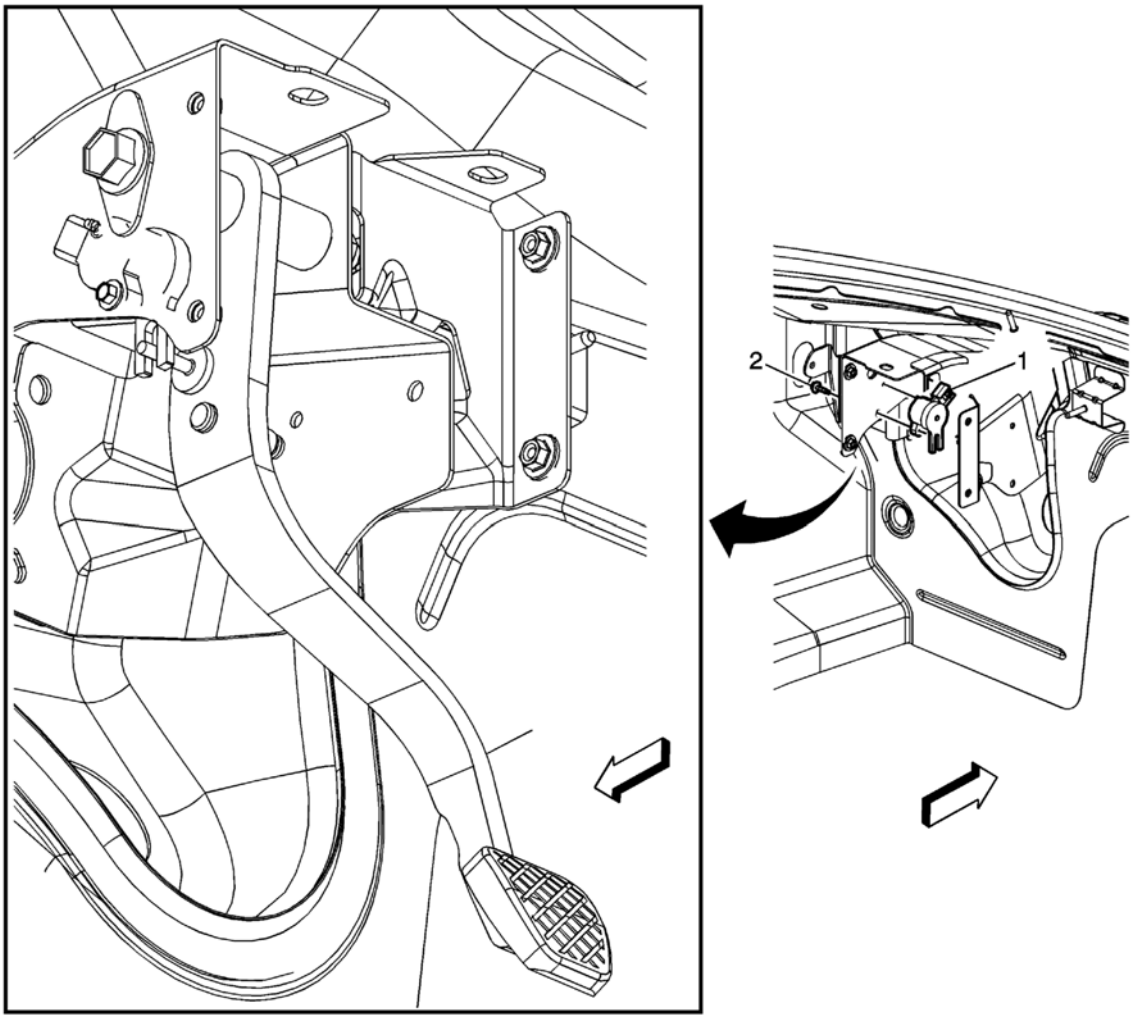

Fig. 16: Brake Pedal Position Sensor
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Brake Pedal Position Sensor Assembly **TIP:** Disconnect the electrical connector.
2	Brake Pedal Position Sensor Bolt **CAUTION:**

Callout	Component Name
	Refer to Fastener Caution . • Calibrate the position sensor. Refer to **Brake Pedal Position Sensor Calibration**. • Do not reuse the position sensor or bolt. Always use a new sensor and bolt. **Tighten** 2 N.m (18 lb in)

HEADLAMP SWITCH REPLACEMENT (IMPALA LIMITED)

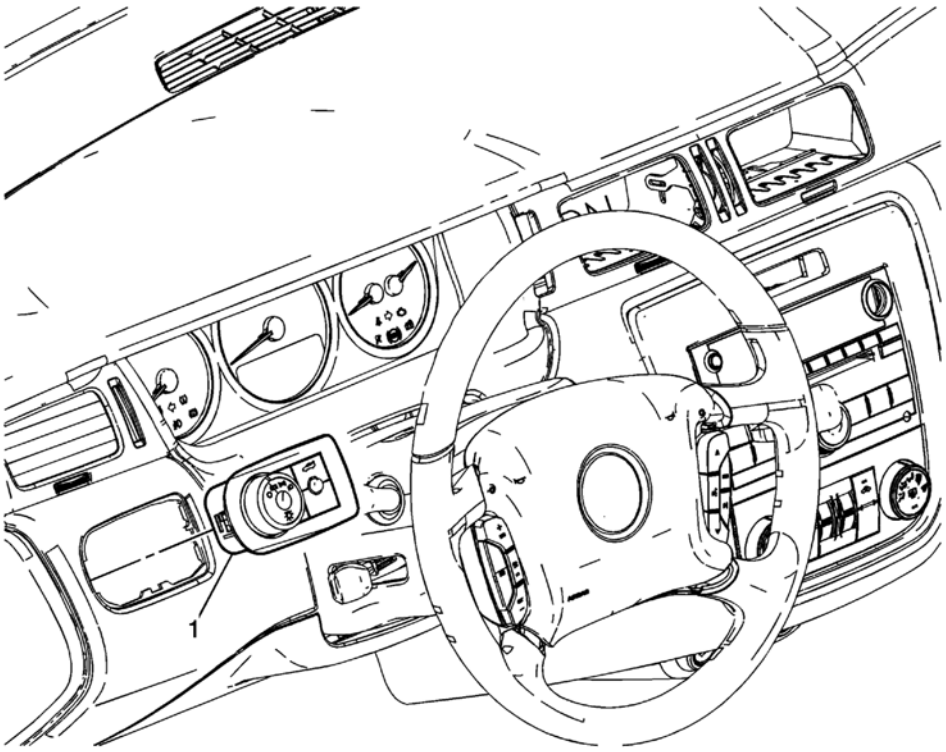

Fig. 17: View Of Traction Control Switch
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Fastener Tightening Specifications: Refer to **Fastener Specifications**.	
1	Switch Assembly, Head lamp Instrument Panel Dimmer **TIP:** Disconnect the electrical connector.

DAYTIME RUNNING LAMP (DRL) AMBIENT LIGHT SENSOR REPLACEMENT

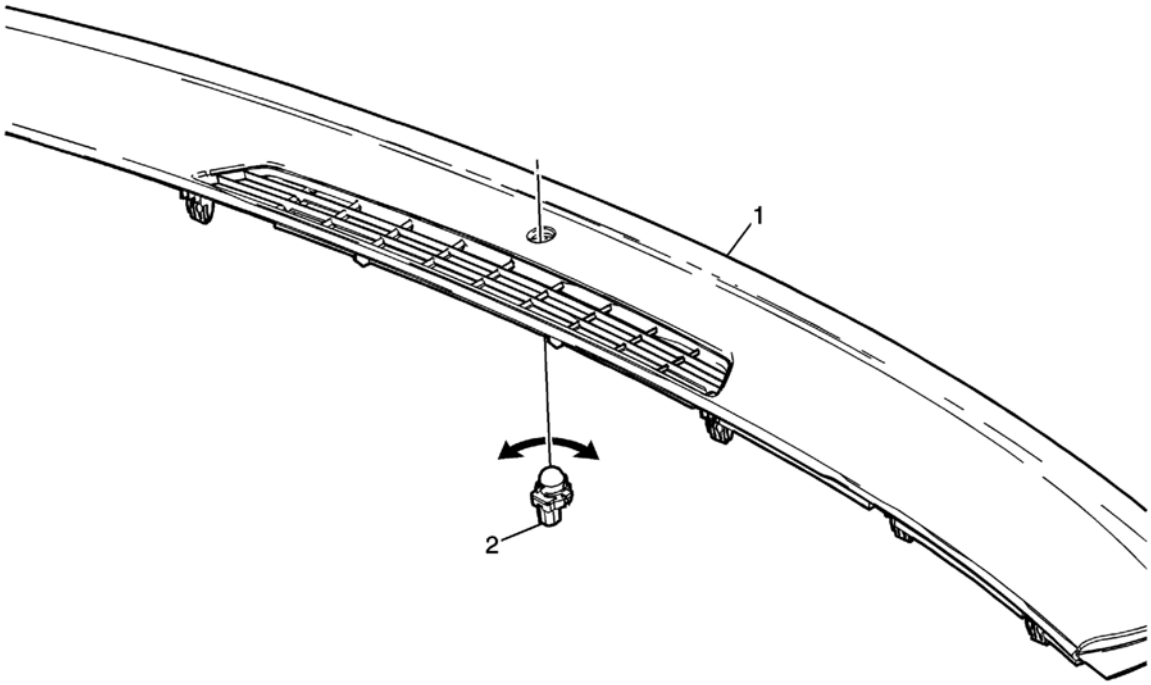

Fig. 18: Daytime Running Lamps (DRL) Ambient Light Sensor
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Fastener Tightening Specifications: Refer to **Fastener Specifications**.	
1	Instrument Panel Upper Trim Panel Refer to **Instrument Panel Upper Trim Panel Replacement** .
2	Ambient Light Sensor Assembly

EMERGENCY VEHICLE HEADLAMP FLASHER REPLACEMENT

Removal Procedure

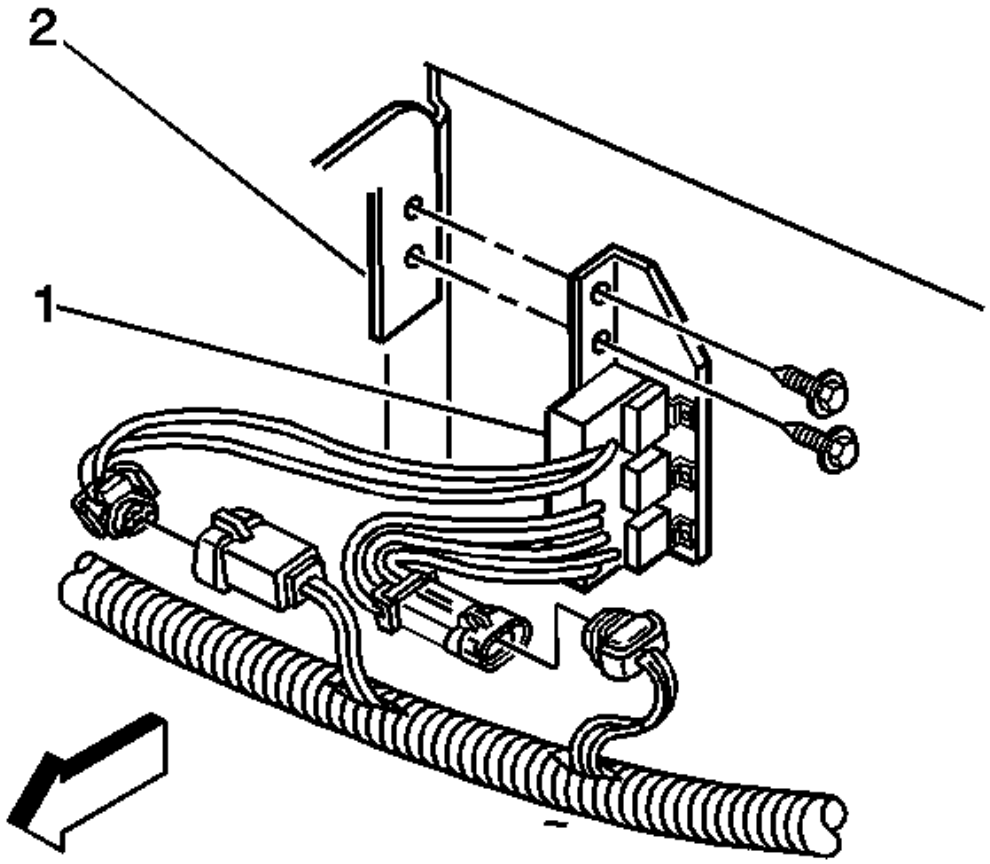

Fig. 19: Headlamp Flasher Components
Courtesy of GENERAL MOTORS COMPANY

1. Remove the upper radiator baffle. Refer to **Radiator Air Upper Baffle and Deflector Replacement** .
2. Disconnect the electrical connectors.
3. Remove the headlamp flasher bolts at the front radiator support (2).

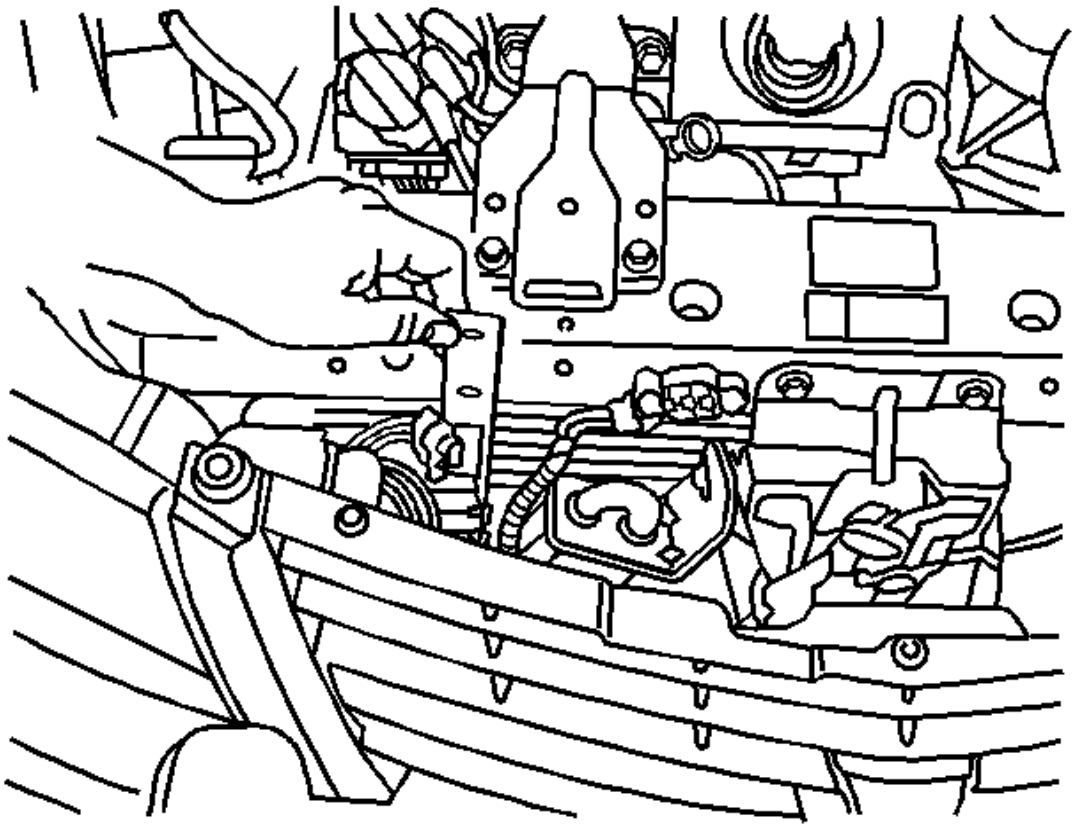

Fig. 20: Headlight Flasher
Courtesy of GENERAL MOTORS COMPANY

4. Remove the headlamp flasher.

Installation Procedure

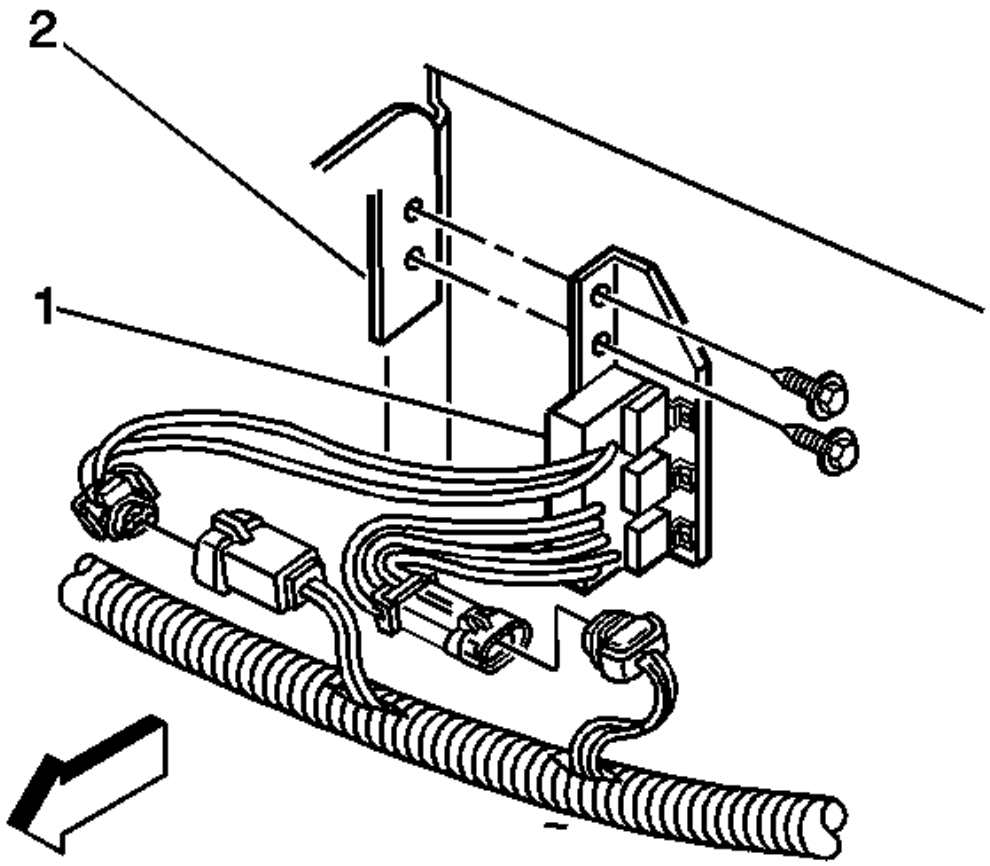

Fig. 21: Headlamp Flasher Components
Courtesy of GENERAL MOTORS COMPANY

1. Position the headlamp flasher (1) to the front radiator support (2).

CAUTION: Refer to Fastener Caution .

2. Install the headlamp flasher bolts.

Tighten

Tighten the bolts to 10 N.m (89 lb in).

3. Connect the electrical connectors.
4. Install the upper radiator baffle. Refer to **Radiator Air Upper Baffle and Deflector Replacement** .

READING LAMP BULB REPLACEMENT

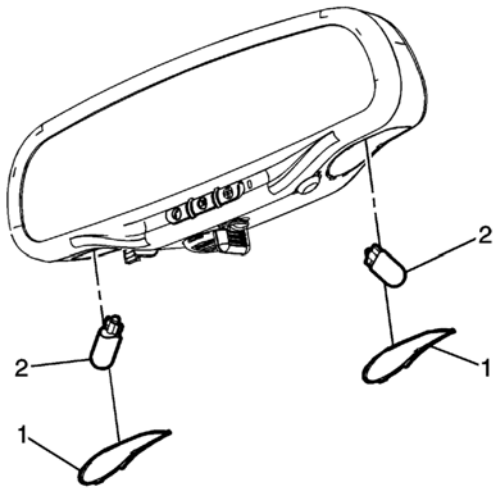

Fig. 22: Reading Lamp Bulb
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Fastener Tightening Specifications: Refer to **Fastener Specifications**.	
1	Reading Lamp Lens (Qty: 2)
2	Reading Lamp Bulb (Qty: 2)

INSTRUMENT PANEL COURTESY LAMP BULB REPLACEMENT

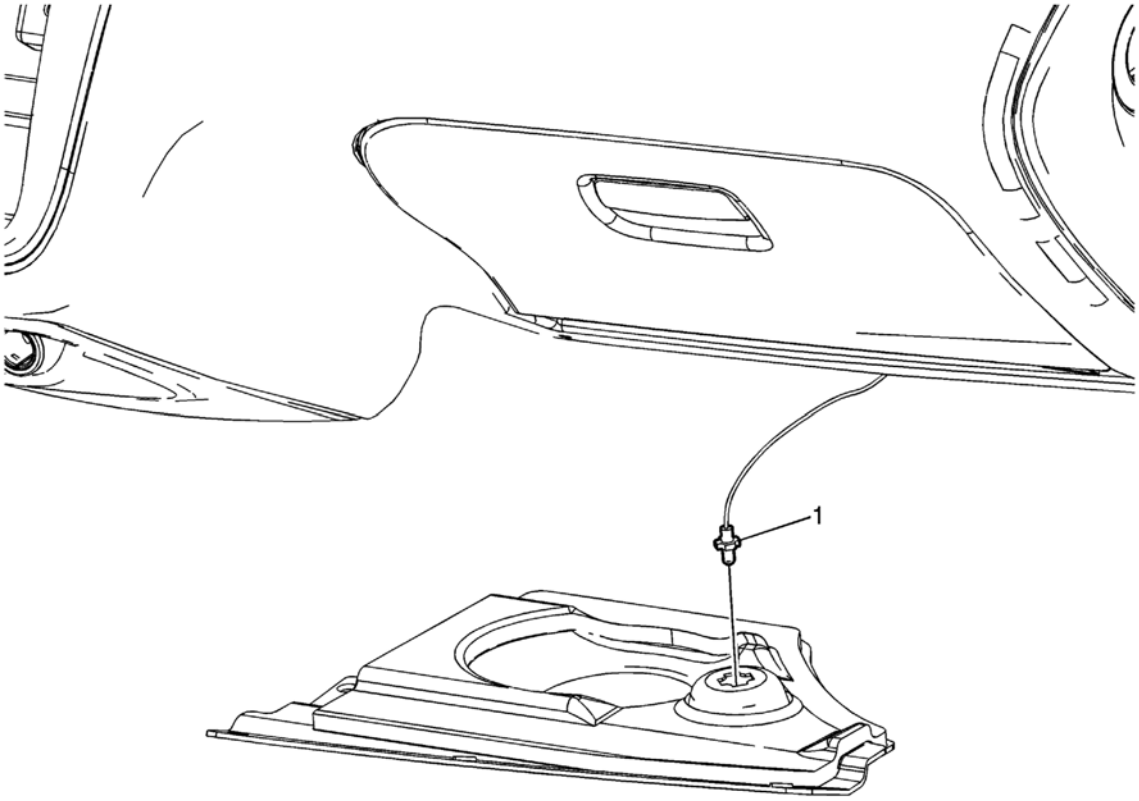

Fig. 23: Instrument Panel Courtesy Lamp
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Fastener Tightening Specifications: Refer to **Fastener Specifications**. **Preliminary Procedure** Remove the instrument panel (I/P) insulator panel. Refer to **Instrument Panel Insulator Panel Replacement - Right Side** , or **Instrument Panel Insulator Panel Replacement - Left Side** .	
1	Courtesy Lamp, Instrument Panel **TIP:** Disconnect the electrical connector.

SUNSHADE ILLUMINATED MIRROR LAMP BULB REPLACEMENT

Removal Procedure

1. Lower the sunshade and open the illuminated mirror door.
2. Insert a small flat-bladed tool at the outer edge of the lamp lens in the slot. Carefully press down to remove the lens.

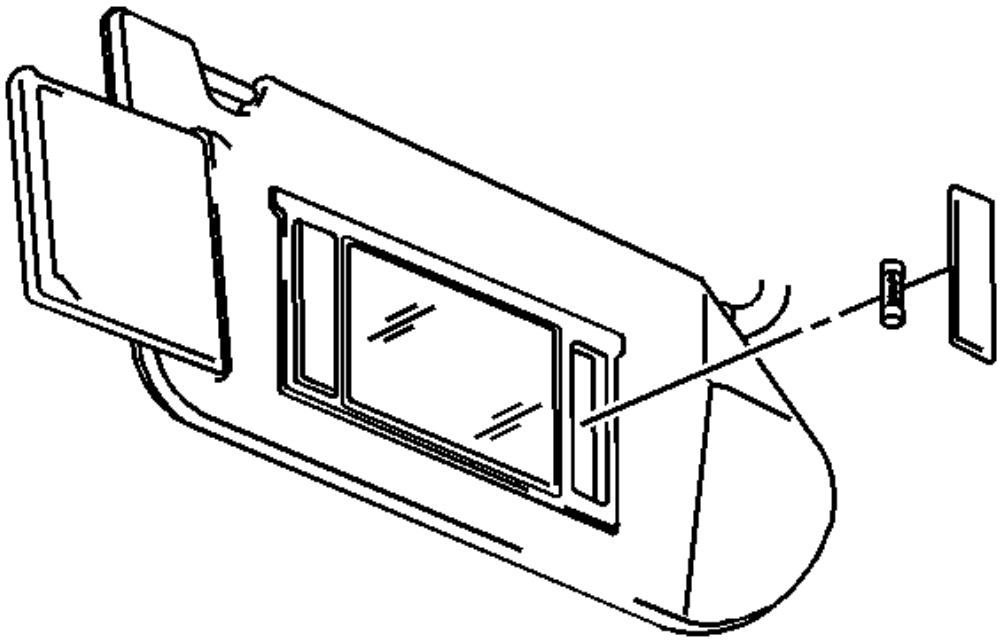

Fig. 24: Lamp Bulb
Courtesy of GENERAL MOTORS COMPANY

3. Remove the bulb.

Installation Procedure

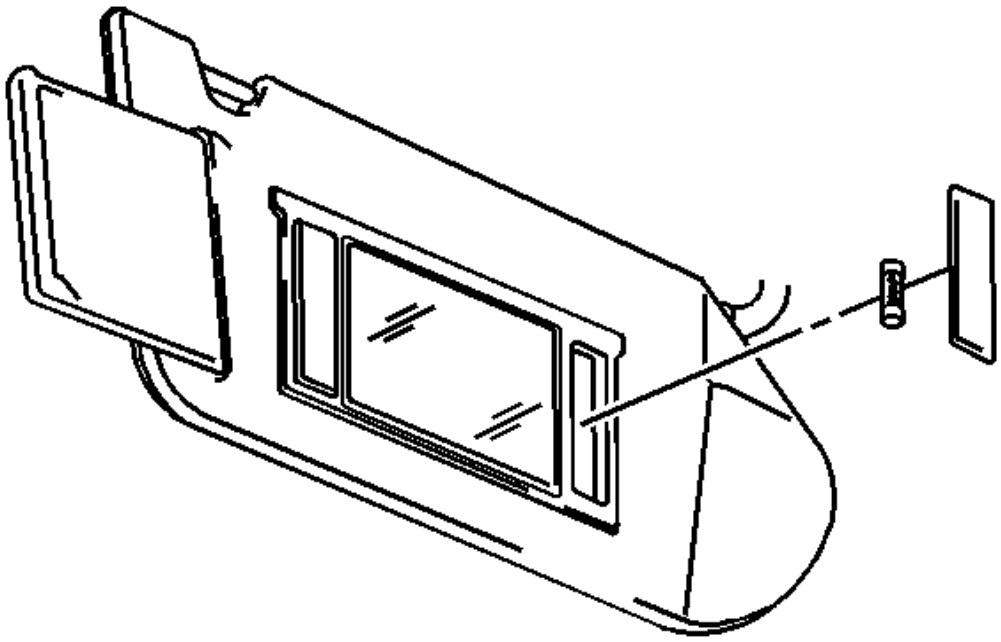

Fig. 25: Lamp Bulb
Courtesy of GENERAL MOTORS COMPANY

1. Install the bulb.
2. Align the upper lens tab to the opening. Insert the upper edge of the lens.
3. Insert a small flat-bladed tool at the outer edge of the lamp lens. Carefully press up to install the lens.
4. Close the illuminated mirror door and raise the sunshade.

DOME LAMP REPLACEMENT (IMPALA LIMITED)

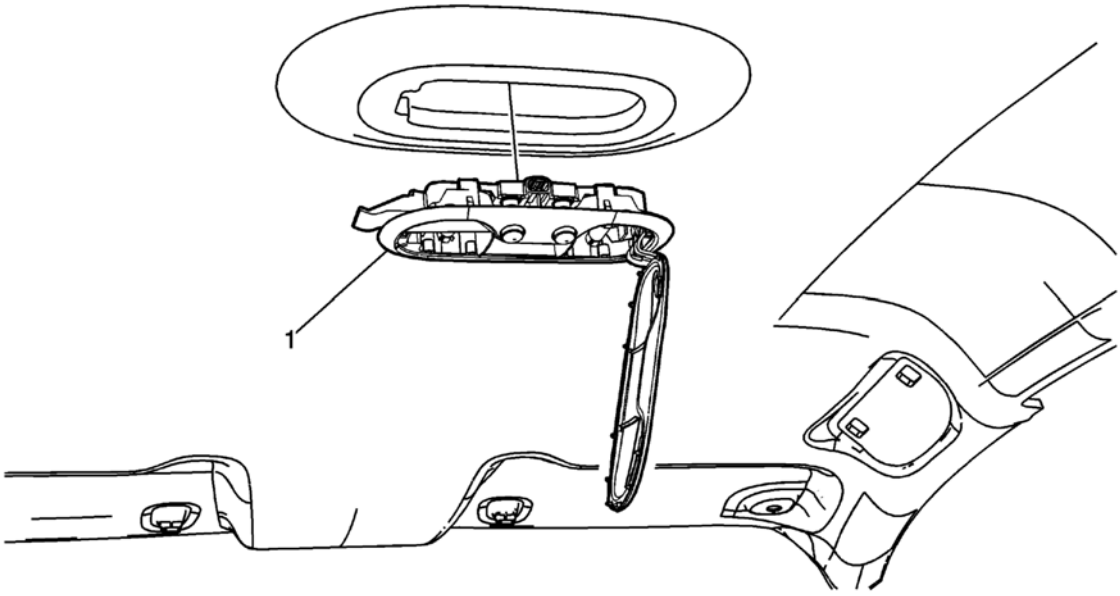

Fig. 26: Dome Light
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Fastener Tightening Specifications: Refer to **Fastener Specifications**.	
1	Lamp Assembly, Dome Reading • Pry open the driver side. • Disconnect the electrical connectors.

DOME LAMP BULB REPLACEMENT (IMPALA LIMITED)

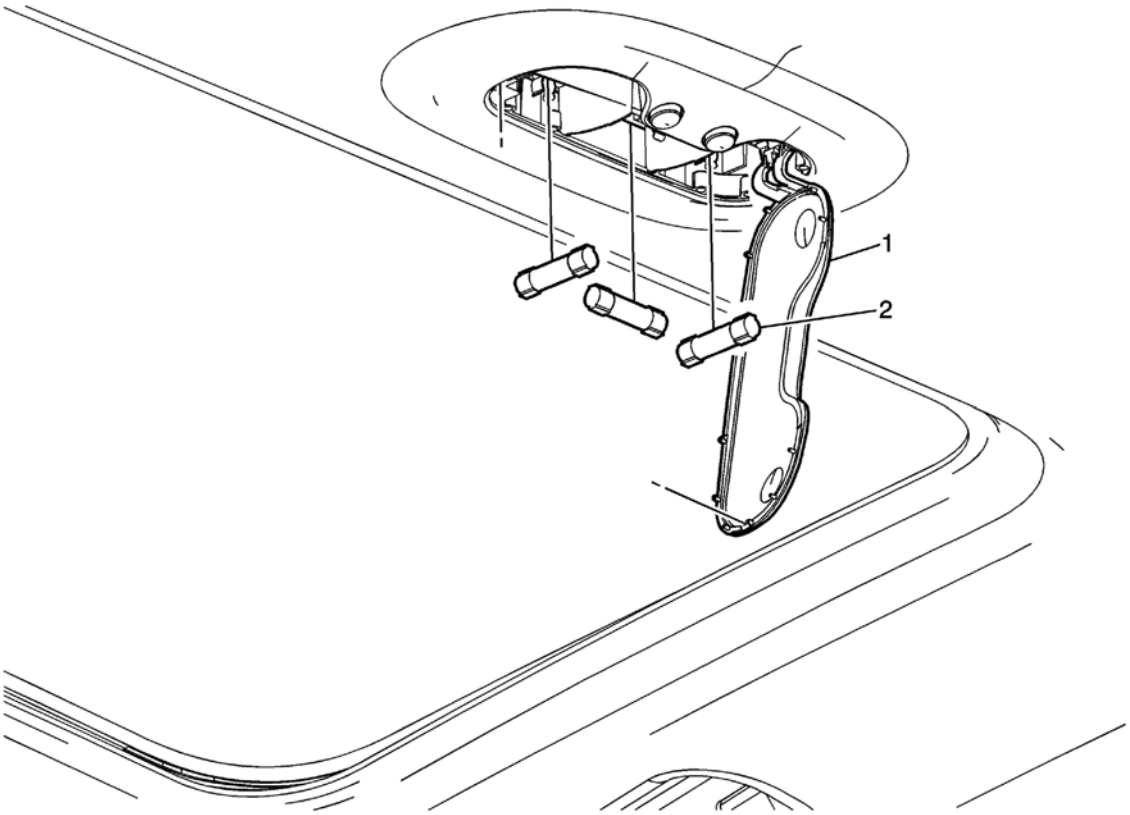

Fig. 27: Dome Lamp Bulb
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Fastener Tightening Specifications: Refer to **Fastener Specifications**.	
1	Lens, Dome Lamp **TIP:** Pry open the driver side.
2	Bulb, Dome lamp

HEADLAMP REPLACEMENT

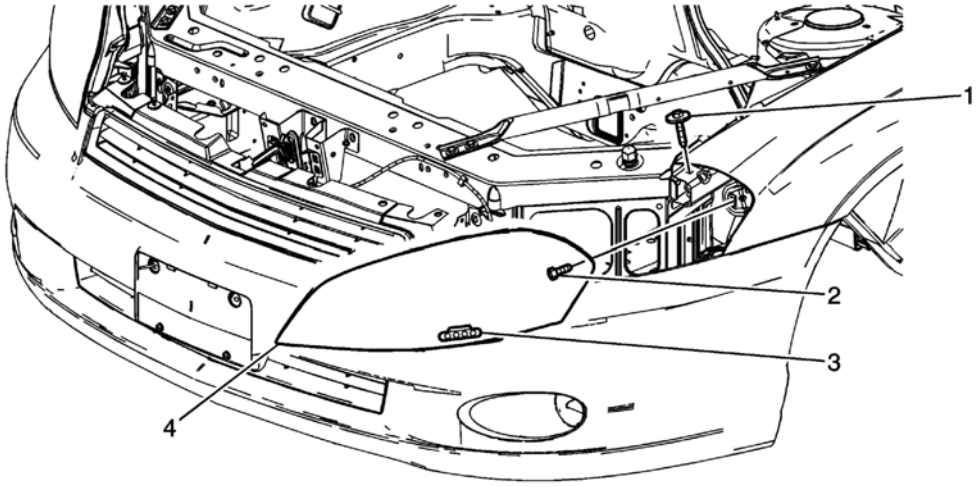

Fig. 28: Headlamp
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedures 1. Open the hood. 2. Release the inner headlamp retainer by pulling the retainer upward in order to release the headlamp.	
1	Headlamp Assembly Bolt **CAUTION:** **Refer to Fastener Caution .** **Tighten** 6 N.m (53 lb in)
2	Headlamp Lock Pin **TIP:** Pull headlamp from the outboard edge in order to release the lock pin from the fender flange retainer.
3	Forward Lamp Harness Connector **TIP:** Disconnect the electrical connector before removing the headlamp from the vehicle.
4	Headlamp Assembly **WARNING:** **Refer to Halogen Bulb Warning .**

HEADLAMP BULB REPLACEMENT

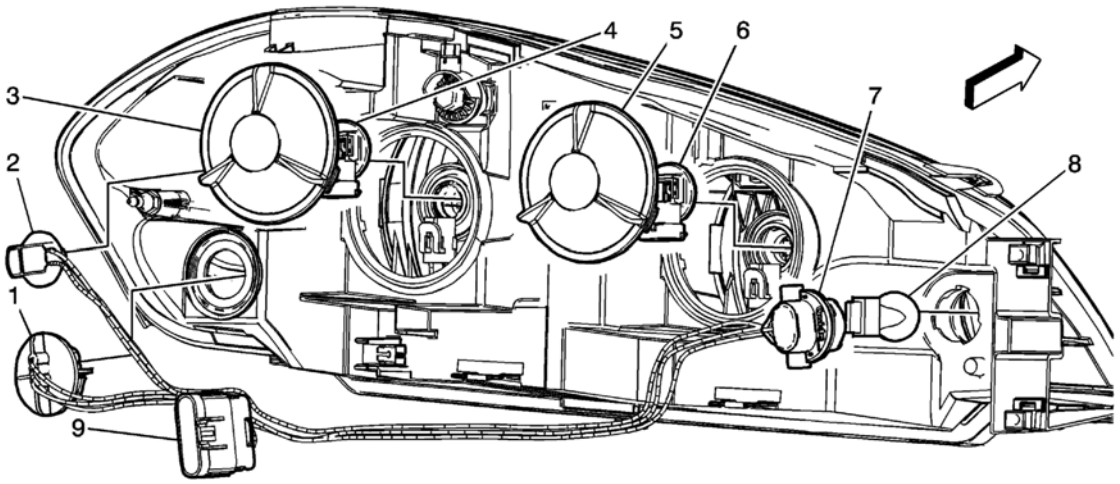

Fig. 29: Headlamp Bulb
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedures 1. Open the hood. 2. Remove either the LH of RH headlamp assembly. Refer to **Headlamp Replacement**.	
1	Daytime Running and Front Park and Turn Signal Lamp Assembly **WARNING:** **Refer to Halogen Bulb Warning .**
2	Park Lamp Assembly **TIP:** Pull outward on the housing in order to access the electrical connector.
3	Headlamp Bulb Accessory Cover **TIP:** Turn the cover counterclockwise in order to remove.
4	Headlamp Bulb (LO Beam) **WARNING:** **Refer to Halogen Bulb Warning .** **TIP:** Disconnect the electrical connector from the headlamp bulb socket and turn bulb socket a quarter turn counterclockwise in order to remove.

Callout	Component Name
5	Headlamp Bulb Accessory Cover **TIP:** Turn the cover counterclockwise in order to remove.
6	Headlamp Bulb (HI Beam) **WARNING:** **Refer to Halogen Bulb Warning .** **TIP:** Disconnect the electrical connector from the headlamp bulb socket and turn bulb socket a quarter turn counterclockwise in order to remove.
7	Front Park and Turn Signal Socket **TIP:** Turn lamp socket counterclockwise in order to remove from the headlamp assembly.
8	Front Park and Turn Signal Bulb **TIP:** Pull the park and turn signal lamp bulb straight from the bulb socket.
9	Forward Lamp Harness Connector

HEADLAMP AIMING

The vehicle has a visual optical headlamp aiming system. The aim has been preset at the factory and should need no further adjustment

However, If the vehicle is damaged in an accident, the headlamp aim may be affected and adjustment may be necessary.

The vehicle should be properly prepared as follows:

- The vehicle should be placed so the headlamps are 7.6 m (25 ft) from a light colored wall or other flat surface.
- The vehicle must have all four tires on a perfectly level surface which is level all the way to the wall or other flat surface.
- The vehicle should be placed so it is perpendicular to the wall or other flat surface.
- The vehicle should not have any snow, ice or mud on it.
- The vehicle should be fully assembled and all other work stopped while headlamp aiming is being done.
- The vehicle should be normally loaded with a full tank of fuel and one person or 75 kg(160 lbs) on the driver seat.
- Tires should be properly inflated.

Headlamp aiming is done with the vehicle's low-beam headlamps. The high-beam headlamps will be correctly aimed if the low-beam headlamps are aimed properly.

The vertical headlamp aiming screws are located under the hood near the headlamps.

The adjustment screw can be turned with a 6 mm male hex.

To adjust the vertical aim on the headlamps, do the following:

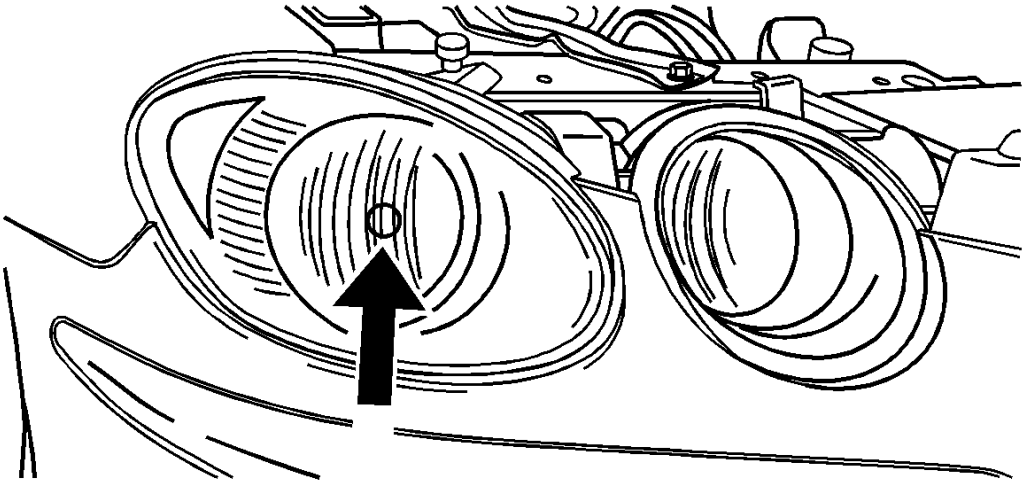

Fig. 30: Identifying Headlight Aiming Dot
Courtesy of GENERAL MOTORS COMPANY

1. Find the aim dot on the lens of the low-beam lamp.
2. Measure the distance from the ground to the aim dot on the lamp. Record the distance.
3. At the wall or other flat surface, measure from the ground upward the recorded distance from Step 2 and draw or tape a horizontal line the width of the vehicle.

CAUTION: Do not cover a headlamp to improve beam cut-off when aiming. Covering a headlamp may cause excessive heat build-up which may cause damage to the headlamp.

4. Turn on the low-beam headlamps and place a piece of cardboard or equivalent in front of the headlamp not being aimed. This should allow only the beam of light from the headlamp being aimed to be seen on the flat surface.

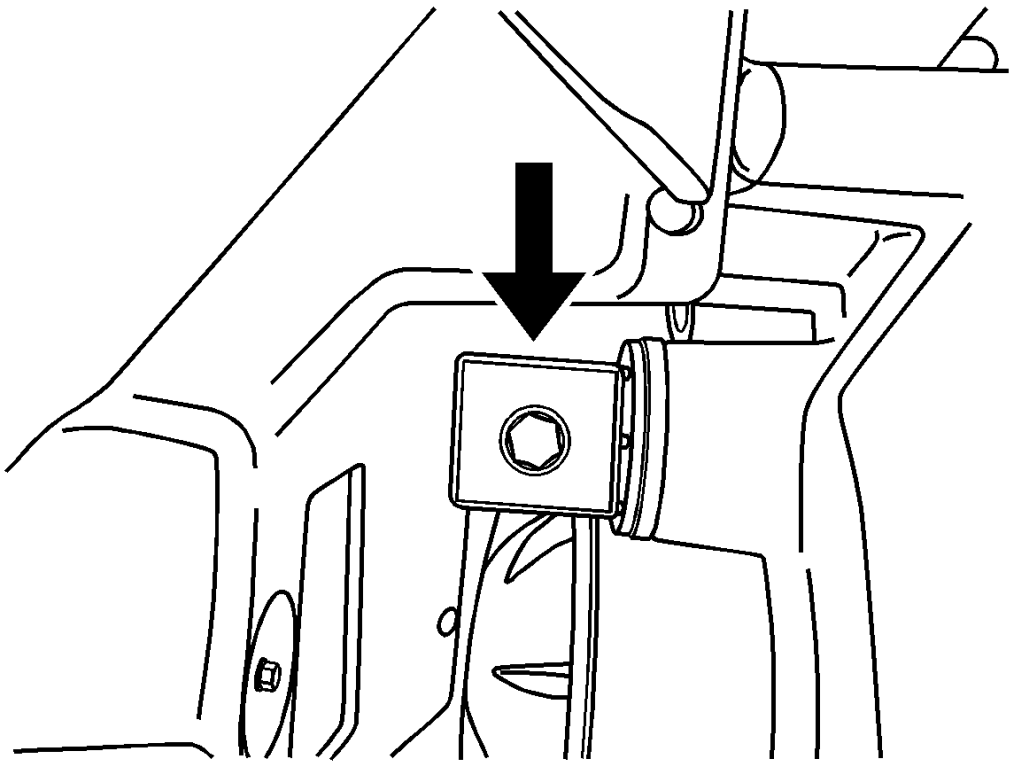

Fig. 31: Identifying Vertical Aiming Screw
Courtesy of GENERAL MOTORS COMPANY

5. Turn the vertical aiming screw until the headlamp beam is aimed to the horizontal tape line. The top edge of the cut-off should be positioned at the bottom edge of the horizontal tape line.
6. Repeat Steps 4 and 5 for the opposite headlamp.

FRONT FOG LAMP REPLACEMENT

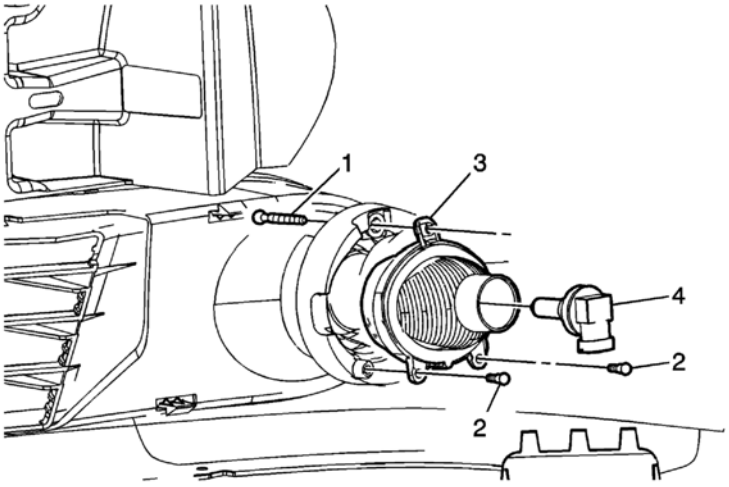

Fig. 32: Identifying Fog Lamp Components
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedures 1. Raise and support the vehicle. Refer to **Lifting and Jacking the Vehicle** . 2. Remove either the LF or RF front fender liner. Refer to **Front Fender Liner Replacement** . 3. Disconnect fog lamp bulb socket electrical connector.	
1	Front Fog Lamp Adjuster Screw **Procedure** 1. Remove the adjuster screw from the fog lamp bracket and lamp assembly. 2. Count the number of turns when removing the adjuster screw for a reference upon installation. 3. Aim the fog lamp after installation. Refer to **Fog Lamp Aiming**.
2	Front Fog Lamp Screws (Qty: 2) **CAUTION:** **Refer to Fastener Caution .** **Tighten** 2 N.m (18 lb in)
3	Front Fog Lamp Assembly **TIP:** Remove the lamp assembly from the fog lamp bracket.
4	Front Fog Lamp Bulb

Callout	Component Name
	WARNING: **Refer to Halogen Bulb Warning .** **TIP:** Turn the bulb socket counterclockwise and remove from lamp assembly.

FRONT FOG LAMP BULB REPLACEMENT

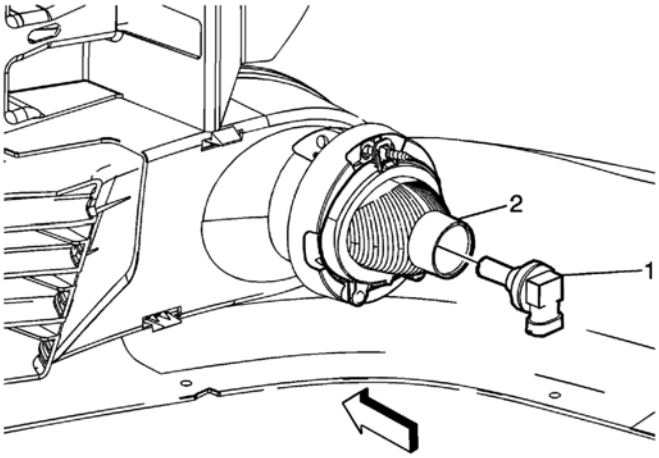

Fig. 33: Identifying Fog Lamp Components
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedures 1. Remove either the LF or RF headlamp assembly. Refer to **Headlamp Replacement**. 2. Disconnect the fog lamp electrical connector.	
1	Front Fog Lamp Projector Bulb **WARNING:** **Refer to Halogen Bulb Warning .** **TIP:** Twist the bulb socket counterclockwise to remove from the lamp housing.
2	Front Fog Lamp Projector Housing

FOG LAMP AIMING

The front fog lamps must be aimed for proper illumination of the road. The front fog lamp aim should be checked when a new front fog lamp assembly is installed, or if service or repairs in the front end area may have disturbed the front fog lamp mounting.

There is no horizontal adjustment for aiming the front fog lamp assemblies on this vehicle.

1. To ensure accurate vertical front fog lamp aiming, first perform the following steps to prepare the vehicle.
    - Ensure that all the components are in place on the vehicle, if other service has been performed on the vehicle.
    - Ensure the fuel level is full.
    - Place the vehicle on a level surface 1.52 m (5 ft) away from a target screen.
    - Stop all other operations of work on the vehicle.
    - Jounce the vehicle to settle the suspension.
    - Cover the headlamps while aiming the fog lamps.
2. Turn the front fog lamps ON.

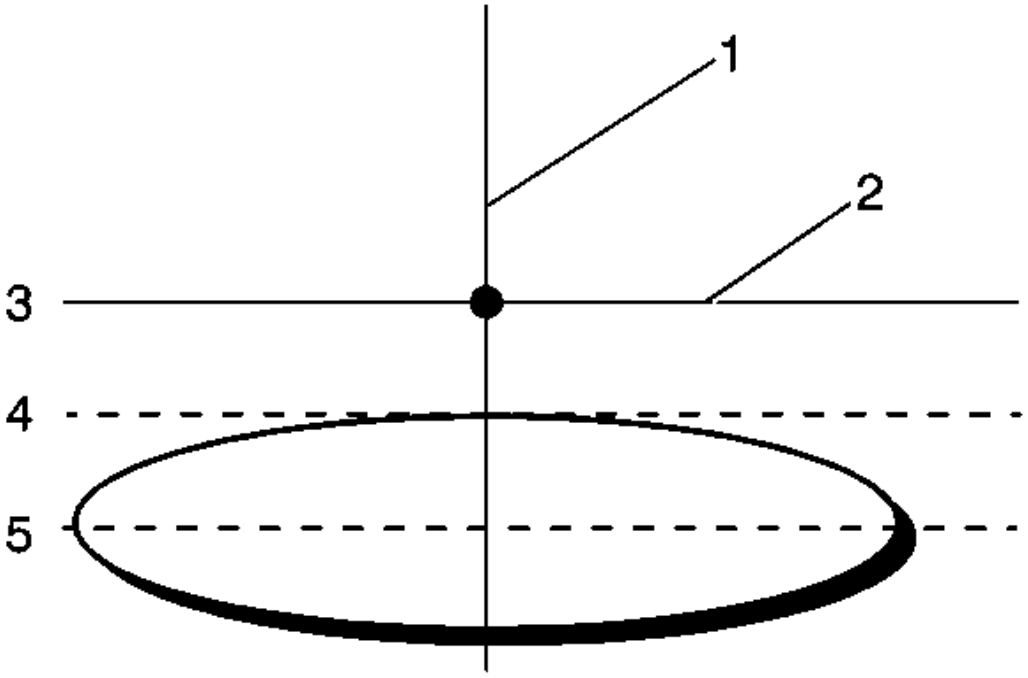

Fig. 34: Fog Lamp Aiming Pattern
Courtesy of GENERAL MOTORS COMPANY

3. Adjust the fog lamp up or down until the top edge of the high intensity zone on the screen is 102 mm (4 in) below the horizontal centerline (2), within the range of 0 mm (0 in) (3) to 203 mm (8 in) (5), below

the horizontal centerline, on the target screen.

4. Turn OFF the front fog lamps.

PARKING AND TURN SIGNAL LAMP BULB REPLACEMENT

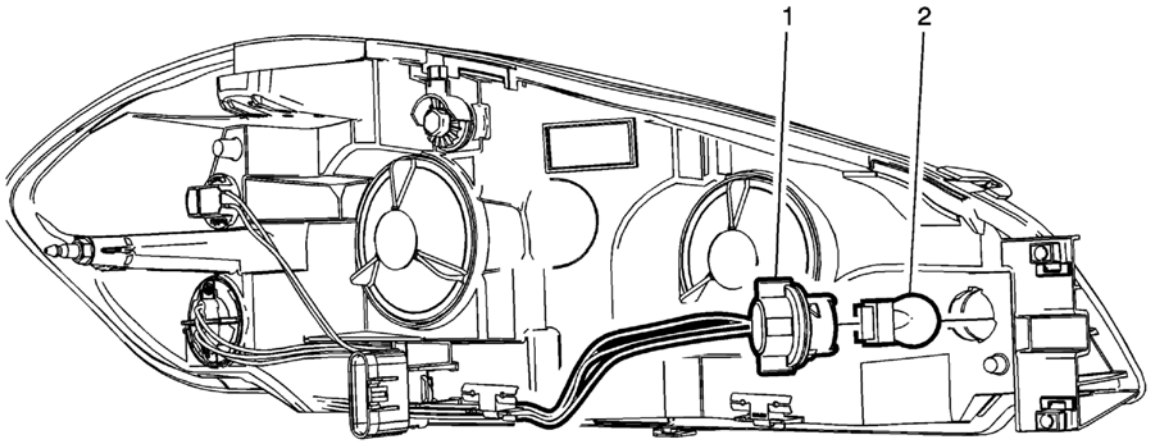

Fig. 35: Parking and Turn Signal Lamp Bulb
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedures 1. Open the hood. 2. Remove either the LH of RH headlamp assembly. Refer to **Headlamp Replacement**.	
1	Front Park and Turn Signal Socket **NOTE:** **Turn the lamp socket counterclockwise in order to remove from the headlamp assembly.**
2	Front Park and Turn Signal Bulb

Callout	Component Name
	NOTE: Hold the lamp socket and pull the

HIGH MOUNT STOP LAMP REPLACEMENT (IMPALA LIMITED)

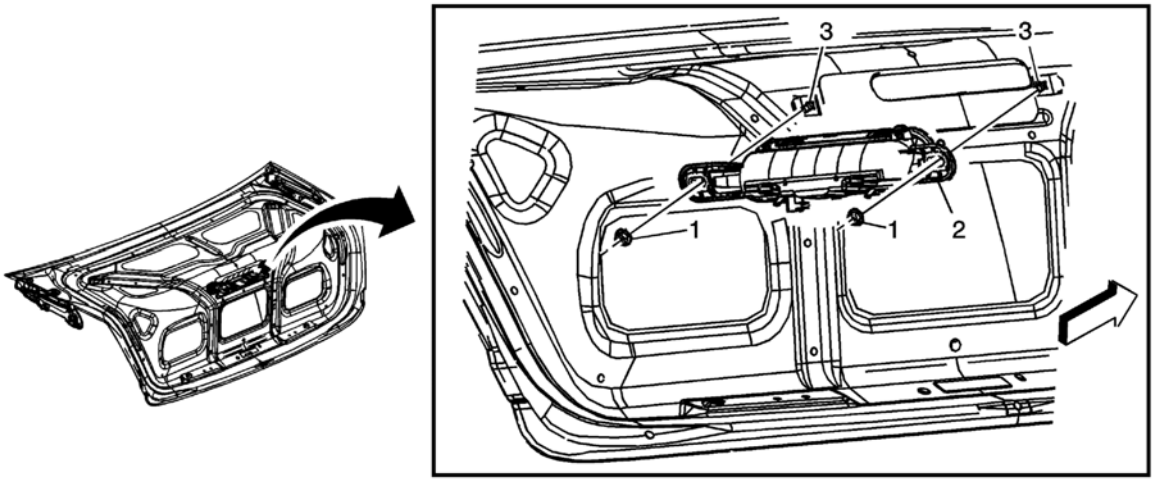

Fig. 36: High Mounted Stop Lamp
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure Remove the rear interior compartment lid trim. Refer to **Rear Compartment Lid Inner Panel Trim Replacement** .	
1	High Mounted Stop Lamp Assembly Nuts (Qty: 2) **CAUTION:** **Refer to Fastener Caution .** **Tighten** 4 N.m (35 lb in)
2	High Mounted Stop Lamp Assembly • Remove the high mounted stop lamp from the inside of the rear compartment lid mounting studs. • Disconnect the electrical connector to the high mounted stop lamp.
3	Rear Compartment Inner Panel Studs **TIP:** Ensure the studs are secure to the inner compartment panel upon reassemble.

BACKUP LAMP BULB REPLACEMENT

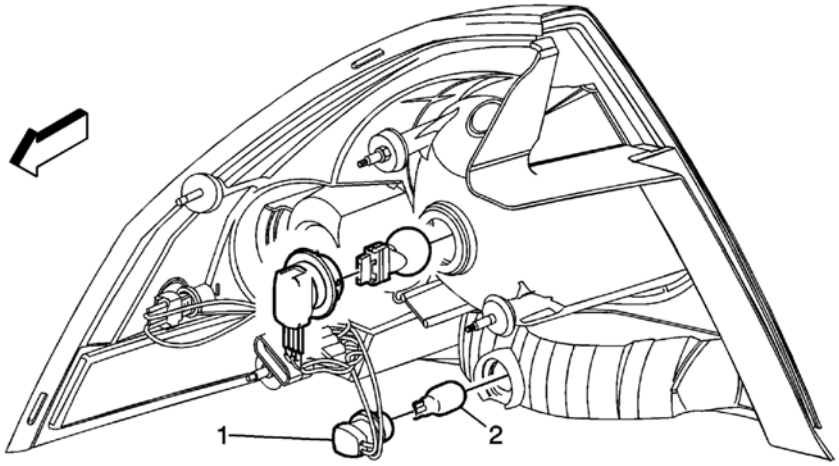

Fig. 37: Backup Lamp Bulb
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Fastener Tightening Specifications: Refer to **Fastener Specifications**. **Preliminary Procedure** Remove either the LR or RR tail lamp assembly. Refer to **Tail Lamp Replacement (Impala Limited)**.	
1	Socket, Reverse Lamp Bulb **TIP:** Twist the socket counterclockwise a quarter turn to remove.
2	Bulb, Reverse Lamp **TIP:** Pull outward on the bulb in order to replace.

REAR LICENSE PLATE LAMP REPLACEMENT (IMPALA LIMITED)

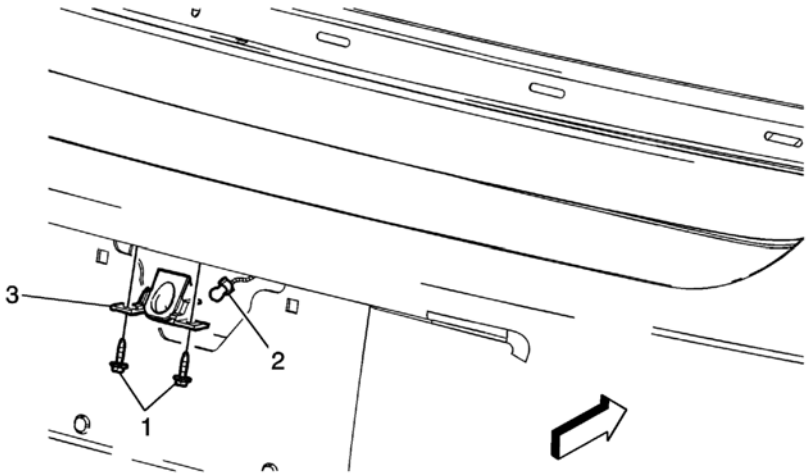

Fig. 38: Rear License Lamp
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Rear License Plate Lamp Screws (Qty: 2)

Callout	Component Name
	CAUTION: **Refer to** **Fastener** **Caution .** Tighten 2 N.m (18 lb in)
2	Rear License Lamp **Procedure** 1. Pull downward on the lamp in order to access the lamp electrical connector on the inside of the rear bumper fascia. 2. Twist the connector socket counterclockwise in order to remove from the lamp housing. 3. Pull the bulb outward to remove from the socket.
3	Rear License Plate Lens **TIP:** Snap lens into outer rear compartment lid upon installation.

TAIL LAMP REPLACEMENT (IMPALA LIMITED)

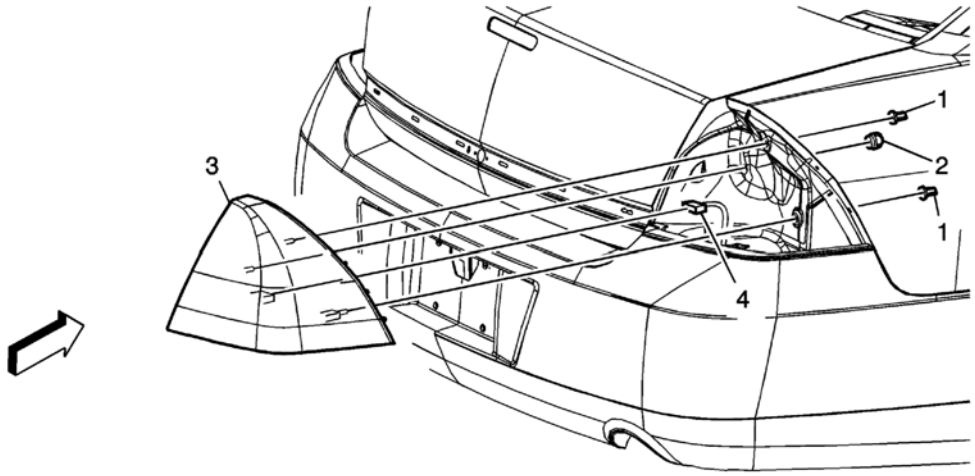

Fig. 39: Tail Lamp
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedures 1. Open the rear compartment lid. 2. Remove the nut securing the rear compartment trim the backside of the tail lamp assembly. 3. Pull down the rear compartment trim liner.	
1	Tail Lamp Assembly Nuts (Qty: 2)

Callout	Component Name
	CAUTION: **Refer to** **Fastener** **Caution .** Tighten 2 N.m (18 lb in)
2	Trunk Trim Line Nut **TIP:** Ensure the trim liner nut is installed after the liner is repositioned in the rear compartment.
3	Tail Lamp Assembly **TIP:** Pull rearward to remove and connect the electrical connector and push lamp inward in order to position the lamp to the body panel.
4	Rear Lamp Harness Connector Ensure to connect the lamp harness connector before securing the lamp to the rear body panel.

TAIL LAMP BULB REPLACEMENT (IMPALA LIMITED)

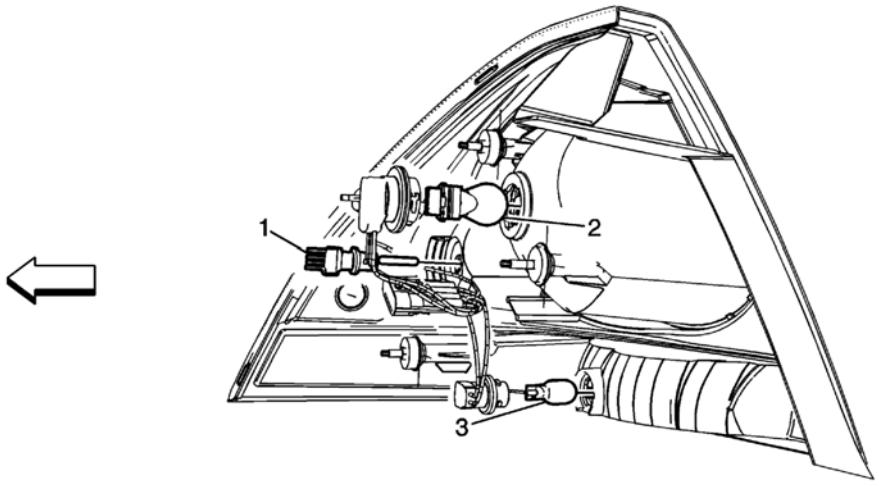

Fig. 40: Tail Lamp Bulb
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure Remove either the LR or RR tail lamp assembly. Refer to **Tail Lamp Replacement (Impala Limited)**.	
1	Rear Park Lamp Bulb **TIP:** Turn the lamp socket counterclockwise in order to remove.
2	Park and Turn Signal Assembly Bulb **TIP:** Pull the bulb straight out of the lamp socket.
3	Rear Back Up Assembly Bulb **WARNING:**

Callout	Component Name
	Refer to Halogen Bulb Warning . **TIP:** Remove the bulb from the lamp socket by pulling the bulb straight outward from the socket.

REAR TURN SIGNAL LAMP BULB REPLACEMENT

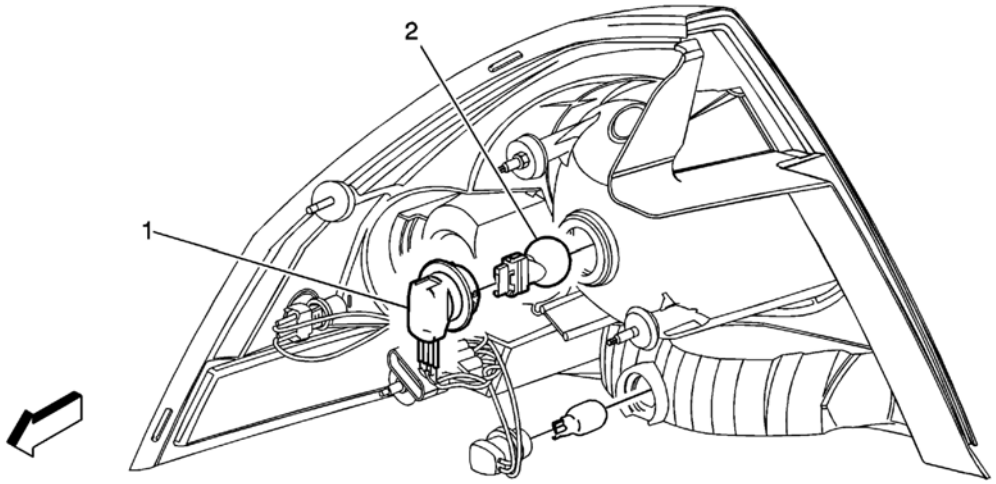

Fig. 41: Rear Turn Signal Lamp Bulb
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Fastener Tightening Specifications: Refer to Fastener Specifications. **Preliminary Procedure** Remove either the LR or RR tail lamp assembly. Refer to Tail Lamp Replacement (Impala Limited).	
1	Socket, Stop and Tail Lamp **TIP:** Twist the socket counterclockwise a quarter turn to remove.
2	Bulb, Stop and Tail Lamp **TIP:** Pull outward on the bulb in order to replace.

EMERGENCY VEHICLE REAR COMPARTMENT LID LAMP REPLACEMENT (IMPALA LIMITED RPO T53)

Removal Procedure

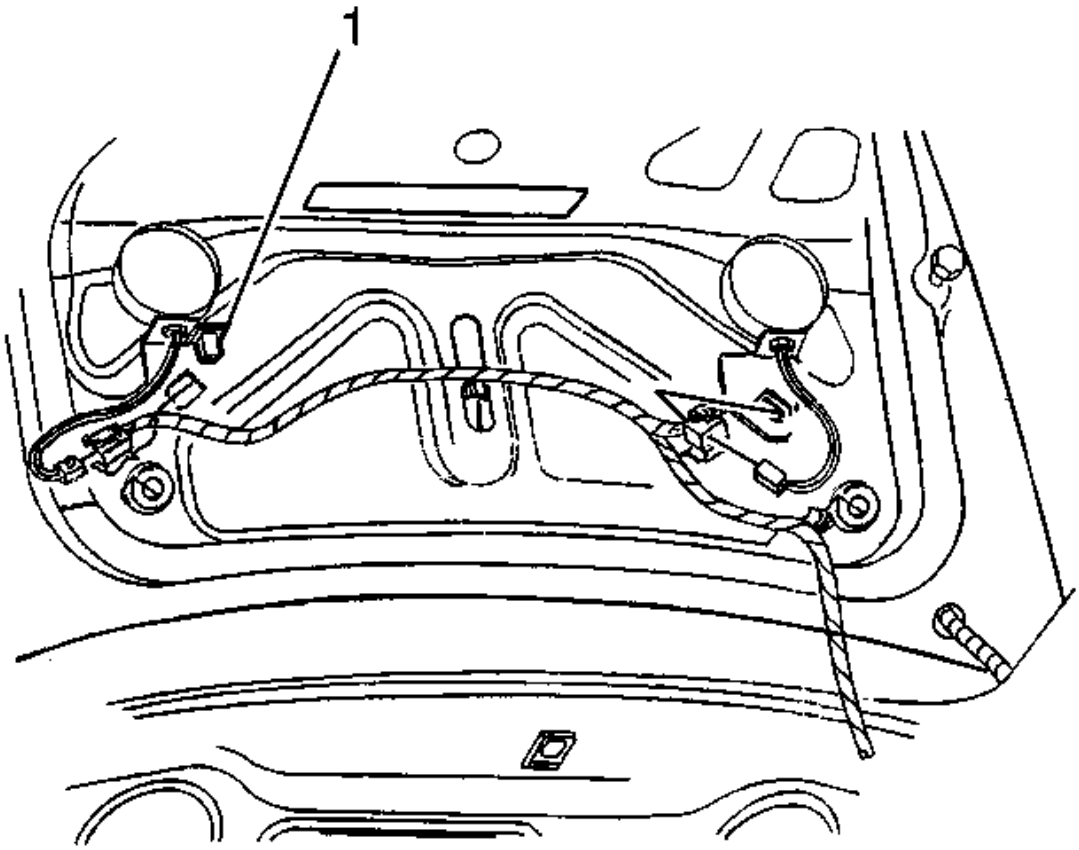

Fig. 42: Rear Compartment Lid Lamps & Flasher Fuse
Courtesy of GENERAL MOTORS COMPANY

1. Open the rear compartment.
2. Disconnect the electrical connectors from the rear compartment lid lamp(s).
3. Disconnect the electrical connector from the flasher fuse (1).
4. Remove the flasher fuse (1) if required.

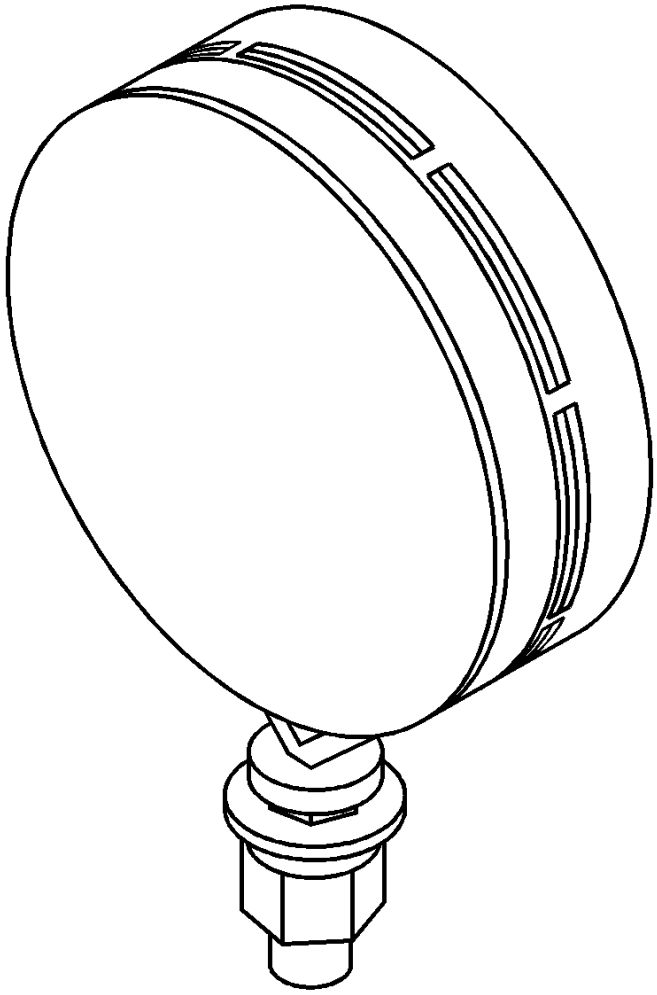

Fig. 43: Rear Compartment Lid Lamp
Courtesy of GENERAL MOTORS COMPANY

5. Remove the rear compartment lid lamp(s) from the rear compartment lid.

Installation Procedure

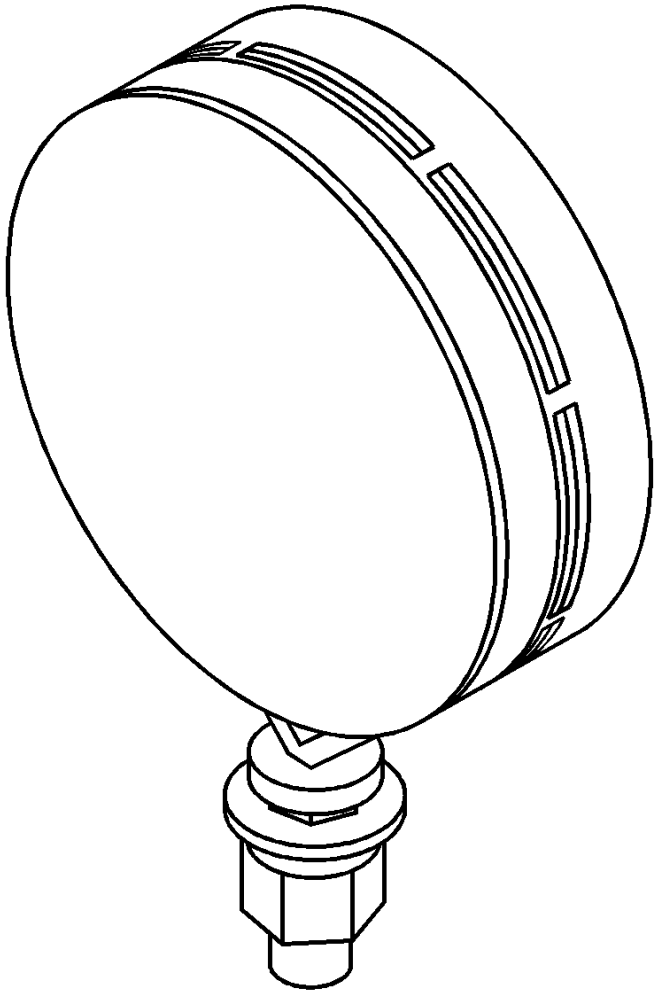

Fig. 44: Rear Compartment Lid Lamp
Courtesy of GENERAL MOTORS COMPANY

1. Position the rear compartment lid lamp(s) from the rear compartment lid.

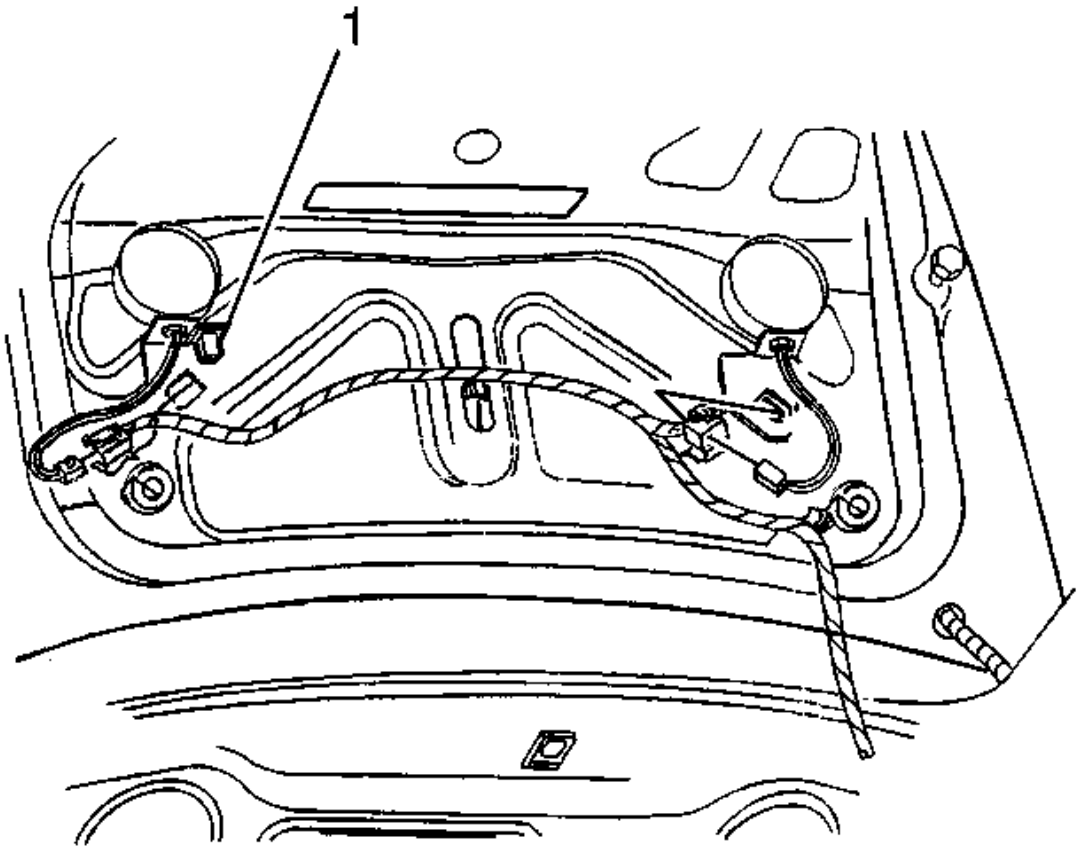

Fig. 45: Rear Compartment Lid Lamps & Flasher Fuse
Courtesy of GENERAL MOTORS COMPANY

2. Install the flasher fuse (1) if required.
3. Connect the electrical connector to the flasher fuse (1).
4. Connect the electrical connectors to the rear compartment lid lamp(s).
5. Close the rear compartment.

REAR COMPARTMENT LID LAMP LENS AND BULB REPLACEMENT (IMPALA LIMITED RPO T53)

Removal Procedure

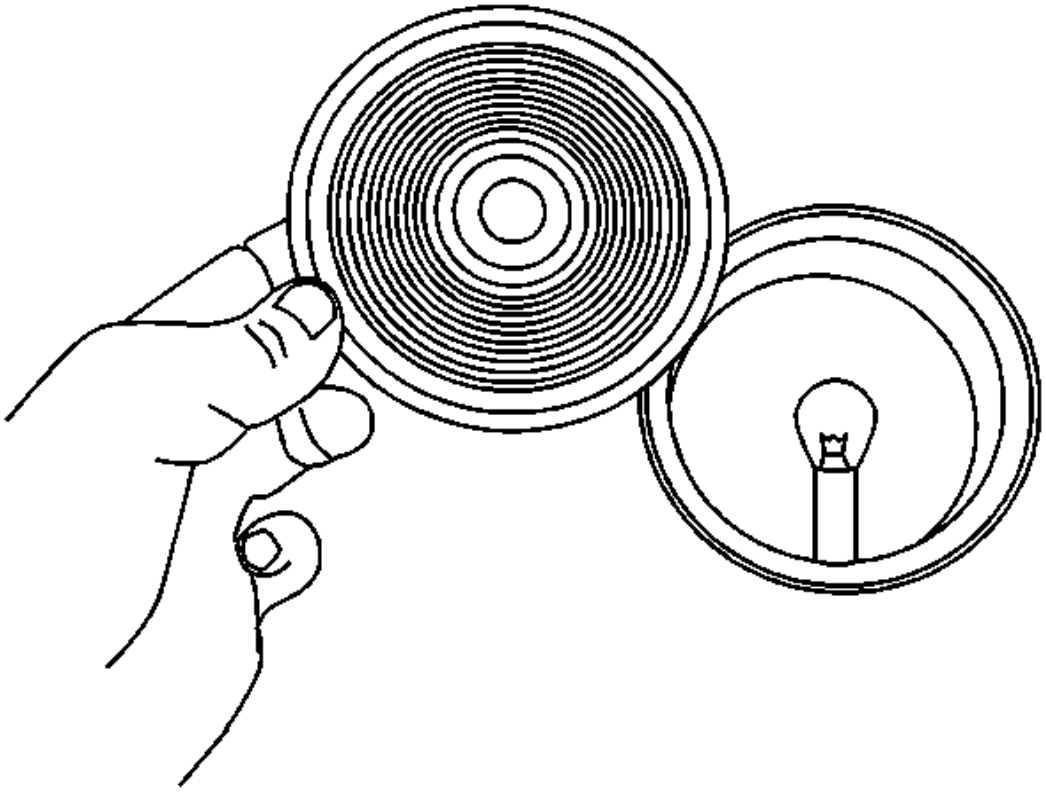

Fig. 46: Rear Compartment Lid Lamp Lens (Impala Limited RPO T53)
Courtesy of GENERAL MOTORS COMPANY

1. Open the rear compartment.
2. Remove the lens from the rear compartment lid lamp.

   Inserted a small coin under the rear compartment lid lamp lens and then twist the coin.

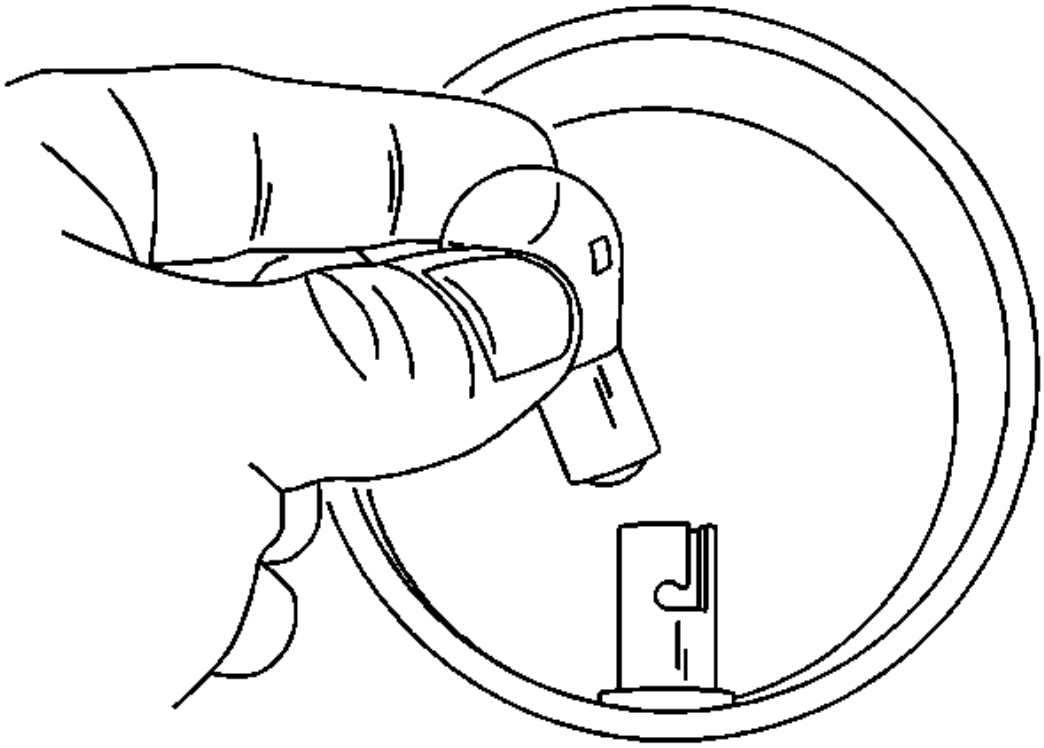

Fig. 47: Lid Lamp Bulb (Impala Limited RPO T53)
Courtesy of GENERAL MOTORS COMPANY

3. Remove the bulb from the rear compartment lid lamp socket.

Installation Procedure

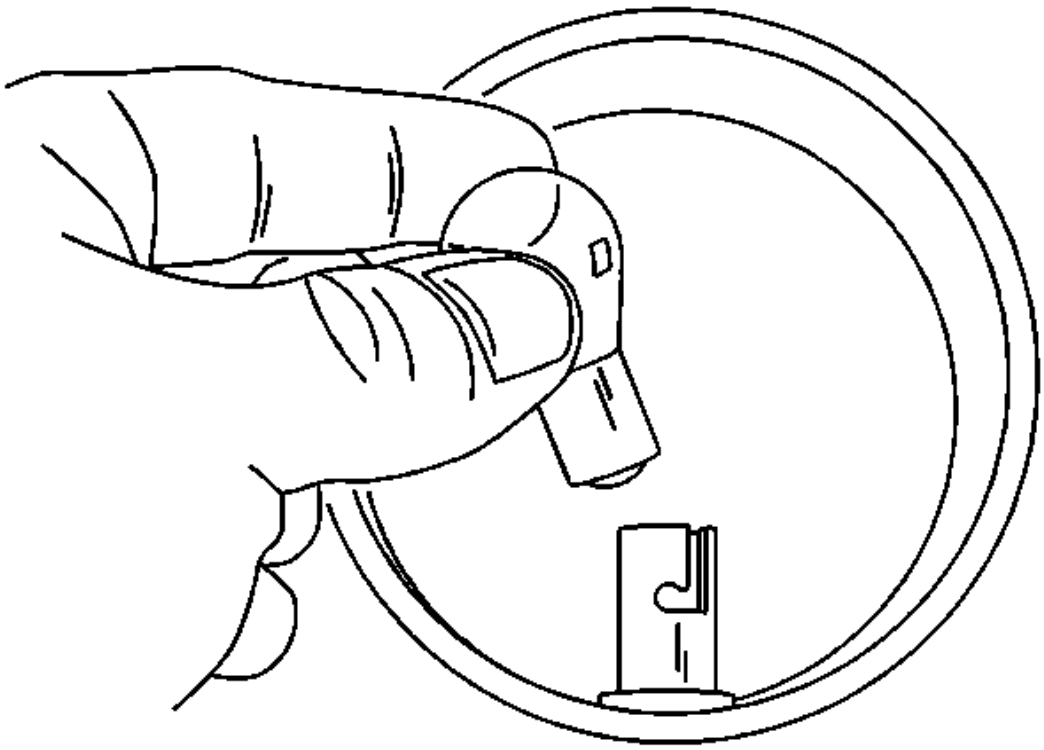

Fig. 48: Lid Lamp Bulb (Impala Limited RPO T53)
Courtesy of GENERAL MOTORS COMPANY

1. Install the bulb to the rear compartment lid lamp socket.

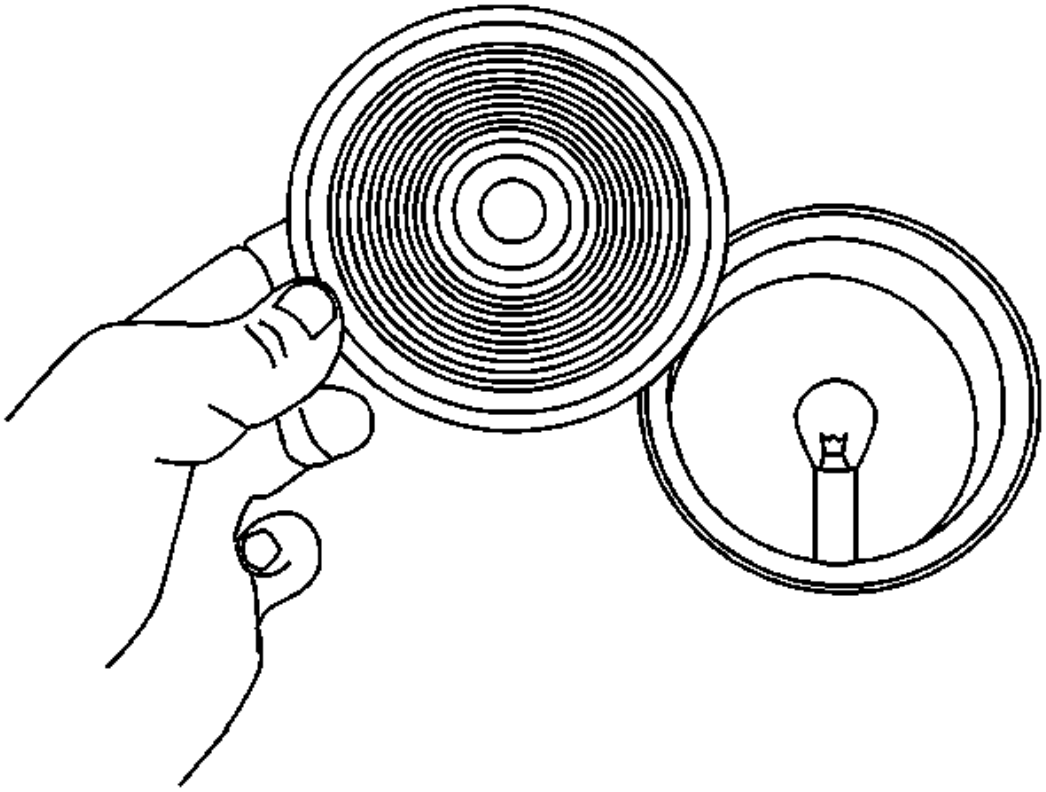

Fig. 49: Rear Compartment Lid Lamp Lens (Impala Limited RPO T53)
Courtesy of GENERAL MOTORS COMPANY

2. Install the lens to the rear compartment lid lamp, pressing into place until fully seated.
3. Close the rear compartment.

EMERGENCY VEHICLE REAR LAMP REPLACEMENT (IMPALA LIMITED RPO 6J6)

Removal Procedure

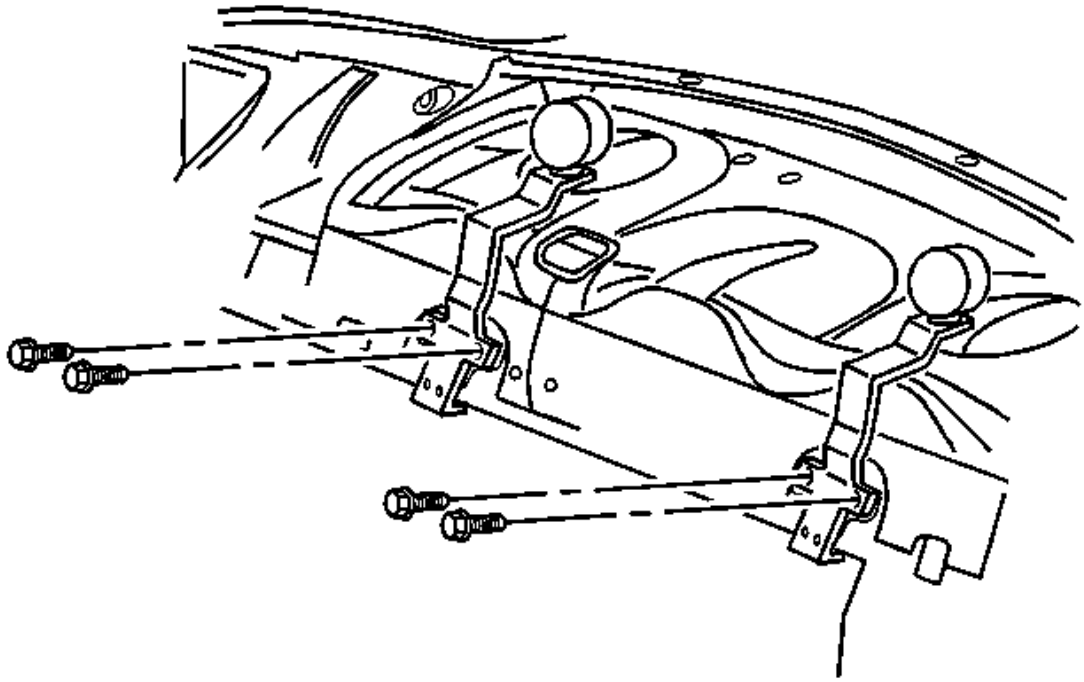

Fig. 50: Window Panel Lamp Bracket(s) (Impala Limited RPO 6J6)
Courtesy of GENERAL MOTORS COMPANY

1. Remove the rear seat back. Refer to **Rear Seat Back Cushion Removal and Installation (Impala Limited)** .
2. Remove the bolts from the rear window panel lamp bracket(s).

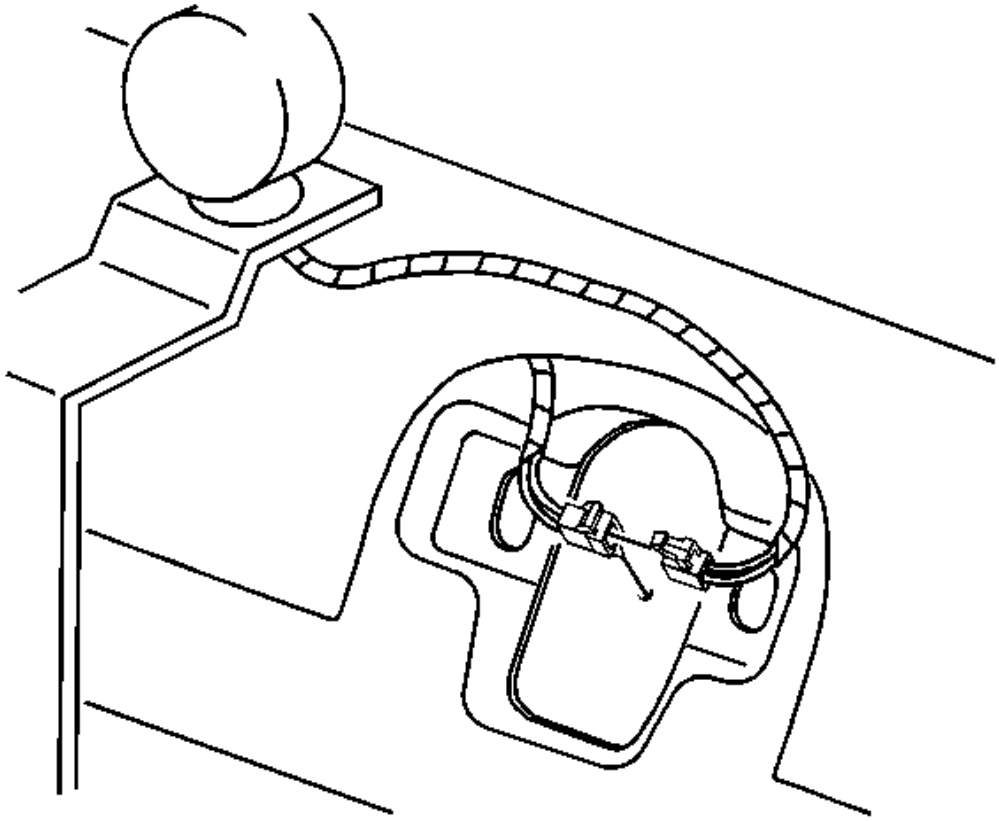

Fig. 51: Window Panel Lamp Electrical Connectors (Impala Limited RPO 6J6)
Courtesy of GENERAL MOTORS COMPANY

3. Disconnect the electrical connector(s).
4. Remove the rear window panel lamp(s) from the rear window panel.

Installation Procedure

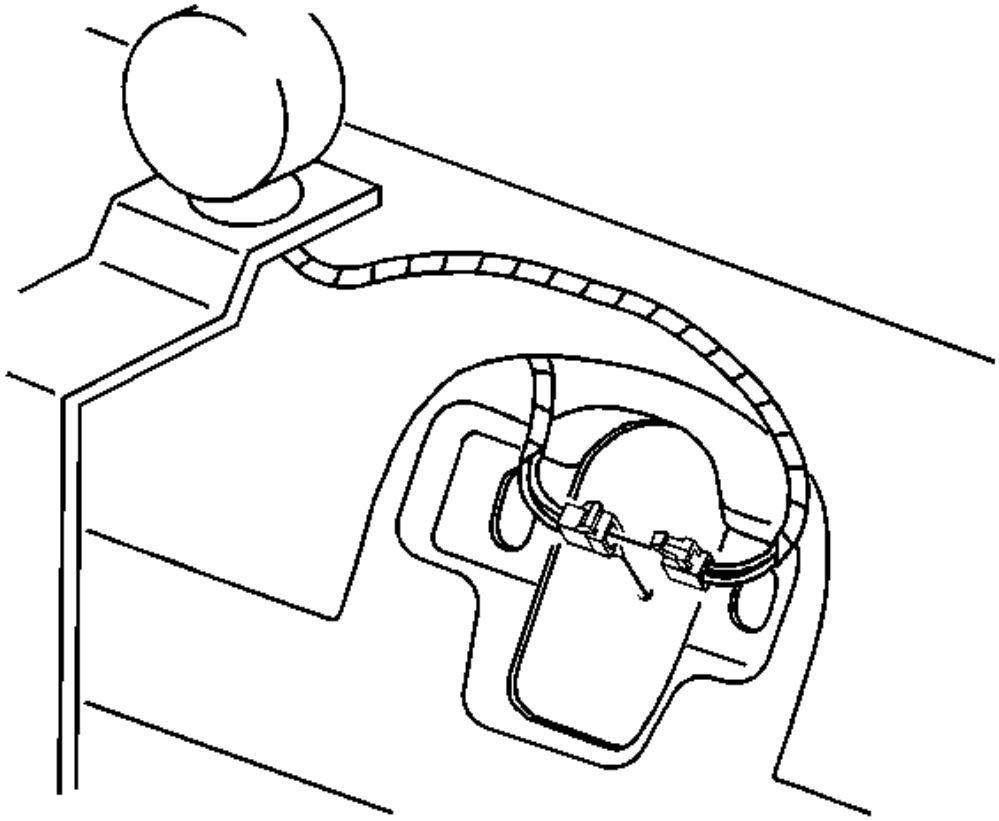

Fig. 52: Window Panel Lamp Electrical Connectors (Impala Limited RPO 6J6)
Courtesy of GENERAL MOTORS COMPANY

1. Connect the electrical connector.

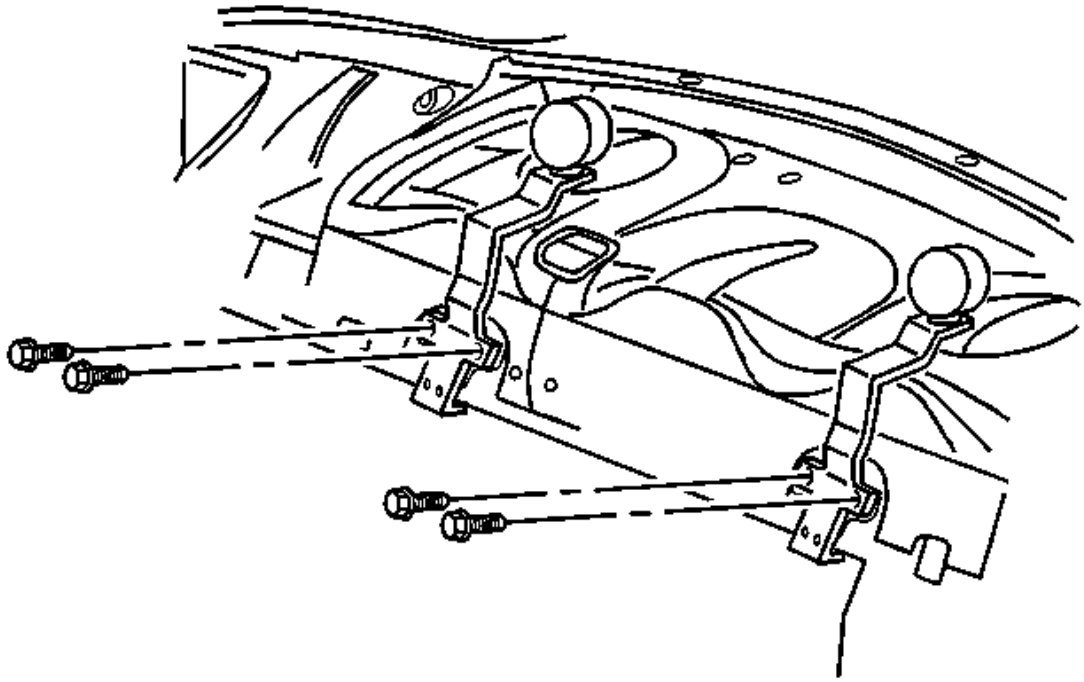

Fig. 53: Window Panel Lamp Bracket(s) (Impala Limited RPO 6J6)
Courtesy of GENERAL MOTORS COMPANY

2. Position the rear window panel lamp bracket(s) to the rear window panel.

CAUTION: Refer to Fastener Caution .

3. Install the bolts to the rear window panel bracket(s).

Tighten

Tighten the window panel bolts to 3 N.m (27 lb in).

4. Install the rear seat back. Refer to **Rear Seat Back Cushion Removal and Installation (Impala Limited)** .

EMERGENCY VEHICLE REAR LAMP LENS AND BULB REPLACEMENT (IMPALA LIMITED RPO 6J6)

Removal Procedure

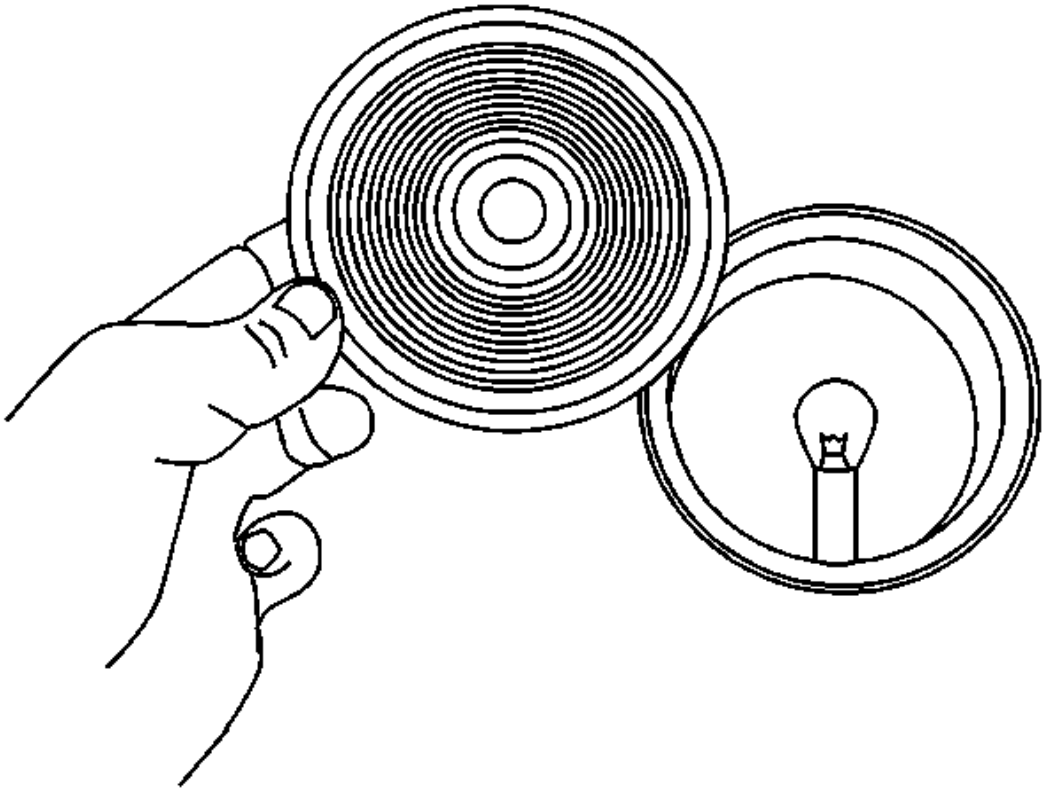

Fig. 54: Rear Compartment Lid Lamp Lens (Impala Limited RPO T53)
Courtesy of GENERAL MOTORS COMPANY

1. Remove the lens from the rear window panel lamp.

   Inserted a small coin under the rear window panel lamp lens and then twist the coin.

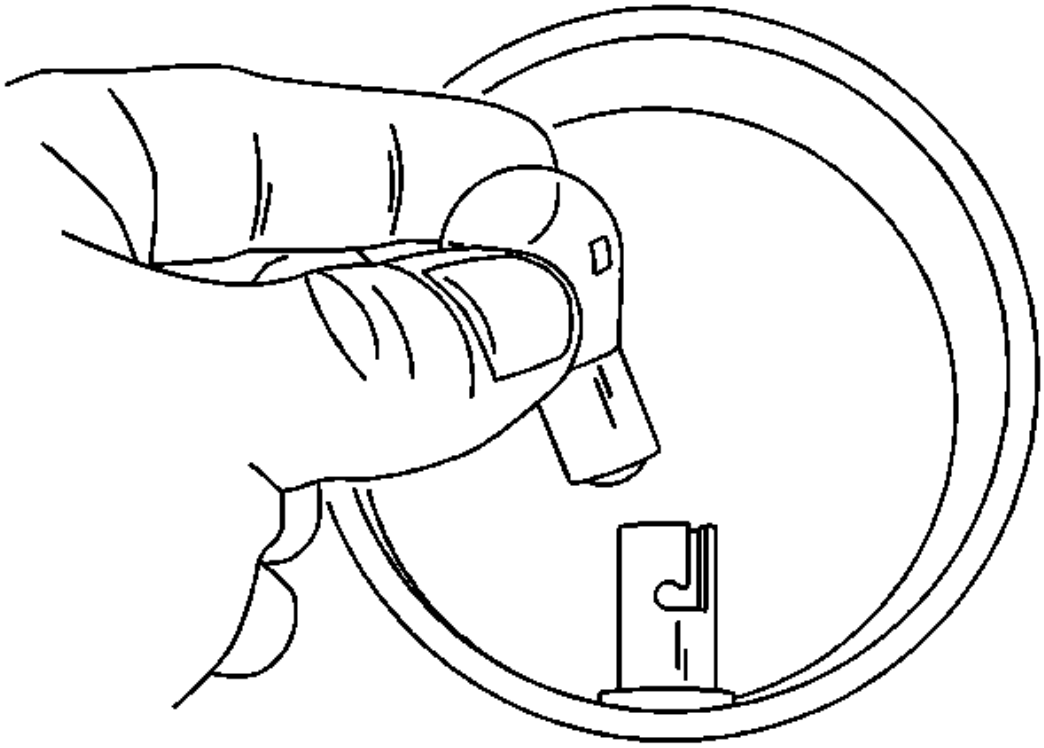

Fig. 55: Lid Lamp Bulb (Impala Limited RPO T53)
Courtesy of GENERAL MOTORS COMPANY

2. Remove the bulb from the rear window panel lamp socket.

Installation Procedure

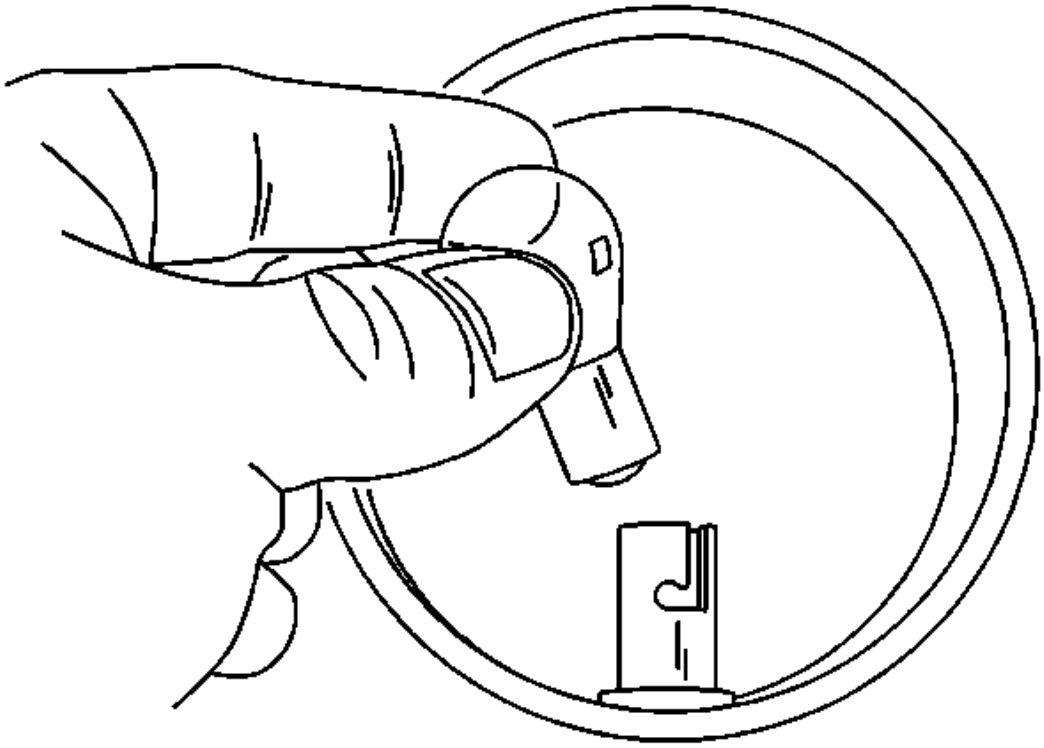

Fig. 56: Lid Lamp Bulb (Impala Limited RPO T53)
Courtesy of GENERAL MOTORS COMPANY

1. Install the bulb to the rear window panel lamp socket.

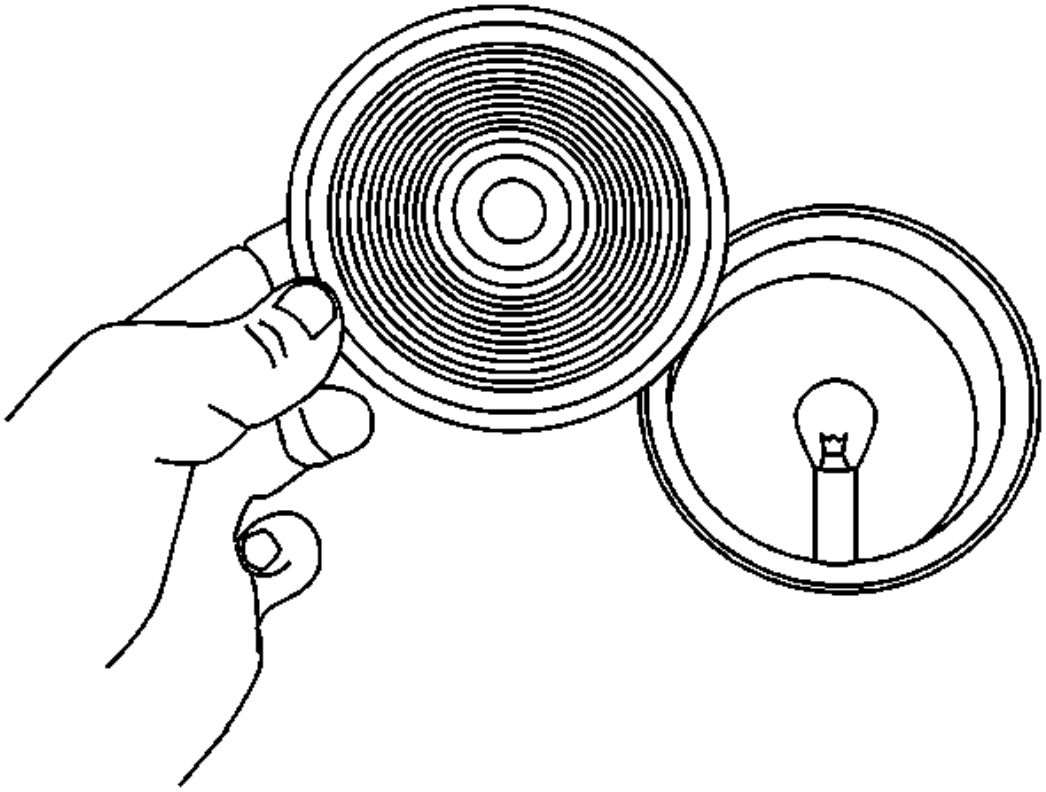

Fig. 57: Rear Compartment Lid Lamp Lens (Impala Limited RPO T53)
Courtesy of GENERAL MOTORS COMPANY

2. Install the lens to the rear window panel lamp, pressing into place until fully seated.

SPOT LAMP REPLACEMENT (IMPALA LIMITED RPO 7X6, 7X7)

Removal Procedure

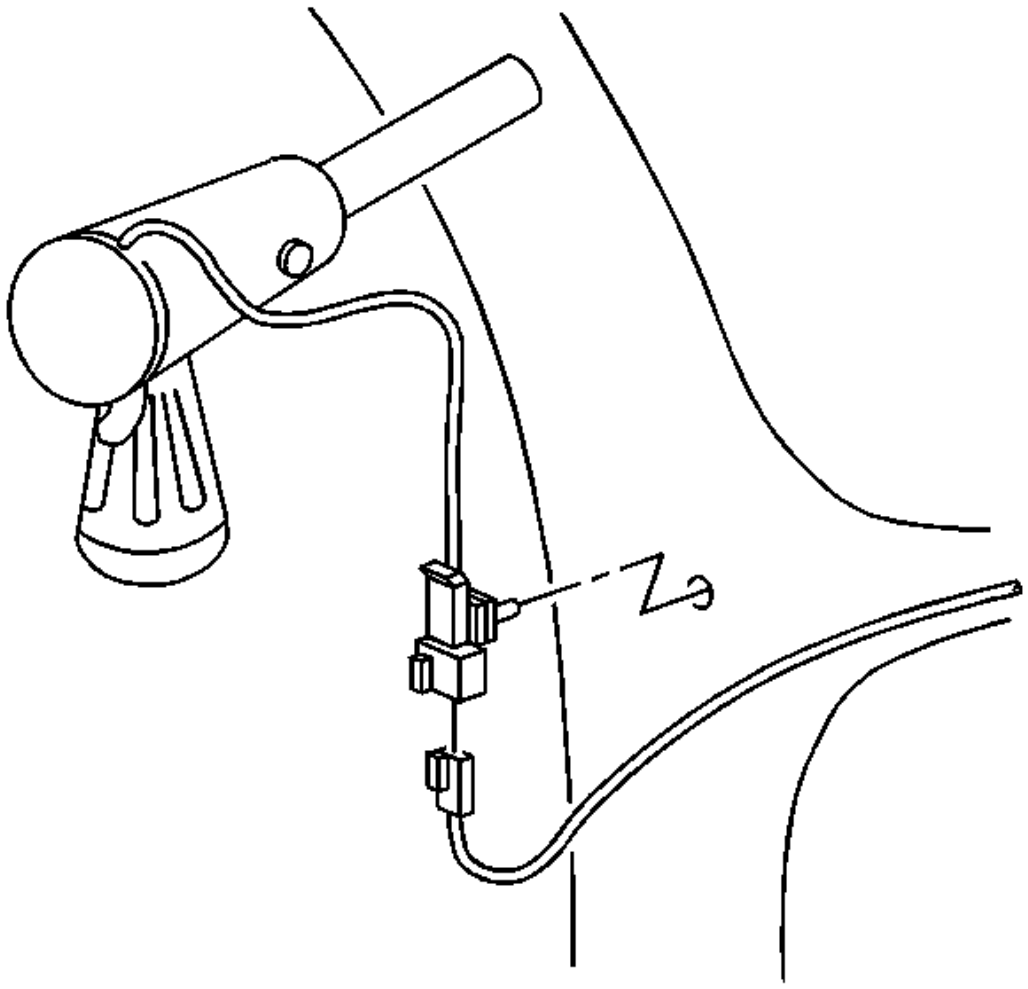

Fig. 58: Spot Lamp Wiring Harness Push-In Retainer & Electrical Connector
Courtesy of GENERAL MOTORS COMPANY

1. Remove the spot lamp wiring harness push-in retainer from the windshield garnish molding, using a small flat bladed tool.
2. Disconnect the electrical connector.

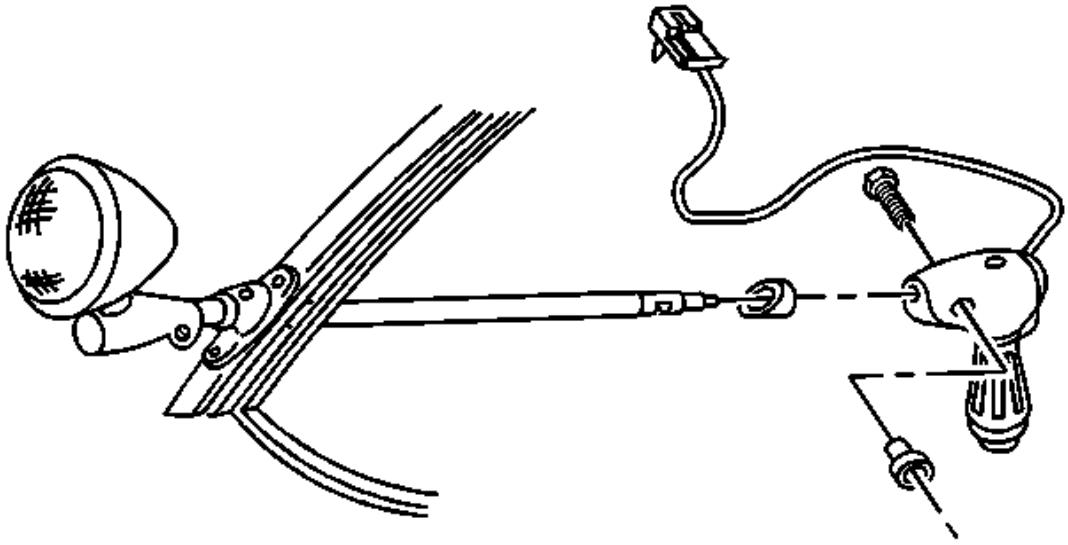

Fig. 59: Spot Lamp & Components
Courtesy of GENERAL MOTORS COMPANY

3. Remove the spot lamp handle wedge key screw from the spot lamp handle.

   Loosen the wedge key screw a few turns then with a light tap with a suitable hammer to the wedge key screw will loosen it from the spot lamp outer tube shaft.

4. Remove the spot lamp handle from the outer tube shaft.
5. Remove the rubber grommet from the outer tube shaft.

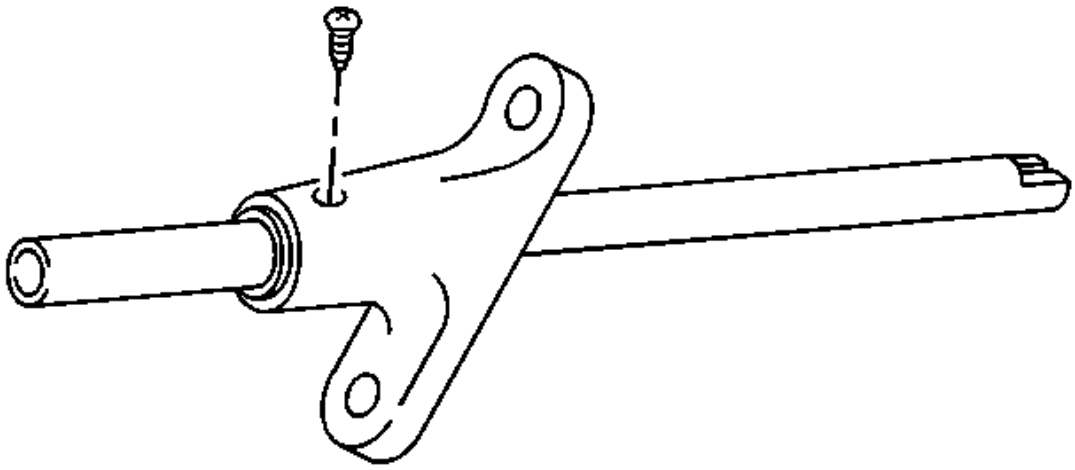

Fig. 60: Spot Lamp Bracket Set Screw
Courtesy of GENERAL MOTORS COMPANY

6. Loosen the spot lamp bracket set screw.

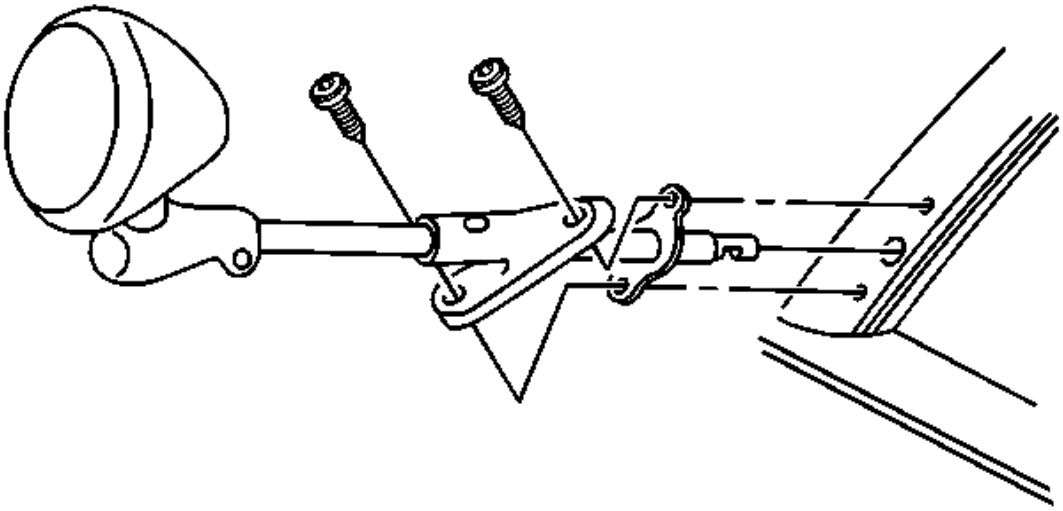

Fig. 61: Spot Lamp Mounting Bracket Screws
Courtesy of GENERAL MOTORS COMPANY

7. Pull the spot lamp with the outer tube shaft out of the spot lamp mounting bracket and set aside.
8. Remove the spot lamp mounting bracket screws.
9. Remove the mounting bracket and the gasket from the windshield pillar.
10. Clean the mounting surface of the windshield pillar.

Installation Procedure

NOTE: **This method of installation will stop the chance of any alignment and binding problems.**

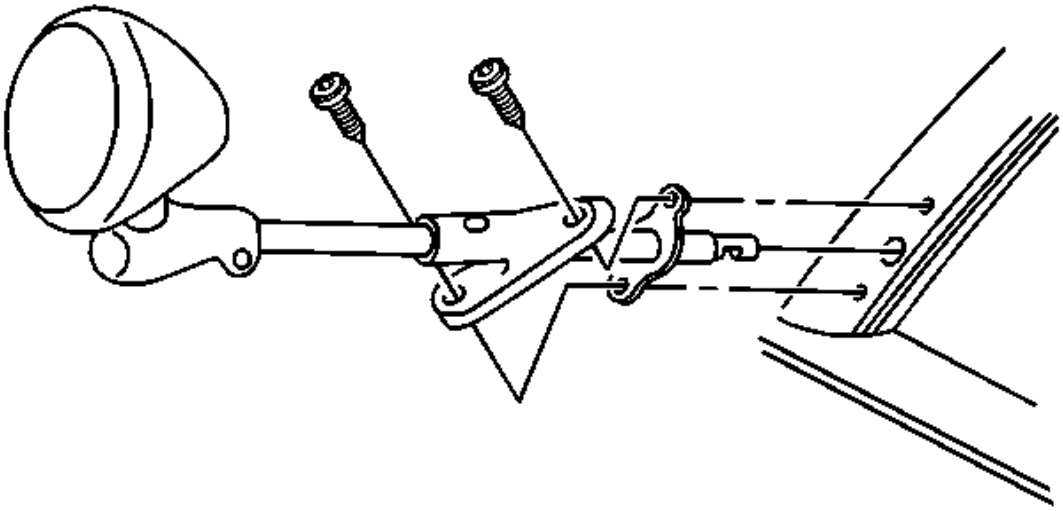

Fig. 62: Spot Lamp Mounting Bracket Screws
Courtesy of GENERAL MOTORS COMPANY

1. Install the mounting bracket and the gasket on to the spot lamp outer tube shaft.
2. Apply a small amount of RTV sealer GM P/N 12345336 or Canadian P/N 12346286 or equivalent to the screw holes on the windshield pillar.
3. Install the mounting bracket , the gasket and the spot lamp outer tube shaft through the windshield pillar.

CAUTION: Refer to Fastener Caution .

4. Install the spot lamp mounting bracket screws.

Tighten

Tighten the spot lamp mounting bracket screws to 3.5 N.m (31 lb in).

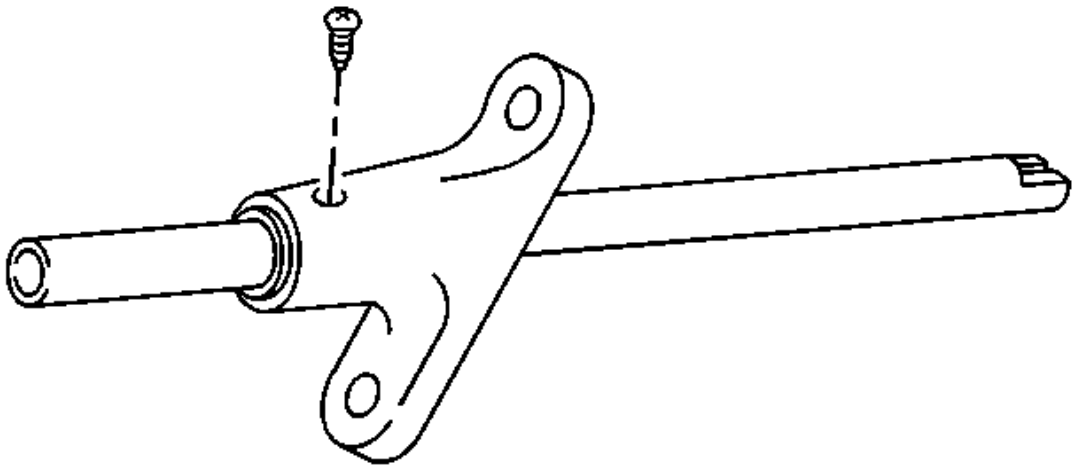

Fig. 63: Spot Lamp Bracket Set Screw
Courtesy of GENERAL MOTORS COMPANY

5. Rotate the spot lamp to the upright position.

   Point the spot lamp forward.

6. Tighten the spot lamp mounting bracket set screw just enough in order to firmly hold the spot lamp in the upright position.

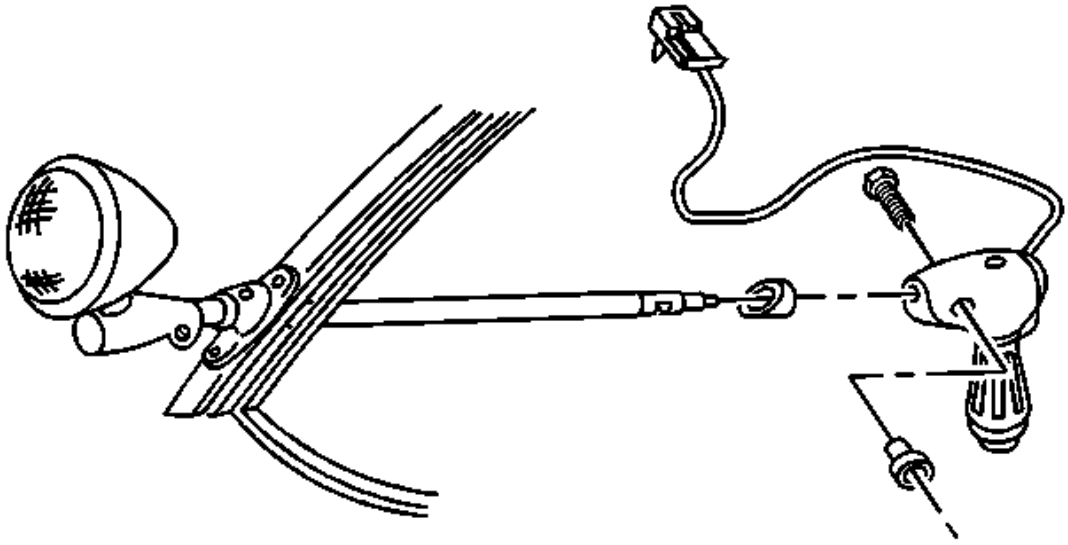

Fig. 64: Spot Lamp & Components
Courtesy of GENERAL MOTORS COMPANY

7. Install the rubber grommet to the outer tube shaft.
8. Install the spot lamp handle onto the outer tube shaft in the vertical down position until the handle bottoms out, and the flat detent on the outer tube shaft is exposed through the wedge key screw hole.
9. Install the spot lamp wedge key screw.

Tighten

Tighten the spot lamp wedge key screw to 7.5 N.m (66 lb in).

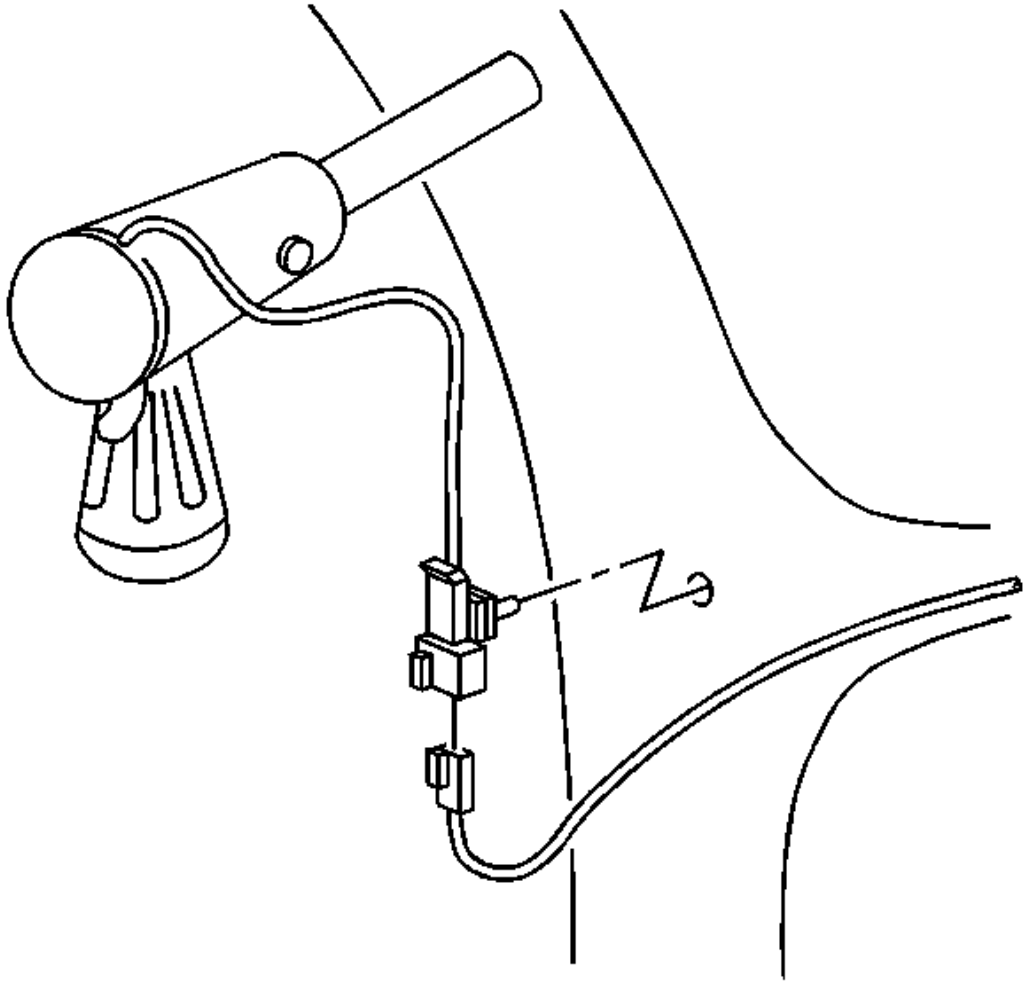

Fig. 65: Spot Lamp Wiring Harness Push-In Retainer & Electrical Connector
Courtesy of GENERAL MOTORS COMPANY

10. Connect the electrical connector.
11. Install the spot lamp wiring harness push-in retainer to the windshield garnish molding, pressing in until fully seated.
12. Inspect the spot lamp for proper operation.
    - The handle must rotate the spotlamp approximately 90 degrees about the spot lamp shaft axis from the parked position to the vertical position.
    - The spot lamp head must rotate 360 degrees about its axis.
    - The spot lamp must able to be turned ON/OFF independent of the ignition switch.
13. If spot lamp adjustment is required, refer to **Spot Lamp Travel Adjustment (Impala Limited RPO 7X6, 7X7)**.

SPOT LAMP BULB REPLACEMENT (IMPALA LIMITED RPO 7X6, 7X7)

Removal Procedure

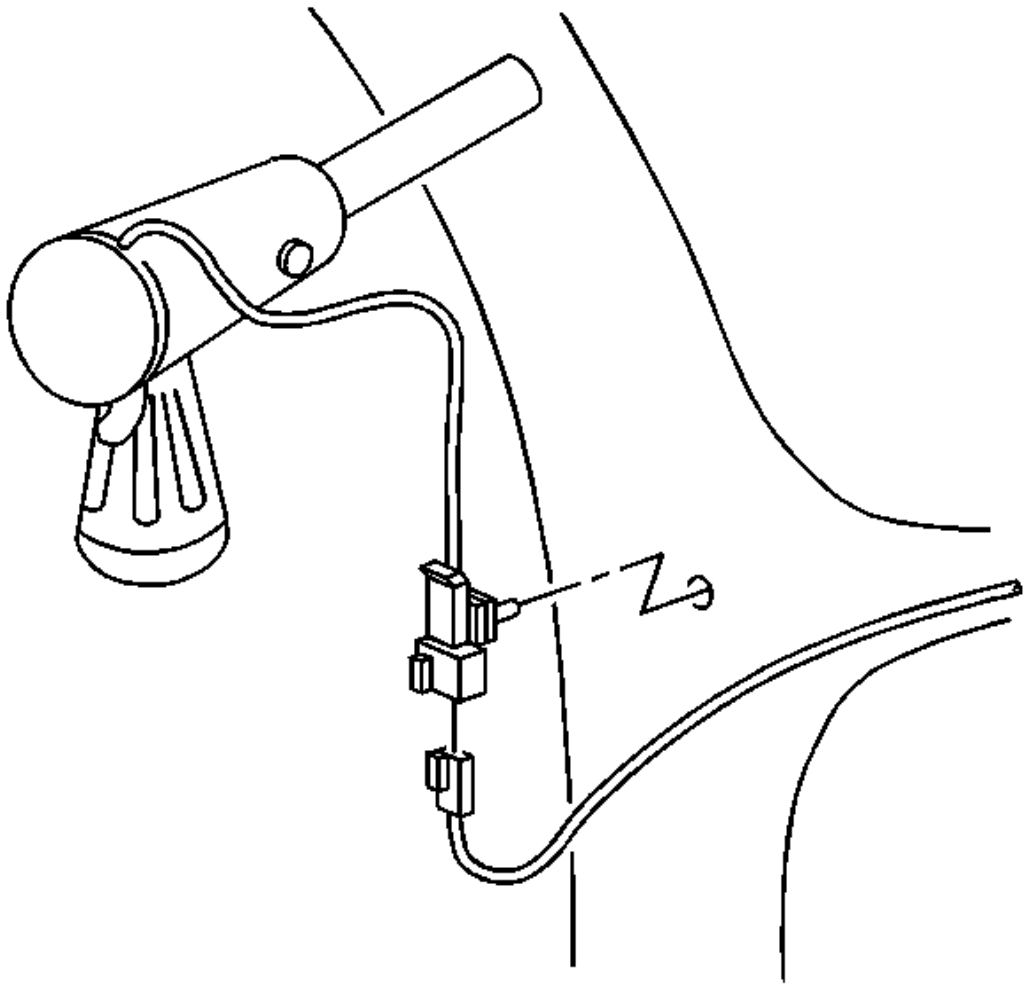

Fig. 66: Spot Lamp Wiring Harness Push-In Retainer & Electrical Connector
Courtesy of GENERAL MOTORS COMPANY

1. Remove the spot lamp wiring harness push-in retainer from the windshield garnish molding, using a small flat bladed tool.
2. Disconnect the electrical connector.

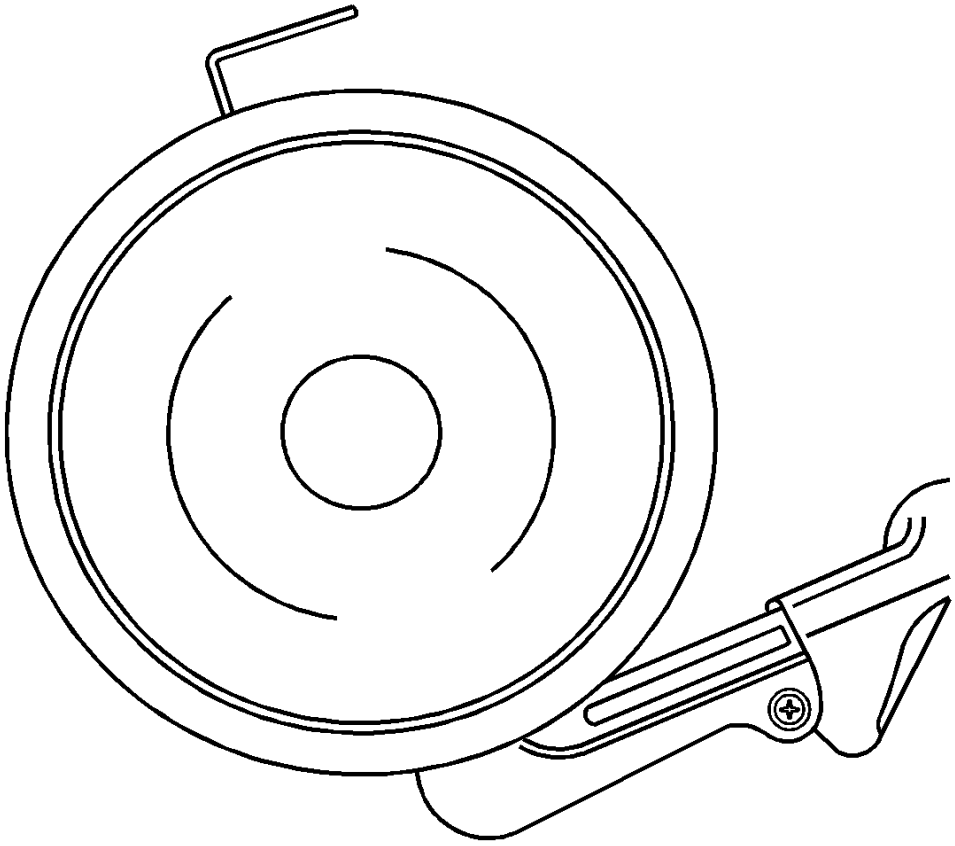

Fig. 67: Locating Spot Lamp Bezel Screw (Impala Limited RPO 7X6, 7X7)
Courtesy of GENERAL MOTORS COMPANY

3. Remove the screw from the spot lamp bezel.

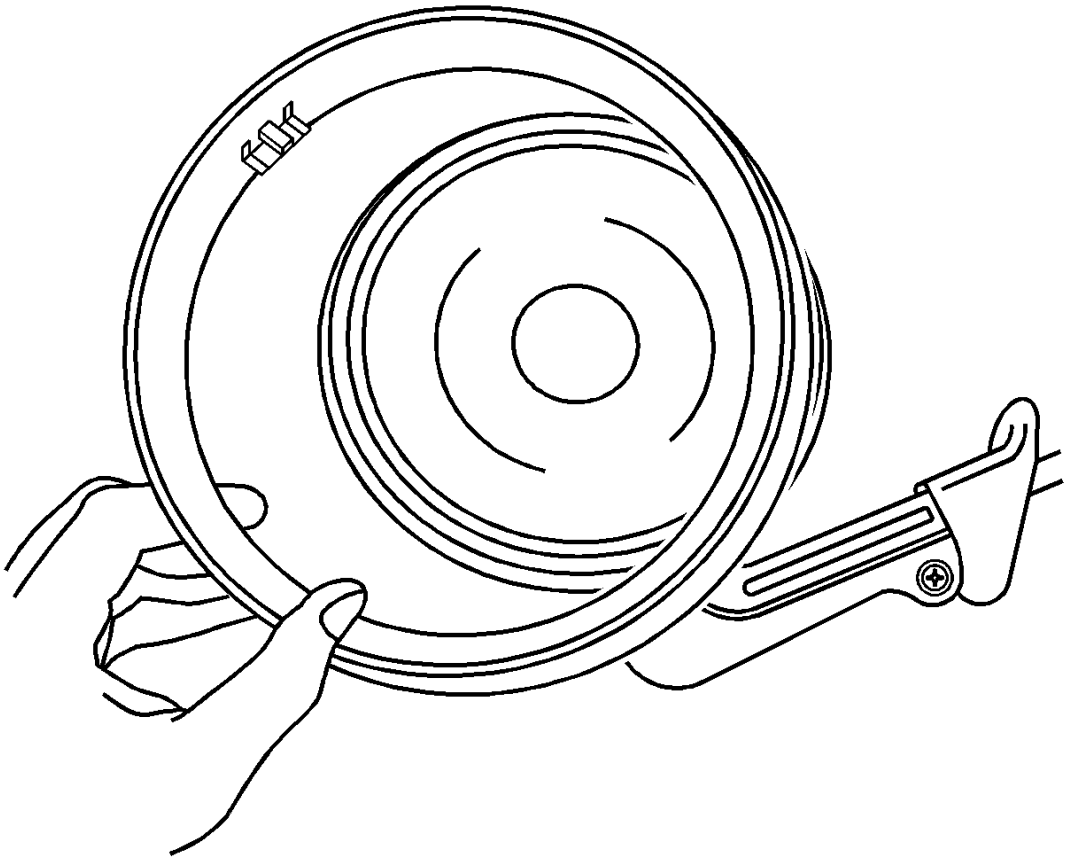

Fig. 68: Spot Lamp Bezel
Courtesy of GENERAL MOTORS COMPANY

4. Remove the spot lamp bezel from the spot lamp.

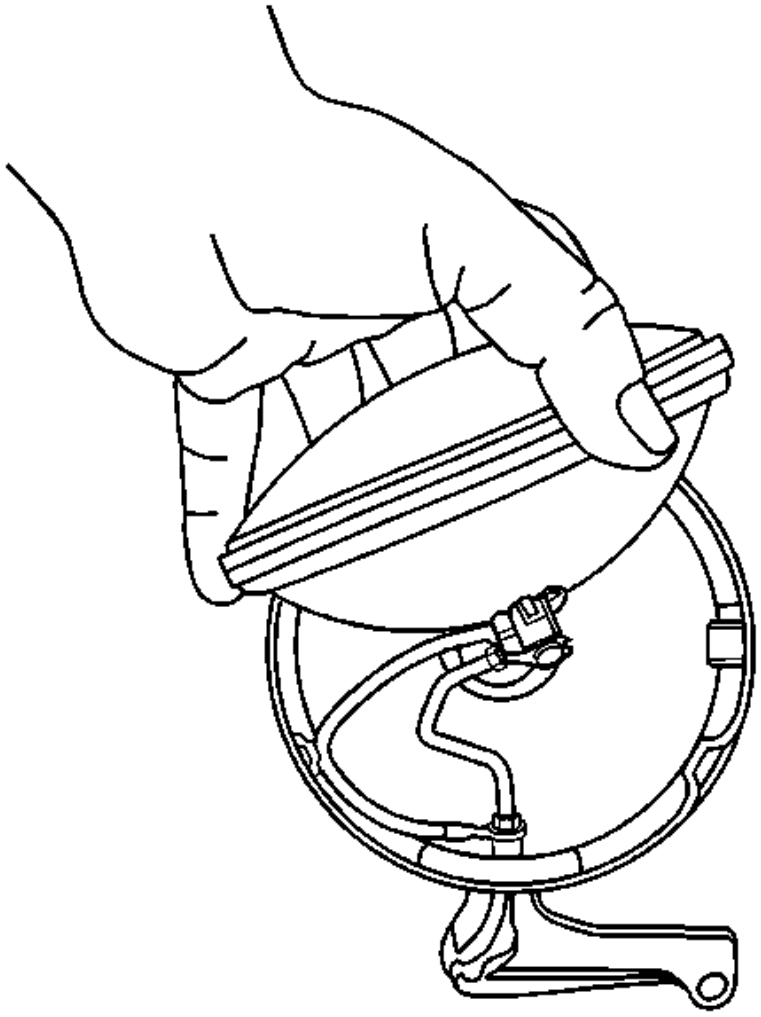

Fig. 69: Spot Lamp (Impala Limited RPO 7X6, 7X7)
Courtesy of GENERAL MOTORS COMPANY

5. Remove the lamp from the spot lamp.

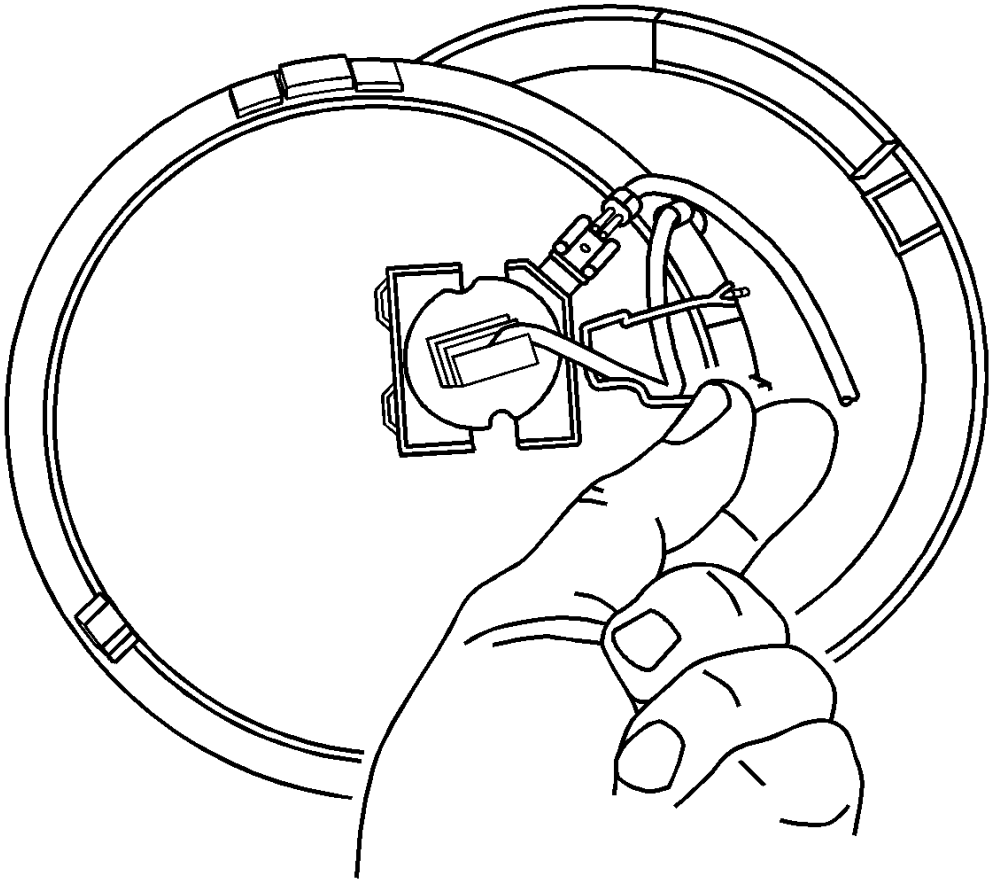

Fig. 70: Spot Lamp Retaining Clip
Courtesy of GENERAL MOTORS COMPANY

6. Remove spot lamp bulb retaining clip.

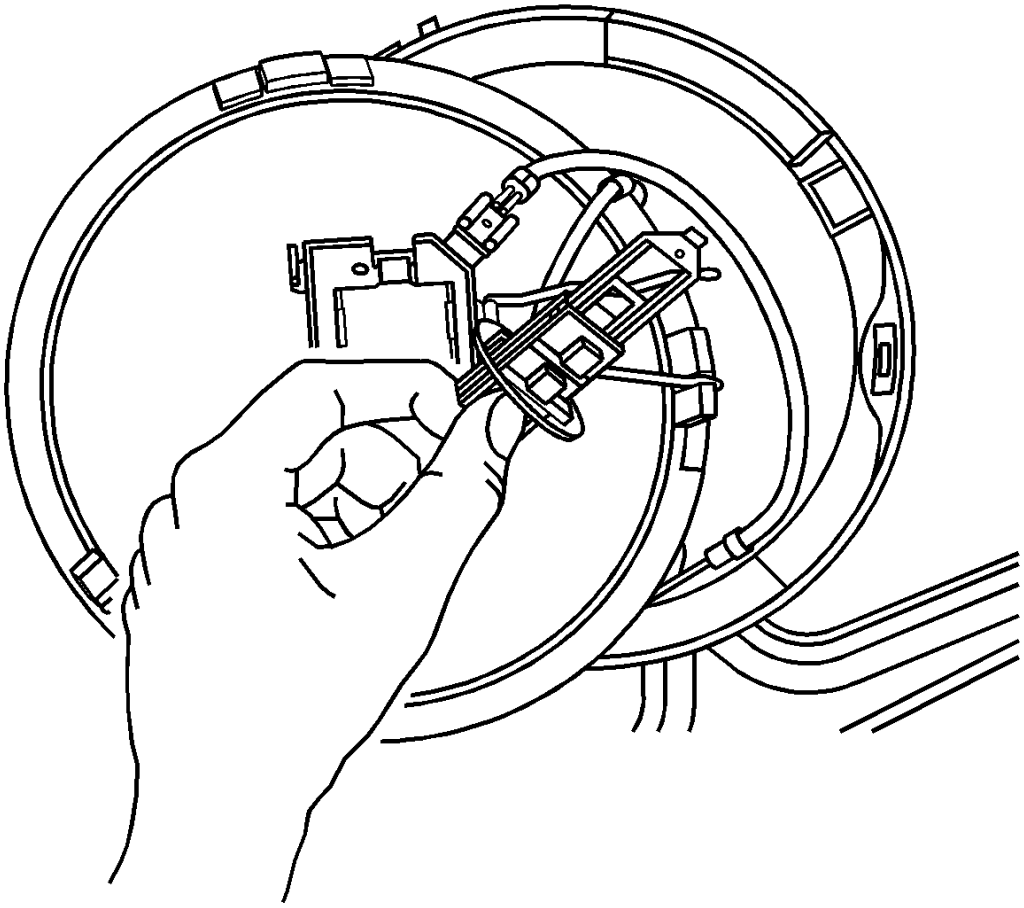

Fig. 71: Spot Lamp Bulb & Spot Lamp
Courtesy of GENERAL MOTORS COMPANY

7. Remove the spot lamp bulb from the spot lamp.

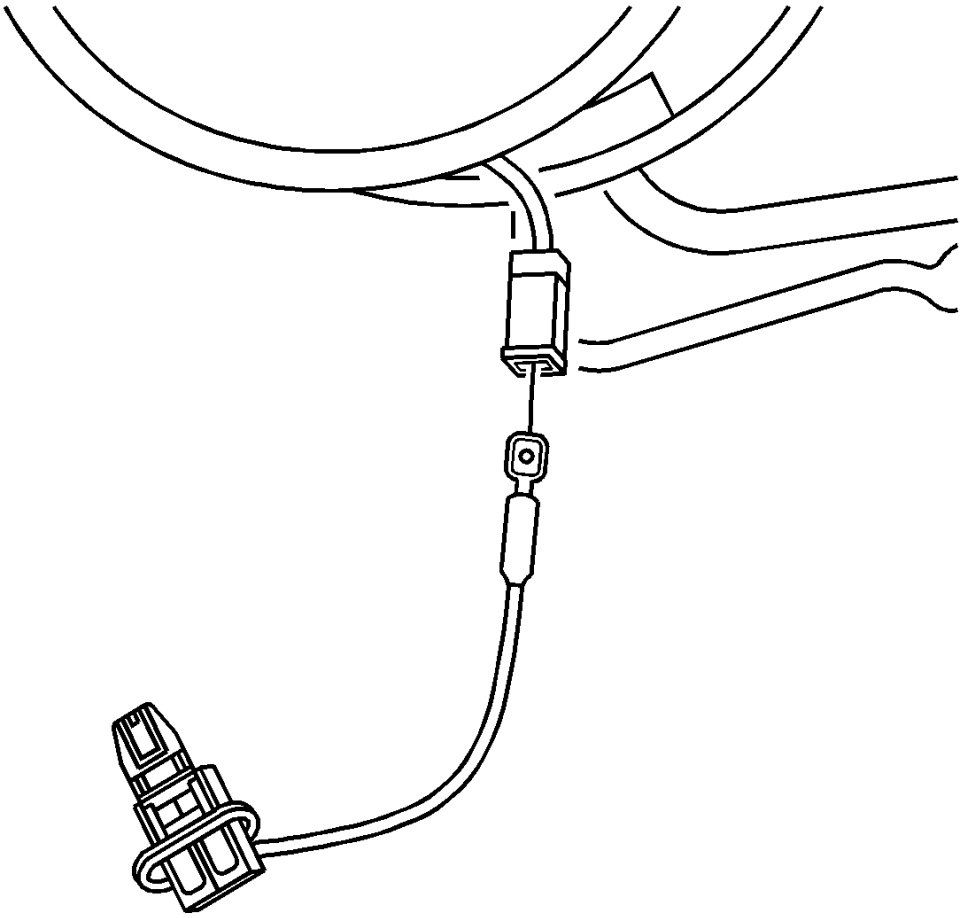

Fig. 72: Spot Lamp Bulb Electrical Connector
Courtesy of GENERAL MOTORS COMPANY

8. Disconnect the spot lamp bulb electrical connector.

Installation Procedure

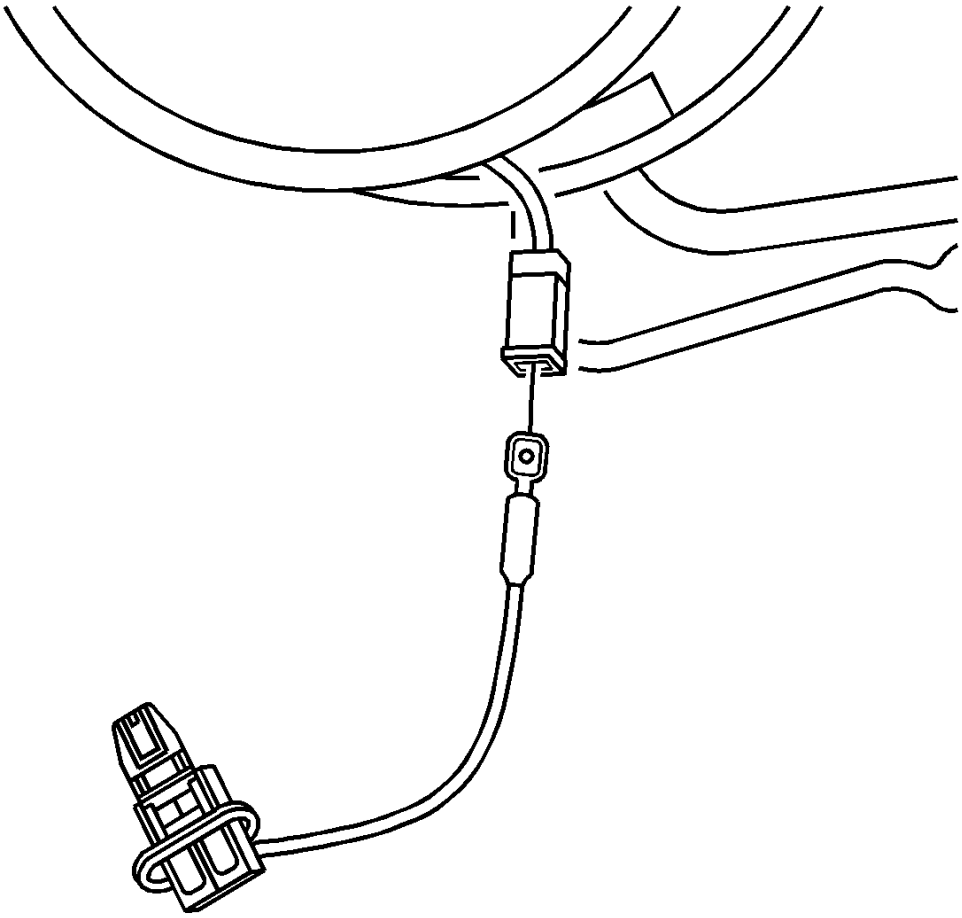

Fig. 73: Spot Lamp Bulb Electrical Connector
Courtesy of GENERAL MOTORS COMPANY

1. Connect the spot lamp bulb electrical connector.

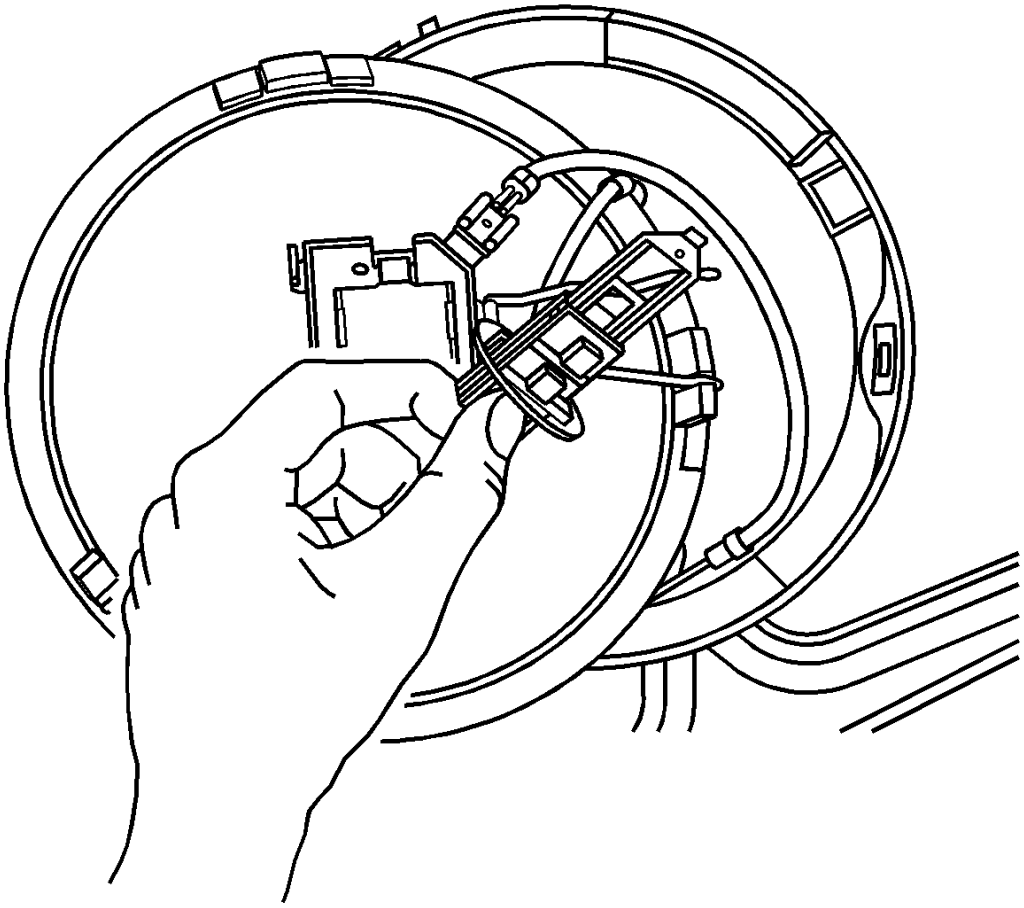

Fig. 74: Spot Lamp Bulb & Spot Lamp
Courtesy of GENERAL MOTORS COMPANY

2. Install the spot lamp bulb to the spot lamp.

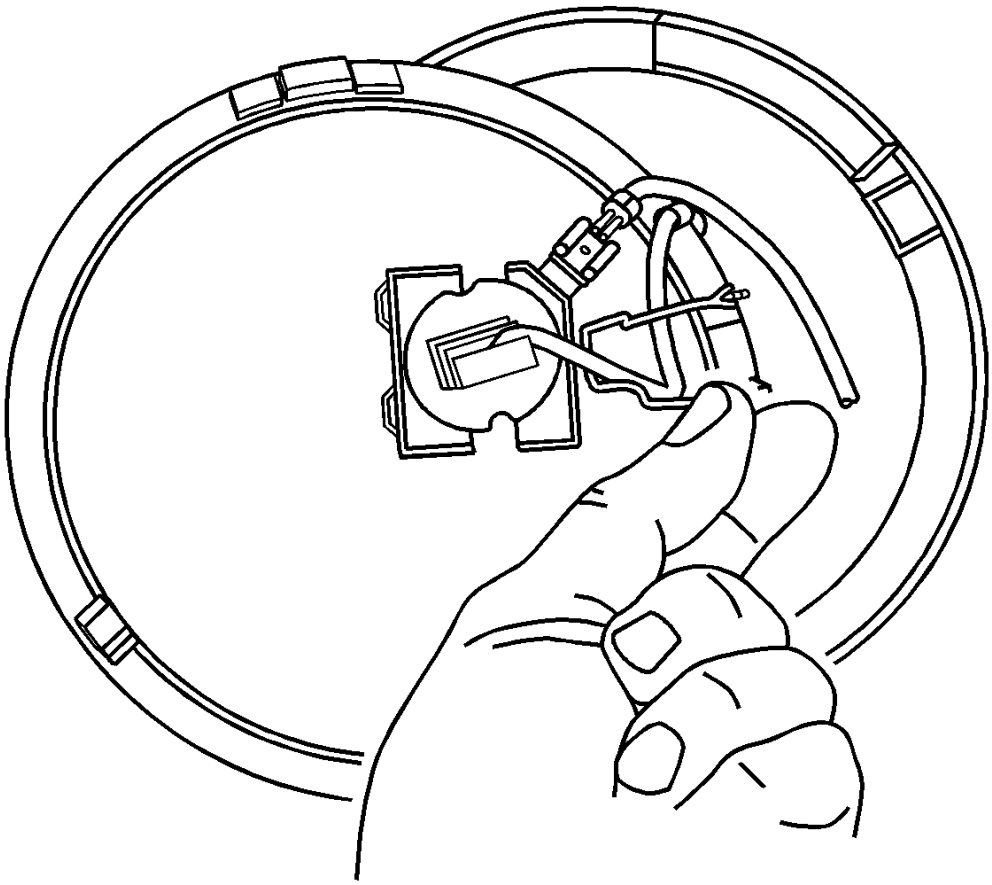

Fig. 75: Spot Lamp Retaining Clip
Courtesy of GENERAL MOTORS COMPANY

3. Install the spot lamp bulb retaining clip.

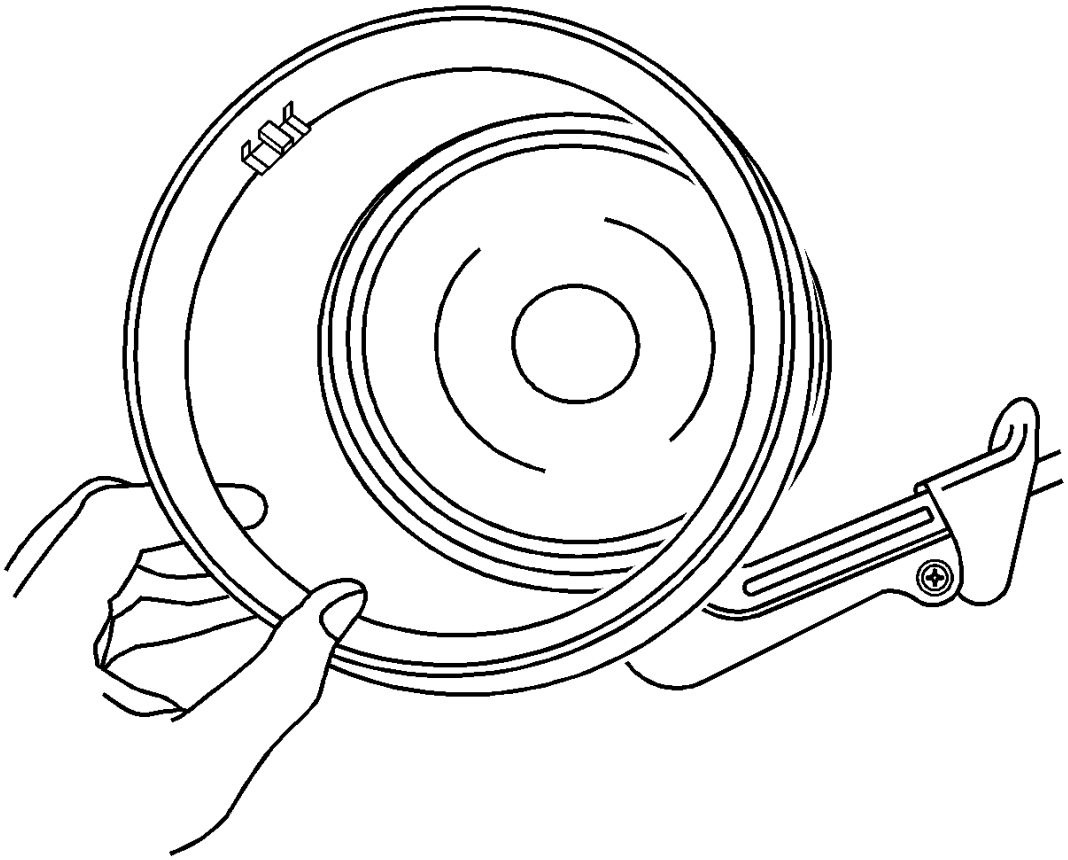

Fig. 76: Spot Lamp Bezel
Courtesy of GENERAL MOTORS COMPANY

NOTE: **The spot lamp assembly must be clocked in the UP position, refer to the emblem on the face of the lamp.**

4. Holding the spot lamp in position, install the spot lamp bezel to the spot lamp.

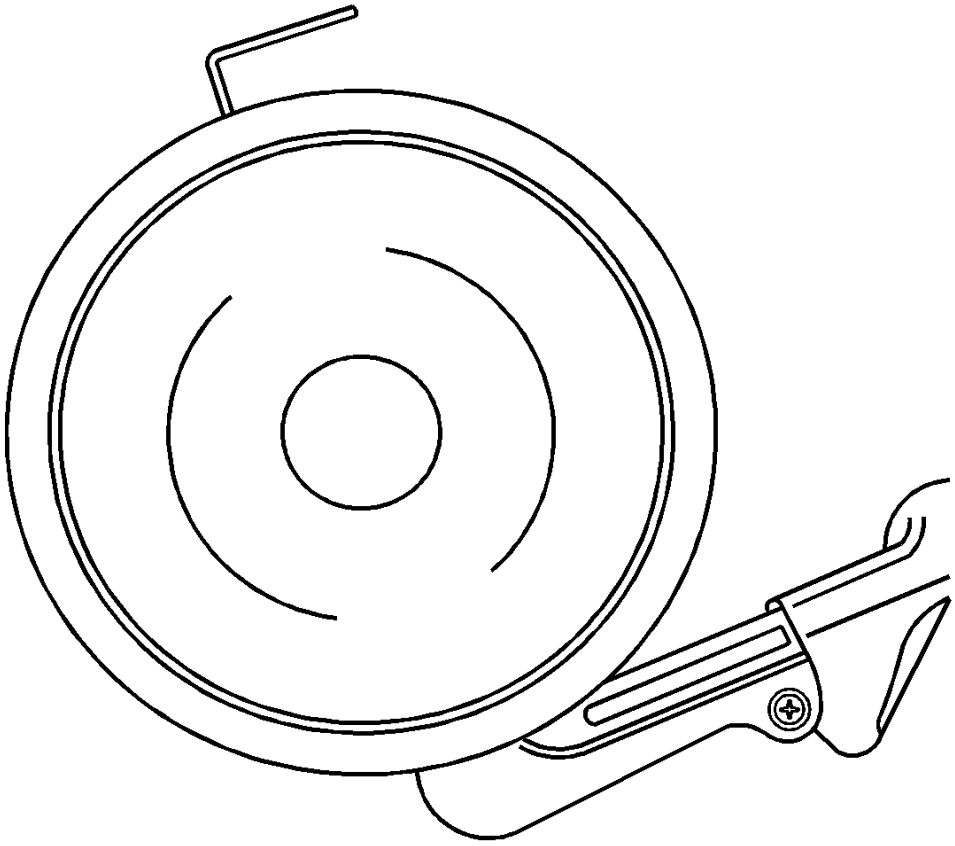

Fig. 77: Locating Spot Lamp Bezel Screw (Impala Limited RPO 7X6, 7X7)
Courtesy of GENERAL MOTORS COMPANY

CAUTION: Refer to Fastener Caution .

5. Install the spot lamp bezel screws.

Tighten

Tighten the spot lamp bezel screws to 2 N.m (18 lb in).

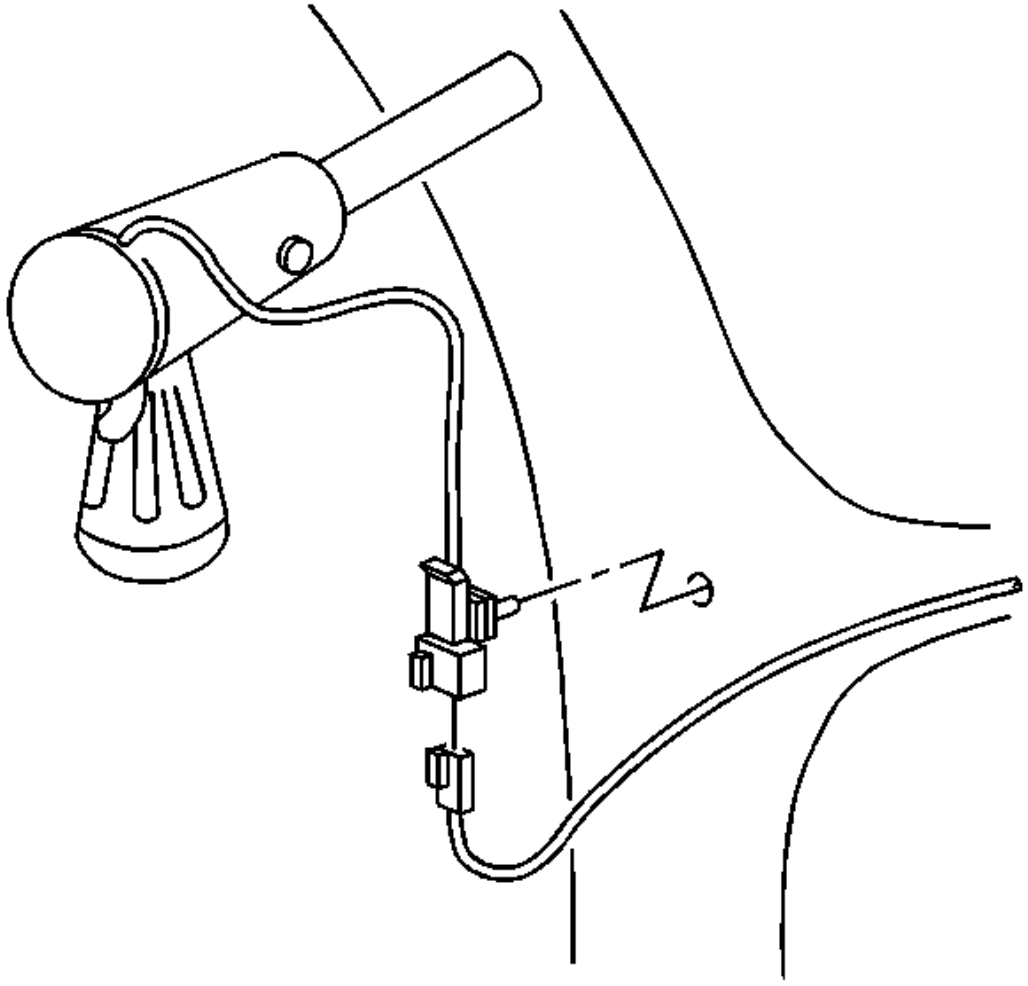

Fig. 78: Spot Lamp Wiring Harness Push-In Retainer & Electrical Connector
Courtesy of GENERAL MOTORS COMPANY

6. Using a small flat-bladed tool, install the spot lamp wiring harness push-in retainer to the windshield garnish molding.
7. Connect the electrical connector.
8. Inspect the spot lamp for proper operation.

SPOT LAMP TRAVEL ADJUSTMENT (IMPALA LIMITED RPO 7X6, 7X7)

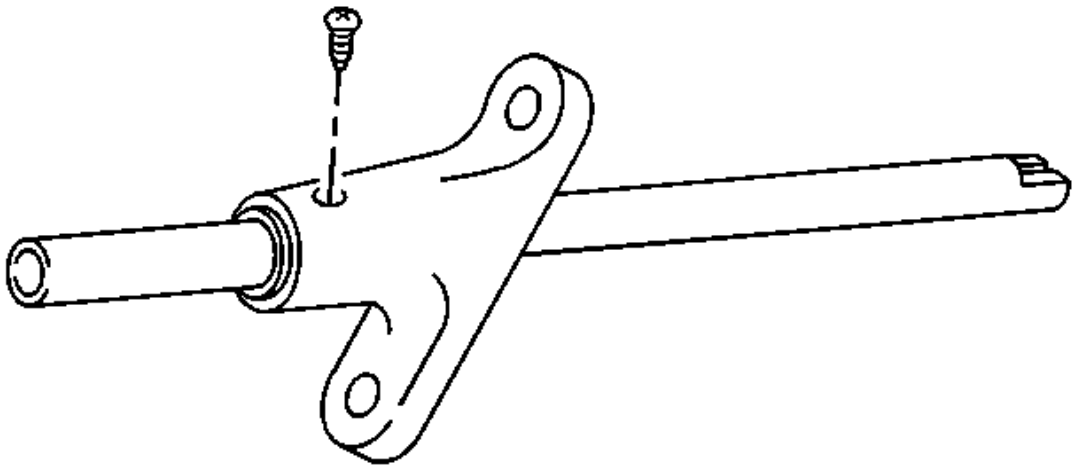

Fig. 79: Spot Lamp Bracket Set Screw
Courtesy of GENERAL MOTORS COMPANY

1. Loosen the spot lamp bracket clamp bolt.
2. Grasp the spot lamp.

   Slowly rotate the spot lamp inboard until the shaft contacts the parkstop position.

3. Rotate the spot lamp slowly outboard to 5 degrees past the vertical position in order for the backstop to be in motion and the outer tube shaft to rotate.
4. Tighten the bracket clamp bolt sufficiently, in order to prevent the outer shaft tube from rotating while the spotlamp is moving between the stop positions.
5. Rotate the spot lamp head inboard to the parkstop position in order to prevent the spot lamp from coming in contact with the body components.
6. Position the parkstop of the shaft in order to rotate the spot lamp on its axis, clearing the nearest body components by 13-0.5 mm (0.50-0.02 in).

CAUTION: Refer to Fastener Caution .

7. Tighten the bracket clamp screw when the parkstop has been set, in order to prevent rotation of the spot lamp shaft.

   Tighten

   Tighten the spot lamp bracket clamp bolt to 6 N.m (53 lb in).

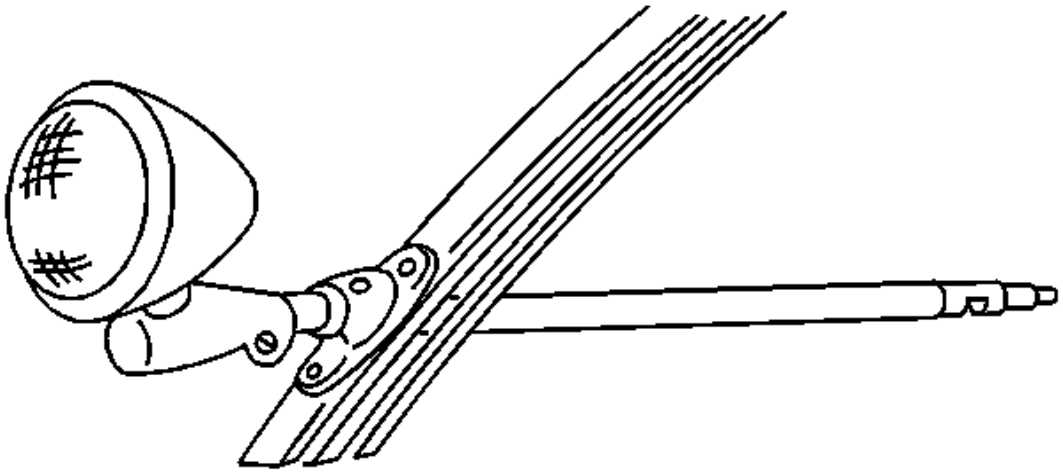

Fig. 80: Stop Lamp (Impala Limited RPO 7X6, 7X7)
Courtesy of GENERAL MOTORS COMPANY

8. Adjust the spot lamp head clamping bolt, in order to easily rotate the spot lamp (120 degrees) in any adjustable position between the parkstop and the backstop positions.

   The total motion of the spot lamp is approximately 90 degrees.

   Tighten

   Tighten the spot lamp head clamping bolt to 2.5 N.m (22 lb in).

REAR COMPARTMENT COURTESY LAMP REPLACEMENT

Removal Procedure

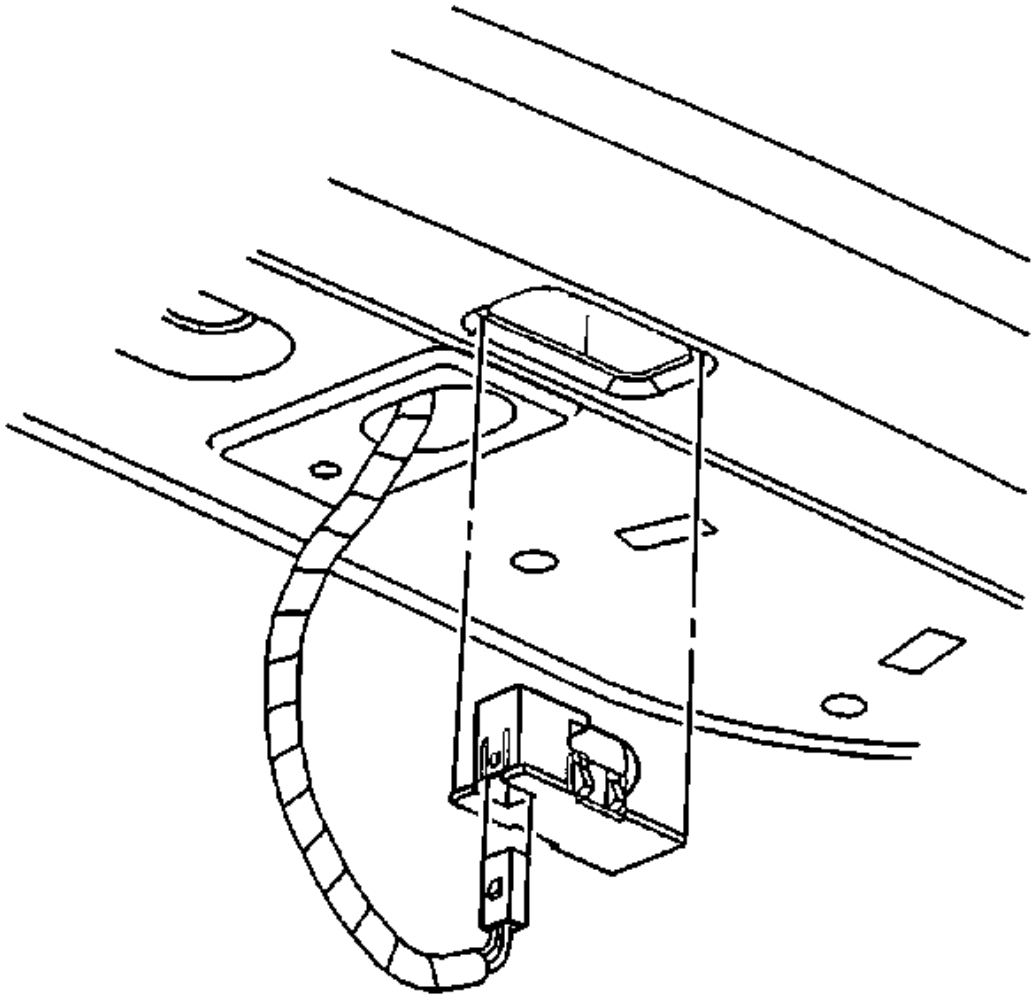

Fig. 81: Rear Compartment Lamp
Courtesy of GENERAL MOTORS COMPANY

1. Open the rear compartment.
2. Remove the rear compartment lamp using a small flat-bladed tool to release the retaining tabs.
3. Remove the bulb from the rear compartment lamp socket.

Installation Procedure

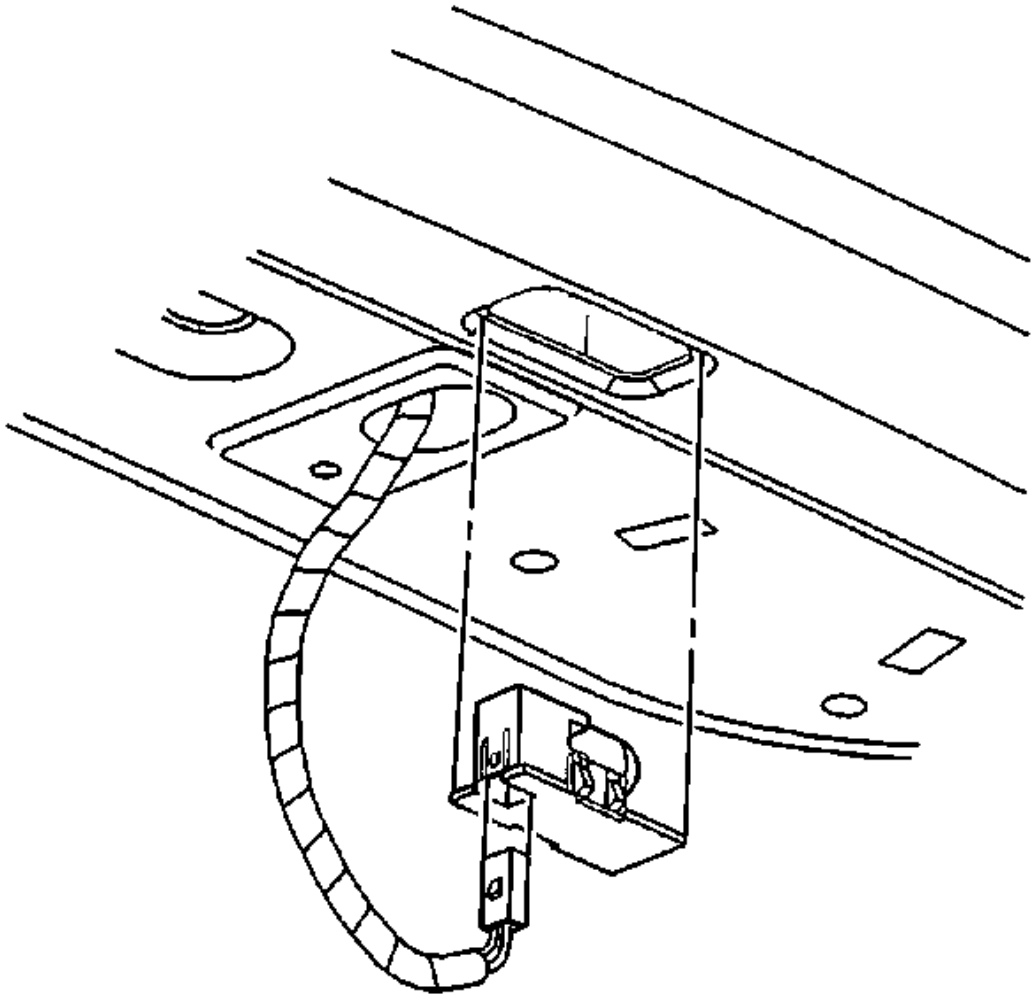

Fig. 82: Rear Compartment Lamp
Courtesy of GENERAL MOTORS COMPANY

1. Install the bulb to the rear compartment lamp socket.
2. Install the rear compartment lamp, pressing into place until full seated.
3. Close the rear compartment.

DESCRIPTION AND OPERATION

EXTERIOR LIGHTING SYSTEMS DESCRIPTION AND OPERATION

Exterior Lamps

The exterior lighting system consists of the following components:

- Headlamp switch
- Turn signal/multifunction switch
- Brake pedal position sensor

- Body control module (BCM)
- Ambient light sensor
- DRL PCB relay
- Low beam PCB relay
- High beam PCB relay
- Park lamp PCB relay
- Fog lamp PCB relay
- Low beam headlamps
- High beam headlamps
- Park lamps
- Tail lamps
- License lamps
- Marker lamps
- Turn signal lamps
- Stop lamps
- Center high mounted stop lamp (CHMSL)
- Backup lamps
- Front fog lamps

Low Beam Headlamp Operation

The low beam headlamps may be turned ON in 3 different ways:

- When the headlamp switch in the HEAD position for normal operations
- When the headlamp switch is in the AUTO position, for automatic lamp control (ALC)
- When the headlamp switch is placed in the AUTO position, with the windshield wipers ON in daylight conditions, after a 6 second delay

Battery voltage is applied at all times to the coil and switch sides of the LOW BEAM PCB Relay located in the underhood fuse block. When the headlamp switch is placed in the HEAD position, ground is applied through headlamps ON switch signal circuit to the body control module (BCM), signaling the headlamps ON request. In response to this signal, the BCM applies ground through the headlamp low beam relay control circuit energizing the low beam relay. With the relay energized, battery voltage is applied through the switch side of the relay, the left and right low beam fuses, and the low beam supply voltage circuits illuminating the low beam headlamps.

High Beam Headlamp Operation

Battery voltage is applied at all times to the coil and switch sides of the HIGH BEAM PCB Relay located in the underhood fuse block. When the headlamp dimmer switch is placed in the high beam position, the headlamp dimmer switch signal circuit to the BCM is pulled low signaling the headlamp high beam request. In response to this signal, the BCM applies ground through the high beam relay control circuit energizing the high beam relay. With the high beam relay energized, battery voltage is applied through the switch side of the relay, the left and right high beam fuses, and the high beam supply voltage circuits illuminating the high beam headlamps. At the same time the BCM sends a serial data message to the instrument panel cluster (IPC) requesting the IPC to

illuminate the high beam indicator.

Flash to Pass (FTP)

When the turn signal/multifunction switch handle is pulled toward the driver, the FTP switch is active and the flash to pass switch signal circuit to the BCM is pulled low signaling the flash to pass request. The BCM then turns ON the high beam headlamps, as described above, until the turn signal/multifunction switch handle is released. If the low beam headlamps were ON during FTP operation, they will remain ON.

Daytime Running Lamps (DRL) and Automatic Lamp Control (ALC)

The low beam headlamps are used for DRL operation at a reduced intensity. The DRLs will operate only while the engine is running and the headlamp switch is in the AUTO position. When the DRLs are ON, no other exterior lamps such as the parking lamps, tail lamps, etc. will be on when the DRL are being used. The instrument panel will not be illuminated either.

DRL operation is determined by the ambient light sensor and controlled by the body control module (BCM). The ambient light sensor is a light-sensitive transistor used to monitor outside lighting conditions. The BCM provides a 5-volt reference signal to the sensor. The sensor will vary this voltage signal between 0.2 and 4.9 volts depending on outside lighting conditions. The BCM monitors the ambient light sensor signal circuit to determine if outside lighting conditions are correct for either DRL or ALC operation. When the BCM determines the conditions are met for DRL operation, it applies ground to the DRL relay control circuit energizing the DRL PCB Relay. With the relay energized, battery voltage is applied through the switch side of the relay, the DRL 1 fuse, a resistor wire to the DRL 2 fuse, both low beam headlamp fuses, and the low beam supply voltage circuits illuminating the headlamps at a reduced intensity. Any function or condition that turns on the headlamps will cancel DRL operation.

When the BCM detects low light conditions, it will turn OFF the daytime running lamps and turn ON the low beam headlamps as described above in Low Beam Headlamp Operation. The BCM will also turn ON the low beam headlamps in daylight conditions when the windshield wipers are turned ON.

Park, Tail, Marker and License Lamps

The park, tail, license, and marker lamps are turned ON when the headlamp switch is placed in either the HEAD or PARK lamp positions, or anytime the automatic light control (ALC) turns the headlamps ON. When the headlamp switch is placed in the park lamp or headlamp positions, ground is applied through the signal circuit to the BCM indicating the park lamp request. In response to this signal, the BCM applies ground through the park lamp relay control circuit energizing the PARK LP PCB Relay. With the relay energized, battery voltage is applied through the switch side of the relay, both park lamp fuses, and the supply voltage circuits illuminating the park, tail marker, and license lamps.

Turn Signal Lamps

The LT T/SIG and RT T/SIG fuses located in the underhood fuse block supplies battery positive voltage to the body control module (BCM) for turn signal and hazard lamp operation. When the turn signal switch is place in either the LEFT or RIGHT position, ground is applied through the turn signal switch signal circuit to the BCM indicating the turn signal request. In response to this signal, the BCM applies a pulsating voltage to the front and rear turn signal lamps supply voltage circuits cycling the lamps ON and OFF. The BCM also sends a message via to the instrument panel cluster (IPC) to cycle the turn signal indicator ON and OFF depending on the position of the turn signal switch.

Hazard Lamps

The hazard flashers may be activated in any power mode. When the hazard switch is placed in the ON position, ground is applied through the hazard switch signal circuit to the body control module (BCM) indicating the hazard lamps ON request. In response to this signal, the BCM applies a pulsating voltage to all front and rear turn signal lamps supply voltage circuits cycling the lamps ON and OFF. The BCM also sends a serial data message to the instrument panel cluster (IPC) to cycle both turn signal indicators ON and OFF.

Stop Lamps

The LT T/SIG and RT T/SIG fuses located in the underhood fuse block are also used by the body control module (BCM) for stop lamp operation.

The brake pedal position sensor is used to sense the action of the driver application of the brake pedal. The body control module (BCM) provides both, a 5-volt reference voltage and low reference to the brake pedal position sensor. The position sensor provides an analog voltage signal back to the BCM that will increase as the brake pedal is applied. When the brake pedal is applied, the BCM will then apply battery voltage to the left and right stop lamp supply voltage circuits and the center high mounted stop lamp (CHMSL) supply voltage circuit illuminating the stop lamps. At the same time the BCM signals the transmission control module (TCM) and the engine control module (ECM) that the brakes are applied.

The stop lamps on this vehicle will not illuminate unless the ignition is in the accessory, run, or crank positions. When the ignition is in the OFF position the stop lamps will not illuminate when the brake pedal is applied.

Backup Lamps

Battery voltage from the CHMSL/BCK-UP fuse is supplied to the body control module (BCM) for backup lamp operation. When the gear selector is placed in to the REVERSE position, the powertrain control module (PCM) sends a serial data message to the BCM indicating that the gear selector is in the reverse position. The BCM then applies battery voltage to the backup lamp supply voltage circuit illuminating the left and right backup lamps. The engine may need to be running for the backup lamps to function.

Front Fog Lamps

Battery voltage is applied at all times to the coil and switch sides of the FOG LAMP PCB Relay located in the underhood fuse block. . When the fog lamp switch is turned ON, ground is applied through the fog lamp switch signal circuit to the body control module (BCM) indicating the fog lamp request. In response to this signal, the BCM applies ground to the fog lamp relay control circuit energizing the FOG LP PCB Relay. With the relay energized, battery voltage is applied through the switch side of the relay, the FOG LAMPS fuse, and the fog lamp supply voltage circuits illuminating the fog lamps. At the same time the BCM sends a message via serial data to the instrument panel cluster (IPC) requesting that the fog lamp indicator be illuminated.

Battery Rundown Protection/Inadvertent Power

The BCM controls the lighting system through circuits that enable the exterior lamp functions of the park lamps, the head lamps, the fog lamps, and the interior lamps. The BCM opens these enabling circuits 10 minutes after the ignition switch is turned OFF with no lamp switch activity. If the ignition switch is turned to any position other than OFF, or if a lamp switch is activated during this time period, the timer resets for another 10 minutes.

INTERIOR LIGHTING SYSTEMS DESCRIPTION AND OPERATION

The interior lighting consist of two groups; lamps that may not be manually dimmed (Interior Lamps) and lamps that may be dimmed (Interior Lamps Dimming).

The first group listed below includes lamps that may not be dimmed

- Left and right I/P courtesy lamps
- Dome lamp (Coupe)
- Dome/reading lamp (Sedan)
- Left and right vanity mirror lamps
- Reading lamp assembly (w/ 9C1, 9C3)
- Inside rearview mirror lamps
- Rear compartment courtesy lamp

Interior Lamps Features

The interior lamps system features the following functions:

- An illuminated entry feature that illuminates the courtesy lamps when entering the vehicle or activating the remote keyless entry system.
- An illuminated exit feature that illuminates the courtesy lamps when the ignition key has been removed from the ignition.
- An inadvertent power feature that supplies voltage to all interior lamps after the ignition is turned OFF. The inadvertent power feature will deactivate all interior lamps after 10 minutes to prevent battery rundown.
- A theater dimming feature that will slowly dim the interior lamps from full brightness to OFF.
- An lamp switch assembly that illuminates the courtesy lamps.
- Individual switches for control of each interior lamp that is not illuminate with the interior lamp switch.

Courtesy Lamps

When the driver door is opened, ground is applied through the door latch door open switch and the left front door open switch signal circuit to the BCM indicting the door open position. Or, when either one of the passenger doors is opened, ground is applied through the door latch door open switch and the passenger door open switch signal circuit to the BCM indicating the door open position. Once a door open signal is received, the BCM will apply battery voltage from the INT LIGHTS fuse through the courtesy lamp supply voltage circuits illuminating the lamps listed below:

- Left and right I/P courtesy lamps
- Dome lamp (Coupe)
- Dome/reading lamp (Sedan)

Courtesy Lamps Manual Operation

The courtesy lamps can be manually turned ON by the IP dimmer switch. When the dimmer switch is placed in the DOME position, ground is applied through the dimmer switch and the courtesy lamp switch ON signal circuit to the BCM indicating the courtesy lamps ON request. In response to this signal, the BCM then applies

battery positive voltage from the INT LIGHTS fuse through the courtesy lamp supply voltage circuits illuminating the courtesy lamps listed above. The courtesy lamps ON operation of the dimmer switch will override any BCM operation of the interior lamps already in progress.

Keyless Entry Interior Illumination

When the remote function actuator transmitter is used to unlock the doors, the BCM receives a door-unlock signal. The BCM must have inputs that indicate that the ignition switch is OFF, the courtesy lamp switch is OFF, and all the doors are closed. The BCM will then illuminate the courtesy lamps and will remain illuminated for approximately 25 seconds after the door is closed. If the door locks are activated to the LOCK position, or if the ignition switch is turned to either the RUN or START position, the BCM will turn OFF the courtesy lamps immediately.

Courtesy/Illuminated Exit

The illuminated exit feature will activate the courtesy lamps when the key IN input of the BCM transitions from an active state to an inactive state (removing the ignition key). When the key is removed from the ignition, the key IN input to the BCM becomes inactive. The BCM will illuminate the courtesy lamps for approximately 25 seconds.

Theater Dimming

The theater dimming feature that will slowly dim the interior lamps from full brightness to OFF. The following actions will over ride the theater dimming feature causing the courtesy lamps to deactivate immediately if no other BCM function commands the courtesy lamps ON:

- A transition from active to inactive of the interior lamps switch, turning OFF the interior lamps switch
- A LOCK command from the remote keyless entry system
- A last door closed locking function, locking and closing all the doors

I/P Compartment Lamp

The BCM supplies battery positive voltage from the INT LTS/PNL DIM fuse through the inadvertent power courtesy lamps circuit to the IP compartment lamp. When the IP compartment is opened, the IP compartment lamp switch closes to ground and the lamp illuminates.

Rear Compartment Lamp

The BCM supplies battery positive voltage from the INT LTS/PNL DIM fuse through the inadvertent power courtesy lamps circuit to the rear compartment lamp. When the rear compartment is opened, the rear compartment lamp switch closes to ground and the lamp illuminates.

Dome/Reading Lamps

The dome/reading lamp is a duel purpose lamp that can be illuminated two different ways. First, the lamp can be turned ON during courtesy lamp operation as described above. Second, the lamps can be turned ON individually for reading lamp operation by the lamp switch. The BCM supplies battery voltage from the INT LTS/PNL DIM fuse through the inadvertent power courtesy lamp circuit to the dome/reading lamp for reading lamp operation only.

Sunshade Vanity Mirror Lamps

The BCM supplies battery voltage from the INT LTS/PNL DIM fuse through the inadvertent power courtesy lamps circuit to the left and right vanity mirror lamps. When the vanity mirror cover on the sunshade is opened, the vanity mirror lamp switch is closed to ground and the lamp illuminates.

Interior Lamps Dimming

The second interior lighting group includes lamps which may be dimmed. This group may use a combination of vacuum fluorescent (VF) illumination, LED illumination and incandescent lamps.

- Headlamp switch
- Instrument panel cluster (IPC)
- Driver window switch
- Driver door lock switch
- Outside rearview mirror switch
- Front passenger window switch
- Front passenger door lock switch
- Radio
- HVAC control module
- Driver information center (DIC) switch
- Steering wheel controls

When the ignition switch is turned to the RUN position, the instrument panel cluster (IPC), radio VF display, and the HVAC control assembly turns ON at maximum brightness. When the headlamp switch is in the PARK or HEADLAMP ON position, all incandescent and LED back lighting turn ON at the dimming level indicated by the instrument panel (I/P) dimmer switch. The dimmer switch is used to increase and decrease the brightness of the interior backlighting components. The BCM supplies a voltage reference through the I/P dimming voltage reference circuit to the interior lamp dimmer switch, which is part of the headlamp switch. When the dimmer switch is placed in a desired brightness position, reference voltage is applied through the dimmer switch rheostat and the I/P lamps dimmer switch signal circuit to the BCM. The BCM interprets this voltage signal, then applies a pulse width modulated (PWM) voltage through the I/P lamps supply voltage circuits and the LED dimming supply circuit to all related interior lamps, illuminating them to the desired level of brightness.

Battery Rundown Protection / Inadvertent Power

The BCM controls the lighting system through circuits that enable the exterior lamp functions of the park lamps, the head lamps, the fog lamps, and the interior lamps. The BCM opens these enabling circuits 10 minutes after the ignition switch is turned OFF with no lamp switch activity. If the ignition switch is turned to any position other than OFF, or if a lamp switch is activated during this time period, the timer resets for another 10 minutes.

Article GUID: A00737175

SPECIFICATIONS

APPROXIMATE FLUID CAPACITIES

The following approximate capacities are given in US English and metric conversions. See **Fluid and Lubricant Recommendations** for more information. All capacities are approximate. When adding, be sure to fill to the approximate level, as recommended in this manual. Recheck fluid level after filling.

Application	Specification	
	Metric	US English
Cooling System		
• 3.6L Engines	9.6 liters	10.1 quarts
• Police Package	10.0 liters	10.6 quarts
Engine Oil With Filter		
• 3.6L Engines	5.7 liters	6.0 quarts
• Police Package	5.7 liters	6.0 quarts
Fuel Tank	66.2 liters	17.5 gallons
6T70 (MH2) Transaxle		
• Valve Body Cover Removal - Approximate Capacity	5.0 - 7.0 liters	5.3 - 7.4 quarts
• Fluid Change - Drain Plug - Approximate Capacity	4.0 - 6.0 liters	4.2 - 6.3 quarts
• Overhaul - Approximate Capacity	7.0 - 9.0 liters	7.4 - 9.5 quarts

FLUID AND LUBRICANT RECOMMENDATIONS

Usage	Fluid/Lubricant
Engine Oil	Use only engine oil licensed to the dexos1 specfication, or equivalent, of the proper SAE viscosity grade. ACDelco dexos1 Synthetic Blend is recommended. Use SAE 5W-30 viscosity grade engine oil. Cold Temperature Operation: In an area of extreme cold, where the temperature falls below -29 Â°C (-20 Â°F), an SAE 0W-30 oil may be used. An oil of this viscosity grade will provide easier cold starting for the engine at extremely low temperatures. When selecting an oil of the appropriate viscosity grade, always select an oil of the correct specification. Refer to Owner's Manual for more information.

Usage	Fluid/Lubricant
Engine Coolant	50/50 mixture of clean, drinkable water and use only DEX-COOL Coolant.
Hydraulic Brake System	DOT 3 Hydraulic Brake Fluid GM P/N 88862806 (Canadian P/N 88862807)
Windshield Washer	Automotive windshield washer fluid that meets regional freeze protection requirements.
Power Steering System	GM Power Steering Fluid GM P/N 89021184 (Canadian P/N 89021186)
Automatic Transmission	DEXRONÂ®-VI Automatic Transmission Fluid
Key Lock Cylinders	Multi-Purpose Lubricant, Superlube GM P/N 12346241 (Canadian P/N 10953474)
Hood Latch Assembly, Secondary Latch, Pivots, Spring Anchor, and Release Pawl	Lubriplate Lubricant Aerosol GM P/N 89021668 (Canadian P/N 89021674) or lubricant meeting requirements of NLGI #2, Category LB or GC-LB
Hood and Hood Hinges	Multi-Purpose Lubricant, Superlube GM P/N 12346241 (Canadian P/N 10953474)
Weatherstrip Conditioning	Weatherstrip Lubricant GM P/N 3634770 (Canadian P/N 10953518) or Dielectric Silicone Grease GM P/N 12345579 (Canadian P/N 10953481)

MAINTENANCE REPLACEMENT PARTS

Replacement parts identified below by name, part number, or specification can be obtained from your dealer.

Part	GM Part Number	ACDelco Part Number

Part	GM Part Number	ACDelco Part Number
Engine Air Cleaner/Filter	10350737	A2962C
Engine Oil Filter	89017525	PF63
Passenger Compartment Air Filter	15284938	CF132
Spark Plugs	12622561	41-109
Wiper Blades		
• Driver Side - 55.0 cm (21.7 in)	15941731	-
• Passenger Side - 55.0 cm (21.7 in)	15941732	-

MAINTENANCE

MAINTENANCE SCHEDULE (NORTH AMERICAN EMISSIONS)

The Maintenance Schedule information will only be found in the Owner's Manual.

Refer to the Maintenance Schedule subsection of the Owner's Manual, or you may be able to use the Search information function using the words Scheduled Maintenance.

GM OIL LIFE SYSTEM RESETTING

When the system has calculated that oil life has been diminished, it will indicate that an oil change is necessary. A CHANGE ENGINE OIL SOON message will come on. Change the engine oil as soon as possible within the next 600 miles (1 000 km). It is possible that, if driving under the best conditions, the oil life system may not indicate that an oil change is necessary for over a year. However, the engine oil and filter must be changed at least once a year and at this time the system must be reset.

If the system is ever reset accidentally, change the engine oil at 3,000 miles (5 000 km) since last oil change.

How to Reset the Engine Oil Life System

To reset the Engine Oil Life System, do the following:

1. Display the OIL LIFE REMAINING on the driver information center (DIC).
2. Press and hold the SET/RESET button on the DIC for more than five seconds. The oil life will change to 100 percent.

If the CHANGE ENGINE OIL SOON message comes back on when you start the vehicle the Engine Oil Life System has not reset. Repeat the procedure.

Article GUID: A00737182

REMINDER INDICATOR (RESET PROCEDURES)

GM: Buick / Cadillac / Chevrolet / GMC / Olds / Pontiac - 1980-18

ENGINE OIL REPLACEMENT REMINDER

NOTE: **Most 1981-88 General Motors vehicles do not use a Service Reminder Indicator (SRI).**

NOTE: **To determine the appropriate reset procedure, refer to ENGINE OIL REPLACEMENT REMINDER RESET INDEX. Only vehicles listed in this index have an oil change reminder reset.**

ENGINE OIL REPLACEMENT REMINDER RESET - PROCEDURE 1

1. The CHANGE OIL (or CHANGE ENGINE OIL) message is displayed when its time to change engine oil, usually between 3000 and 7500 miles since last oil change.
2. To reset the oil life monitor, turn the ignition switch to RUN position, with engine off. Press the TRIP/OIL RESET button on the instrument panel for 12 seconds. The OIL CHANGE light will start to flash to confirm that system is reset (on some models a chime will also sound). Reset is complete when OIL CHANGE light goes out.

ENGINE OIL REPLACEMENT REMINDER RESET - PROCEDURE 2

Engine oil life monitor calculates engine oil temperature and RPM. It indicates when the engine oil is nearly worn out. A CHANGE OIL light on the instrument cluster is illuminated when it is time to change the engine oil. To reset CHANGE OIL light:

1. Remove IP fuse block cover (cover can be seen when driver's door is open).
2. Turn ignition ON, engine OFF.

3. Press OIL RESET button and hold for 5 seconds.
4. If Oil Life light does not reset, repeat procedure with ignition OFF.

ENGINE OIL REPLACEMENT REMINDER RESET - PROCEDURE 3

Engine oil life monitor calculates engine oil temperature and RPM. It indicates when the engine oil is nearly worn out. A CHANGE OIL light on the instrument cluster is illuminated when it is time to change the engine oil.

1. To reset oil life monitor and turn off CHANGE OIL light (or message), turn ignition to ON position with engine off.
2. Depress accelerator pedal to wide open throttle 3 times within 5 seconds.
3. Turn ignition to LOCK/OFF
4. If light (or message) does not turn off, turn ignition OFF and repeat procedure.

ENGINE OIL REPLACEMENT REMINDER RESET - PROCEDURE 4

When the system has calculated that oil life has been diminished, it will indicate that an oil change is necessary. A CHANGE ENGINE OIL SOON message will come on. Change the engine oil as soon as possible within the next 600 miles (1, 000 km). It is possible that, if driving under the best conditions, the oil life system may not indicate that an oil change is necessary for over a year. However, the engine oil and filter must be changed at least once a year and at this time the system must be reset.

Reset Procedure

1. Turn the ignition key to RUN with the engine OFF.
2. Press the INFO and RESET buttons on the Driver Information Center (DIC) at the same time to enter the personalization menu.
3. Press the INFO button to scroll through the available personalization menu modes until the DIC display shows OIL-LIFE RESET.
4. Press the INFO and RESET buttons at the same time for one second and release.
5. Press and hold the reset button until the DIC display shows ACKNOWLEDGED. This will tell you the system has been reset.
6. Turn the key to LOCK/OFF.

Alternate Method (Some Models)

1. Turn the ignition key to RUN with the engine off.
2. Fully press the release the accelerator pedal 3 times within 5 seconds. Several beeps sound. This confirms the oil life system has been reset.
3. If the CHANGE/OIL message comes back on when you start the engine, the engine oil life system has not been reset. Repeat the procedure.

ENGINE OIL REPLACEMENT REMINDER RESET - PROCEDURE 5

Engine oil life monitor calculates engine oil temperature and RPM. It indicates when the oil is nearly worn out. A CHANGE OIL light on left side of instrument cluster is illuminated when it is time to change oil. To reset oil

life monitor:

1. Turn ignition on.
2. Depress ENG MET button on trip monitor and release.
3. Within 5 seconds, depress and release ENG MET button again.
4. Within 5 seconds, depress and hold the ENG MET or GAUGES button again. The CHANGE OIL light should flash.
5. Depress and hold the RANGE or GAUGES button until the CHANGE OIL light stops flashing and goes out. When the light goes out, the engine oil life monitor is reset. This should take about 10 seconds.

NOTE: **If the light does not reset, turn ignition off and repeat the procedure.**

ENGINE OIL REPLACEMENT REMINDER RESET - PROCEDURE 6

The Driver Information Center (DIC) will display a CHANGE OIL message when an oil change is due. The instrument cluster may also have a CHANGE OIL light. To reset the oil life monitor:

Reset Procedure

1. Turn ignition switch to RUN position, with engine off.
2. Press the TRIP (on some models SELECT or SET/RESET) button, located on the DIC, until the OIL LIFE display appears. Message will display percentage of oil life remaining.

   NOTE: **On models without DIC buttons, use the TRIP/ODOMETER reset stem.**

3. Press and hold SET/RESET button (on some models, the check-symbol button) on DIC for at least 5 seconds. The message will change to indicate that the Oil Life has been reset. On some models, 3 chimes will also sound.
4. Turn ignition off.
5. Turn the key to OFF. If the light or message comes back on when you start your vehicle, the oil life system has not reset. Repeat the procedure.

NOTE: **On some models, if oil life system does not reset, try turning ignition OFF after displaying oil life message. Then press and hold reset button.**

Alternate Method (Some Models)

1. Turn the ignition key to RUN with the engine off.
2. Fully press the release the accelerator pedal 3 times within 5 seconds. Several beeps sound. This confirms the oil life system has been reset.
3. If the CHANGE/OIL message comes back on when you start the engine, the engine oil life system has not been reset. Repeat the procedure.

ENGINE OIL REPLACEMENT REMINDER RESET - PROCEDURE 7

When the system has calculated that oil life has been diminished, it indicates that an oil change is necessary. A CHANGE ENGINE OIL SOON message in the DIC comes on. Reset the system whenever the engine oil is

changed so that the system can calculate the next engine oil change. To reset the system:

1. Press the up or down arrow to scroll the DIC to show OIL LIFE.
2. Once the XXX% ENGINE OIL LIFE menu item is highlighted, press and hold the RESET button until the percentage shows 100%

ENGINE OIL REPLACEMENT REMINDER RESET - PROCEDURE 8

The CHANGE ENGINE OIL message is displayed when its time to change engine oil, usually between 3000 and 7500 miles since last oil change. The oil change interval is not based on mileage, but on engine revolutions and engine operating temperature.

1. There are 2 ways to reset the engine oil life monitor. To reset the engine oil life monitor using the accelerator pedal, go to step 4. To reset the engine oil life monitor using the radio, turn the radio off. Turn ignition to ACC or ON, with the engine off. Press and hold the DISP (on some models, TUNE DISP) button (or knob) on the radio for at least 5 seconds until SETTINGS is displayed.
2. Press the SEEK (on some models, SEEK PTYPE or SEEK PSCAN) up or down arrow to scroll through the main menu. Scroll until OIL LIFE appears on the display. Press the PREV or NEXT button to enter the sub-menu. RESET will be displayed.
3. Press the DISP/TUNE DISP button to reset. A chime will sound to verify the new setting and DONE will be displayed for one second. Once the message indicator has been reset, scroll through the menu until EXIT appears on the display. Press the DISP/TUNE DISP button to exit the program. A chime will sound to verify the exit.
4. To reset the engine oil life monitor using the accelerator pedal, turn ignition on with engine off. Fully depress and release the accelerator pedal slowly 3 times within 5 seconds. If CHANGE ENGINE OIL light flashes, oil life monitor is reset. If the CHANGE ENGINE OIL light comes back on and stays on, oil life monitor has not reset. Repeat reset procedure.

ENGINE OIL REPLACEMENT REMINDER RESET - PROCEDURE 9

When the system has calculated that oil life has been diminished, it will indicate that an oil change is necessary. A CHANGE message will come on. Change the engine oil as soon as possible within the next 600 miles (1000 km). It is possible that, if driving under the best conditions, the oil life may not indicate that an oil change is necessary for over a year. However, the engine oil and filter must be changed at least once a year and at this time the system must be reset.

To reset the Engine Oil Life System, do the following:

1. Press and hold the TRIP button on the steering wheel while turning on the ignition. Do not start the engine.
2. The instrument panel cluster will prompt to clear the service code.
3. Release the button.
4. Press and hold ENTER Switch on the left side of the steering wheel for approximately one second.
5. Turn off the ignition.

If the CHANGE ENGINE OIL SOON message comes back on when you start the vehicle, the engine oil life system has not reset. Repeat the procedure.

ENGINE OIL REPLACEMENT REMINDER RESET - PROCEDURE 10

1. Turn ignition ON, with engine off.
2. Press and release reset stem on instrument panel while OIL LIFE message is displayed.
3. Once the alternating OIL LIFE and RESET messages appear, press and hold stem in until several beeps will sound. This confirms that oil life system has been reset. Turn ignition off or full LOCK position. If CHANGE OIL messages comes back after starting engine, repeat reset procedure.

ENGINE OIL REPLACEMENT REMINDER RESET - PROCEDURE 11

Reset Procedure

If vehicle is equipped with a Driver Information Center (DIC), reset oil life monitor by pressing the Driver Information Center SELECT button for 5 seconds while ENGINE OIL LIFE is displayed.

Alternate Method

To reset the oil life monitor, turn ignition switch to ON or RUN position with engine off. Depress accelerator pedal slowly to wide open throttle 3 times within 5 seconds. If CHANGE ENG OIL light flashes for 5 seconds, oil life monitor is reset. If the CHANGE ENG OIL light does not flash, oil life monitor has not reset. Repeat this step.

ENGINE OIL REPLACEMENT REMINDER RESET - PROCEDURE 12

1. CHANGE OIL SOON light will come on when engine oil has broken down enough to require changing. After changing oil, reset oil life display.
2. To reset light, turn ignition on. Open glove box to access oil reset button. Press and hold oil reset button in glove box for at least 5 seconds, but not longer than 60 seconds. The CHANGE OIL SOON light will flash 4 times to indicate light has been reset.

ENGINE OIL REPLACEMENT REMINDER RESET - PROCEDURE 13

GM Oil Life System calculates when to change your engine oil and filter based on vehicle use. Anytime oil is changed, reset the system so it can calculate when the next oil change is required. If a situation occurs where you change your oil prior to a Change Oil Soon message being turned on, reset the system. After changing the engine oil, reset the system.

1. Display OIL LIFE RESET on the DIC.
2. Press and hold ENTER button for at least one second. An ACKNOWLEDGED display message will appear for 3 seconds or until the next button is pressed. This will tell you the system has been reset.
3. Turn key to OFF.
4. If Change Oil Soon message comes back on when you start your vehicle, engine oil life system has not reset. Repeat the procedure.

ENGINE OIL REPLACEMENT REMINDER RESET - PROCEDURE 14

1. To display this light, press the GAGE INFO or GAGES button on the Driver Information Center (DIC). When oil life index is less than 10 percent, display will show OIL LIFE INDEX CHANGE OIL. After changing oil, reset system.

2. To reset light, display OIL LIFE INDEX. Hold RESET button for more than 5 seconds. After reset, oil life will change to 100 percent.

ENGINE OIL REPLACEMENT REMINDER RESET - PROCEDURE 15

1. CHANGE OIL SOON light will come on when engine oil has broken down enough to require changing. After changing oil, reset oil life display.
2. To reset light, locate reset button hole under the dash near passenger door. Use a pencil or similar object to push and hold button (inside hole) for 5 seconds. The CHANGE OIL SOON light will flash 4 times to indicate light has been reset.

ENGINE OIL REPLACEMENT REMINDER RESET - PROCEDURE 16

Vehicles WITHOUT Driver Information Center (DIC) Buttons

1. Turn the ignition to ON/RUN, with the engine off. The vehicle must be in P (Park) to access this display. Press the trip odometer reset stem until OIL LIFE REMAINING displays.
2. Press and hold the trip odometer reset stem until OIL LIFE REMAINING shows "100%." Three chimes sound and the CHANGE ENGINE OIL SOON message goes off.
3. Turn the key to LOCK/OFF. If the CHANGE ENGINE OIL SOON message comes back on when the vehicle is started, the engine oil life system has not been reset. Repeat the procedure.

Vehicles WITH Driver Information Center (DIC) Buttons

1. Turn the ignition to ON/RUN position, with the engine off.
2. Press the VEHICLE INFORMATION BUTTON (i) until OIL LIFE REMAINING displays.
3. Press and hold the SET/RESET button (check-mark symbol) until "100%" is displayed. Three chimes sound (on some models) and the CHANGE ENGINE OIL SOON message goes off.
4. Turn ignition to LOCK/OFF position. If the CHANGE ENGINE OIL SOON message comes back on when engine is started, repeat reset procedure.

ENGINE OIL REPLACEMENT REMINDER RESET - PROCEDURE 17

Reset Procedure

1. Turn the ignition to ON, with the engine off.
2. Press the MODE button until the Driver Information Center (DIC) reads OIL LIFE LEFT/HOLD SET TO RESET.
3. Press and hold the SET button until 100% is displayed. You will hear three chimes and the CHANGE ENGINE OIL message will go off. Turn the key to OFF.
4. If the CHANGE ENGINE OIL message comes back on when engine is started, the engine oil life system has not reset. Repeat the procedure.

Alternate Method (Some Models)

1. Turn the ignition key to RUN with the engine off.
2. Fully press the release the accelerator pedal 3 times within 5 seconds. Several beeps sound. This confirms the oil life system has been reset.

3. If the CHANGE/OIL message comes back on when you start the engine, the engine oil life system has not been reset. Repeat the procedure.

ENGINE OIL REPLACEMENT REMINDER RESET - PROCEDURE 18

When the system has calculated that oil life has been diminished, it will indicate that an oil change is necessary. A CHANGE ENGINE OIL message or light will come on. Change the engine oil as soon as possible within the next 600 miles (1 000 km). It is possible that, if driving under the best conditions, the oil life system may not indicate that an oil change is necessary for over a year. However, the engine oil and filter must be changed at least once a year and at this time the system must be reset.

NOTE: **Be careful not to reset the oil life display accidentally at any time other than after the oil is changed. It cannot be reset accurately until the next oil change.**

Vehicles with DIC (& Steering Wheel Controls)

1. Using the DIC controls on the right side of the steering wheel (see **Fig. 1**), display REMAINING OIL LIFE on the driver information center (DIC).
2. Press SEL or SET/CLR (check mark icon on some systems) on the DIC controls and hold down for a few seconds to clear the CHANGE ENGINE OIL SOON message and reset the oil life at 100%.

NOTE: **Be careful not to reset the oil life display accidentally at any time other than after the oil is changed. It cannot be reset accurately until the next oil change.**

NOTE: **If the CHANGE OIL message comes back on when the vehicle is started, the engine oil life system has not been reset. Repeat the procedure.**

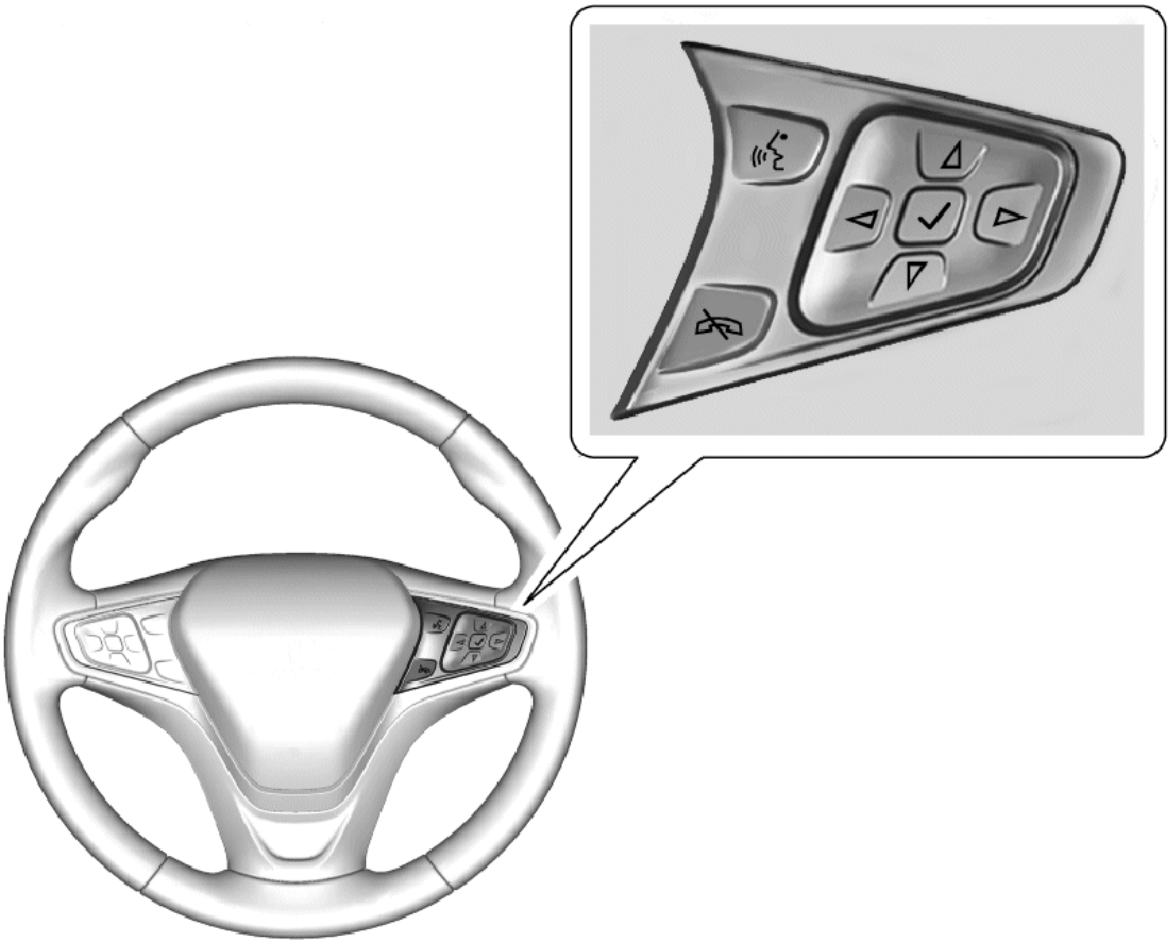

Fig. 1: Identifying DIC Controls (Steering Wheel - Typical)
Courtesy of GENERAL MOTORS COMPANY

Vehicles with DIC (& Turn Signal Lever Controls)

1. Turn the ignition to ON/RUN with the engine off.
2. Press the DIC MENU button on the turn signal lever to enter the Vehicle Information Menu. Use the thumbwheel to scroll through the menu items until you reach REMAINING OIL LIFE. See **Fig. 2**.

   NOTE: On vehicles with an Uplevel DIC, the controls are at the right-hand side of the steering wheel.

3. Press the SET/CLR button (on some models, the check-symbol button) while the oil life display is active. After a few seconds, there will be a single chime (on some models) and the oil life will be reset to 100%
4. Turn the ignition to LOCK/OFF.

The system is reset when the CHANGE OIL message is off and the REMAINING OIL LIFE 100% message is displayed.

NOTE: If the CHANGE OIL message comes back on or Code 82 DIC message comes on when the vehicle is started, the engine oil life system has not been reset. Repeat the procedure.

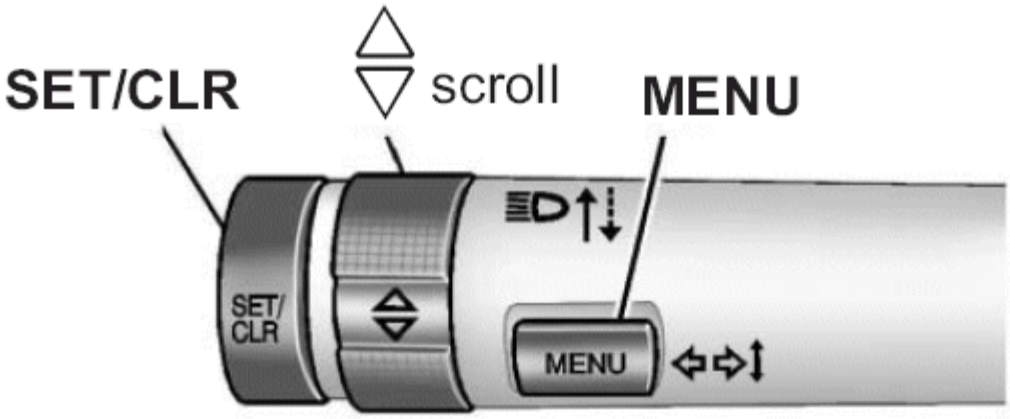

Fig. 2: Identifying DIC Controls (Turn Signal Lever)
Courtesy of GENERAL MOTORS COMPANY

Vehicles without DIC (Some Models)

1. With the engine OFF, turn the ignition key to RUN.
2. Fully press and release the accelerator pedal slowly three times within five seconds.
3. Turn the key to OFF, than start the vehicle.

Reset Using Diagnostic Scan Tool (Some Models)

1. Turn on ignition.
2. Connect scan tool.
3. Select Module Diagnosis.
4. Select Engine Control Module.
5. Select Configuration/Reset function.
6. Select Engine Oil System Reset.
7. Push Enter button to run function.
8. Confirm Executed successfully.
9. Turn ignition of and confirm.
10. Turn ignition on and confirm.

ENGINE OIL REPLACEMENT REMINDER RESET - PROCEDURE 19

1. The Driver Information Center (DIC) will display remaining oil life as a percentage estimate of the useful life of oil.
2. When remaining oil life is 10 percent or less, the system will display CHANGE OIL SOON. When oil life expires, display will show CHANGE ENGINE OIL. After changing oil, reset oil life display.
3. To reset oil life display, press INFORMATION (or INFORMATION SKIP) button to display OIL LIFE LEFT. Press and hold RESET (or RESET NO) button until 100 OIL LIFE LEFT (0.0 OIL LIFE LEFT on some early models) is displayed.

ENGINE OIL REPLACEMENT REMINDER RESET - PROCEDURE 20

With Base Audio System

Press up or down arrow on the INFO button located to right of Driver Information Center (DIC) display to access DIC menu. Once 100 percent ENGINE OIL LIFE menu item is highlighted, press and hold the CLR button. Percentage will return to 100 and oil life indicator will be reset. Repeat procedure if the percentage does not return to 100.

With Navigation System

Turn the system on by pressing PWR/VOL knob once. PWR/VOL knob is located to lower left of DIC display. Press INFO button located to left of the display to access Vehicle Information menu. Turn TUNE/SEL knob located to lower right of the display until ENGINE OIL LIFE is highlighted. Press TUNE/SEL knob once to select it. When 100 percent Engine Oil Life is displayed, press multifunction button next to reset prompt in upper right corner of the display. Percentage will return to 100 and the oil life indicator will be reset. Repeat procedure if the percentage does not return to 100.

ENGINE OIL REPLACEMENT REMINDER RESET - PROCEDURE 21

1. Use the SELECT knob to select OIL LIFE on the DIC menu.
2. Press SELECT to start the OIL LIFE reset procedure.
3. The DIC menu will display "Are you sure that you want to reset?" Use SELECT to choose YES to reset oil life or NO to exit and return to the previous menu.
4. If YES is selected, the DIC menu will display RESET OIL LIFE for a short time and then 100% OIL LIFE will be display when OIL LIFE is successfully reset.

ENGINE OIL REPLACEMENT REMINDER RESET - PROCEDURE 22

With Base Audio System

1. Press the CLR button located to the right of the driver information center (DIC) display to acknowledge the Change Engine Oil message. This will clear the message from the display and reset it.
2. Press the up or down arrow on the INFO button located to the right of the Driver Information Center (DIC) display to access the DIC menu.
3. Once 100% ENGINE OIL LIFE menu item is highlighted, press and hold the CLR button. The percentage will return to 100 and the oil life indicator will be reset. Repeat the steps if the percentage does not return to 100.
4. Turn OFF the key. If the Change Engine Oil message comes back on when you start the vehicle, the engine oil life system has not reset. Repeat the procedure.

Without DIC

1. With the engine OFF, turn the ignition key to RUN.
2. Fully press and release the accelerator pedal slowly three times within five seconds.
3. Turn the key to OFF, then start the vehicle.

With Navigation System

1. Press the multifunction button, next to the OK prompt in the upper right of the display to acknowledge the Change Engine Oil message. This will clear the message from the display and reset it.

2. Turn the system on by pressing the PWR/VOL knob once. The PWR/VOL knob is located to the lower left of the driver information center (DIC) display.
3. Press the INFO button located to the left of the display to access the Vehicle Information menu.
4. Turn the TUNE/SEL knob located to the lower right of the display until Engine Oil Life is highlighted. Press the knob once to select it.
5. Once the 100% Engine Oil Life is displayed, press the multifunction button next to the Reset prompt in the upper right corner of the display. The percentage will return to 100 and the oil life indicator will be reset. Repeat the steps if the percentage does not return to 100.
6. Turn OFF the key. If the Change Engine Oil message comes back on when you start the vehicle, the engine oil life system has not reset. Repeat the procedure.

ENGINE OIL REPLACEMENT REMINDER RESET - PROCEDURE 23

1. An OIL LIFE INDEX is one of the displays on Driver Information Center (DIC). It will display remaining oil life as a percentage estimate of the useful life of oil.
2. It will show 100 percent when the system is reset. When the oil life is 0 percent, the display will show CHANGE ENGINE OIL. After changing oil, reset oil life display.
3. To reset service reminder on 1989 models, press RANGE button until OIL LIFE INDEX appears on display. Depress and hold in AVG ECON and RANGE buttons for more than 5 seconds or until 100 is displayed. This will reset remaining oil life to 100 percent.
4. On 1990-93 models, press RANGE button until OIL LIFE INDEX appears on DIC display. Depress and hold in AVG SPEED and RANGE buttons for more than 5 seconds or until 100 is displayed. This will reset remaining oil life to 100 percent.

ENGINE OIL REPLACEMENT REMINDER RESET - PROCEDURE 24

1. An OIL LIFE INDEX is one of 4 displays on Driver Information Center (DIC). It will display remaining oil life as a percentage estimate of the useful life of oil.
2. Display will show 100 percent when the system is reset. When remaining oil life is 10 percent or less, the system will display CHANGE OIL SOON. When the oil life expires, the display will show CHANGE ENGINE OIL. After changing oil, reset oil life display.
3. To reset oil life display, press ENG DATA button until OIL LIFE INDEX appears on DIC display. Depress and hold in ENG DATA and RANGE buttons until 100 is displayed. This will reset remaining oil life to 100 percent.

ENGINE OIL REPLACEMENT REMINDER RESET - PROCEDURE 25

1. An OIL LIFE INDEX is one of the displays on Driver Information Center (DIC). It will display remaining oil life as a estimated percentage of the useful life of oil.
2. It will show 100 percent when the system is reset. When the oil life is 0 percent, the display will show CHANGE ENGINE OIL. After performing necessary services, reset service reminder.
3. To reset service reminder, turn ignition to on position. Do not start engine. Depress and hold RANGE and FUEL USED buttons until OIL LIFE INDEX appears on DIC display. Depress and hold RANGE and RESET buttons for 5-60 seconds.
4. When CHANGE OIL SOON light flashes 4 times, remaining oil life index is reset to 100 percent. If CHANGE OIL SOON comes on and stays on for 5 seconds, display did not reset. Repeat step 3.

ENGINE OIL REPLACEMENT REMINDER RESET - PROCEDURE 26

1. Oil change reminder display on the Driver Information Center (DIC) is similar to 1990-91 models, but reset procedures are different. After changing oil, reset oil life display.
2. To reset, press INFORMATION button to display OIL LIFE INDEX. Press and hold STORE/RECALL button until 100 is displayed. This will reset oil life display to 100 percent.

ENGINE OIL REPLACEMENT REMINDER RESET - PROCEDURE 27

1. The Driver Information Center (DIC) displays estimated percentage of the remaining useful life of engine oil or transaxle fluid. When remaining oil or fluid life is 0 percent, the display will show CHANGE OIL NOW or CHANGE TRNS FLUID NOW. After changing engine oil or transaxle fluid, reset oil life display.
2. To reset the display, turn ignition on with engine off. Press ENG button to select the OIL LIFE or TRNS FLUID LIFE percentage display. Then, press and hold in RESET for at least 5 seconds.
3. The word RESET will appear. Then, OIL LIFE 100 or TRNS FLUID 100 will be displayed.

ENGINE OIL REPLACEMENT REMINDER RESET - PROCEDURE 28

1. An oil change reminder displays estimated percentage of the remaining useful life of the oil. When engine is started, a tone will sound and approximate distance to next oil change will be displayed.
2. When remaining oil life is 10 percent or less, the system will calculate distance to next oil change. When the oil life is 0 percent, the display will show CHANGE OIL NOW. After changing oil, reset oil life display.
3. To reset the display, press and hold in OIL button to select the oil life display. Then, press and hold in RESET and OIL buttons for at least 5 seconds. This will reset oil life display to 100 percent.

ENGINE OIL REPLACEMENT REMINDER RESET - PROCEDURE 29

1. To reset the display, press and release the TEST button.
2. Press and release the OIL button.
3. Press and hold the RESET button for at least 7 seconds. This will reset oil life display to 100 percent.

ENGINE OIL REPLACEMENT REMINDER RESET - PROCEDURE 30

1. To reset the display, press and release RESET button on Driver Information Center (DIC).
2. Press SEL button (with down arrow) to select OIL.
3. Press SEL button (with left and right arrows) to display oil life.
4. Press and hold RESET button for about 5 seconds.
5. A reset message will display, then oil life will display 100 percent.

ENGINE OIL REPLACEMENT REMINDER RESET - PROCEDURE 31

With Information Center Display

OIL LIFE INDEX is one of 4 engine data displays used on models with Information Center display. It will display remaining oil life as estimated percentage of the useful life of oil. It will show 100 percent when the

system is reset. After changing oil, reset oil life display.

1. To reset the display, press ENG DATA button (1989-90) or OPTIONS button (1991-92) until oil life index is displayed.
2. Then, press and hold in ENG DATA and GAGE buttons (1989) or RESET/ENTER button (1990-92) for at least 5 seconds. This will reset remaining oil life to 100 percent.

With Visual Information Center

OIL LIFE is one of the displays used on models with a Visual Information Center (VIC). It will display data regarding previous oil change. A bar graph display shows full when oil is changed. Bar graph will go down as vehicle is driven and oil ages. When bar graph reaches CHANGE OIL mark, oil should be changed. After changing oil, reset oil life display.

1. To reset the display, press INFO hard key and then OIL LIFE soft key to display oil life index.
2. Press RESET soft key.
3. A reset confirmation page will appear and ask if oil has been changed. Press YES soft key to reset bar graph, and update last oil change date and mileage information.

ENGINE OIL REPLACEMENT REMINDER RESET - PROCEDURE 32

When the system has calculated that oil life has been diminished, it will indicate that an oil change is necessary. A CHANGE ENGINE OIL SOON message will come on. Change the engine oil as soon as possible within the next 600 miles (1000 km). It is possible that, if driving under the best conditions, the oil life system may not indicate that an oil change is necessary for over a year. However, the engine oil and filter must be changed at least once a year and at this time the system must be reset.

To reset the Engine Oil Life System, do the following:

1. With the CHANGE OIL SOON message displayed, press any of the three driver information center (DIC) buttons to clear the CHANGE OIL SOON message.
2. Display OIL LIFE RESET on the DIC.
3. Press and hold the ENTER button for at least one second. An ACKNOWLEDGED display message will appear for three seconds or until the next button is pressed. This will tell you the system has reset.
4. Turn the ignition to OFF.

If the CHANGE ENGINE OIL message comes back on when you start the vehicle the Engine Oil Life System has not reset. Repeat the procedure.

ENGINE OIL REPLACEMENT REMINDER RESET - PROCEDURE 33

This vehicle has a computer system that indicates when to change the engine oil and filter. This is based on a combination of factors which include engine revolutions, engine temperature, and miles driven. Based on driving conditions, the mileage at which an oil change is indicated can vary considerably. For the oil life system to work properly, the system must be reset every time the oil is changed. To reset the system:

Reset Procedure

1. Using the DIC controls on the right side of the steering wheel, display REMAINING OIL LIFE on the

driver information center (DIC).

2. Press SEL (check mark icon on some systems) on the DIC controls and hold down for a few seconds to clear the CHANGE ENGINE OIL SOON message and reset the oil life at 100%.

NOTE: **Be careful not to reset the oil life display accidentally at any time other than after the oil is changed. It cannot be reset accurately until the next oil change.**

Alternate Method (Some Models)

1. Turn the ignition key to RUN with the engine off.
2. Fully press the release the accelerator pedal 3 times within 5 seconds. Several beeps sound. This confirms the oil life system has been reset.
3. If the CHANGE/OIL message comes back on when you start the engine, the engine oil life system has not been reset. Repeat the procedure.

ENGINE OIL REPLACEMENT REMINDER RESET - PROCEDURE 34

Vehicles with Driver Information Center (DIC)

1. Turn the ignition to ON/RUN with the engine off.
2. Press the DIC MENU button on the center console to enter the Vehicle Information Menu.
3. Press either the up or down arrows to view REMAINING OIL LIFE.
4. Press the SET/CLR button until 100% is displayed.
5. Turn the ignition to LOCK/OFF.

The system is reset when the CHANGE ENGINE OIL SOON message goes off.

NOTE: **If the CHANGE OIL message comes back on when the vehicle is started, the engine oil life system has not been reset. Repeat the procedure.**

Alternate Method

1. With the engine OFF, turn the ignition key to RUN.
2. Fully press and release the accelerator pedal slowly three times within five seconds.
3. Turn the key to OFF, than start the vehicle.

ENGINE OIL REPLACEMENT REMINDER RESET - PROCEDURE 35

Reset the system whenever the engine oil is changed so that the system can calculate the next engine oil change. Always reset the engine oil life to 100% after every oil change. It will not reset itself. Use the DIC controls at the right side of the instrument cluster to reset the system.

1. Display remaining oil life (oil can w/ %) on the DIC
2. Press and hold SET/CLR on the DIC for more than five seconds. The oil life will change to 100%.

If the OIL CHANGE DIC message comes back on when the vehicle is started, the engine oil life system has not reset. Repeat the procedure.

EMISSIONS MAINTENANCE REMINDER (REMINDER FLAG)

NOTE: **To determine the appropriate reset procedure, refer to EMISSIONS MAINTENANCE REMINDER RESET. Only vehicles listed in this index have an Oxygen Sensor Reminder Flag reset.**

EMISSIONS MAINTENANCE REMINDER RESET INDEX

Model & Year	Reset Procedure
Some Models	
1980	Emissions Maintenance Reminder Reset - Procedure 1

EMISSIONS MAINTENANCE REMINDER RESET- PROCEDURE 1

1. Every 30, 000 miles, a reminder flag appears in speedometer face, indicating service of oxygen sensor is necessary. See **Fig. 3**. Inspect and service oxygen sensor as necessary and reset flag.
2. To reset flag, remove instrument panel trim plate. Remove instrument cluster lens. Using pointed tool, apply light downward pressure on notches of flag until it is reset. An alignment mark will appear in left center of odometer window when flag is fully reset.

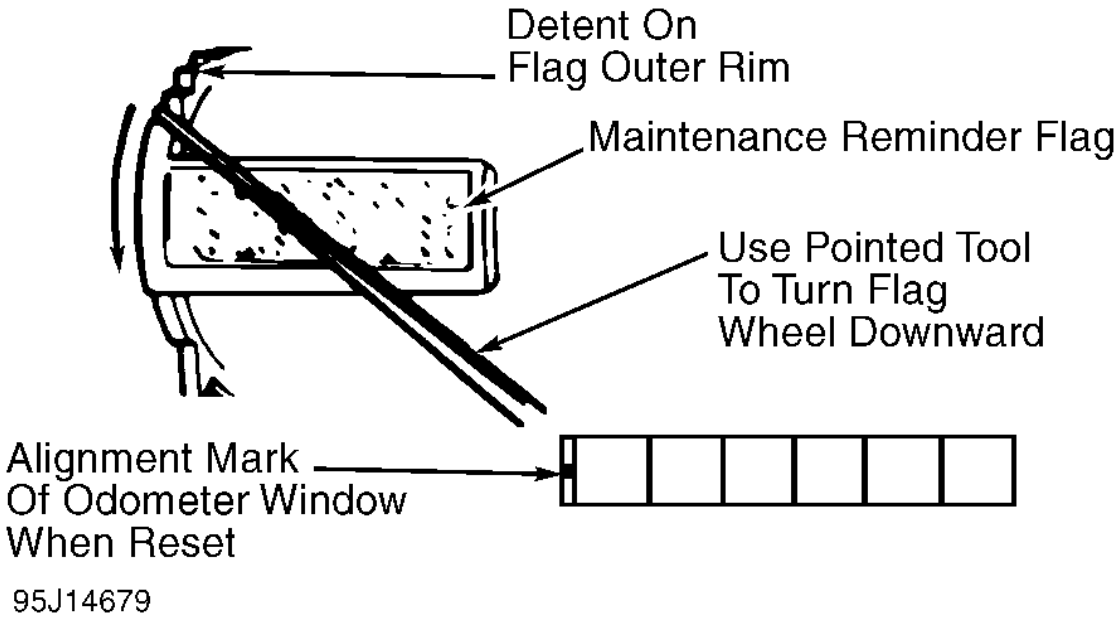

Fig. 3: Resetting Reminder Flag
Courtesy of GENERAL MOTORS CORP.

EMISSIONS MAINTENANCE REMINDER (WARNING LIGHT)

NOTE: **To determine the appropriate reset procedure, refer to EMISSIONS MAINTENANCE REMINDER RESET INDEX. Only vehicles listed in this index have an oxygen sensor warning light reset.**

EMISSIONS MAINTENANCE REMINDER RESET INDEX

Model & Year	Reset Procedure
Sprint	
1985-86	Emissions Maintenance Reminder Reset - Procedure 1

EMISSIONS MAINTENANCE REMINDER RESET - PROCEDURE 1

At 30, 000 mile intervals, a SENSOR light in dash will start flashing, indicating oxygen sensor needs replacement. To reset mileage counter (after sensor replacement), locate SENSOR light cancel switch on right side of fuse box. Return cancel switch to OFF position. Start engine to ensure light remains off.

EMISSIONS MAINTENANCE REMINDER (CHECK ENGINE LIGHT)

NOTE: **To determine the appropriate reset procedure, refer to EMISSIONS MAINTENANCE REMINDER RESET INDEX. Only vehicles listed in this index have a check engine light reset.**

EMISSIONS MAINTENANCE REMINDER RESET INDEX

Model & Year	Reset Procedure
Geo Tracker	
1989-94	Emissions Maintenance Reminder Reset - Procedure 1

EMISSIONS MAINTENANCE REMINDER RESET - PROCEDURE 1

Federal Emissions

1. CHECK ENGINE light functions as a service reminder indicator and emission system service. CHECK ENGINE light will come on each 50, 000 miles (PCV and EGR), each 80, 000 miles (oxygen sensor) and each 100, 000 miles (charcoal canister) to indicate needed emission system service.
2. After servicing and/or replacing components, reset CHECK ENGINE light by sliding cancel switch to its opposite position. See **CHECK ENGINE LIGHT RESET SWITCH LOCATION (GEO TRACKER)**for switch location.

CHECK ENGINE LIGHT RESET SWITCH LOCATION (GEO TRACKER)

Application	Location
1989-91	Behind Access Panel, Directly Below Steering Column
1992-94	(1) Behind Instrument Panel, Next To Left Speaker
(1) See **Fig. 4**.	

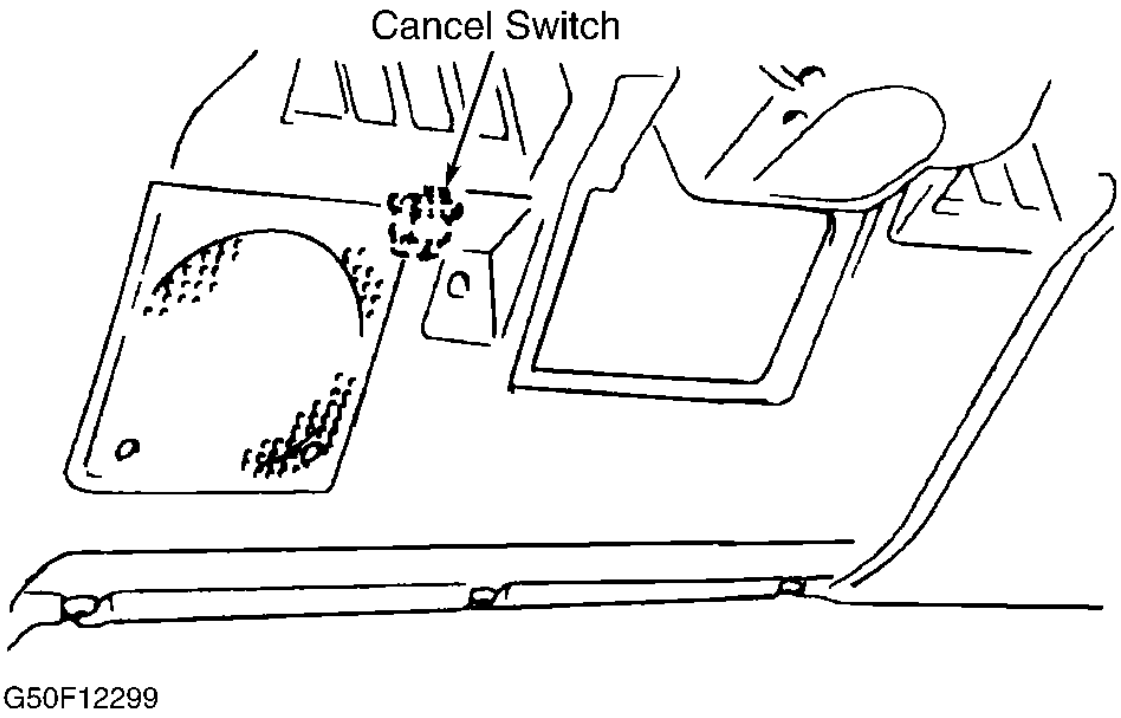

Fig. 4: Check Engine Light Reset Switch Location (1992-94 Geo Tracker - Federal Emissions)
Courtesy of GENERAL MOTORS CORP.

California Emissions

CHECK ENGINE light indicates when it is necessary to have emission system serviced, regardless of mileage. CHECK ENGINE light comes on briefly when starting as a bulb check. If light does not come on or stays on constantly, repair as necessary.

FUEL FILTER REPLACEMENT REMINDER

NOTE: To determine the appropriate reset procedure, refer to Fuel Filter Life Reset Index. Only vehicles listed in this index have a fuel filter life reset.

FUEL FILTER REPLACEMENT REMINDER RESET INDEX

Application	Reset Procedure
Some Models	Fuel Filter Replacement Reminder Reset - Procedure 1

FUEL FILTER REPLACEMENT REMINDER RESET - PROCEDURE 1

NOTE: This procedure does not apply to all models. Manufacturer does not specify which vehicles are equipped with a Fuel Filter Replacement Reminder.

NOTE: ALWAYS reset the FUEL FILTER LIFE system (if equipped) after a fuel filter change.

"FUEL FILTER LIFE" message will appear when a reset is performed either by using the steering wheel controls or performing manual reset procedure.

1. On vehicles with steering wheel controls, press and hold the select button for 5 seconds while the FUEL FILTER LIFE message is displayed. This message will appear on the Driver Information Center (DIC) for 10 seconds.
2. On vehicles without steering wheel controls, go to next step.
3. Without pressing the pedals, turn the ignition key to the ON position, engine off. Wait 5 seconds.
4. Completely depress the brake and accelerator pedals simultaneously and hold for 10 seconds. The system is now reset. Turn ignition key OFF.
5. On all vehicles, the next time engine is started, the message will no longer be displayed.

MAINTENANCE SERVICE REMINDER

NOTE: **To determine the appropriate reset procedure, refer to MAINTENANCE SERVICE REMINDER RESET INDEX. Only vehicles listed in this index have a Service Reminder reset.**

MAINTENANCE SERVICE REMINDER RESET INDEX

Model & Year	Reset Procedure
6000 STE	
1987-89	Maintenance Service Reminder Reset - Procedure 1
Bonneville	
1988-91	Maintenance Service Reminder Reset - Procedure 1
Caprice	
2011	Maintenance Service Reminder Reset - Procedure 2

MAINTENANCE SERVICE REMINDER RESET - PROCEDURE 1

The SERVICE REMINDER message light is used on models with a Driver Information Center (DIC). After performing necessary services, reset service reminder light.

1. To reset service reminder, push DIC button until desired service item is displayed.
2. Press and hold down the DIC button. With button pressed, the distance display will decrease in increments of 500 miles.
3. Release button when desired distance is displayed on the DIC.

MAINTENANCE SERVICE REMINDER RESET - PROCEDURE 2

The displayed service reminder is reset using a scan tool or by the following procedure:

1. Turn the ignition to the OFF position.
2. Press and hold the TRIP button.
3. Turn the ignition to the ON position.
4. Release the TRIP button.

5. Once in the Service Reset screen, press and hold the ENTER switch for 3-5 seconds. A confirmation beep will sound upon reset.
6. Turn the ignition to the OFF position.

NOTE: **If the service reminder comes back on when you start the vehicle, the Service Reminder Display has not reset. Repeat the procedure.**

TIMING BELT REPLACEMENT REMINDER

NOTE: **To determine the appropriate reset procedure, refer to TIMING BELT REPLACEMENT REMINDER INDEX. Only the vehicles listed in this index have a Timing Belt Replacement Reminder Reset.**

CHANGE TIMING BELT MESSAGE INDEX

Model & Year	Reset Procedure
Chevrolet Cruze - 1.8L LUW and LWE Engines (2011-16)	Timing Belt Replacement Reminder Reset - Procedure 1
Chevrolet Sonic - 1.8L LUW and LWE Engines (2012-16)	Timing Belt Replacement Reminder Reset - Procedure 1

TIMING BELT REPLACEMENT REMINDER RESET - PROCEDURE 1

NOTE: **Applies to 1.8L LUW and LWE engines.**

Description

On LUW and LWE engines, the Instrument Cluster monitors the odometer mileage to determine when a timing belt (if equipped) replacement may be necessary. After the vehicle has accumulated approximately 100, 000 miles (160, 000 kilometers), the Instrument Cluster may display the CHANGE TIMING BELT message.

Message Reset

After the engine timing belt has been replaced, reset the CHANGE TIMING BELT message by locating and removing the fuses that supply power to the Instrument Cluster, for two minutes.

- **2011-16 Cruze** : Fuse #21 (F21DA) Underhood (**Fig. 5**)
- **2012-16 Sonic** : Fuse #F26 (F26DA) Under Dash (lower-left of dash - **Fig. 6**)

SRX	
2004	Transmission Fluid Replacement Reminder Reset - Procedure 2

TRANSMISSION FLUID REPLACEMENT REMINDER RESET - PROCEDURE 1

The CHANGE TRANS FLUID message will appear on the Driver Information Center (DIC) when trans fluid change is due. Change fluid in both the oil pan and side cover.

1. To reset display, turn ignition ON with engine OFF.
2. On the climate control panel, press and hold OFF and REAR DEFOG buttons until TRANS FLUID RESET message appears in DIC (about 5-20 seconds).

TRANSMISSION FLUID REPLACEMENT REMINDER RESET - PROCEDURE 2

The CHANGE TRANS FLUID message will appear on the Driver Information Center (DIC) when trans fluid change is due. Percentage of transaxle fluid life remaining may be checked at any time by pressing INFO button

several times until TRANS FLUID LIFE message appears.

1. To reset display, turn ignition key ON with engine OFF.
2. Press the INFO button until TRANS FLUID LIFE message appears.
3. Press and hold INFO RESET button until display shows 100 percent TRANS FLUID LIFE. Transaxle fluid life index is now reset.

TRANSMISSION FLUID REPLACEMENT REMINDER RESET - PROCEDURE 3

NOTE: **The CHANGE TRANS FLUID message will appear on the Driver Information Center (DIC) when trans fluid change is due.**

Resetting With Base Audio System

Press CLR button located to the right of the DIC display to acknowledge the CHANGE TRANS FLUID message. This will clear the message from the display and reset it. To reset transmission fluid life indicator, press up or down arrow on INFO button located to the right of the DIC display to access the DIC menu. Once percentage TRANS FLUID LIFE menu item is highlighted, press and hold CLR button. Percentage will return to 100, and transmission fluid life indicator will be reset. Repeat if percentage does not return to 100.

Resetting With Navigation System

Press multifunction button located to the right of the DIC display, next to the OK prompt to acknowledge the CHANGE TRANS FLUID message. This will clear the message form the display and reset it. To reset transmission fluid life indicator, turn system on by pressing PWR/VOL knob once. PWR/VOL knob is located to the lower left of the DIC display. Press INFO button located to the left of the DIC display to access the VEHICLE INFO menu. Turn TUNE/SEL knob located to the lower right of the DIC display until TRANS FLUID LIFE is highlighted. Press knob once to select it. Once percentage TRANS FLUID LIFE is displayed, press multifunction button next to the RESET prompt in the upper right corner of the display. Percentage will return to 100, and transmission fluid life indicator will be reset. Repeat if percentage does not return to 100.

TRANSMISSION FLUID REPLACEMENT REMINDER RESET - PROCEDURE 4

1. The Driver Information Center (DIC) displays estimated percentage of the remaining useful life of transaxle fluid. When remaining fluid life is 0 percent, the display will show CHANGE TRNS FLUID NOW. After changing transaxle fluid, reset oil life display.
2. To reset the display, turn ignition on with engine off. Press ENG button to select the TRNS FLUID LIFE percentage display. Then, press and hold in RESET for at least 5 seconds.
3. The word RESET will appear. Then, TRNS FLUID 100 will be displayed.

TIRE PRESSURE MONITOR SYSTEM REMINDER

NOTE: **To determine the appropriate reset procedure, refer to TPMS REMINDER RESET INDEX. Only vehicles listed in this index have a TPMS Reminder Reset.**

(1) This is an Indirect TPM System. A tire sensor activation tool is not required for this procedure.

(2) A tire sensor activation tool cannot be used for this procedure.

TPMS REMINDER RESET - PROCEDURE 1

NOTE: **When the wheels have been rotated, or a tire pressure sensor or EGM/LGM has been replaced, retrain tire pressure sensors.**

NOTE: **The DIC will display the "SERVICE TIRE MONITOR" message if one or more of the tire pressure sensors has malfunctioned or if all of the sensors have not been programmed successfully. If, after the relearn procedure, the warning indicators are still on, there is a problem in the TPM system.**

NOTE: **If this procedure is performed following replacement and reprogramming of the Liftgate Module (LGM), DIC may display a low tire pressure fault and all tire pressures read 0 psi. If this problem occurs, see appropriate manufacturer service information.**

NOTE: **The TPM system will cancel the learn mode if more than 2 minutes have passed and no sensors have been learned, or if the system has been in learn mode for more than 5 minutes. If the learn mode is canceled before any sensor has been learned, the EGM/LGM will remember all current sensor IDs and their locations. As soon as the first sensor ID code is learned, all other IDs are erased from the EGM/LGM's memory. On models that display the individual tire pressure on DIC, updated tire pressures will not be displayed until EGM/LGM receives 2 more valid transmissions from each sensor.**

NOTE: **Before proceeding with the steps below, ensure that no other sensor learn procedure is being performed simultaneously, or that tire pressures are not being adjusted on a TPM equipped vehicle within close proximity.**

1. Set the tire pressure of all wheels to pressure specified on the tire and loading information label.
2. Turn ignition ON with engine OFF. Apply parking brake.

NOTE: **If Learn Mode cannot be enabled, TPM system is not enabled in EGM/LGM. See appropriate manufacturer service information.**

3. To enable Learn Mode, turn headlight switch from OFF to parking lamps 4 times within 4 seconds. A double horn chirp will sound and the low tire pressure indicator will begin to flash to indicate the learn mode has been enabled.
4. Starting with left front tire, hold a tire sensor activation tool against the side wall of the tire, within 3 inches of the valve stem. Activate tool until a horn chirp sounds.
5. After horn chirp has sounded, proceed to the next 3 sensors in the following order: right front, right rear and left rear.
6. After left rear sensor has been learned, turn ignition switch to OFF position to exit Learn Mode.
7. Test drive the vehicle above 25 mph for at least 2 minutes before viewing tire pressures on DIC.

TPMS REMINDER RESET - PROCEDURE 2

NOTE: **If a tire pressure sensor or the Remote Control Door Lock Receiver (RCDLR) is replaced, or if wheels have been rotated, tire pressure sensor must be retrained.**

NOTE: **When the tire pressure warning light illuminates and warning message appears on DIC, immediately check air pressure of all tires and adjust to the specified pressure. If warning indicators are still on or display shows dashes instead of a value, there is a problem in the TPM system. See appropriate manufacturer service information.**

NOTE: **Under the following conditions, the TPM system may not function properly:**

- **If one or more of the tire pressure sensors are missing or inoperable.**
- **A compact spare tire is used.**

NOTE: **If a tire pressure sensor or the Remote Control Door Lock Receiver (RCDLR) is replaced, or if wheels have been rotated, tire pressure sensor must be retrained.**

NOTE: **The relearn procedure must be completed within 15 minutes from when the vehicle is stationary after being driven at 20 mph (32 km/h), or greater, for 10 seconds.**

NOTE: **The learn mode will cancel if the ignition is cycled to OFF or if more than 2 minutes has elapsed for any sensor that has not been learned. If the learn mode is cancelled before the first sensor is learned, the original sensor IDs will be maintained. If the learn mode is canceled after the first sensor is learned, the following will occur:**

- **All stored sensor IDs will be invalidated in the RCDLR memory.**
- **If equipped, the DIC will display dashes instead of tire pressures.**
- **DTC C0775 will be set.**

These conditions will now require the learn procedure to be repeated for the system to function properly.

IMPORTANT: Ensure that no other learn procedure is being performed simultaneously or that tire pressures are not being adjusted on another TPM equipped vehicle within close proximity. Stray signals from other TPM equipped vehicles just driving by can be inadvertently learned. If any random horn chirps are heard from the vehicle while performing the learn procedure, most likely a stray sensor has been learned and the procedure will need to be cancelled and repeated. Under these circumstances, performing the TPM Learn Procedure away from other vehicles would be highly recommended. In the event a particular sensor activation does not cause the horn to chirp, it may be necessary to rotate the wheel valve stem to a different position due to the sensor signal is being blocked by another component.

1. Turn ignition switch to ACC position. Apply parking brake.
2. Set the tire pressure of all wheels to pressure specified on the tire and loading information label.
3. To enable Learn Mode:
   - On vehicles equipped with keyless entry, simultaneously press the keyless entry transmitters lock and unlock buttons until a double horn chirp sounds indicating the Learn Mode has been enabled. On vehicles with DIC, a TIRE LEARN message may be displayed. The left front turn signal will also be illuminated.
   - On vehicles not equipped with keyless entry, press and release the driver information center (DIC) INFO button until the TIRE LEARN message appears on the DIC display. Press and hold the SET/RESET button until a double horn chirp sounds indicating the Learn Mode has been enabled. The left front turn signal will also be illuminated.
4. Ignition ON.
5. Starting with left front tire, hold a tire sensor activation tool against the side wall of the tire, within 3 inches of the valve stem. Activate tool until a horn chirp sounds.
6. After horn chirp has sounded, proceed to the next 3 sensors in the following order: right front, right rear and left rear.
7. After left rear sensor has been learned, turn ignition switch to OFF position to exit Learn Mode.

TPMS REMINDER RESET - PROCEDURE 3

NOTE: **If a tire pressure sensor or the Remote Control Door Lock Receiver (RCDLR) is replaced, or if wheels have been rotated, tire pressure sensor must be relearned.**

NOTE: **When the tire pressure warning light illuminates and warning message appears on DIC, immediately check air pressure of all tires and adjust to the specified pressure. If warning indicators are still on or display shows dashes instead of a value, there is a problem in the TPM system. See appropriate manufacturer service information.**

NOTE: **In vehicles without the "UH3" option, each turn signal will illuminate one at a time indicating which location is to be learn.**

NOTE: **The TPM system will cancel the learn mode if more then 2 minutes have passed and no sensors have been learned, or if the ignition switch is turn to the OFF position. If the learn mode is canceled before the first ID is learned, the RCDLR will remember all previously stored IDs and their locations. As soon as the first sensor ID is learned, all other IDs are erased from the RCDLR's memory. If the learn mode is canceled after the first ID is learned, the RCDLR will store the IDs as invalid and the DIC will display dashes instead of tire pressures.**

NOTE: **Before proceeding with the registration procedure, ensure that no other sensor learn procedure is being performed simultaneously, or that no tire pressures are being adjusted on another TPM equipped vehicle within close proximity.**

1. Set the tire pressure of all wheels to pressure specified on the tire and loading information label.
2. Turn ignition switch to ACC position. Apply parking brake.
3. Simultaneously press the keyless entry transmitter's lock and unlock buttons until a double horn chirp sounds, indicating the Learn Mode has been enabled.

   NOTE: **The left front turn signal will also illuminate to indicate the learn mode has been enabled.**

4. Starting with left front tire, hold a tire sensor activation tool against the side wall of the tire, within 3 inches of the valve stem. Activate tool until a horn chirp sounds.
5. After horn chirp has sounded and the right turn signal has illuminated, proceed to the next 3 sensors in the following order: right front, right rear and left rear.
6. After left rear sensor has been learned, a double horn chirp will sound, indicating all 4 sensor IDs have been learned. Turn ignition switch to OFF position to exit Learn Mode.

TPMS REMINDER RESET - PROCEDURE 4

NOTE: **If the wheels have been rotated, or tire pressure sensor or Remote Control Door Lock Receiver (RCDLR) is replaced, the TPM system needs to relearn tire pressure sensor IDs.**

NOTE: **When the tire pressure warning light illuminates and warning message appears on DIC, immediately check air pressure of all tires and adjust to the specified pressure. If warning indicators are still on, there is a problem in the TPM system. See appropriate manufacturer service information.**

NOTE: **The TPM system will cancel Learn Mode if ignition is turned off, if more than 1 or 2 minutes has passed and no sensors have been learned, vehicle battery voltage is less than 8 volts, all 4 sensors have been learned, or if the RCDLR has been in Learn Mode for more than 5 minutes. If Learn Mode is cancelled before any IDs are learned, the RCDLR will remember all previously stored IDs and their locations. As soon as the first sensor ID is learned, all other IDs are erased from the RCDLR's memory.**

NOTE: **Before proceeding with the registration procedure, ensure that no other sensor**

learn procedure is being performed simultaneously, or that no tire pressures are being adjusted on another TPM equipped vehicle within close proximity.

1. Set the tire pressure of all wheels to pressure specified on the tire and loading information label.
2. Turn ignition ON with engine OFF.

NOTE: **If the TPM Learn Mode cannot be enabled, ensure the TPM option is enabled in the RCDLR. See appropriate manufacturer service information.**

3. Simultaneously press the keyless entry transmitter's lock and unlock buttons until a horn chirp sounds, indicating Learn Mode has been enabled.

NOTE: **If a horn chirp does not sound after 15 seconds, remove, then re-apply TPM sensor relearn magnet.**

4. Starting with left front tire, hold a tire sensor activation tool against the side wall of the tire, within 3 inches of the valve stem. Activate tool until a horn chirp sounds.
5. After the horn chirp sounds, proceed to the next 3 sensors in the following order: right front, right rear, then left rear.
6. After the left rear sensor ID is learned, a double horn chirp will sound, indicating all 4 sensor IDs have been learned. Turn the ignition switch to OFF position to exit Learn Mode.

TPMS REMINDER RESET - PROCEDURE 5

NOTE: **If the wheels have been rotated, or tire pressure sensor or Remote Control Door Lock Receiver (RCDLR) is replaced, the TPM system needs to relearn tire pressure sensor IDs.**

NOTE: **When the tire pressure warning light illuminates and warning message appears on DIC, immediately check air pressure of all tires and adjust to the specified pressure. If warning indicators are still on, there is a problem in the TPM system. See appropriate manufacturer service information.**

NOTE: **The TPM system will cancel Learn Mode if ignition is turned off, if more than 1 or 2 minutes has passed and no sensors have been learned, vehicle battery voltage is less than 8 volts, all 4 sensors have been learned, or if the RCDLR has been in Learn Mode for more than 5 minutes. If Learn Mode is cancelled before any IDs are learned, the RCDLR will remember all previously stored IDs and their locations. As soon as the first sensor ID is learned, all other IDs are erased from the RCDLR's memory.**

NOTE: **Before proceeding with the registration procedure, ensure that no other sensor learn procedure is being performed simultaneously, or that no tire pressures are being adjusted on another TPM equipped vehicle within close proximity.**

1. Set the tire pressure of all wheels to pressure specified on the tire and loading information label.
2. Turn ignition ON with engine OFF.

3. Simultaneously press the keyless entry transmitter's lock and unlock buttons until a horn chirp sounds, indicating Learn Mode has been enabled.
4. Starting with left front tire, hold a tire sensor activation tool against the side wall of the tire, within 3 inches of the valve stem. Activate tool until a horn chirp sounds.
5. After the horn chirp sounds, proceed to the next 3 sensors in the following order: right front, right rear, then left rear.
6. After the left rear sensor ID is learned, a double horn chirp will sound, indicating all 4 sensor IDs have been learned. Turn the ignition switch to OFF position to exit Learn Mode.

TPMS REMINDER RESET - PROCEDURE 6

NOTE: **If the wheels have been rotated, or tire pressure sensor or Remote Control Door Lock Receiver (RCDLR) is replaced, the TPM system needs to relearn tire pressure sensor IDs.**

NOTE: **When the tire pressure warning light illuminates and warning message appears on DIC, immediately check air pressure of all tires and adjust to the specified pressure. If warning indicators are still on, there is a problem in the TPM system. See appropriate manufacturer service information.**

NOTE: **The TPM system will cancel Learn Mode if ignition is turned off, if more than 1 or 2 minutes has passed and no sensors have been learned, vehicle battery voltage is less than 8 volts, all 4 sensors have been learned, or if the RCDLR has been in Learn Mode for more than 5 minutes. If Learn Mode is cancelled before any IDs are learned, the RCDLR will remember all previously stored IDs and their locations. As soon as the first sensor ID is learned, all other IDs are erased from the RCDLR's memory.**

1. Set the tire pressure of all wheels to pressure specified on the tire and loading information label.
2. Turn ignition ON with engine OFF.
3. Press RESET button on DIC in order to clear any warning messages.
4. Press and release OPTIONS button until display is blank.
5. Press and hold RESET button for 3 seconds.

NOTE: **If the DIC does not display "TIRE TRAINING" message, ensure TPM option is enabled in the RCDLR. See appropriate manufacturer service information.**

6. Press and release OPTIONS button until "TIRE TRAINING" is displayed.
7. Press and release RESET button. The DIC should display "LEARN L FRONT TIRE", verifying Learn Mode has been enabled.
8. Starting with left front tire, hold a tire sensor activation tool against the side wall of the tire, within 3 inches of the valve stem. Activate tool until a horn chirp sounds.
9. After the horn chirp sounds, proceed to the next 3 sensors in the following order: right front, right rear, then left rear.
10. Turn the ignition switch to OFF position to exit the learn mode.

TPMS REMINDER RESET - PROCEDURE 7

NOTE: **An OEM scan tool or Pressure Increase/Decrease Method is used to perform this procedure.**

NOTE: **Before proceeding with this process, ensure that no other learn procedure is being performed simultaneously or that tire pressures are not being adjusted on another TPM equipped vehicle within close proximity. Stray signals from other TPM equipped vehicles just driving by can be inadvertently learned. If any random horn chirps are heard from the vehicle while performing the learn procedure, most likely a stray sensor has been learned and the procedure will need to be cancelled and repeated. Under these circumstances, performing the TPM Learn Procedure away from other vehicles would be highly recommended. In the event a particular sensor activation does not cause the horn to chirp, it may be necessary to rotate the wheel valve stem to a different position due to the sensor signal is being blocked by another component.**

1. Ignition ON with engine OFF, apply the parking brake.
2. Using a scan tool, initiate the TPM Learn Mode.
3. Perform the procedure by following the menu selections. A double horn chirp will sound and the IPC tire pressure monitor indicator warning lamp icon will flash indicating Learn Mode is enabled.
4. Starting with the left front tire, active the sensors by one of the following methods:
   - Hold the antenna of the scan tool, aimed upward, against the tire sidewall close to the wheel rim at the valve stem location. Press and release the activate button and wait for a horn chirp. Once the horn chirp has sounded, the sensor information is learned.
   - Increase/decrease the tire pressure for 8-10 seconds then wait for a horn chirp. The horn chirp may occur before or up to 30 seconds after the 8-10 second pressure increase/decrease time period has been reached. Once the horn chirp has sounded, the sensor information has been learned.
5. After the horn chirp has sounded, repeat step 4 for the remaining 3 sensors in the following order: Right front, Right rear, Left rear.
6. After the left rear sensor is learned, a double horn chirp will sound indicating all sensor IDs have been learned and the tire pressure module will exit the Learn mode turning OFF the IPC tire pressure monitor warning indicator lamp icon.
7. Ignition OFF, adjust all tires to the recommended pressures. Refer to the tire placard label.

TPMS REMINDER RESET - PROCEDURE 8

Automatic Sensor Learn Process

Each TPMS sensor has a unique identification code. The identification code needs to be matched to a new tire/wheel position after rotating the tires or replacing one or more of the TPMS sensors. When a tire is installed, the vehicle must be stationary for about 20 minutes before the system recalculates. The following relearn process takes up to 10 minutes, driving at a minimum speed of 12 mph (19 km/h). A dash (-) or pressure value will display in the DIC. A warning message displays in the DIC if a problem occurs during the relearn process.

TPMS REMINDER RESET - PROCEDURE 9

NOTE: **For Cadillac CTS with RPO UH3, use this procedure. For CTS without RPO UH3, see Procedure 10.**

NOTE: **If a tire pressure sensor or the Remote Control Door Lock Receiver (RCDLR) is replaced, or if wheels have been rotated, tire pressure sensor must be relearned.**

NOTE: **When the tire pressure warning light illuminates and warning message appears on DIC, immediately check air pressure of all tires and adjust to the specified pressure. If warning indicators are still on or display shows dashes instead of a value, there is a problem in the TPM system. See appropriate manufacturer service information.**

NOTE: **The TPM system will cancel the learn mode if more then 2 minutes have passed and no sensors have been learned, or if the ignition switch is turn to the OFF position. If the learn mode is canceled before the first ID is learned, the RCDLR will remember all previously stored IDs and their locations. As soon as the first sensor ID is learned, all other IDs are erased from the RCDLR's memory. If the learn mode is canceled after the first ID is learned, the RCDLR will store the IDs as invalid and the DIC will display dashes instead of tire pressures.**

NOTE: **Before proceeding with the registration procedure, ensure that no other sensor learn procedure is being performed simultaneously, or that no tire pressures are being adjusted on another TPM equipped vehicle within close proximity.**

1. Set the tire pressure of all wheels to pressure specified on the tire and loading information label.
2. Turn ignition switch to RUN position. Apply parking brake.
3. Simultaneously press the keyless entry transmitter's lock and unlock buttons until a double horn chirp sounds, indicating the Learn Mode has been enabled. On some models, a TIRE LEARNING ACTIVE message may also be displayed on the DIC screen.
4. Starting with left front tire, hold a tire sensor activation tool against the side wall of the tire, within 3 inches of the valve stem. Activate tool until a horn chirp sounds.
5. After horn chirp has sounded and the right turn signal has illuminated, proceed to the next 3 sensors in the following order: right front, right rear and left rear.
6. After left rear sensor has been learned, a double horn chirp will sound, indicating all 4 sensor IDs have been learned. Turn ignition switch to OFF position to exit Learn Mode.

TPMS REMINDER RESET - PROCEDURE 10

NOTE: **For Cadillac CTS without RPO UH3, use this procedure. For CTS with RPO UH3, see Procedure 9.**

NOTE: **If a tire pressure sensor or the Remote Control Door Lock Receiver (RCDLR) is replaced, or if wheels have been rotated, tire pressure sensor must be relearned.**

NOTE: **When the tire pressure warning light illuminates and warning message appears**

on DIC, immediately check air pressure of all tires and adjust to the specified pressure. If warning indicators are still on or display shows dashes instead of a value, there is a problem in the TPM system. See appropriate manufacturer service information.

NOTE: **The TPM system will cancel the learn mode if more then 2 minutes have passed and no sensors have been learned, or if the ignition switch is turn to the OFF position. If the learn mode is canceled before the first ID is learned, the RCDLR will remember all previously stored IDs and their locations. As soon as the first sensor ID is learned, all other IDs are erased from the RCDLR's memory. If the learn mode is canceled after the first ID is learned, the RCDLR will store the IDs as invalid and the DIC will display dashes instead of tire pressures.**

NOTE: **Before proceeding with the registration procedure, ensure that no other sensor learn procedure is being performed simultaneously, or that no tire pressures are being adjusted on another TPM equipped vehicle within close proximity.**

1. Set the tire pressure of all wheels to pressure specified on the tire and loading information label.
2. Depending on ignition type:
   - With standard ignition switch, place the switch in the RUN position.
   - With electronic keyless ignition, place the switch in the ACC position.
3. Simultaneously press the keyless entry transmitter's lock and unlock buttons until a double horn chirp sounds, indicating the Learn Mode has been enabled.
4. Starting with left front tire, hold a tire sensor activation tool against the side wall of the tire, within 3 inches of the valve stem. Activate tool until a horn chirp sounds.
5. After horn chirp has sounded and the right turn signal has illuminated, proceed to the next 3 sensors in the following order: right front, right rear and left rear.
6. After left rear sensor has been learned, a double horn chirp will sound, indicating all 4 sensor IDs have been learned. Turn ignition switch to OFF position to exit Learn Mode.

TPMS REMINDER RESET - PROCEDURE 11

NOTE: **This procedure is for vehicles with an Uplevel DIC.**

When a low tire pressure condition is detected, the TPMS illuminates the low tire pressure warning light on the instrument cluster. A message to check the pressure in a specific tire displays in the Driver Information Center (DIC). The low tire pressure warning light and the DIC warning message come on at each ignition cycle until the tires are inflated to the correct inflation pressure. Each TPMS sensor has a unique identification code. The identification code needs to be matched to a new tire/wheel position after rotating the vehicle's tires or replacing one or more of the TPMS sensors. The TPMS sensor matching process should also be performed after replacing a spare tire with a road tire containing the TPMS sensor. The malfunction light and the DIC message should go off at the next ignition cycle. The sensors are matched to the tire/wheel positions, using a TPMS relearn tool.

1. Set the tire pressure of all wheels to pressure specified on the tire and loading information label.
2. Set the parking brake.
3. Place the vehicle power mode in ON/RUN/START.

4. Make sure the Tire Pressure info display option is turned on. The info displays on the DIC can be turned on and off through the Settings menu.
5. Use the five-way DIC control on the right side of the steering wheel to scroll to the Tire Pressure screen under the DIC info page.
6. Press and hold the SEL button located in the center of the five-way DIC control. The horn sounds twice to signal the receiver is in relearn mode and the TIRE LEARNING ACTIVE message displays on the DIC screen
7. Start with the driver side front tire. Place a tire sensor activation tool against the tire sidewall, near the valve stem. Then press the button to activate the TPMS sensor. A horn chirp confirms that the sensor identification code has been matched to this tire and wheel position.
8. After horn chirp has sounded, proceed to the next 3 sensors in the following order: right front, right rear and left rear.
9. After left rear sensor has been learned, the horn sounds two times to indicate the sensor identification code has been matched to the driver side rear tire, and the TPMS sensor matching process is no longer active. The TIRE LEARNING ACTIVE message on the DIC display screen goes off.
10. Press STOP to turn the ignition off.

TPMS REMINDER RESET - PROCEDURE 12

If refilling a low tire, no specific reset procedure is required. All warnings are extinguished once the TPMS receives a signal that all tires are properly inflated.

Each TPMS sensor has a unique identification code. The identification code needs to be matched to a new tire/wheel position after rotating the tires or replacing one or more of the TPMS sensors. The TPMS sensor matching process should also be performed after replacing a spare tire with a road tire containing the TPMS sensor. The malfunction light and the DIC message should go off at the next ignition cycle. The sensors are matched to the tire/ wheel positions, using a TPMS relearn tool.

1. Set the tire pressure of all wheels to pressure specified on the tire and loading information label.
2. Set the parking brake.
3. Turn the ignition to ON/RUN with the engine off.
4. Use the MENU button (center console) to select the Vehicle Information Menu in the Driver Information Center (DIC). Use the arrow keys to scroll to the Tire Pressure screen
5. Press the SET/CLR button to begin the sensor matching process. A message requesting acceptance of the process should display.
6. Press the SET/CLR button again to confirm the selection. The horn sounds twice to signal the receiver is in relearn mode and the TIRE LEARNING ACTIVE message displays on the DIC screen.
7. Start with the driver side front tire. Place a tire sensor activation tool against the tire sidewall, near the valve stem. Then press the button to activate the TPMS sensor. A horn chirp confirms that the sensor identification code has been matched to this tire and wheel position.
8. After horn chirp has sounded, proceed to the next 3 sensors in the following order: right front, right rear and left rear.
9. After left rear sensor has been learned, the horn sounds two times to indicate the sensor identification code has been matched to the driver side rear tire, and the TPMS sensor matching process is no longer active. The TIRE LEARNING ACTIVE message on the DIC display screen goes off.

10. Turn the ignition to LOCK/OFF.

TPMS REMINDER RESET - PROCEDURE 13

LOW TIRE PRESSURE light comes on if air pressure in one tire drops to 12 psi (kPa) less than the other 3 tires, if tires are rotated, if tire(s) are repaired or replaced, if air pressure is adjusted or when vehicle battery is disconnected. Light will stay on until ignition is turned off or RESET button is pressed. Check and adjust air pressure in all 4 tires before resetting system.

1. There are 2 ways to reset the tire inflation monitor. To reset the tire inflation monitor using the exterior or interior lamp controls, go to step 4. To reset tire inflation monitor using the radio, turn the radio off. Turn ignition to ACC or ON, with the engine OFF. Press and hold the TUNE DISP button on the radio for at least 5 seconds until settings is displayed.
2. To scroll through the main menu:
   - On Impala, press the SEEK PTYPE up or down arrow.
   - On Monte Carlo, press the SEEK PSCAN up or down arrow.

   On all models, scroll until TIRE MON appears on the display. Press the 1 PREV or 2 NEXT button to enter the sub-menu. RESET will be displayed.
3. Press the TUNE DISP button to reset. A chime will sound to verify the new setting and DONE will be displayed for one second. Once the message has been reset, scroll through the menu until EXIT appears on the display. Press the TUNE DISP button to exit the program. A chime will sound to verify the exit.
4. Reset the tire inflation monitor:
   - On Impala, using the interior lighting controls, turn the switch from OFF to ON position 3 times with ignition switch in ON position.
   - On Monte Carlo, using the exterior lighting controls, turn the switch from OFF to parking lamps 3 times with ignition switch in ON position.

TPMS REMINDER RESET - PROCEDURE 14

NOTE: **There are 3 different ways to reset the Tire Pressure Monitor (TPM) system. After resetting, the TPM system requires up to 30 minutes of straight line driving in each of the 3 speed ranges to complete the calibration process.**

Using Exterior Lamp Switch

1. Adjust all tire pressures to the recommended kPa/psi.
2. Turn ignition ON with engine OFF.
3. Cycle the exterior lamp switch from OFF to parking lamps 3 times within 5 seconds.
4. Use the scan tool in order to clear the TPM DTC.

Using RDS Radio, If Equipped

1. Adjust all tire pressures to the recommended kPa/psi.
2. Turn the ignition to ACC or ON, with the engine OFF.
3. Turn the radio OFF.
4. Press and hold the DISP button until SETTINGS is displayed.

5. Press the SEEK up or down arrows until TIRE MON is displayed.
6. Press the PREV or NEXT button to enter the sub-menu. RESET will be displayed.
7. Press the DISP button, A chime will sound and DONE will be displayed.
8. Scroll until EXIT is displayed.
9. Press the DISP button to exit the TPM reset mode. A chime will sound to verify exit.
10. Use the scan tool in order to clear the TPM DTC.

Using Scan Tool

1. Adjust all tire pressures to the recommended kPa/psi.
2. Install the scan tool.
3. Turn ignition ON with engine OFF.
4. With the scan tool select Special Functions.
5. Select TIM Reset.
6. Press the Reset soft key.
7. Use the scan tool in order to clear the TPM DTC.

TPMS REMINDER RESET - PROCEDURE 15

CHECK TIRE PRESSURE or TIRE PRESS message will come on if air pressure in one tire is lower than the other 3 tires, if tires are rotated, if tire(s) are repaired or replaced, or if air pressure is adjusted. Message will stay on until system is recalibrated. Check and adjust air pressure in all 4 tires before recalibrating system.

NOTE: **If vehicle is equipped with Systems Monitor, go to step 2.**

1. To recalibrate vehicle equipped with Driver Information Center (DIC), turn ignition ON with engine OFF. Using the MODE and SELECT button on DIC, change display until TIRE PRESSURE appears. Press and hold RESET button for 5 seconds. TIRE PRESSURE RESET should now appear on display. If TIRE PRESSURE RESET does not appear on display after 5 seconds, repair system as necessary. Using a scan tool, clear TPM DTC.
2. To recalibrate vehicle equipped with Systems Monitor, turn ignition ON with engine OFF. Press and hold TIRE PRESS RESET button for 5 seconds. TIRE PRESS light on the Systems Monitor should begin to flash. Release the TIRE PRESS RESET button. TIRE PRESS light should go out and system is now reset. If TIRE PRESS light does not begin to flash after 5 seconds, repair system as necessary. Using a scan tool, clear TPM DTC.

TPMS REMINDER RESET - PROCEDURE 16

CHECK TIRE PRESSURE light comes on if air pressure in one tire drops to 12 psi (kPa) less than the other 3 tires, if tires are rotated, if tire(s) are repaired or replaced, or if air pressure is adjusted. Light will stay on until ignition is turned off or RESET button is pressed. Check and adjust air pressure in all 4 tires before resetting system.

1. To reset tire inflation monitor, turn ignition ON with engine OFF. Press and release the RESET button. RESET button is located inside of driver's side instrument panel fuse block (left end of instrument panel). The CHANGE OIL indicator light will begin to flash.

2. Press and release the RESET button again. The CHANGE OIL indicator light will turn off, and the CHECK TIRE PRESSURE indicator light will begin to flash. While the CHECK TIRE PRESSURE indicator light is flashing, press and hold the RESET button until the chime sounds indicating system is reset. If CHECK TIRE PRESSURE light does not go out, repeat reset procedure. If system still will not reset, repair system as necessary.

TPMS REMINDER RESET - PROCEDURE 17

NOTE: **When a spare tire is mounted, a wheel is replaced or rotated, or tire pressure has been adjusted, TPM system will need to be recalibrated.**

NOTE: **When the low tire pressure warning messages appear, immediately check air pressure of all tires and adjust to the specified pressure. If warning messages are still displayed, there is a malfunction in the TPM system. See appropriate manufacturer service information.**

NOTE: **Under the following conditions, the system may not function properly:**

- **More than one tire is low.**
- **Only one tire is replaced with a new tire during service.**
- **Vehicle is moving faster than 65 mph (105 km/h).**
- **The system is not yet calibrated.**
- **Tire treadwear is uneven.**
- **Compact spare tire is installed.**
- **Tire chains are being used.**
- **Vehicle is being driven on a rough or frozen road.**
- **If ABS warning light is on.**

CAUTION: **DO NOT recalibrate TPM system until all problems are fixed and tire pressure in all 4 tires has been adjusted. If recalibration is done when tire pressures are incorrect, TPM system will not work properly and may not set an alert when a tire pressure is low or high.**

NOTE: **There are 2 ways to recalibrate the Tire Pressure Monitor (TPM) system:**

- ***Using DIC Reset Button*** **(if no scan tool is available)**
- ***Using Scan Tool*** **(if an OBD-II compatible scan tool is available).**

Using DIC Reset Button

1. Turn ignition switch to OFF position.
2. Ensure all tire pressures are adjusted to the pressure recommended on tire pressure label.
3. Turn ignition ON with engine OFF.
4. Press SELECT right arrow button until "GAGE" is displayed.

5. Press SELECT down arrow button until "TIRE PRESSURE" is displayed.
6. Press and hold RESET button until "TIRE PRESSURE RESET" is displayed.
7. Release RESET button. DIC should display "TIRE PRESSURE NORMAL".
8. After resetting, the TPM system requires up to 30 minutes of straight line driving in each of the following speed ranges to complete calibration process:
    - 15-40 mph (24-64 km/h).
    - 40-70 mph (64-113 km/h).
    - 70-90 mph (113-145 km/h).

NOTE: **The EBCM learns tire pressure calibration for each speed range independently. In Monitor Mode 1, EBCM has only partially learned tire pressure calibration for speed range and has limited detection capability for a tire pressure condition. In Monitor Mode 2, EBCM has fully learned tire pressure calibration for speed range and has full detection capability for a tire pressure condition.**

NOTE: **Learning process does not need to be completed during a single trip.**

Using Scan Tool

1. Turn ignition switch to OFF position.
2. Ensure all tire pressures are adjusted to the pressure recommended on tire pressure label.
3. Connect scan tool. Turn ignition ON with engine OFF.
4. Using scan tool, select "SPECIAL FUNCTIONS".
5. Select "TIRE PRESSURE RESET".
6. Press RESET soft key. A "TIRE PRESSURE NORMAL" message should appear on display.
7. If necessary, use scan tool to clear any TPM Diagnostic Trouble Codes (DTCs).
8. After resetting, the TPM system requires up to 30 minutes of straight line driving in each of the following speed ranges to complete calibration process:
    - 15-40 mph (24-64 km/h).
    - 40-70 mph (64-113 km/h).
    - 70-90 mph (113-145 km/h).

NOTE: **The EBCM learns tire pressure calibration for each speed range independently. In Monitor Mode 1, EBCM has only partially learned tire pressure calibration for speed range and has limited detection capability for a tire pressure condition. In Monitor Mode 2, EBCM has fully learned tire pressure calibration for speed range and has full detection capability for a tire pressure condition.**

NOTE: **Learning process does not need to be completed during a single trip.**

TPMS REMINDER RESET - PROCEDURE 18

The Tire Pressure Monitor (TPM) system alerts the driver when a large change in the pressure of one tire exists,

while the vehicle is being driven. The TPM system uses the Electronic Brake Control Module (EBCM), ABS wheel speed sensor inputs, class 2 serial data circuit, and the Driver Information Center (DIC) to perform the system functions. The EBCM contains software to calculate relative tire pressure differences. The software requires approximately 30 minutes of straight line driving in 3 different speed ranges to complete the calibration process to have full capability for detecting a tire pressure condition. The speed ranges are 15-40 mph, 40-70 mph and 70-90 mph.

1. LOW TIRE PRESSURE light comes on if air pressure in one tire drops to 12 psi less than the other 3 tires, if tires are rotated, if tire(s) are repaired or replaced, if air pressure is adjusted or if vehicle battery is disconnected. Light will stay on until ignition is turned off or RESET button is pressed. Check and adjust air pressure in all 4 tires before resetting system.
2. To reset tire inflation monitor, turn ignition ON with engine OFF. Press and release the RESET button. RESET button is located inside of driver's side instrument panel fuse block (left end of instrument panel). The CHANGE OIL indicator light will begin to flash.
3. Press and release the RESET button again. The CHANGE OIL indicator light will turn off, and the LOW TIRE PRESSURE indicator light will begin to flash. While the LOW TIRE PRESSURE indicator light is flashing, press and hold the RESET button until the chime sounds indicating system is reset. If the LOW TIRE PRESSURE indicator light does not go out, repeat reset procedure. If system still will not reset, repair system as necessary.

TPMS REMINDER RESET - PROCEDURE 19

NOTE: **After resetting, the tire pressure monitoring (TPM) system requires 60 minutes or more of driving at a speed of 30 km/h (19 mph) or above to complete the calibration process to have full capability for detecting a tire pressure condition.**

1. Adjust all tire pressures to the recommended kPa/psi.
2. Turn ignition ON with engine OFF.
3. Press and hold the tire pressure warning reset switch until the tire pressure warning indicator blinks 3 times at one second intervals.
4. If the tire pressure warning indicator does not blink, repeat the procedure starting at step 2.
5. Drive the vehicle for 60 minutes or more at a speed of 30 km/h (19 mph).
6. Verify the system has initialized. Turn ignition ON with engine OFF and observe the tire pressure warning indicator.
    - System Initialized: light on for 3 seconds.
    - System not initialized: light on for 4 seconds.

TPMS REMINDER RESET - PROCEDURE 20

NOTE: **When a spare tire is mounted, a wheel is replaced or rotated, or tire pressure has been adjusted, TPM system will need to be recalibrated.**

CAUTION: **DO NOT recalibrate TPM system until all problems are fixed and tire pressure in all 4 tires has been adjusted. If recalibration is done when tire pressures are incorrect, TPM system will not work properly and may not set an alert when a**

tire pressure is low or high.

NOTE: **When the tire pressure warning message appears on DIC, immediately check air pressure of all tires and adjust to the specified pressure. If warning message is still displayed, there is a malfunction in the TPM system. See appropriate manufacturer service information.**

NOTE: **Under the following conditions, the system may not function properly:**

- **More than one tire is low.**
- **Vehicle is moving faster than 65 mph (105 km/h).**
- **The system is not yet calibrated.**
- **Tire treadwear is uneven.**
- **Compact spare tire is installed.**
- **Tire chains are being used.**
- **Vehicle is being driven on a rough or frozen road.**
- **If ABS warning light is on.**

NOTE: **There are 2 ways to recalibrate the Tire Pressure Monitor (TPM) system:**

- ***Using DIC Reset Button*** **(if no scan tool is available)**
- ***Using Scan Tool*** **(if an OBD-II compatible scan tool is available).**

Using DIC Reset Button

1. Turn ignition switch to OFF position.
2. Ensure all tire pressures are adjusted to the pressure recommended on tire pressure label.
3. Turn ignition ON with engine OFF.
4. Press and hold appropriate button (located on left side of steering column) until "TIRE PRESSURE" message appears on display:
   - 1997-99 models: Press and hold GAGES button
   - 2000-05 models: Press and hold GAGES INFO button
5. Press and hold RESET button for 5 seconds. After 5 seconds, "TIRE PRESSURE RESET" message should appear on display.
6. Release RESET button. A "TIRE PRESSURE NORMAL" message should appear on display.
7. After resetting, the TPM system requires up to 30 minutes of straight line driving in each of the following speed ranges to complete calibration process:
   - 15-40 mph (24-64 km/h).
   - 40-70 mph (64-113 km/h).
   - 70-90 mph (113-145 km/h).

NOTE: **The EBCM learns tire pressure calibration for each speed range**

independently. In Monitor Mode 1, EBCM has only partially learned tire pressure calibration for speed range and has limited detection capability for a tire pressure condition. In Monitor Mode 2, EBCM has fully learned tire pressure calibration for speed range and has full detection capability for a tire pressure condition.

NOTE: **Learning process does not need to be completed during a single trip.**

Using Scan Tool

1. Turn ignition switch to OFF position.
2. Ensure all tire pressures are adjusted to the pressure recommended on tire pressure label.
3. Connect scan tool. Turn ignition ON with engine OFF.
4. Using scan tool, select SPECIAL FUNCTIONS.
5. Select TIM RESET.
6. Press RESET soft key. A "TIRE PRESSURE NORMAL" message should appear on display.
7. If necessary, use scan tool to clear any TPM Diagnostic Trouble Codes (DTCs).
8. After resetting, the TPM system requires up to 30 minutes of straight line driving in each of the following speed ranges to complete calibration process:
   - 15-40 mph (24-64 km/h).
   - 40-70 mph (64-113 km/h).
   - 70-90 mph (113-145 km/h).

NOTE: **The EBCM learns tire pressure calibration for each speed range independently. In Monitor Mode 1, EBCM has only partially learned tire pressure calibration for speed range and has limited detection capability for a tire pressure condition. In Monitor Mode 2, EBCM has fully learned tire pressure calibration for speed range and has full detection capability for a tire pressure condition.**

NOTE: **Learning process does not need to be completed during a single trip.**

TPMS REMINDER RESET - PROCEDURE 21

Using Reset Button (1999-05 Models)

1. Adjust all tire pressures to the recommended Psi (kPa). See vehicle's Loading Information Label for recommended tire pressure. Turn ignition ON with engine OFF.
2. Press and hold the red RESET button located in the passenger side instrument panel fuse block.
3. The LOW TIRE indicator will flash 3 times, then turn off.
4. Use scan tool to clear the TPM DTC.

Using Scan Tool (2003-05 Models)

1. Adjust all tire pressures to the recommended Psi (kPa). See vehicle's Loading Information Label for recommended tire pressure. Turn ignition ON with engine OFF.

2. Install scan tool. Turn ignition ON with engine OFF.
3. With scan tool, select Special Functions.
4. Select TIM Reset.
5. Press Reset soft key.
6. LOW TIRE indicator will flash 3 times, then turn OFF.
7. Clear the TPM DTC.

TPMS REMINDER RESET - PROCEDURE 22

NOTE: **When a spare tire is mounted, a wheel is replaced or rotated, or tire pressure has been adjusted, TPM system will need to be recalibrated.**

CAUTION: **DO NOT recalibrate TPM system until all problems are fixed and tire pressure in all 4 tires has been adjusted. If recalibration is done when tire pressures are incorrect, TPM system will not work properly and may not set an alert when a tire pressure is low or high.**

1. Turn ignition switch to OFF position.
2. Ensure all tire pressures are adjusted to the pressure recommended on tire pressure label.
3. Turn ignition ON with engine OFF.
4. Press and hold the MODE button until DIC display reads "LOW TIRE PRESSURE HOLD SET TO RESET".
5. Press and hold SET button chime sounds and "TIRE PRESSURE RESET" is displayed and a chime sounds 3 times.
6. Release SET button and DIC will display "TIRE PRESSURE NORMAL".

NOTE: **If low tire pressure warning message is still set, TPM system has not reset. Repeat procedure. If it does not work after two tries, refer to appropriate service information.**

7. After resetting, the TPM system requires up to 5 miles of driving in each of the following speed ranges to complete the calibration process:
   - 25-40 mph (40-64 km/h).
   - 40-60 mph (65-96 km/h).
   - 60-85 mph (96-136 km/h).

NOTE: **Learning process does not need to be completed during a single trip.**

TPMS REMINDER RESET - PROCEDURE 23

1. Check and adjust air pressure in all 4 tires before resetting system. Refer to tire placard located on the inside edge of the driver's door. Turn ignition ON, with engine OFF.
2. Press the MODE button on the Driver Information System until LOW TIRE PRESSURE HOLD SET TO RESET is displayed.
3. Press and hold the SET button until a chime sounds and TIRE PRESSURE RESET is displayed and a

chime sounds 3 times.

4. Release the SET button and TIRE PRESSURE NORMAL will be displayed.

TPMS REMINDER RESET - PROCEDURE 24

NOTE: **When a spare tire is mounted, a wheel is replaced or rotated, or tire pressure has been adjusted, TPM system will need to be recalibrated.**

CAUTION: **DO NOT recalibrate TPM system until all problems are fixed and tire pressure in all 4 tires has been adjusted. If recalibration is done when tire pressures are incorrect, TPM system will not work properly and may not set an alert when a tire pressure is low or high.**

1. Turn ignition switch to OFF position.
2. Ensure all tire pressures are adjusted to the pressure recommended on tire pressure label.
3. Turn ignition ON with engine OFF.
4. Press and hold the MODE button until DIC display reads "LOW TIRE PRESSURE HOLD SET TO RESET".
5. Press and hold SET button until a chime sounds and "TIRE PRESSURE RESET" is displayed.
6. System will now sound a chime 3 times, and DIC will display "TIRE PRESSURE NORMAL".

   NOTE: **If low tire pressure warning message is still set, TPM system has not reset. Repeat procedure.**

7. After resetting, the TPM system requires up to 5 miles (8 km) of flat, smooth road, straight line driving in each of the 4 speed ranges (about 10-20 minutes in each range) to complete the calibration process:
   - 19-40 mph (31-65 km/h).
   - 40-59 mph (65-95 km/h).
   - 59-74.5 mph (95-120 km/h).
   - 74.5-90 mph (120-145 km/h).

   NOTE: **The EBCM learns tire pressure calibration for each speed range independently. In Calibration Mode, EBCM has only partially learned tire pressure calibration for speed range and has limited detection capability for a tire pressure condition. In Detection Mode, EBCM has fully learned tire pressure calibration for speed range and has full detection capability for a tire pressure condition.**

   NOTE: **Learning process does not need to be completed during a single trip.**

TPMS REMINDER RESET - PROCEDURE 25

NOTE: **This procedure is for vehicles with a Base DIC.**

If refilling a low tire, no specific reset procedure is required. All warnings are extinguished once the TPMS receives a signal that all tires are properly inflated.

Each TPMS sensor identification code needs to be matched to a new tire/wheel position after rotating the vehicle's tires or replacing one or more of the TPMS sensors. The TPMS sensor matching process should also be performed after replacing a spare tire with a road tire containing the TPMS sensor. The malfunction light and the DIC message should go off at the next ignition cycle. The sensors are matched to the tire/wheel positions using a TPMS relearn tool. There are two minutes to match the first tire/wheel position, and five minutes overall to match all four tire/wheel positions. If it takes longer, the matching process stops and must be restarted.

1. Set the tire pressure of all wheels to pressure specified on the tire and loading information label.
2. Set the parking brake.
3. Turn the ignition to ON/ RUN with the engine OFF or place the vehicle power mode in ON/ RUN/ START. See **Fig. 7**.
4. Use the MENU button to select the VEHICLE INFORMATION MENU in the Driver Information Center (DIC). See **Fig. 8**.
5. Use the thumbwheel (or up and down arrows) to scroll to the TIRE PRESSURE MENU item screen.
6. Press the SET/CLR button to begin the sensor matching process. A message requesting acceptance of the process should display.
7. Press the SET/CLR button again to confirm the selection. The horn sounds twice to signal the receiver is in relearn mode and the TIRE LEARNING ACTIVE message displays on the DIC screen.
8. Starting with left front tire, hold a tire sensor activation tool against the side wall of the tire, within 3 inches of the valve stem. Activate tool until a horn chirp sounds.
9. After horn chirp has sounded and the right turn signal has illuminated, proceed to the next 3 sensors in the following order: right front, right rear and left rear.
10. After left rear sensor has been learned, a double horn chirp will sound, indicating all 4 sensor IDs have been learned. Turn ignition switch to OFF position to exit Learn Mode.

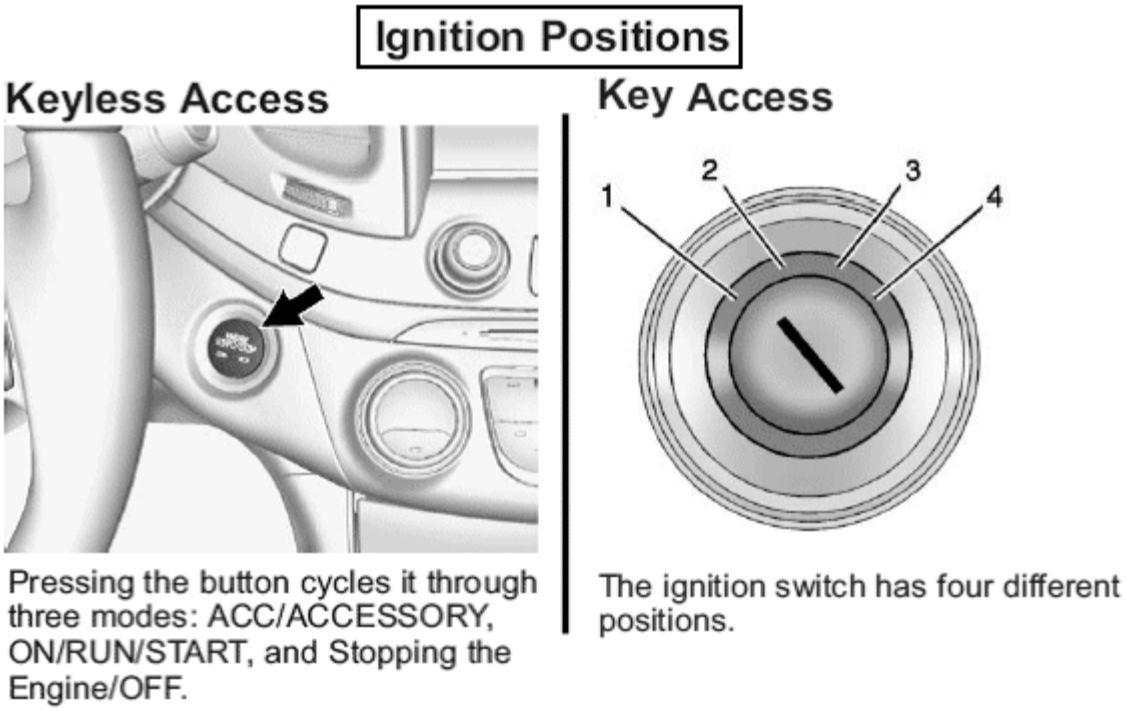

Fig. 7: Ignition Positions (Key & Keyless)

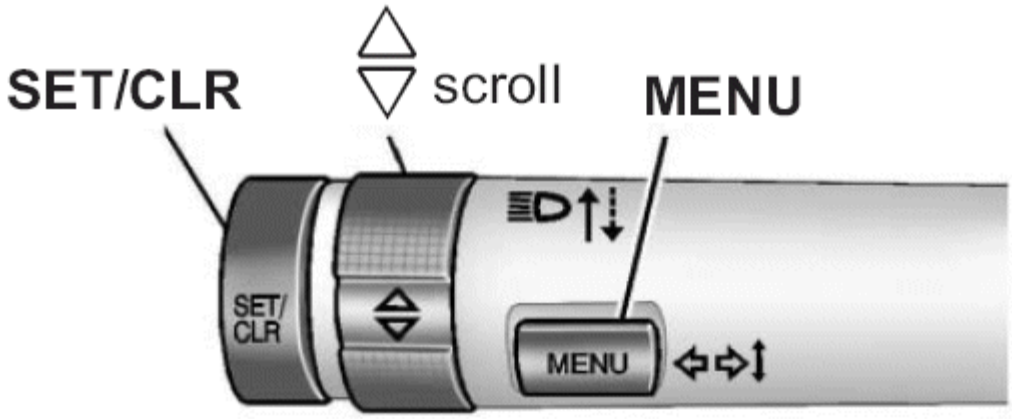

Fig. 8: Identifying DIC Controls (Turn Signal Lever)
Courtesy of GENERAL MOTORS CORP.

TPMS REMINDER RESET - PROCEDURE 26

If refilling a low tire, no specific reset procedure is required. All warnings are extinguished once the TPMS receives a signal that all tires are properly inflated.

Each TPMS sensor has a unique identification code. The identification code needs to be matched to a new tire/wheel position after rotating the tires or replacing one or more of the TPMS sensors. The TPMS sensor matching process should also be performed after replacing a spare tire with a road tire containing the TPMS sensor. The malfunction light and the DIC message should go off at the next ignition cycle. The sensors are matched to the tire/ wheel positions, using a TPMS relearn tool.

1. Set the tire pressure of all wheels to pressure specified on the tire and loading information label.
2. Set the parking brake.
3. Turn the ignition to ON/RUN with the engine OFF.
4. Up-level Driver Information Center (DIC) Only: Make sure the TIRE PRESSURE INFO page option is turned on. The info pages on the DIC can be turned on and off through the SETTINGS menu.
5. - **Up-Level DIC** : Use the DIC controls (arrow buttons) on the right side of the steering wheel to scroll to the TIRE PRESSURE screen under the DIC info page.
   - **Base-Level DIC** : Use the TRIP ODOMETER RESET stem to scroll to the TIRE PRESSURE screen.
6. - **Up-Level DIC** : Press and hold the SET/RESET button (check-mark symbol) located in the center of the DIC controls.
   - **Base-Level DIC** : Press and hold the TRIP ODOMETER RESET stem for about five seconds. A message asking if the process should begin should appear. Select YES and press the TRIP ODOMETER RESET stem to confirm the selection.
7. The horn sounds twice to signal the receiver is in relearn mode and the TIRE LEARNING ACTIVE message displays on the DIC screen.
8. Starting with left front tire, hold a tire sensor activation tool against the side wall of the tire, within 3 inches of the valve stem. Activate tool until a horn chirp sounds.

9. After horn chirp has sounded and the right turn signal has illuminated, proceed to the next 3 sensors in the following order: right front, right rear and left rear.
10. After left rear sensor has been learned, a double horn chirp will sound, indicating all 4 sensor IDs have been learned. Turn ignition switch to OFF position to exit Learn Mode.

TPMS REMINDER RESET - PROCEDURE 27

If refilling a low tire, no specific reset procedure is required. All warnings are extinguished once the TPMS receives a signal that all tires are properly inflated.

Each TPMS sensor has a unique identification code. The identification code needs to be matched to a new tire/wheel position after rotating the tires or replacing one or more of the TPMS sensors. The TPMS sensor matching process should also be performed after replacing a spare tire with a road tire containing the TPMS sensor. The malfunction light and the DIC message should go off at the next ignition cycle. The sensors are matched to the tire/ wheel positions, using a TPMS relearn tool.

1. Set the tire pressure of all wheels to pressure specified on the tire and loading information label.
2. Turn ignition switch to ON/RUN position, with engine OFF.
3. Simultaneously press the keyless entry transmitter's lock and unlock buttons until a horn chirp sounds, indicating Learn Mode has been enabled. The TIRE LEARNING ACTIVE message displays on the DIC screen.

NOTE: **If the vehicle does not have RKE, press the Driver Information Center (DIC) vehicle information button until the PRESS (check mark symbol) TO RELEARN TIRE POSITIONS message displays. The horn sounds twice to signal the receiver is in relearn mode and TIRE LEARNING ACTIVE message displays on the DIC screen. If the vehicle does not have RKE or DIC buttons, press the trip odometer reset stem on the instrument cluster until the PRESS (check mark symbol) TO RELEARN TIRE POSITIONS message displays. The horn sounds twice to signal the receiver is in relearn mode and TIRE LEARNING ACTIVE message displays on the DIC screen.**

4. Starting with left front tire, hold a tire sensor activation tool against the side wall of the tire, within 3 inches of the valve stem. Activate tool until a horn chirp sounds.
5. After horn chirp has sounded and the right turn signal has illuminated, proceed to the next 3 sensors in the following order: right front, right rear and left rear.
6. After left rear sensor has been learned, a double horn chirp will sound, indicating all 4 sensor IDs have been learned. Turn ignition switch to OFF position to exit Learn Mode.

TPMS REMINDER RESET - PROCEDURE 28

If refilling a low tire, no specific reset procedure is required. All warnings are extinguished once the TPMS receives a signal that all tires are properly inflated.

TPMS sensors are mounted onto each tire and wheel assembly, excluding the spare tire and wheel assembly. Each TPMS sensor has a unique identification code. The identification code needs to be matched to a new tire/wheel position after rotating the vehicle's tires or replacing one or more of the TPMS sensors. The TPMS

sensor matching process should also be performed after replacing a spare tire with a road tire containing the TPMS sensor. The malfunction light and the DIC message should go off at the next ignition cycle. The sensors are matched to the tire/wheel positions, using a TPMS relearn tool.

1. Set the tire pressure of all wheels to pressure specified on the tire and loading information label.
2. Set the parking brake.
3. Turn the ignition to ON/ RUN with the engine OFF or place the vehicle power mode in ON/ RUN/ START. See **Fig. 7**.
4. Make sure the Tire Pressure info page option is turned on. The info pages on the Driver Information Center (DIC) can be turned on and off through the Settings menu.
5. Use the DIC controls on the right side of the steering wheel to scroll to the Tire Pressure screen under the DIC info page.
6. Press and hold the SET/RESET button (check mark symbol) located in the center of the DIC controls.
7. The horn sounds twice to signal the receiver is in relearn mode and the TIRE LEARNING ACTIVE message displays on the DIC screen.
8. Starting with left front tire, hold a tire sensor activation tool against the side wall of the tire, within 3 inches of the valve stem. Activate tool until a horn chirp sounds.
9. After horn chirp has sounded and the right turn signal has illuminated, proceed to the next 3 sensors in the following order: right front, right rear and left rear.
10. After left rear sensor has been learned, a double horn chirp will sound, indicating all 4 sensor IDs have been learned. Turn ignition switch to OFF position to exit Learn Mode.

TPMS REMINDER RESET - PROCEDURE 29

If refilling a low tire, no specific reset procedure is required. All warnings are extinguished once the TPMS receives a signal that all tires are properly inflated.

TPMS sensors are mounted onto each tire and wheel assembly, excluding the spare tire and wheel assembly. Each TPMS sensor has a unique identification code. The identification code needs to be matched to a new tire/wheel position after rotating the vehicle's tires or replacing one or more of the TPMS sensors. The TPMS sensor matching process should also be performed after replacing a spare tire with a road tire containing the TPMS sensor. The malfunction light and the DIC message should go off at the next ignition cycle. The sensors are matched to the tire/wheel positions, using a TPMS relearn tool.

1. Set the tire pressure of all wheels to pressure specified on the tire and loading information label.
2. Set the parking brake.
3. Turn the ignition to ON/RUN with the engine OFF.
4. Press the MENU button (right-hand side of instrument cluster) once on the Driver Information Center (DIC).
5. Press the up or down arrow button until the Tire Learn screen is displayed.
6. Press and hold the SET/CLR button to begin the sensor matching process.
7. The horn sounds twice to signal the receiver is in relearn mode and the TIRE LEARNING ACTIVE message displays on the DIC screen.
8. Starting with left front tire, hold a tire sensor activation tool against the side wall of the tire, within 3 inches of the valve stem. Activate tool until a horn chirp sounds.

9. After horn chirp has sounded and the right turn signal has illuminated, proceed to the next 3 sensors in the following order: right front, right rear and left rear.
10. After left rear sensor has been learned, a double horn chirp will sound, indicating all 4 sensor IDs have been learned. Turn ignition switch to OFF position to exit Learn Mode.

TPMS REMINDER RESET - PROCEDURE 30

If refilling a low tire, no specific reset procedure is required. All warnings are extinguished once the TPMS receives a signal that all tires are properly inflated.

TPMS sensors are mounted onto each tire and wheel assembly, excluding the spare tire and wheel assembly. Each TPMS sensor has a unique identification code. The identification code needs to be matched to a new tire/wheel position after rotating the vehicle's tires or replacing one or more of the TPMS sensors. The TPMS sensor matching process should also be performed after replacing a spare tire with a road tire containing the TPMS sensor. The malfunction light and the DIC message should go off at the next ignition cycle. The sensors are matched to the tire/wheel positions, using a TPMS relearn tool.

1. Set the tire pressure of all wheels to pressure specified on the tire and loading information label.
2. Set the parking brake.
3. Put the vehicle in ON/ RUN and place the vehicle in P (Park).
4. If the Driver Information Center (DIC) display is minimized, press the SELECT knob to maximize it. See **Fig. 9**.
5. Use the SELECT knob to scroll to the Tire Pressure display screen.
6. Press and hold the SELECT knob for five seconds to begin the sensor matching process. A message displays confirming to begin the process.
7. Use the SELECT knob to select YES with the highlighted selection, and press the SELECT knob again to confirm the selection.
8. The horn sounds twice to signal the receiver is in relearn mode and the TIRE LEARNING ACTIVE message displays on the DIC screen.
9. Starting with left front tire, hold a tire sensor activation tool against the side wall of the tire, within 3 inches of the valve stem. Activate tool until a horn chirp sounds.
10. After horn chirp has sounded and the right turn signal has illuminated, proceed to the next 3 sensors in the following order: right front, right rear and left rear.
11. After left rear sensor has been learned, a double horn chirp will sound, indicating all 4 sensor IDs have been learned. Turn ignition switch to OFF position to exit Learn Mode.

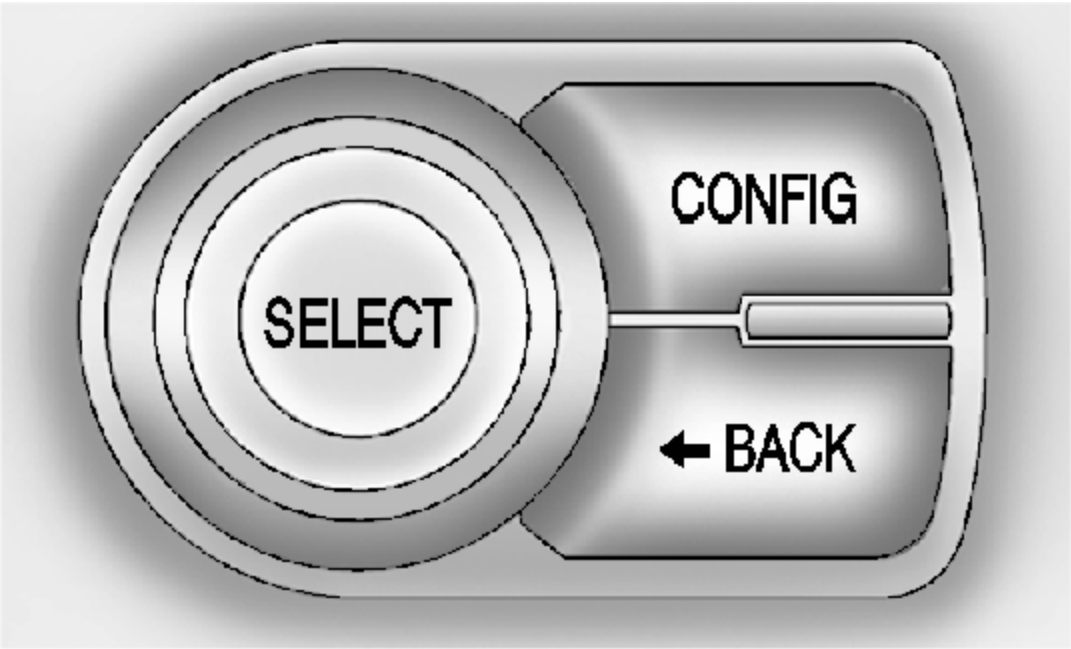

Fig. 9: Identifying DIC Controls (Spark EV)
Courtesy of GENERAL MOTORS CORP.

TPMS REMINDER RESET - PROCEDURE 31

NOTE: **You have two minutes to match the first tire/wheel position, and five minutes overall to match all four tire/wheel positions. If it takes longer, the matching process stops and must be restarted.**

1. Set the tire pressure of all wheels to pressure specified on the tire and loading information label.
2. Set the parking brake.
3. Turn the ignition to ON/RUN with the engine off.
4. Enter the learn sequence from the TPM Learn screen, located under the Customization Menu in the instrument panel cluster. Press SRCE button until you see Customize Options and then press ENTER (left pointing arrow). Move the thumbwheel up or down to scroll through the available options. Press ENTER to select an item. To exit the current menu, or go back, use the thumbwheel to select BACK (left arrow) at the top of the screen and then press ENTER.
5. Start with the driver side front tire. The driver side front indicator lamp also comes on to indicate that corner's sensor is ready to be learned. Place a tire sensor activation tool against the tire sidewall, near the valve stem. Then press the button to activate the TPMS sensor. A horn chirp confirms that the sensor identification code has been matched to this tire and wheel position
6. After horn chirp has sounded and the right turn signal has illuminated, proceed to the next 3 sensors in the following order: right front, right rear and left rear.
7. After the driver side rear TPMS sensor has been learned the horn chirps two times. The driver side rear indicator lamp turns off and the TPMS sensor matching process is done. Turn the ignition switch to LOCK/OFF.

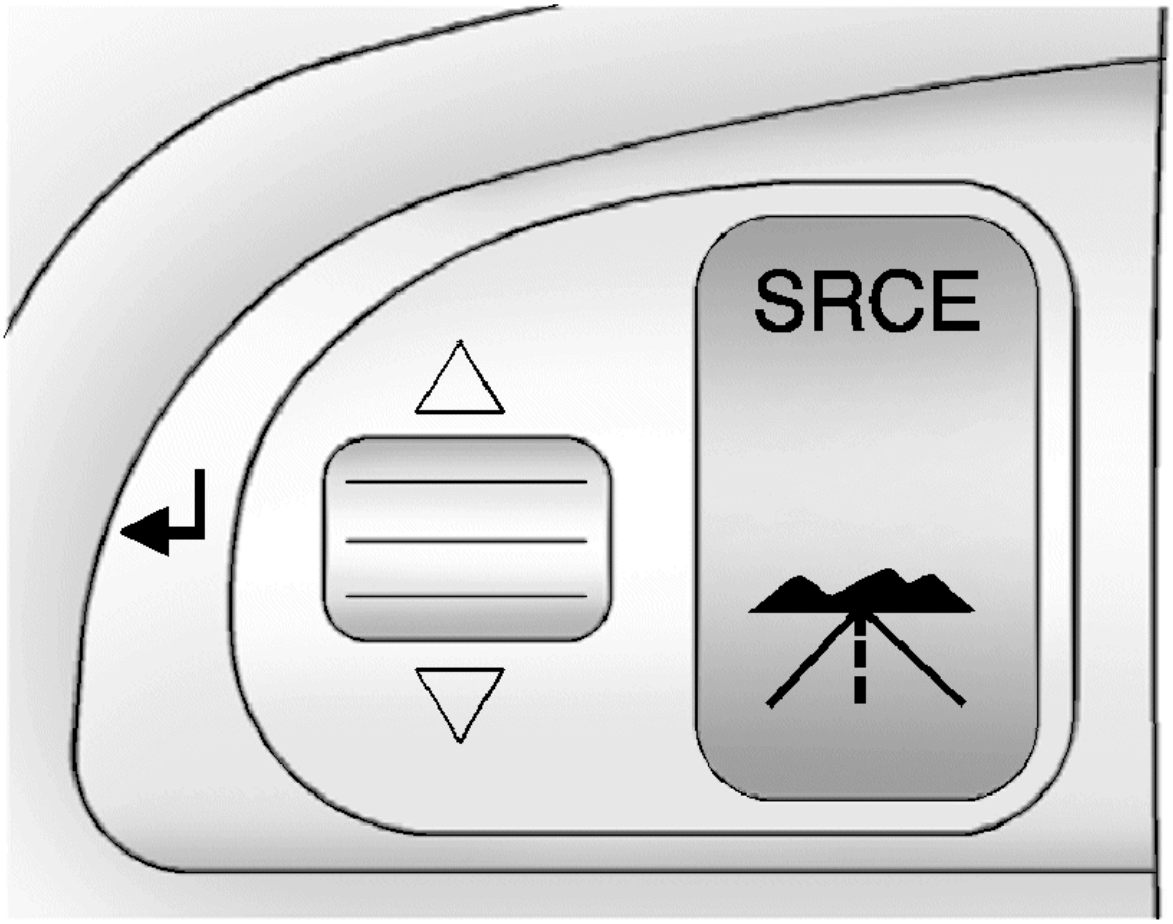

Fig. 10: Identifying DIC Controls
Courtesy of GENERAL MOTORS CORP.

TPMS REMINDER RESET - PROCEDURE 32

NOTE: **An OEM scan tool is used to perform this procedure.**

NOTE: **The sensor learn procedure must be performed after every tire rotation, tire pressure indicator module replacement, or sensor replacement. Make sure the TPM tool battery is sufficient to complete TPM learn process. Do not place the TPM tool directly on the valve stem. The TPM tool should be placed against the tire sidewall near the valve stem. The TPM sensor learn activation procedure may have to be repeated up to 3 times before determining a sensor is malfunctioning. The low tire pressure warning light will start to flash to indicate the learn mode has been enabled. The front and back turn signals will flash twice when a sensor has been learned.**

1. Ignition ON with engine OFF, apply the parking brake.
2. Using a scan tool, initiate the TPM Learn Mode.
3. Starting with the left front tire, active the sensor by holding the antenna of the tire pressure monitor special tool aimed upward against the tire sidewall close to the wheel rim at the valve stem location. Press and release the activate button. Ensure that the transmit indicator on the special tool indicates that the sensor activation signal is being transmitted. Wait for the front and back turn signals to flash twice. If the

front and back turn signals do not flash, repeat the sensor activation sequence with the tool. Once the front and back turn signals have flashed twice, the sensor information is learned.

NOTE: **Follow the sensor order listed here since there is no visual indicator on the vehicle for the sensor learn order.**

4. After the front and back turn signals have flashed twice, repeat step 2 for the remaining 3 sensors in the following order: Right front, Right rear, Left rear.
5. When the left rear sensor has been learned, the front and back turn signals will flash twice, the learn process is complete and the tire pressure indicator module exits the Learn mode.

TPMS REMINDER RESET - PROCEDURE 33

If refilling a low tire, no specific reset procedure is required. All warnings are extinguished once the TPMS receives a signal that all tires are properly inflated.

Each TPMS sensor has a unique identification code. The identification code needs to be matched to a new tire/wheel position after rotating the tires or replacing one or more of the TPMS sensors. The TPMS sensor matching process should also be performed after replacing a spare tire with a road tire containing the TPMS sensor. The malfunction light and the DIC message should go off at the next ignition cycle. The sensors are matched to the tire/ wheel positions, using a TPMS relearn tool.

1. Set the tire pressure of all wheels to pressure specified on the tire and loading information label.
2. Set the parking brake.
3. Turn the ignition to ON/RUN with the engine OFF.
4. Press the MENU button (center console) to select the Vehicle Information Menu in the Driver Information Center (DIC).
5. Use the arrow keys to scroll to the Tire Pressure screen.
6. Press the SET/CLR button to begin the sensor matching process. A message should display requesting acceptance of the process.
7. Press the SET/CLR button again to confirm the selection. The horn sounds twice to signal the receiver is in relearn mode and the TIRE LEARNING ACTIVE message displays on the DIC screen.
8. Starting with left front tire, hold a tire sensor activation tool against the side wall of the tire, within 3 inches of the valve stem. Activate tool until a horn chirp sounds.
9. After horn chirp has sounded, proceed to the next 3 sensors in the following order: right front, right rear and left rear.
10. After left rear sensor has been learned, a double horn chirp will sound, indicating all 4 sensor IDs have been learned. Turn ignition switch to OFF position to exit Learn Mode.

TPMS REMINDER RESET - PROCEDURE 34

If refilling a low tire, no specific reset procedure is required. All warnings are extinguished once the TPMS receives a signal that all tires are properly inflated.

Each TPMS sensor has a unique identification code. The identification code needs to be matched to a new tire/wheel position after rotating the tires or replacing one or more of the TPMS sensors. The TPMS sensor matching process should also be performed after replacing a spare tire with a road tire containing the TPMS

sensor. The malfunction light and the DIC message should go off at the next ignition cycle. The sensors are matched to the tire/ wheel positions, using a TPMS relearn tool.

1. Set the tire pressure of all wheels to pressure specified on the tire and loading information label.
2. Turn the ignition to ON/RUN with the engine OFF. Set the parking brake.
3. Up-level Driver Information Center (DIC) Only: Make sure the TIRE PRESSURE INFO page option is turned on. The info pages on the DIC can be turned on and off through the SETTINGS menu.
4. - **Up-Level DIC** : Use the DIC controls (arrow buttons) on the right side of the steering wheel to scroll to the TIRE PRESSURE screen under the DIC info page.
   - **Base-Level DIC** : Use the MENU button to select the Vehicle Information menu in the DIC. Use the thumbwheel to scroll to the Tire Pressure Menu item screen. See **Fig. 8**.
5. - **Up-Level DIC** : Press and hold the SET/RESET button (check-mark symbol) located in the center of the DIC controls.
   - **Base-Level DIC** : Press the SET/CLR button to begin the sensor matching process. A message asking if the process should begin should appear. Press the SET/CLR button again to confirm the selection.
6. The horn sounds twice to signal the receiver is in relearn mode and the TIRE LEARNING ACTIVE message displays on the DIC screen.
7. Starting with left front tire, hold a tire sensor activation tool against the side wall of the tire, within 3 inches of the valve stem. Activate tool until a horn chirp sounds.
8. After horn chirp has sounded and the right turn signal has illuminated, proceed to the next 3 sensors in the following order: right front, right rear and left rear.
9. After left rear sensor has been learned, the horn sounds two times to indicate the sensor identification code has been matched to the driver side rear tire, and the TPMS sensor matching process is no longer active. The TIRE LEARNING ACTIVE message on the DIC display screen goes off.
10. Turn the ignition switch to LOCK/OFF.
11. Set all four tires to the recommended air pressure level as indicated on the Tire and Loading Information label.

DIAGNOSTIC INFORMATION AND PROCEDURES

SEAT BELT SYSTEM OPERATIONAL AND FUNCTIONAL CHECKS

NOTE: **If the vehicle has been in a collision, refer to Repairs and Inspections Required After a Collision for additional information.**

Perform the following inspection from the driver seat:

1. Turn the ignition switch to the ON position. Verify the proper operation of the seat belt reminder lamp with the belt buckled and with the belt unbuckled. Refer to **Seat Belt System Description and Operation**.
2. Inspect the shoulder belt guide in order to ensure that the following conditions are met:
   - The shoulder belt guide swivels freely.
   - The seat belt webbing is seated flatly in the guide slot.
   - The seat belt webbing does not bind.
3. Verify that the seat belt buckle faces inboard and is accessible.
4. Verify that the seat belt retractor units are securely attached.
5. Verify that the seat belt anchor bolts are secure.
6. Fully extend the seat belt webbing. Verify that the seat belt webbing does not have any twists or tears.
7. Allow the seat belt webbing to retract. Verify that the seat belt webbing returns freely and completely

d

back into the retractor. If the seat belt webbing will not retract, refer to **Seat Belt Does Not Retract**.

8. Snap the seat belt latch plate into the buckle.
9. Sharply tug on the seat belt latch plate and the buckle. Verify that the seat belt latch plate and the buckle remain locked when tugged.
10. Push the button on the buckle:
    - Verify that the seat belt latch plate releases easily from the buckle.
    - Verify that the button returns to its original position.

Repeat the inspection procedure found in steps 2-10 for the front passenger seat.

Perform the following steps in order to inspect the center seat belts:

1. Verify that the center seat belts are accessible.
2. Verify that the center seat belts have no twists or tears in the webbing.
3. Snap the center seat belt latch plate into the buckle.
4. Sharply tug on the seat belt latch plate and the buckle. Verify that the seat belt latch plate and the buckle remain locked when tugged.
5. Push the button on the buckle:
    - Verify that the seat belt latch plate releases easily from the buckle.
    - Verify that the button returns to its original position.

Repeat the inspection procedure found in steps 2-10 for the rear seats.

Repeat the center seat belt inspection procedure found in steps 1-5 for the rear seat.

For information on removal of the rear seats cushions, refer to **Rear Seat Cushion Removal and Installation (Impala Limited)** .

Emergency Locking Retractors

WARNING: Perform this test in an area clear of other vehicles or obstructions. Do not conduct this test on the open road. A large, empty parking lot is suitable. Failure to observe this precaution may result in damage to the vehicle and possible personal injury.

1. Fasten the seat belts. Use an assistant when the retractor under test is not part of the driver seat belt.
2. Accelerate the vehicle slowly to 16 km/h (10 mph) and apply the brakes firmly.
3. Verify that the seat belt locks when braking firmly.
4. If the belt does not lock, proceed with the following steps:
    1. Remove the seat belt retractor assembly, refer to the appropriate service procedure.
    2. Tilt the seat belt retractor slowly.

d

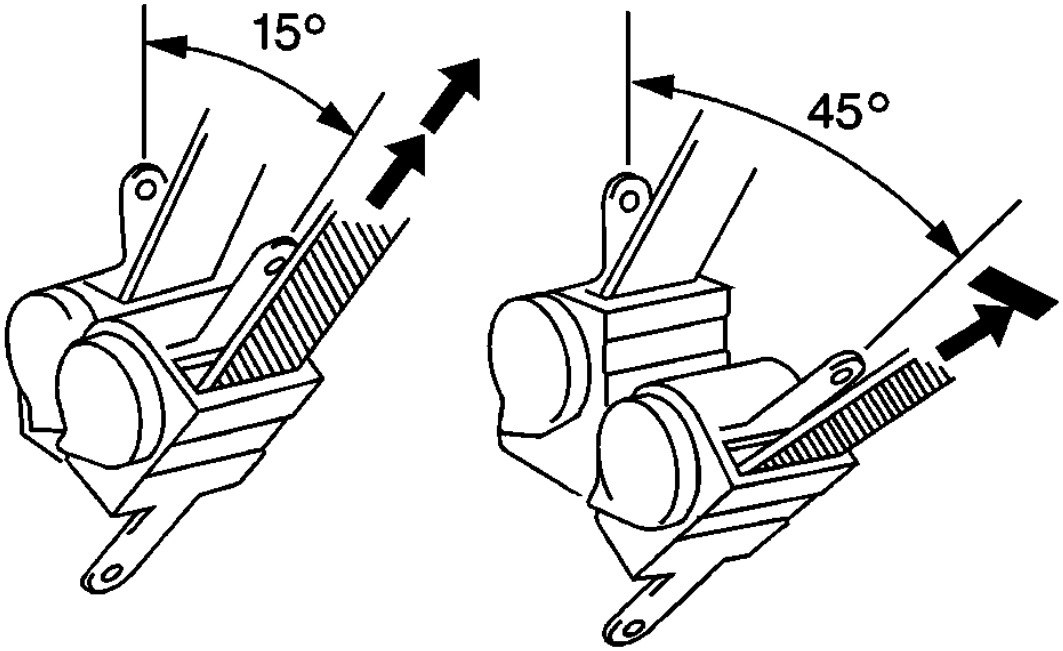

Fig. 2: Checking Seat Belt Retractor Inclination
Courtesy of GENERAL MOTORS COMPANY

3. Ensure that the seat belt webbing can be pulled from the retractor at an inclination of 15 degrees or less and cannot be pulled from the retractor at an inclination of 45 degrees or more.
4. If the seat belt retractor does not operate as described, replace the retractor assembly. Refer to the appropriate service procedure.

SYMPTOMS - SEAT BELTS

IMPORTANT: Review the seat belt system description and operation in order to familiarize yourself with the system and how it functions. Refer to **Seat Belt System Description and Operation**.

Visual/Physical Inspection

- Inspect for aftermarket devices which could affect the operation of the seat belt system. Refer to **Checking Aftermarket Accessories** .
- Inspect the easily accessible or visible system components for obvious damage or conditions which could cause the symptom.

d

Intermittent

Faulty electrical connections or wiring may be the cause of intermittent conditions. Refer to **Testing for Intermittent Conditions and Poor Connections** .

Symptom List

- Refer to **Seat Belt Indicator Malfunction - Driver** in order to diagnose the symptom.
- Refer to **Seat Belt Indicator Malfunction - Passenger** in order to diagnose the symptom.

SEAT BELT DOES NOT RETRACT

1. Grasp the seat belt and pull it out slowly and evenly from the retractor, do that in 15-25mm (5/8-1in) increments, continuing until the seat belts entire length has been pulled out.
2. Release the seat belt, and allow the retractor to slowly retract the full length of the seat belt. The seat belt must retract without any additional help.
3. Additionally, make sure, that the seat belt can be stopped any time while retracting and then resumed while being released again. This must also be possible in all retracting positions.
4. Should problems be observed in step 3, perform the first two steps 2 more times.
5. Should the retractor, after performing these steps, not function freely and properly, it is to be replaced with a new part.

SEAT BELT INDICATOR MALFUNCTION - DRIVER

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Seat Belt Switch Signal	1	2	-	-
Low Reference	-	2	-	-

1. Indicator will remain ON with seat belt buckled.
2. Indicator will illuminate only for the bulb test.

Circuit/System Description

The driver seat belt switch is a 2-wire switch wired to the inflatable restraint sensing and diagnostic module (SDM) using a signal circuit and a low reference circuit. When the seat belt is unbuckled the switch is closed, and when the seat belt is buckled the switch is open. The SDM sends the status of the driver seat belt via serial data to the instrument panel cluster (IPC). After receiving the message, the IPC controls the illumination of the driver seat belt indicator.

- **Wiring Repairs**

Scan Tool Reference

Control Module References for Scan Tool Information

Circuit/System Verification

1. Ignition ON, with a scan tool perform the IPC Display Test and verify the driver seat belt indicator is illuminated for 5 seconds.
   - If the indicator does not illuminate, replace the IPC.
2. Monitor the SDM Driver Seat Belt Switch parameter while connecting and disconnecting the seat belt. The parameter should display Buckled and Unbuckled when changing seat belt states.

Circuit/System Testing

IMPORTANT:

When removing connectors inspect for damage or corrosion. Damage or corrosion in the following requires repair or replacement of the affected component/connector.

- The seat belt switch
- The seat belt switch harness connector
- The SDM
- The SDM harness connector

1. Ignition OFF, disconnect the harness connector at the seat belt switch.
2. Ignition ON, test the resistance between the low reference circuit terminal B and signal circuit terminal A of the switch (buckle side) while connecting and disconnecting the seat belt. The resistance should switch between infinity and less than 2 ohms.
   - If not as specified, replace the seat belt buckle.

3. Ignition OFF, reconnect the harness connector at the seat belt switch.
4. Make sure the seat belt is buckled.
5. Ignition ON, using a scan tool, verify the SDM Driver Seat Belt Switch parameter display is Buckled.
    - If the parameter is Unbuckled, test the seat belt switch signal circuit for a short to ground. If the circuit tests normal replace the SDM.
6. Make sure the seat belt is unbuckled.
7. Install a 3-amp fused jumper wire between the signal circuit terminal A and the low reference circuit terminal B (harness side). Verify the SDM Driver Seat Belt Switch parameter display is Unbuckled.
    - If the parameter is Buckled, test the signal and the low reference circuits for open/high resistance or a short to voltage. If the circuits test normal, replace the SDM.
8. If all circuits test normal, test or replace the seat belt switch.

Component Testing

1. Ignition OFF, disconnect the harness connector at the seat belt switch.
2. With the seat belt buckled, test for infinite resistance between the signal circuit terminal A and the low reference terminal B.
    - If not the specified range, replace the seat belt switch.
3. With the seat belt unbuckled, test for less than 2 ohms of resistance between the signal circuit terminal A and the low reference terminal B.
    - If greater than the specified range, replace the seat belt switch.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the diagnostic procedure.

- **Front Seat Belt Buckle Replacement**
- **Control Module References** for SDM or IPC replacement, setup, and programming

SEAT BELT INDICATOR MALFUNCTION - PASSENGER

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Low Reference	-	2	-	-
Passenger Seat Belt Switch Signal	1	2	-	-
Ignition 1 Voltage	3	3	-	-
Passenger Seat Belt Indicator Control	4	5	-	-

d

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
1. The passenger seat belt indicator will remain ON with seat occupied and the seat belt buckled. 2. The passenger seat belt indicator will not illuminate with the seat occupied and the seat belt disconnected, but will illuminate for the bulb test. 3. No indicator on the inflatable restraint passenger air bag ON/OFF indicator will illuminate at any time. 4. The passenger seat belt indicator will illuminate at all times. 5. The passenger seat belt indicator will never illuminate but the PPS ON/OFF indicator does.				

Circuit/System Description

The seat belt buckle switch is a 2-wire switch wired to the inflatable restraint sensing and diagnostic module (SDM) using a signal circuit and a low reference circuit. When the seat belt is unbuckled the switch is closed, and when the seat belt is buckled the switch is open. When the passenger presence system (PPS) indicates that the seat is occupied, the SDM sends the status of the passenger seat belt via serial data to the instrument panel cluster (IPC). After receiving the message, the IPC controls the illumination of the passenger seat belt indicator by grounding the indicator control circuit. If an occupant is seated in the front passenger seat and the seat belt is unfastened, the SDM will send a message to the IPC to illuminate the fasten seat belt indicator for approximately 72 seconds or until the seat belt is fastened.

Diagnostic Aids

Objects on the passenger seat can cause the passenger seat belt reminder to be commanded on. Depending on the sensing technology used, a conductive object (computers, MP3 players, cell phones, diagnostic scan tool, wires, a hand, etc.) placed on the passenger seat may cause the Passenger Presence Detection Module to command the passenger air bag indicator ON and/or command the passenger seat belt indicator ON. The fasten seat belt chime will also sound.

- **Connector Repairs**

d

- **Testing for Intermittent Conditions and Poor Connections**
- **Wiring Repairs**

Scan Tool Reference

Control Module References for Scan Tool Information

Circuit/System Verification

1. With no weight in the passenger seat observe the passenger seat belt status indicator. Turn ON the ignition, the indicator should illuminate for 5 seconds.
   - If the indicator is always ON or always OFF, refer to Indicator Circuit Test.
2. Ignition ON, monitor the Passenger Seat Belt Switch parameter while connecting and disconnecting the seat belt. The parameter should display Buckled and Unbuckled when changing seat belt states.
   - If the parameter displays incorrectly, refer to Switch Circuit Test.

Circuit/System Testing

Indicator Circuit Test

1. Ignition OFF, disconnect the harness connector at the passenger air bag ON/OFF indicator.
2. Ignition ON, verify a test lamp illuminates between the ignition circuit terminal 4 and ground.
   - If the test lamp does not illuminate, test the ignition circuit for a short to ground or an open/high resistance. If the circuit tests normal and the ignition circuit fuse is open, test or replace the passenger air bag ON/OFF indicator.
3. Connect a test lamp between the control circuit terminal 5 and the ignition circuit terminal 4.

   IMPORTANT: Allow 5 seconds after seat is occupied for test lamp to change states.

4. With the passenger seat occupied the test lamp should turn ON with the seat belt disconnected, and turn OFF with the seat belt connected.
   - If the test lamp is always ON, test the control circuit for a short to ground. If the circuit tests normal, replace the IPC.
   - If the test lamp is always OFF, test the control circuit for an open/high resistance. If the circuit tests normal, replace the IPC.
5. If the circuits test normal, replace the passenger air bag ON/OFF indicator.

Switch Circuit Test

IMPORTANT: When removing connectors inspect for damage or corrosion. Damage or corrosion in the following requires repair or replacement of the affected component/connector.

- The passenger seat belt switch
- The passenger seat belt switch harness connector
- The SDM
- The SDM harness connector

d

1. Ignition OFF, disconnect the harness connector at the passenger seat belt switch.
2. Test the resistance between the low reference circuit terminal B X1 and signal circuit terminal A X1 of the switch (buckle side) while connecting and disconnecting the seat belt. The resistance should switch between infinity and less than 2 ohms.
    - If not as specified, replace the seat belt buckle.
3. Ignition ON, using a scan tool, verify the Passenger Seat Belt Switch parameter display is Buckled.
    - If the parameter is Unbuckled, test the seat belt switch signal circuit for a short to ground. If the circuit tests normal replace the SDM.
4. Install a 3 A fused jumper wire between the signal circuit terminal A X1 and the low reference circuit terminal B X1 (harness side). Verify the scan tool Passenger Seat Belt Switch parameter display is Unbuckled.
    - If the parameter is Buckled, test the signal and the low reference circuits for open/high resistance. If the circuits test normal, replace the SDM.

Component Testing

1. Ignition OFF, disconnect the harness connector at the seat belt switch.
2. With the seat belt buckled, test for infinite resistance between the signal circuit terminal A X1 and the low reference terminal B X1 (buckle side).
    - If not the specified range, replace the seat belt switch.
3. With the seat belt unbuckled, test for less than 2 ohms between the signal circuit terminal A X1 and the low reference terminal B X1.
    - If greater than the specified range, replace the seat belt switch.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair

- **Front Seat Belt Buckle Replacement**
- **Instrument Panel Airbag Arming Status Display Replacement**
- **Control Module References** for SDM or IPC replacement, programming and setup

REPAIR INSTRUCTIONS

REPAIRS AND INSPECTIONS REQUIRED AFTER A COLLISION

WARNING: Restraint systems can be damaged in a collision. To help avoid injury and ensure that all parts in need of replacement are replaced:

- **Replace any seat belt system that was in use during the collision serious enough to deploy any automatic restraint device such as air bags and seat belt pretensioners. This not only includes seat belt systems in use by people of adult size, but seat belt systems used to secure child restraints, infant carriers and booster seats, including LATCH system and top tether anchorages.**
- **Replace any seat belt system that has torn, worn, or damaged**

d

components. This not only includes adult seat belt systems, but built-in child restraints and LATCH system components, if any.

- **Replace any seat belt system if you observe the words "REPLACE" or "CAUTION", or if a yellow tag is visible. Do not replace a seat belt if only the child seat caution label is visible.**
- **Replace any seat belt system if you are doubtful about its condition. This not only includes adult seat belt systems, but built-in child restraints, LATCH system components, and any restraint system used to secure infant carriers, child restraints, and booster seats.**

Do NOT replace single seat belt system components in vehicles that have been in a collision as described above. Always replace the entire seat belt system with the buckle, guide and retractor assembly, which includes the latch and webbing material.

After a minor collision where no automatic restraint device was deployed, seat belt system replacement may not be necessary, unless some of the parts are torn, worn, or damaged.

SEAT BELT LATCH STOP INSTALLATION

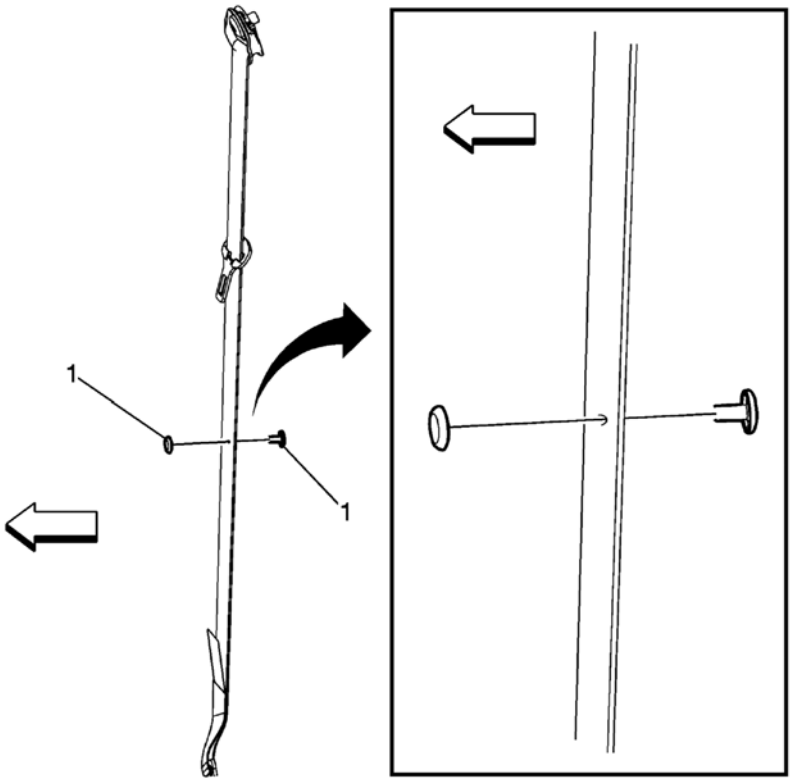

Fig. 3: View Of Seat Belt Latch Stop Components
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure	

d

Callout	Component Name
1. Locate the hole in the seat belt webbing where the original seat belt stop button was located. 2. If the original hole in the seat belt webbing is not visible, perform the following: • If either the right or left stop button is missing use the opposing seat belt as a reference. • With the opposing seat belt fully stowed, measure the distance between the seat belt lower anchor and the stop button. • Using the measurement obtained above, measure and mark the location of the missing stop button on the center of the seat belt webbing. 3. Ensure the seat belt latch plate is located above the mark or original hole.	
1	Seat Belt Stop Button **Procedure** 1. Work the male half of the stop button through the hole in the webbing or at the marked location. 2. Align the female half of the stop button with the male half of the stop button. 3. Snap the two halves together. 4. Trim off any access of the male half of the stop button flush with the female half of the stop button. **TIP:** Ensure the male half of the stop button is facing forward in the vehicle in order to ensure the stop button will not snag customers clothing.

FRONT SEAT BELT BUCKLE REPLACEMENT

2	Child Seat Restraint System Bracket

DESCRIPTION AND OPERATION

SEAT BELT SYSTEM DESCRIPTION AND OPERATION

Restraint System

NOTE: **If the vehicle has been in a collision, refer to Repairs and Inspections Required After a Collision for additional information.**

Vehicle has front and rear seat belts that are the primary means of occupant restraint. Seat belts help to keep the occupants inside the passenger compartment and to gradually reduce the impact forces during the following

d

events:

- Frontal impact type crashes
- Rear impact type crashes
- Side impact type crashes
- Roll-over type crashes

All seat belt retractors have emergency locks. The retractors remain unlocked during normal operation and under normal driving conditions. The retractors remain unlocked during normal conditions in order to allow free movement of the upper body of each occupant. A pendulum locks the seat belt webbing into position. The pendulum causes a locking bar to engage a cog on the spool of the retractor mechanism when any of the following conditions occur:

- A rapid extraction of the seat belt webbing from the retractor
- An abrupt change in vehicle speed
- An abrupt change in vehicle direction
- Operation of the vehicle on a steep upgrade
- Operation of the vehicle on a downgrade

The seat belts have an automatic locking (cinch) feature. The cinch feature is activated when the seat belt webbing is completely extended from the retractor. The cinch feature prevents the webbing from extending beyond the position from which it is allowed to retract. Use of the cinch feature is recommended for securing a child seat. The cinch feature may be cancelled by allowing the webbing to wind back completely into the retractor. After the cinch feature is cancelled, the webbing is unlocked. After the cinch feature is cancelled, the webbing will extend from the retractor. This vehicle is also equipped with a supplemental inflatable restraint (SIR) system. Refer to **Supplemental Inflatable Restraint System Description and Operation** .

Front Seat Belt System

The front seat belt system includes a driver and passenger seat belt pretensioner retractor. For more information on the pretensioner retractor refer to **Supplemental Inflatable Restraint System Description and Operation** . Both front seat belts includes a seat belt switch in the seat buckle which is monitored by the inflatable restraint sensing and diagnostic module (SDM) for control of a reminder lamp and a tone alarm.

NOTE: **The front passenger seat is equipped with a passenger presence system (PPS), which detects an occupant. If the PPS detects an empty front passenger seat, then the passenger fasten safety belt indicator will be disabled.**

- When the driver and passenger seat belts are buckled, and the ignition switch is turned ON, the instrument cluster will illuminate the driver and passenger seat belt indicators for a bulb check for several seconds, then turn OFF.
- When the driver seat belt is not buckled, and the ignition switch is in the ON position, the following events will occur:
  - The tone alarm will operate for 4-8 seconds and then go OFF.
  - The fasten safety belt indicator will turn ON solid for 20 seconds, then flash for 55 seconds before turning OFF. The tone alarm and indicator will immediately turn OFF when the driver seat belt is

d

buckled.

- When the passenger seat belt is not buckled with an occupant sitting in the passenger front seat, and the ignition switch is turned ON, the following events will occur after a delay of approximately 25 seconds:
  - The tone alarm will operate for 4-8 seconds and then go OFF.
  - The reminder lamp, which is located within the PPS status indicator for the passenger seat, will be turned ON solid for 20 seconds, then flash for 55 seconds before turning OFF. The tone alarm and indicator will immediately turn OFF when the passenger seat belt is buckled.

Rear Seat Belt System

The Rear Seat Belt System includes the following components:

- The rear seat belt retractor is located at the wheelhouse panel and attached to the floor panel by the rear seat shoulder belt retractor bracket.
- The rear seat belt buckles and the center seat belt are attached to floor panel.

Child Seat Restraint System

WARNING: A child in a rear-facing child restraint can be seriously injured if the right-front passengers air bag inflates. This is because the back of a rear-facing child restraint would be very close to the inflating air bag. NEVER use a rear-facing child restraint in this vehicle. If a forward-facing child restraint is suitable for your child, ALWAYS move the front passenger seat as far back as it will go and then install the child restraint. Be sure the child restraint position does not conflict with any additional requirements provided by the manufacturer. For more information, refer to the vehicle owners manual and the instruction that came with the child restraint.

The child seat may only be used in a forward facing seating location. The child seat should be installed and secured according to the manufacturer's directions. If the child seat has a top strap, the seat will need to be anchored. Passengers should not be allowed to sit at locations where the seat belts are being used to secure the child seat.

All vehicles are equipped with a dual-mode type retractor with emergency and automatic locking features. The automatic locking feature is for restraint of a child seat. The child seat can be secured by pulling the seat belt all the way out to lock it. Then tighten the seat belt around the child seat.

If a child seat is to be used in the second seat position, a special dealer-installed anchor must be used in order to anchor the child seat top strap. This only applies to the seats designed with the top strap provision and for the vehicles sold in Canada. In order to ensure the correct top strap angle, the child seat is only to be used at the seating position for which the top strap anchor is installed.

Fasten Safety Belt Indicators

There are 2 fasten safety belt indicators for this vehicle. The driver fasten safety belt reminder is located on the instrument panel cluster (IPC) and the passenger fasten safety belt reminder is located in the PASSENGER AIR BAG ON/OFF status indicator. The fasten safety belt indicator is only illuminated with the ignition in the RUN position. The IPC illuminates the fasten safety belt indicator under the following condition:

d

After a bulb check the SDM controls both indicators by using a serial data communications message to request illumination. If either seat belt is unfastened, (passenger indicator will only illuminate after an approximate 25 second delay, and only if an occupant is seated in the front passenger seat), the SDM will illuminate the appropriate fasten safety belt indicator for 20 seconds of solid illumination and then 55 seconds of flashing illumination before turning OFF or immediately turn OFF when the seat belt is fastened. If the driver seat belt is unfastened within 8 seconds following a key transition to RUN the SDM sends a message requesting 5 chimes to sound. When the enhanced reminder function is enabled the illumination and chime sequence will repeat after approximately 30 seconds and then again after 3 minutes if the seat belt remains unfastened and vehicle speed is greater than 5 mph.

Circuit/System Description

During a frontal crash of sufficient force the Inflatable Restraint Sensing and Diagnostic Module will allow current to flow through the deployment loop in order to deploy the driver Steering Wheel Air Bag. The Inflatable Restraint Sensing and Diagnostic Module performs continuous diagnostic tests on the deployment loops to check for proper circuit continuity and for shorts to ground or voltage. There are 2 shorting bars used

within the driver Steering Wheel Air Bag coil connector which will short together both driver Steering Wheel Air Bag stage 1 high circuit and driver Steering Wheel Air Bag stage 1 low circuit and both driver Steering Wheel Air Bag stage 2 high circuit and driver Steering Wheel Air Bag stage 2 low circuit when the connector is disconnected. This will help to prevent unwanted deployment of the Steering Wheel Air Bag during servicing.

Conditions for Running the DTC

Ignition voltage is between 9-16 V.

Conditions for Setting the DTC

B0012 01 stage 1 or B0013 01 stage 2

The driver Steering Wheel Air Bag deployment loop is shorted to voltage for 2 seconds.

B0012 02 stage 1 or B0013 02 stage 2

The driver Steering Wheel Air Bag deployment loop is shorted to ground for 2 seconds.

B0012 08 stage 1 or B0013 08 stage 2

The driver Steering Wheel Air Bag deployment loop is invalid during Inflatable Restraint Sensing and Diagnostic Module initialization.

B0012 0D stage 1 or B0013 0D stage 2

The driver Steering Wheel Air Bag deployment loop resistance is greater than 4.4 Ω for 2 seconds.

B0012 0E stage 1 or B0013 0E stage 2

The driver Steering Wheel Air Bag deployment loop resistance is less than 1.7 Ω for 2 seconds.

Action Taken When the DTC Sets

- The Inflatable Restraint Sensing and Diagnostic Module requests the Instrument Cluster to illuminate the AIR BAG indicator.
- The Inflatable Restraint Sensing and Diagnostic Module will store a DTC, however if an event occurs the system will still attempt deployment.

Conditions for Clearing the DTC

- The condition for setting the DTC is no longer exists.
- A history DTC will clear once 100 malfunction-free ignition cycles have occurred.

Diagnostic Aid

NOTE: The following diagnostic aids apply for both current and history DTCs.

A worn Steering Wheel Air Bag coil can cause a repeated history DTC to set. To verify this condition, turn the steering wheel 360 degrees in one direction then back 360 degrees in the other direction, multiple times, while viewing the scan tool Deployment Loop Resistance 1 and 2 parameters.

An incorrectly installed connector position assurance (CPA) or incorrectly seated connector can cause a shorting bar to short both control circuits together. Check the connectors and CPAs if a DTC with symptom byte 02 or 0E is set, to ensure the shorting bars are not causing the circuits to be shorted together. Shorting bars are used in the locations listed below:

- Steering Wheel Air Bag assembly
- Steering Wheel Air Bag Coil assembly
- Inline harness connectors
- Harness side of the Inflatable Restraint Sensing and Diagnostic Module connector

Terminal fretting or incorrectly seated connector can cause an open/high resistance condition. Check the circuit terminals for fretting or incorrectly seated connector if a DTC with symptom byte 04 or 0D is set.

Circuit/System Verification

NOTE:

- **Refer to SIR Service Precautions**
- **Inspect all terminals for damage or corrosion when disconnecting connectors. Damage or corrosion in the following requires repair or replacement of the affected component/connector.**
  - **Driver Steering Wheel Air Bag**

- **Driver Steering Wheel Air Bag coil**
- **Inflatable Restraint Sensing and Diagnostic Module**
- **Air bag wiring harness connector**
- **Inflatable Restraint Sensing and Diagnostic Module wiring harness connector**

- **The connector and connector position assurance (CPA) may seat independent of each other. Both the connector and CPA should seat with an audible and/or tactile click. The CPA isolates the shorting-bars within the connector allowing the deployment circuit to operate properly.**
- **If the condition is intermittent or cannot be duplicated, disconnect the connectors and add dielectric grease / lubricant (Nyogel 760G or equivalent, meeting GM specification 9986087). This procedure will correct the high resistance condition due to terminal fretting corrosion.**

1. Verify the appropriate scan tool Deployment Loop Resistance parameters stay consistently between 2.1 and 4.0 Ω without any spikes or dropouts while turning the steering wheel 360 degrees in one direction then back 360 degrees in the other direction.
   - **If less than 2.1 or greater than 4.0 Ω**

     Refer to Circuit/System Testing.

   - **If there are spikes or dropouts**

     Replace the X85 Steering Wheel Air Bag Coil.

   - **If within 2.1 and 4.0 Ω without any spikes or dropouts**
2. Verify DTC B0012 or B0013 is only set as a history DTC.
   - **If the DTC is set as current**

     Refer to Circuit/System Testing.

   - **If the DTC is set as history**
3. Verify the scan tool Deployment Loop Resistance parameters stay consistently between 2.1 and 4.0 Ω without any drop outs or spikes while moving the harness near each connector listed below.
   - X85 Steering Wheel Air Bag coil
   - F107 Steering Wheel Air Bag
   - Any inline harness connector
   - K36 Inflatable Restraint Sensing and Diagnostic Module
   - **If the reading is erratic while moving the harness, perform the following**
   - Inspect each connector terminal for damage or corrosion and repair as necessary.
   - Apply dielectric grease / lubricant (Nyogel 760G or equivalent, meeting GM specification 9986087) to each connector terminal.
   - Ensure each connector and CPA is correctly seated.
   - **If within 2.1 and 4.0 Ω without any spikes or dropouts**

4. All OK

Circuit/System Testing

1. Ignition OFF. Disconnect the scan tool. Disconnect the appropriate harness connector listed below at the F107 Steering Wheel Air Bag.
    - DTC B0012 connector X1
    - DTC B0013 connector X2
2. At the harness connector, test for greater than 25 Ω between the control circuit terminal 1 and the control circuit terminal 2.
    - **If 25 Ω or less**
    1. Disconnect the X1 harness connector at the Inflatable Restraint Sensing and Diagnostic Module.

        NOTE: **Some connectors may be equipped with shorting bars as a safety component to prevent accidental inflator deployment. When testing on a connector with shorting bars, the shorting bars must be disabled to ensure accurate test results. Insert an appropriate pick from EL-38125-580 and depress the shorting bars above the appropriate terminals. This will lift the shorting bar from the terminal and allow accurate test results. Take care not to damage the connector, shorting bar, or terminal when depressing the shorting bar.**

    2. Test for infinite resistance between the two control circuits.
        - If less than infinite resistance, repair the short between the two circuits.
        - If infinite resistance, replace the Inflatable Restraint Sensing and Diagnostic Module.
    - **If greater than 25 Ω**
3. Ignition ON.
4. Test for less than 11 V between the control circuit terminals listed below and ground:
    - Control circuit terminal 1
    - Control circuit terminal 2
    - **If 11 V or greater**
    1. Ignition OFF, disconnect the X1 harness connector at the K36 Inflatable Restraint Sensing and Diagnostic Module, ignition ON.
    2. Test for less than 1 V between the control circuit and ground.
        - If 1 V or greater, repair the short to voltage on the circuit.
        - If less than 1 V, replace the K36 Inflatable Restraint Sensing and Diagnostic Module.
    - **If less than 11 V**
5. Ignition OFF.
6. Test for greater than 25 Ω between the control circuit terminals listed below and ground:
    - Control circuit terminal 1
    - Control circuit terminal 2
    - **If 25 Ω or less**

1. Disconnect the X1 harness connector at the K36 Inflatable Restraint Sensing and Diagnostic Module.
2. Test for infinite resistance between the control circuit and ground.
    - If less than infinite resistance, repair the short to ground on the circuit.
    - If infinite resistance, replace the K36 Inflatable Restraint Sensing and Diagnostic Module.

- **If greater than 25 Ω**

7. Ignition OFF, install a 3 A fused jumper wire between the control circuit terminal 1 and the control circuit terminal 2, ignition ON.
8. Verify the scan tool Deployment Loop Resistance parameter is consistently less than 2 Ω while turning the steering wheel 360 degrees in one direction then back 360 degrees in the other direction.
    - **If the reading is erratic while turning the steering wheel**

      Replace the X85 Steering Wheel Air Bag.

    - **If 2 Ω or greater**

    1. Ignition OFF, disconnect the X1 harness connector at the K36 Inflatable Restraint Sensing and Diagnostic Module.
    2. Test for less than 2 Ω in the X85 Steering Wheel Air Bag coil and each control circuit end to end.
        - If 2 Ω or greater, replace the coil or repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the K36 Inflatable Restraint Sensing and Diagnostic Module.

    - **If less than 2 Ω**

9. Ignition OFF, disconnect the 3 A fused jumper wire. Connect the harness connector at the F107 Steering Wheel Air Bag, press in the CPA (if equipped) until an audible and/or tactile click is heard.
10. Ignition ON, clear DTCs. Operate the vehicle within the Conditions for Running the DTC.
11. Verify DTC B0012 is not set.
    - **If DTC B0012 is set**

      Replace the F107 Steering Wheel Air Bag.

    - **If DTC B0012 is not set**

12. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- **Steering Wheel Airbag Coil Replacement**
- **Airbag Steering Wheel Module Replacement**
- **SIR/SRS Wiring Repairs**
- **Control Module References** for Inflatable Restraint Sensing and Diagnostic Module replacement, programming and setup

Right Front Side Air Bag Low Control	B0021 02, B0021 0E	B0021 0D	B0021 08	B0021 01	-

Circuit/System Description

During a side or frontal crash of sufficient force the Inflatable Restraint Sensing and Diagnostic Module will allow current to flow through the deployment loop in order to deploy an air bag. There are 2 shorting bars used within the connector that will short together the control circuits, when the connector is disconnected. This will help to prevent unwanted deployment of the air bag or retractor pretensioner during servicing.

Conditions for Running the DTC

Ignition voltage is between 9-16 V.

Conditions for Setting the DTC

B0014 01, B0021 01

The air bag control circuit is shorted to voltage for 2 seconds.

B0014 02, B0021 02

The air bag control circuit is shorted to ground for 2 seconds.

B0014 08, B0021 08

The air bag control circuit is open for 2 seconds.

B0014 0D, B0021 0D

The air bag deployment loop resistance is greater than 4.2 Ω for 2 seconds.

B0014 0E, B0021 0E

The air bag deployment loop resistance is less than 1.4 Ω for 2 seconds.

Action Taken When the DTC Sets

- The Inflatable Restraint Sensing and Diagnostic Module requests the Instrument Cluster to illuminate the AIR BAG indicator.
- The Inflatable Restraint Sensing and Diagnostic Module will store a DTC, however if an event occurs the system will still attempt deployments.

Conditions for Clearing the DTC

- The condition for setting the DTC no longer exists.
- A history DTC will clear once 100 malfunction-free ignition cycles have occurred.

Diagnostic Aid

NOTE: The following diagnostic aids apply for both current and history DTCs.

An incorrectly installed connector position assurance (CPA) or incorrectly seated connector can cause a shorting bar to short both control circuits together. Check the connectors and CPAs if a DTC with symptom byte 02 or 0E is set, to ensure the shorting bars are not causing the circuits to be shorted together. Shorting bars are used in the locations listed below:

- Left and right Seat Side Air Bags
- Inline harness connectors
- Harness side of the Inflatable Restraint Sensing and Diagnostic Module connector

Terminal fretting or incorrectly seated connector can cause an open/high resistance condition. Check the circuit terminals for fretting or incorrectly seated connector if a DTC with symptom byte 04 or 0D is set. DTCs of deployment loops which are in the seat can occur because of stress or damage to the harness due to seat movement. Move the seat to the full extent of travel while using the scan tool to observe deployment type loop parameters.

Circuit/System Testing

NOTE:

- **Refer to SIR Service Precautions**
- **Inspect all terminals for damage or corrosion when disconnecting connectors. Damage or corrosion in the following requires repair or replacement of the affected component/connector.**
  - **Seat side air bag**
  - **Inflatable Restraint Sensing and Diagnostic Module**
  - **All wiring harness connectors**
  - **Inflatable Restraint Sensing and Diagnostic Module wiring harness connector**
- **The connector and connector position assurance (CPA) may seat independent of each other. Both the connector and CPA should seat with an audible and/or tactile click. The CPA isolates the shorting-bars within the connector allowing the deployment circuit to operate properly.**
- **If the condition is intermittent or cannot be duplicated, disconnect the connectors and add dielectric grease / lubricant (Nyogel 760G or equivalent, meeting GM specification 9986087). This procedure will correct the high resistance condition due to terminal fretting corrosion.**

1. Ignition OFF, disconnect the scan tool and then disconnect the appropriate F106 Side Air Bag. It may take up to 2 minutes for all vehicle systems to power down.
2. Test for greater than 25 Ω between the control circuit terminals 1 and 2.
   - **If 25 Ω or less**
   1. Disconnect the harness connector listed below at the K36 Inflatable Restraint Sensing and Diagnostic Module:
      - DTC B0014 - connector X1
      - DTC B0021 - connector X2

      NOTE: **Some connectors may be equipped with shorting bars as a safety component to prevent accidental inflator deployment. When testing on a connector with shorting bars, the shorting bars must be disabled to ensure accurate test results. Insert an appropriate pick from EL-38125-580 and depress the shorting bars above the appropriate terminals. This will lift the shorting bar from the terminal and allow accurate test results. Take care not to damage the connector, shorting bar, or terminal when depressing the shorting bar.**

   2. Test for infinite resistance between the two control circuits.
      - If less than infinite resistance, repair the short between the two circuits.
      - If infinite resistance, replace the K36 Inflatable Restraint Sensing and Diagnostic Module.
   - **If greater than 25 Ω**
3. Ignition ON.

4. Test for less than 11 V between the control circuit terminals listed below and ground:
    - F106LF Seat Air Bag - Left Front control circuit terminal 1 X1
    - F106LF Seat Air Bag - Left Front control circuit terminal 2 X1
    - F106RF Seat Air Bag - Right Front control circuit terminal 1 X1
    - F106RF Seat Air Bag - Right Front control circuit terminal 2 X1
    - **If 11 V or greater**

      Repair the short to voltage on the circuit.

    - **If less than 11 V**
5. Ignition OFF.
6. Test for greater than 25 Ω between the control circuit terminals listed below and ground:
    - F106LF Seat Air Bag - Left Front control circuit terminal 1 X1
    - F106LF Seat Air Bag - Left Front control circuit terminal 2 X1
    - F106RF Seat Air Bag - Right Front control circuit terminal 1 X1
    - F106RF Seat Air Bag - Right Front control circuit terminal 2 X1
    - **If 25 Ω or less**

      Repair the short to ground on the circuit.

    - **If greater than 25 Ω**
7. Ignition OFF, disconnect the harness connectors at the Inflatable Restraint Sensing and Diagnostic Module.
8. Test for less than 2 Ω between each harness connector terminal listed below end to end:
    - F106LF Seat Air Bag - Left Front control circuit terminal 1 X1 and K36 Inflatable Restraint Sensing and Diagnostic Module 6 X1
    - F106LF Seat Air Bag - Left Front control circuit terminal 2 X1 and K36 Inflatable Restraint Sensing and Diagnostic Module 5 X1
    - F106RF Seat Air Bag - Right Front control circuit terminal 1 X1 and K36 Inflatable Restraint Sensing and Diagnostic Module 5 X2
    - F106RF Seat Air Bag - Right Front control circuit terminal 2 X1 and K36 Inflatable Restraint Sensing and Diagnostic Module 6 X2
    - **If 2 Ω or greater**

      Repair the open/high resistance in the circuit.

    - **If less than 2 Ω**
9. Ignition OFF, connect all harness connectors, press in the CPA (if equipped) until an audible and/or tactile click is heard.
10. Ignition ON.
11. Clear DTCs. Operate the vehicle within the Conditions for Running the DTC.
12. Verify DTC B0014 or B0021 is not set.
    - **If DTC B0014 or B0021 is set**

Replace the appropriate F106 Side Air Bag.

- **If DTC B0014 or B0021 is not set**

13. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- **Front Seat Outboard Seat Back Airbag Replacement**
- **Control Module References** for Inflatable Restraint Sensing and Diagnostic Module replacement, programming and setup

DTC B0015, B001A, B001B, OR B0022: SEAT BELT ANCHOR PRETENSIONER DEPLOYMENT

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.

Circuit/System Description

During a side or frontal crash of sufficient force the Inflatable Restraint Sensing and Diagnostic Module (SDM) will allow current to flow through the deployment loop in order to deploy an air bag or pretensioner. There are 2 shorting bars which will short together control circuits, when the connector is disconnected. This will help to prevent unwanted deployment of the air bag or pretensioner during servicing.

Conditions for Running the DTC

Ignition voltage is between 9-16 V.

Conditions for Setting the DTC

B0015 01, B001A 01, B001B 01, B0022 01

The pretensioner control circuit is shorted to voltage for 2 seconds.

B0015 02, B001A 02, B001B 02, B0022 02

The pretensioner control circuit is shorted to ground for 2 seconds.

B0015 04, B001A 04, B001B 04, B0022 04

The pretensioner control circuit is open for 2 seconds.

B0015 0D, B001A 0D, B001B 0D, B0022 0D

The pretensioner deployment loop resistance is greater than 4.2 Ω for 2 seconds.

B0015 0E, B001A 0E, B001B 0E, B0022 0E

The pretensioner deployment loop resistance is less than 1.4 Ω for 2 seconds.

Action Taken When the DTC Sets

- The Inflatable Restraint Sensing and Diagnostic Module requests the instrument cluster to illuminate the AIR BAG indicator.
- The Inflatable Restraint Sensing and Diagnostic Module will store a DTC, however if an event occurs the system will still attempt deployments.

Conditions for Clearing the DTC

- The condition for setting the DTC no longer exists.
- A history DTC will clear once 100 malfunction-free ignition cycles have occurred.

Diagnostic Aid

NOTE: The following diagnostic aids apply for both current and history DTCs.

An incorrectly installed connector position assurance (CPA) or incorrectly seated connector can cause a shorting bar to short both control circuits together. Check the connectors and CPAs if a DTC with symptom byte 02 or 0E is set, to ensure the shorting bars are not causing the circuits to be shorted together. Shorting bars are used in the locations listed below:

- Driver and passenger anchor or retractor pretensioners
- Inline harness connectors
- Harness side of the Inflatable Restraint Sensing and Diagnostic Module connector

Terminal fretting or incorrectly seated connectors can cause an open/high resistance condition. Check the circuit terminals for fretting or incorrectly seated connector if a DTC with symptom byte 04 or 0D is set. DTCs of deployment loops which are in the seat can occur because of stress or damage to the harness due to seat movement. Move the seat to the full extent of travel while using the scan tool to observe deployment type loop parameters.

Circuit/System Verification

NOTE: **Refer to SIR Service Precautions.**

Inspect all terminals for damage or corrosion when disconnecting connectors. Damage or corrosion in the following requires repair or replacement of the affected component/connector.

- **Seat Belt Retractor Pretensioner**
- **Seat Belt Anchor Pretensioner**
- **Inflatable Restraint Sensing and Diagnostic Module**
- **Seat Belt Retractor Pretensioner wiring harness connector**
- **Seat Belt Anchor Pretensioner wiring harness connector**
- **Inflatable Restraint Sensing and Diagnostic Module wiring harness connector**

NOTE: **The connector and connector position assurance (CPA) may seat independent of each other. Both the connector and CPA should seat with an audible and/or tactile click. The CPA isolates the shorting-bars within the connector allowing the deployment circuit to operate properly.**

If the condition is intermittent or cannot be duplicated, disconnect the connectors and add dielectric grease / lubricant (Nyogel 760G or equivalent, meeting GM specification 9986087). This procedure will correct the high resistance condition due to terminal fretting corrosion.

1. Verify the appropriate scan tool Deployment Loop Resistance parameters stay consistently between 2.1 and 4.0 Ω without any spikes or dropouts while moving the harness near each connector listed below:
   - F112 Seat Belt Retractor Pretensioner
   - F113 Seat Belt Anchor Pretensioner
   - Any inline harness connector
   - K36 Inflatable Restraint Sensing and Diagnostic Module
   - **If less than 2.1 or greater than 4.0 Ω**

Refer to Circuit/System Testing.

- **If there are spikes or dropouts, perform the following**
- Inspect each connector terminal and harness for damage or corrosion and repair as necessary
- Apply dielectric grease / lubricant (Nyogel 760G or equivalent, meeting GM specification 9986087) to each connector terminal
- Insure each connector and CPA is correctly seated.
- **If within 2.1 and 4.0 Ω without any spikes or dropouts**

2. All OK

Circuit/System Testing

1. Ignition OFF. Scan tool disconnected. Disconnect the appropriate harness connector listed below:
   - F112 Seat Belt Retractor Pretensioner
   - F113 Seat Belt Anchor Pretensioner
2. Test for greater than 25 Ω between the control circuit terminals 1 and 2.
   - **If 25 Ω or less**
   1. Disconnect the X2 harness connector at the K36 Inflatable Restraint Sensing and Diagnostic Module.

      NOTE: **Some connectors may be equipped with shorting bars as a safety component to prevent accidental deployment. When testing on a connector with shorting bars, the shorting bars must be disabled to ensure accurate test results. Insert an appropriate pick from EL-38125-580 and depress the shorting bars above the appropriate terminals. This will lift the shorting bar from the terminal and allow accurate test results. Take care not to damage the connector, shorting bar, or terminal when depressing the shorting bar.**

   2. Test for infinite resistance between the two control circuits.
      - If less than infinite resistance, repair the short between the two circuits.
      - If infinite resistance, replace the K36 Inflatable Restraint Sensing and Diagnostic Module.
   - **If greater than 25 Ω**
3. Ignition ON.
4. Test for less than 11 V between the control circuit terminals listed below and ground:
   - Control circuit terminal 1
   - Control circuit terminal 2
   - **If 11 V or greater**
   1. Ignition OFF. Disconnect the X2 harness connector at the K36 Inflatable Restraint Sensing and Diagnostic Module. Ignition ON
   2. Test for less than 1 V between the control circuit and ground.
      - If 1 V or greater, repair the short to voltage on the circuit.
      - If less than 1 V, replace the K36 Inflatable Restraint Sensing and Diagnostic Module.

- **If less than 11 V**

5. Ignition OFF.
6. Test for greater than 25 Ω between the control circuit terminals listed below and ground:
    - Control circuit terminal 1
    - Control circuit terminal 2
    - **If 25 Ω or less**
    1. Disconnect the X2 harness connector at the K36 Inflatable Restraint Sensing and Diagnostic Module.
    2. Test for infinite resistance between the control circuit and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance, replace the K36 Inflatable Restraint Sensing and Diagnostic Module.
    - **If greater than 25 Ω**
7. Install a 3 A fused jumper wire between the control circuit terminals 1 and 2. Ignition ON.
8. Verify the appropriate scan tool Deployment Loop Resistance parameter is less than 2 Ω.
    - **If 2 Ω or greater**
    1. Ignition OFF. Disconnect the X2 harness connector at the K36 Inflatable Restraint Sensing and Diagnostic Module.
    2. Test for less than 2 Ω in each control circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the K36 Inflatable Restraint Sensing and Diagnostic Module.
    - **If less than 2 Ω**
9. Ignition OFF, connect the harness connector at the F112 Seat Belt Retractor Pretensioner or F113 Seat Belt Anchor Pretensioner, press in the CPA (if equipped) until an audible and/or tactile click is heard.
10. Ignition ON, clear DTCs. Operate the vehicle within the Conditions for Running the DTC.
11. Verify DTC B0015, B001A, B001B, or B0022 is not set.
    - **If DTC B0015, B001A, B001B, or B0022 is set**

      Replace the appropriate F112 Seat Belt Retractor Pretensioner or F113 Seat Belt Anchor Pretensioner.

    - **If DTC B0015, B001A, B001B, or B0022 is not set**
12. All OK.

Circuit/System Description

During a side or frontal crash of sufficient force the Inflatable Restraint Sensing and Diagnostic Module will allow current to flow through the deployment loop in order to deploy an air bag or pretensioner. There are 2 shorting bars which will short together control circuits, when the connector is disconnected. This will help to prevent unwanted deployment of the air bag or pretensioner during servicing.

Conditions for Running the DTC

Ignition voltage is between 9-16 V.

Conditions for Setting the DTC

B0016 01, B0023 01

The air bag control circuit is shorted to voltage for 2 seconds.

B0016 02, B0023 02

The air bag control circuit is shorted to ground for 2 seconds.

B0016 08, B0023 08

The air bag control circuit is open for 2 seconds.

B0016 0D, B0023 0D

The air bag deployment loop resistance is greater than 4.2 Ω for 2 seconds.

B0016 0E, B0023 0E

The air bag deployment loop resistance is less than 1.4 Ω for 2 seconds.

Action Taken When the DTC Sets

- The Inflatable Restraint Sensing and Diagnostic Module requests the instrument cluster to illuminate the AIR BAG indicator.
- The Inflatable Restraint Sensing and Diagnostic Module will store a DTC, however if an event occurs the system will still attempt deployments.

Conditions for Clearing the DTC

- The condition for setting the DTC no longer exists.
- A history DTC will clear once 100 malfunction-free ignition cycles have occurred.

Diagnostic Aid

NOTE: The following diagnostic aids apply for both current and history DTCs.

An incorrectly installed connector position assurance (CPA) or incorrectly seated connector can cause a shorting bar to short both control circuits together. Check the connectors and CPAs if a DTC with symptom byte 02 or 0E is set, to ensure the shorting bars are not causing the circuits to be shorted together. Shorting bars are used in the locations listed below:

- Passenger Instrument Panel Air Bag
- Driver and passenger seat side air bags
- Left and right Roof Rail Air Bags
- Driver and passenger seat belt buckle pretensioners
- Inline harness connectors
- Harness side of the Inflatable Restraint Sensing and Diagnostic Module connector

Terminal fretting or incorrectly seated connectors can cause an open/high resistance condition. Check the circuit terminals for fretting or incorrectly seated connector if a DTC with symptom byte 04 or 0D is set. DTCs of deployment loops which are in the seat DTC can occur because of stress or damage to the harness due to seat movement. Move the seat to the full extent of travel while using the scan tool to observe deployment type loop parameters.

Circuit/System Testing

1. Ignition OFF. Scan tool disconnected. It may take up to 2 minutes for all vehicle systems to shut down. Disconnect the appropriate harness connected listed below:
    - DTC B0016 - Roof Rail Air Bag-Left
    - DTC B0023 - Roof Rail Air Bag-Right
2. At the harness connector, test for greater than 25 Ω between the control circuit terminals 1 and 2.
    - **If 25 Ω or less**
    1. Disconnect the X2 harness connector at the K36 Inflatable Restraint Sensing and Diagnostic Module.

        NOTE: **Some connectors may be equipped with shorting bars as a safety component to prevent accidental inflator deployment. When testing on a connector with shorting bars, the shorting bars must be disabled to ensure accurate test results. Insert an appropriate pick from EL-38125-580 and depress the shorting bars above the appropriate terminals. This will lift the shorting bar from the terminal and allow accurate test results. Take care not to damage the connector, shorting bar, or terminal when depressing the shorting bar.**

    2. Test for infinite resistance between the two control circuits.
        - If less than infinite resistance, repair the short between the two circuits.
        - If infinite resistance, replace the K36 Inflatable Restraint Sensing and Diagnostic Module.
    - **If greater than 25 Ω**
3. Ignition ON.
4. Test for less than 11 V between the control circuit terminals listed below and ground:
    - Control circuit terminal 1
    - Control circuit terminal 2
    - **If 11 V or greater**
    1. Ignition OFF. Disconnect the X2 harness connector at the K36 Inflatable Restraint Sensing and Diagnostic Module. Ignition ON.
    2. Test for less than 1 V between the control circuit and ground.
        - If 1 V or greater, repair the short to voltage on the circuit.
        - If less than 1 V, replace the K36 Inflatable Restraint Sensing and Diagnostic Module.
    - **If less than 11 V**
5. Ignition OFF.
6. Test for greater than 25 Ω between the control circuit terminals listed below and ground:

- Control circuit terminal 1
- Control circuit terminal 2
- **If 25 Ω or less**

1. Disconnect the X2 harness connector at the K36 Inflatable Restraint Sensing and Diagnostic Module.
2. Test for infinite resistance between the control circuit and ground.
    - If less than infinite resistance, repair the short to ground on the circuit.
    - If infinite resistance, replace the K36 Inflatable Restraint Sensing and Diagnostic Module.

- **If greater than 25 Ω**

7. Ignition OFF, disconnect the X2 harness connector at the Inflatable Restraint Sensing and Diagnostic Module.
8. Test for less than 2 Ω between each appropriate harness connector terminal listed below end to end:
    - F105L Roof Rail Air Bag - Left control circuit terminal 1 and K36 Inflatable Restraint Sensing and Diagnostic Module 1 X2
    - F105L Roof Rail Air Bag - Left control circuit terminal 2 and K36 Inflatable Restraint Sensing and Diagnostic Module 2 X2
    - F105R Roof Rail Air Bag - Right control circuit terminal 1 and K36 Inflatable Restraint Sensing and Diagnostic Module 4 X2
    - F105R Roof Rail Air Bag - Right control circuit terminal 2 and K36 Inflatable Restraint Sensing and Diagnostic Module 3 X2
    - **If 2 Ω or greater**

      Repair the open/high resistance in the circuit.

    - **If less than 2 Ω**
9. Ignition OFF, connect all harness connectors, press in the CPA (if equipped) until an audible and/or tactile click is heard.
10. Ignition ON.
11. Clear DTCs. Operate the vehicle within the Conditions for Running the DTC.
12. Verify DTC B0016 or B0023 is not set.
    - **If DTC B0016 or B0023 is set**

      Replace the appropriate F105 Roof Rail Air Bag.

    - **If DTC B0016 or B0023 is not set**
13. All OK.

Circuit/System Description

During a side or frontal crash of sufficient force the Inflatable Restraint Sensing and Diagnostic Module will allow current to flow through the deployment loop in order to deploy an air bag or pretensioner. There are 2 shorting bars which will short together control circuits, when the connector is disconnected. This will help to prevent unwanted deployment of the air bag or pretensioner during servicing.

Conditions for Running the DTC

Ignition voltage is between 9-16 V.

Conditions for Setting the DTC

B0019 01, B0020 01

The air bag control circuit is shorted to voltage for 2 seconds.

B0019 02, B0020 02

The air bag control circuit is shorted to ground for 2 seconds.

B0019 08, B0020 08

The air bag control circuit is open for 2 seconds.

B0019 0D, B0020 0D

The air bag deployment loop resistance is greater than 4.2 Ω for 2 seconds.

B0019 0E, B0020 0E

The air bag deployment loop resistance is less than 1.4 Ω for 2 seconds.

Action Taken When the DTC Sets

- The Inflatable Restraint Sensing and Diagnostic Module requests the instrument cluster to illuminate the

AIR BAG indicator.

- The Inflatable Restraint Sensing and Diagnostic Module will store a DTC, however if an event occurs the system will still attempt deployments.

Conditions for Clearing the DTC

- The condition for setting the DTC no longer exists.
- A history DTC will clear once 100 malfunction-free ignition cycles have occurred.

Diagnostic Aid

NOTE: The following diagnostic aids apply for both current and history DTCs.

An incorrectly installed connector position assurance (CPA) or incorrectly seated connector can cause a shorting bar to short both control circuits together. Check the connectors and CPAs if a DTC with symptom byte 02 or 0E is set, to ensure the shorting bars are not causing the circuits to be shorted together. Shorting bars are used in the locations listed below:

- Passenger Instrument Panel Air Bag
- Inline harness connectors
- Harness side of the Inflatable Restraint Sensing and Diagnostic Module connector

Terminal fretting or incorrectly seated connectors can cause an open/high resistance condition. Check the circuit terminals for fretting or incorrectly seated connector if a DTC with symptom byte 04 or 0D is set. DTCs of deployment loops which are in the seat can occur because of stress or damage to the harness due to seat movement. Move the seat to the full extent of travel while using the scan tool to observe deployment type loop parameters.

Circuit/System Testing

NOTE:

- **Refer to SIR Service Precautions.**
- **Inspect all terminals for damage or corrosion when disconnecting connectors. Damage or corrosion in the following requires repair or replacement of the affected component/connector.**
  - **Passenger Instrument Panel Air Bag**
  - **Passenger Instrument Panel Air Bag wiring harness connector**
  - **Inflatable Restraint Sensing and Diagnostic Module**
  - **Inflatable Restraint Sensing and Diagnostic Module wiring harness connector**
- **The connector and connector position assurance (CPA) may seat independent of each other. Both the connector and CPA should seat with an audible and/or tactile click. The CPA isolates the shorting-bars within the connector allowing the deployment circuit to operate properly.**
- **If the condition is intermittent or cannot be duplicated, disconnect the connectors and add dielectric grease / lubricant (Nyogel 760G or equivalent, meeting GM specification 9986087). This procedure will correct the high resistance condition due to terminal fretting corrosion.**

1. Ignition OFF. Scan tool disconnected. Disconnect the F105 Passenger Instrument Panel Air Bag inline harness connector X278.
2. At the harness connector, test for greater than 25 Ω between the appropriate control circuit terminals listed below on the K36 Inflatable Restraint Sensing and Diagnostic Module side of the connector:
   - F105 Passenger Instrument Panel Air Bag stage 1 X278 terminal B1 and B2
   - F105 Passenger Instrument Panel Air Bag stage 2 X278 terminal A1 and A2
   - **If 25 Ω or less**
   1. Disconnect the X2 harness connector at the K36 Inflatable Restraint Sensing and Diagnostic Module.

      NOTE: **Some connectors may be equipped with shorting bars as a safety component to prevent accidental inflator deployment. When testing on a connector with shorting bars, the shorting bars must be disabled to ensure accurate test results. Insert an appropriate pick from EL-38125-580 and depress the shorting bars above the appropriate terminals. This will lift the shorting bar from the terminal and allow accurate test results. Take care not to damage the**

connector, shorting bar, or terminal when depressing the shorting bar.

2. Test for infinite resistance between the two control circuits.
    - If less than infinite resistance, repair the short between the two circuits.
    - If infinite resistance, replace the K36 Inflatable Restraint Sensing and Diagnostic Module.

- **If greater than 25 Ω**

3. Ignition ON.
4. Test for less than 11 V between the control circuit terminals listed below and ground:
    - X278 control circuit terminal A1
    - X278 control circuit terminal A2
    - X278 control circuit terminal B1
    - X278 control circuit terminal B2

- **If 11 V or greater**

1. Ignition OFF. Disconnect the X2 harness connector at the K36 Inflatable Restraint Sensing and Diagnostic Module. Ignition ON.
2. Test for less than 1 V between the control circuit and ground.
    - If 1 V or greater, repair the short to voltage on the circuit.
    - If less than 1 V, replace the K36 Inflatable Restraint Sensing and Diagnostic Module.

- **If less than 11 V**

5. Ignition OFF. Test for greater than 25 Ω between the control circuit terminals listed below and ground:
    - X278 control circuit terminal A1
    - X278 control circuit terminal A2
    - X278 control circuit terminal B1
    - X278 control circuit terminal B2

- **If 25 Ω or less**

1. Disconnect the X2 harness connector at the K36 Inflatable Restraint Sensing and Diagnostic Module.
2. Test for infinite resistance between the control circuit and ground.
    - If less than infinite resistance, repair the short to ground on the circuit.
    - If infinite resistance, replace the K36 Inflatable Restraint Sensing and Diagnostic Module.

- **If greater than 25 Ω**

6. Ignition OFF. Connect the inline harness connector X278. Disconnect the appropriate F105 Passenger Instrument Panel Air Bag harness connector.
7. Ignition ON.
8. Test for less than 11 V between the control circuit terminals listed below and ground:
    - F105 Passenger Instrument Panel Air Bag control circuit terminal 1 X1
    - F105 Passenger Instrument Panel Air Bag control circuit terminal 2 X1
    - F105 Passenger Instrument Panel Air Bag control circuit terminal 1 X2

- F105 Passenger Instrument Panel Air Bag control circuit terminal 2 X2
- **If 11 V or greater**

  Repair the short to voltage on the circuit.

- **If less than 11 V**

9. Ignition OFF.
10. Test for greater than 25 Ω between the control circuit terminals listed below and ground:
    - F105 Passenger Instrument Panel Air Bag control circuit terminal 1 X1
    - F105 Passenger Instrument Panel Air Bag control circuit terminal 2 X1
    - F105 Passenger Instrument Panel Air Bag control circuit terminal 1 X2
    - F105 Passenger Instrument Panel Air Bag control circuit terminal 2 X2
    - **If 25 Ω or less**

      Repair the short to ground on the circuit.

    - **If greater than 25 Ω**
11. Ignition OFF, disconnect the X1 harness connector at the Inflatable Restraint Sensing and Diagnostic Module.
12. Test for less than 2 Ω between each harness connector terminal listed below end to end:
    - F105 Passenger Instrument Panel Air Bag control circuit - terminal 1 X1 and K36 Inflatable Restraint Sensing and Diagnostic Module 1 X1
    - F105 Passenger Instrument Panel Air Bag control circuit - terminal 2 X1 and K36 Inflatable Restraint Sensing and Diagnostic Module 2 X1
    - F105 Passenger Instrument Panel Air Bag control circuit - terminal 1 X2 and K36 Inflatable Restraint Sensing and Diagnostic Module 4 X1
    - F105 Passenger Instrument Panel Air Bag control circuit - terminal 2 X2 and K36 Inflatable Restraint Sensing and Diagnostic Module 3 X1
    - **If 2 Ω or greater**

      Repair the open/high resistance in the circuit.

    - **If less than 2 Ω**
13. Ignition OFF, connect the harness connector at the F105 Passenger Instrument Panel Air Bag, press in the CPA (if equipped) until an audible and/or tactile click is heard.
14. Ignition OFF, connect all harness connectors, press in the CPA (if equipped) until an audible and/or tactile click is heard.
15. Ignition ON.
16. Clear DTCs. Operate the vehicle within the Conditions for Running the DTC.
17. Verify DTC B0019 or B0020 is not set.
    - **If DTC B0019 or B0020 is set**

      Replace the F105 Passenger Instrument Panel Air Bag.

- **If DTC B0019 or B0020 is not set**

18. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

DTC B0052: DEPLOYMENT COMMANDED

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using the diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptors

DTC B0052 00

Deployment Commanded

DTC B0052 56

Deployment Commanded Too Many Transitions

Circuit/System Description

The inflatable restraint sensing and diagnostic module (SDM) senses vehicle impacts and provides deployment signals to the air bags and anchor and/or retractor pretensioners when warranted. The inflatable restraint sensing and diagnostic module sets DTC B0052 after each command for deployment. DTC B0052 will latch and not clear after 3 commanded deployments by the inflatable restraint sensing and diagnostic module. Therefore the inflatable restraint sensing and diagnostic module has to be replaced.

Conditions for Running the DTC

Ignition voltage is between 9-16 V.

Conditions for Setting the DTC

- The inflatable restraint sensing and diagnostic module detects a frontal impact of sufficient force to warrant deployment of the frontal air bags.
- The inflatable restraint sensing and diagnostic module detects a side impact or rollover (if equipped) of sufficient force to warrant deployment of a seat air bag and/or roof rail air bag.

Action Taken When the DTC Sets

The inflatable restraint sensing and diagnostic module requests the instrument cluster to illuminate the AIR BAG indicator.

Conditions for Clearing the DTC

- DTC B0052 00 is a DTC that may be cleared with a scan tool without replacing the inflatable restraint sensing and diagnostic module. This DTC will not clear if deployment has been commanded more then two times, and the inflatable restraint sensing and diagnostic module would have to be replaced.
- DTC B0052 56 is a latched DTC. The DTC cannot be cleared with the scan tool. Replacement of the inflatable restraint sensing and diagnostic module is required.

DTC B0055: SIDE AIR BAG DEPLOYMENT COMMANDED

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category

DTC Descriptor

DTC B0055 00

Side Air Bag Deployment Commanded

Circuit/System Description

The inflatable restraint sensing and diagnostic module (SDM) contains a sensing device that converts vehicle velocity changes into an electrical signal. The SDM compares this electrical signal to a value stored in memory. When the generated signal exceeds the stored value, the SDM performs additional signal processing and compares the generated signals to values stored in memory. When 2 of the generated signals exceed the stored values, the SDM will cause current to flow through the air bags, deploying the side air bags and causing DTC B0055 to set.

This DTC is set when the SDM has commanded an air bag deployment with no faults present.

Conditions for Running the DTC

Ignition voltage is between 9-16 V.

Conditions for Setting the DTC

- The SDM detects a frontal impact of sufficient force to warrant deployment of the frontal air bags.
- The SDM detects a side impact of sufficient force to warrant deployment of a side air bag and/or roof rail air bag.

Action Taken When the DTC Sets

- The SDM requests the instrument panel cluster (IPC) to illuminate the AIR BAG indicator.
- The SDM records crash data.

Conditions for Clearing the DTC

DTC B0055 is a latched code and cannot be cleared.

DTC B0056-B0058: AIR BAG/PRETENSIONER SUPPRESSED

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptors

DTC B0056 00

Passenger Frontal Air Bag Suppressed

DTC B0057 00

Passenger Side Air Bag Suppressed

DTC B0058 00

Passenger Pretensioner Suppressed

Circuit/System Description

When the ignition is turned ON, the passenger presence system (PPS) and the inflatable restraint sensing and diagnostic module (SDM) performs tests to diagnose critical malfunctions within itself. The PPS is used to monitor the weight of an occupant in the front passenger seat. If the pressure from the occupant's weight is less than a specified value or an empty seat is detected, the PPS module will send a suppress signal to the SDM to disable the passenger instrument panel air bag. When the PPS detects a fault within itself, then the PPS will communicate to the SDM through serial data communications that a PPS fault is present. The SDM will suppress the deployment of the module and then illuminate the AIR BAG indicator.

DTC B0056 sets because the PPS commanded to suppress the passenger instrument panel air bag when the vehicle was involved in a collision and the SDM has commanded an air bag deployment.

DTC B0057 sets because the PPS commanded to suppress the passenger seat side air bag when the vehicle was involved in a collision and the SDM has commanded an air bag deployment.

DTC B0058 sets because the PPS commanded to suppress the passenger seat belt pretensioners when the vehicle was involved in a collision and the SDM has commanded an air bag deployment.

Conditions for Running the DTC

Ignition voltage is between 9-16 volts.

Conditions for Setting the DTC

This DTC sets when the SDM has commanded an air bag deployment while the PPS has determined that the front passenger seat has one the following conditions:

- The pressure from the occupant's weight is less than a specified value. The PPS module sent a suppress signal to the SDM to suppress the passenger instrument panel air bag.

- Empty front passenger seat
- A PPS fault was detected

Action Taken When the DTC Sets

- DTC B0056 and B0058 will only set if there is a child seated or the passenger seat is empty.
- DTC B0052, B0053, or B0055 will set along with this DTC.
- The SDM requests the instrument panel cluster (IPC) to illuminate the AIR BAG indicator.

Conditions for Clearing the DTC

Any of the codes will set along with one of the following latched codes: DTC B0052, B0053, or B0055 and cannot be cleared.

- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptors

DTC B0074 00

Passenger Presence Sensor

DTC B0074 0D

Passenger Presence Sensor Circuit Resistance Above Threshold

DTC B0074 0E

Passenger Presence Sensor Circuit Resistance Below Threshold

DTC B0074 0F

Passenger Presence Sensor Circuit Erratic (Wet Seat)

Circuit/System Description

The passenger presence sensor continually monitors itself and if a fault in this circuit occurs, a DTC will set in the passenger presence module. When the inflatable restraint sensing and diagnostic module (SDM) detects this DTC within the passenger presence module, it will notify the customer of the enable/disable status by illuminating the OFF indicator on the PASSENGER AIR BAG ON/OFF indicators. Then the passenger presence module will communicate to the SDM through serial data communications that a PPS fault is present. The SDM will then disable the deployment of the passenger instrument panel air bag and then illuminate the AIR BAG warning indicator.

Conditions for Running the DTC

Ignition voltage is between 9-16 V.

Conditions for Setting the DTC

- The SDM has received a fault message from the passenger presence module.
- The passenger presence module detects a wet seat fault if DTC B0074 0F is set.

Action Taken When the DTC Sets

- The SDM disables the passenger instrument panel air bag deployment loop.
- The SDM will illuminate the OFF portion of the PASSENGER AIR BAG ON/OFF indicator.
- The SDM requests the instrument panel cluster (IPC) to illuminate the AIR BAG indicator.

Conditions for Clearing the DTC

- The condition for setting the DTC no longer exists.
- A history DTC will clear once 100 malfunction-free ignition cycles have occurred.

Diagnostic Aids

- If either the SDM or PPS were replaced verify that the correct part numbers were used for the vehicle application.
- If this DTC is set as either current or history it may have been caused by an electronic device. If an electronic device (Computers, MP3 Players, Cell Phones, Diagnostic Scan Tool, Power Inverter, etc.) was placed on the passenger seat the passenger presence module may command the passenger air bag indicator to turn on and/or command the passenger seat belt indicator to turn on. Make sure there are no objects on the passenger seat and clear the DTCs. If this DTC resets then perform this diagnostic. If the DTC does not reset there is no further work needed on the passenger presence system.
- If this DTC is set as either current or history it may have been caused by an aftermarket seat heater. The aftermarket seat heater may command the passenger air bag indicator to turn on and/or command the passenger seat belt indicator to turn on. Remove the aftermarket seat heater from the passenger seat and clear the DTCs. If this DTC resets then perform this diagnostic. If the DTC does not reset there is no further work needed on the passenger presence system.

Circuit/System Testing

NOTE: **The passenger presence system (PPS) is a calibrated unit. When replacing the assembly all parts in the service kit must remain together. Do not mix any of the old parts with the new parts. PPS comes in as part of a service kit which contains a seat foam, presence sensor and a electronic control unit (ECU) module (if applicable).**

When removing connectors, inspect for damage or corrosion. Damage or corrosion in the following requires repair or replacement of the affected component/connector:

- **Passenger presence module**
- **Passenger presence sensor wiring harness**

1. Verify that no other passenger presence module DTCs are set.
   - If other passenger presence module DTCs are set, investigate those DTCs first.
2. Verify that DTC B0074 0F is not set.
   - If this DTC is set, verify there are no electronic devices on the passenger seat. If not, then verify the seat is dry by removing the trim from the seat bottom frame. IF the seat is wet, allow 24-48 hours dry time with trim completely off. If the DTC is history, do not replace the passenger presence module. Clear the passenger presence module codes.
3. Verify that DTC B0074 00, B0074 0D, or B0074 0E is not set.
   - If any of the DTCs are set then replace the passenger presence module.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the diagnostic procedure.

Control Module References for passenger presence system replacement, programming and setup

DTC B0081: PASSENGER PRESENCE MODULE

Diagnostic Instructions

Passenger Presence Module Incorrect Component Installed

DTC B0081 4B

Passenger Presence Module Calibration Not Learned

DTC B0081 5A

Passenger Presence Module Plausibility Failure

DTC B0081 71

Passenger Presence Module Invalid Serial Data Received

Circuit/System Description

When the ignition is turned ON, the Passenger Presence Module and the Inflatable Restraint Sensing and Diagnostic Module performs tests to diagnose critical malfunctions within itself. When the Inflatable Restraint Sensing and Diagnostic Module has completed the power-up mode, the Inflatable Restraint Sensing and Diagnostic Module will establish communication with the Passenger Presence Module. The Inflatable Restraint Sensing and Diagnostic Module will also request the instrument panel cluster to illuminate both of the PASSENGER AIR BAG ON/OFF indicators. If the Inflatable Restraint Sensing and Diagnostic Module detects that the Passenger Presence Module has set a current DTC, the Inflatable Restraint Sensing and Diagnostic Module will then disable the passenger instrument panel air bag deployment loop, set DTC B0081, and illuminate the AIR BAG indicator.

Conditions for Running the DTC

Ignition voltage is between 9-16 V.

Conditions for Setting the DTC

Any of the following conditions must exist for 5 seconds:

B0081 0F

- The Inflatable Restraint Sensing and Diagnostic Module has received a fault present message from the Passenger Presence Module.
- The Passenger Presence Module is in assembly plant mode and the Inflatable Restraint Sensing and Diagnostic Module is in production mode.

B0081 11

The Passenger Presence Module is above maximum threshold. The Passenger Presence Module failed the preload/build check.

B0081 3A

The Inflatable Restraint Sensing and Diagnostic Module has received a mismatch message indicating the wrong Passenger Presence Module is installed on the vehicle.

B0081 4B

The Passenger Presence Module is not calibrated. Preload/build check test not run.

B0081 5A

The Passenger Presence Module detects a plausibility error.

B0081 71

The Inflatable Restraint Sensing and Diagnostic Module has received invalid or no serial data from the Passenger Presence Module.

Action Taken When the DTC Sets

- The Inflatable Restraint Sensing and Diagnostic Module requests the instrument panel cluster (IPC) to illuminate the AIR BAG indicator.
- The passenger instrument panel air bag deployment loop will be disabled.

Conditions for Clearing the DTC

- The condition for setting the DTC no longer exists.
- A history DTC will clear once 100 malfunction-free ignition cycles have occurred.

Diagnostic Aids

- If either the Inflatable Restraint Sensing and Diagnostic Module or Passenger Presence Module were replaced verify that the correct part numbers were used for the vehicle application.
- If this DTC is set as either current or history it may have been caused by an electronic device. If an electronic device (Computers, MP3 Players, Cell Phones, Diagnostic Scan Tool, Power Inverter, etc.) was placed on the passenger seat the Passenger Presence Module may command the passenger air bag indicator to turn on and/or command the passenger seat belt indicator to turn on. Make sure there are no objects on the passenger seat and clear the DTCs. If this DTC resets then perform this diagnostic. If the DTC does not reset there is no further work needed on the passenger presence system.
- If this DTC is set as either current or history it may have been caused by an aftermarket seat heater. The aftermarket seat heater may command the passenger air bag indicator to turn on and/or command the passenger seat belt indicator to turn on. Remove the aftermarket seat heater from the passenger seat and clear the DTCs. If this DTC resets then perform this diagnostic. If the DTC does not reset there is no further work needed on the passenger presence system.

Circuit/System Verification

1. Ignition ON, verify no Passenger Presence Module DTCs are set.
   - If any Passenger Presence Module DTCs are set, refer to **Diagnostic Trouble Code (DTC) List - Vehicle** .
2. Verify that DTC B0081 3A is not set .
   - If DTC B0081 3A is set, verify that the correct Passenger Presence Module is installed. If the incorrect Passenger Presence Module is installed, replace with the correct part number.
3. Verify that DTC B0081 4B is not set.
   - If DTC B0081 4B is set, refer to **Passenger Presence System Preload Test**
4. Verify that DTC B0081 11 is not set.
   - If DTC B0081 11 sets, perform the preload test. If the preload test fails, repeat the test. Refer to **Passenger Presence System Preload Test**.
5. Verify that DTC B1325 is not set.
   - If DTC B1325 is set, refer to **DTC B1325, B1330, B1420, B1424, B1517, C0800, C0895, C0899, C0900, P0560, P0562, or P0563**

Circuit/System Testing

NOTE: **When removing connectors, inspect for damage or corrosion. Damage or corrosion in the following requires repair or replacement of the affected component/connector:**

- **Passenger Presence Module**
- **Inflatable Restraint Sensing and Diagnostic Module**
- **Passenger Presence Module harness connector**
- **Inflatable Restraint Sensing and Diagnostic Module wiring harness connector**

1. Ignition OFF, disconnect the harness connector at the Passenger Presence Module.
2. Ignition OFF, test for less then 10 Ω between the ground circuit terminal 4 and ground.
   - If greater then the specified range, test the ground circuit for an open/high resistance.

3. Ignition ON, verify a test lamp illuminates between the B+ circuit terminal 3 and ground.
    - If the test lamp does not illuminate, test the B+ circuit for a short to ground or an open/high resistance.
4. Reconnect all Passenger Presence Module components and perform the **Passenger Presence System Preload Test**.
5. Clear all DTCs and operate the vehicle. DTC B0081 should not set.
    - If DTC B0081 sets, replace the Passenger Presence Module.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

Circuit/System Description

The impact sensor utilizes a bidirectional 2-wire circuit. The impact sensor modulates current on the interface to send ID, state of health, and deployment commands to the inflatable restraint sensing and diagnostic module (SDM). The SDM serves as a power source and a ground for the impact sensor. When the ignition is turned ON and input power from the SDM is first detected, the impact sensor responds by performing internal diagnostics and sending an ID to the SDM. The SDM considers the ID to be valid if the response time is less than 5 seconds. The impact sensor continually communicates status messages to the SDM, which determines if a fault is present in the impact sensor circuit. When a fault is detected, the SDM may reset the impact sensor up to 2 times by removing and reapplying power to it. If the fault is still present, the SDM will set a DTC.

Conditions for Running the DTC

Ignition voltage is between 9-16 volts.

Conditions for Setting the DTC

Any of the following conditions exist for 2.5 seconds:

B0083 01, B0084 01, B0085 01, B0086 01

The impact sensor has been shorted to voltage.

B0083 02, B0084 02, B0085 02, B0086 02

- The impact sensor has been shorted to ground.
- The impact sensor current is greater than 23 mA for greater than 5 milliseconds.

B0083 05 or B0084 05, B0085 05, B0086 05

- The impact sensor has been shorted to voltage.
- The impact sensor circuit is open.
- The SDM has not received a message from the impact sensor for greater than 375 milliseconds.

B0083 0F, B0084 0F, B0085 0F, B0086 0F

The SDM has received erratic messages from the impact sensor.

B0083 39, B0084 39, B0085 39, B0086 39

- The SDM has received a Not OK (NOK) message from the impact sensor.
- The SDM has not received a message.

B0083 3A, B0084 3A, B0085 3A, B0086 3A

- The SDM has received an ID message from the impact sensor, which does not match the ID stored in the SDM memory.
- The SDM has reset the impact sensor twice without detecting the correct ID message.

B0083 71, B0084 71, B0085 71, B0086 71

The SDM has received invalid serial data from the impact sensor.

Action Taken When the DTC Sets

- The SDM requests the instrument panel cluster (IPC) to illuminate the AIR BAG indicator.
- SIR is disabled and no deployments are allowed.

Conditions for Clearing the DTC

- The condition for setting the DTC no longer exists.
- A history DTC will clear once 100 malfunction-free ignition cycles have occurred.

Circuit/System Verification

NOTE:

- **Refer to SIR Service Precautions.**
- **Inspect all terminals for damage or corrosion when disconnecting connectors. Damage or corrosion in the following requires repair or**

replacement of the affected component/connector.

- **Impact sensor**
- **Inflatable Restraint Sensing and Diagnostic Module**
- **Impact sensor wiring harness connector**
- **Inflatable Restraint Sensing and Diagnostic Module wiring harness connector**

- **The connector and connector position assurance (CPA) may seat independent of each other. Both the connector and CPA should seat with an audible and/or tactile click. The CPA isolates the shorting-bars within the connector allowing the deployment circuit to operate properly. Replace any CPA that is damaged or missing.**
- **If the condition is intermittent or cannot be duplicated, disconnect the connectors and add dielectric grease / lubricant (Nyogel 760G or equivalent, meeting GM specification 9986087). This procedure will correct the high resistance condition due to terminal fretting corrosion.**

1. Verify that DTC B0083-B0088 symptom byte 08, 0F, 3A, or 39 is not set as current.
   - **If DTC B0083-B0088 symptom byte 08, 0F, 3A, or 39 is set as current**

     Replace the appropriate Impact Sensor.

   - **If DTC B0083-B0088 symptom byte 08, 0F, 3A, or 39 is not set as current**
2. Verify that DTC B0083-B0088 symptom byte 02, 05 or 71 is not set as current.
   - **If DTC B0083-B0088 symptom byte 02, 05 or 71 is set as current**

     Refer to Circuit/System Testing.

   - **If DTC B0083-B0088 symptom byte 02, 05 or 71 is not set as current**
3. All OK.

Circuit/System Testing

1. Perform the Circuit/System Verification before proceeding.
2. Ignition OFF, disconnect the harness connector at the appropriate Impact Sensor. It may take up to 2 min for all vehicle systems to power down.
3. Test for less than 10 Ω between the appropriate low reference circuit terminal A and ground.
   - **If 10 Ω or greater**
   1. Ignition OFF, disconnect the appropriate harness connector at the K36 Inflatable Restraint Sensing and Diagnostic Module.
   2. Test for less than 2 Ω in the low reference circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω, replace the K36 Inflatable Restraint Sensing and Diagnostic Module.
   - **If less than 10 Ω**
4. Test for greater than 50k Ω between the appropriate signal circuit terminal B and ground.

- **If 50k Ω or less**

1. Disconnect the appropriate harness connector at the K36 Inflatable Restraint Sensing and Diagnostic Module.
2. Test for infinite resistance between the signal circuit and ground.
    - If less than infinite resistance, repair the short to ground on the circuit.
    - If infinite resistance, replace the K36 Inflatable Restraint Sensing and Diagnostic Module.

- **If greater than 50k Ω**

5. Ignition ON, test for less than 1 V between the appropriate signal circuit terminal B and ground.
    - **If greater than 1 V**

    1. Disconnect the appropriate harness connector at the K36 Inflatable Restraint Sensing and Diagnostic Module.
    2. Ignition ON, test for less than 1 V between the signal circuit and ground.
        - If greater than 1 V, repair the short to voltage on the circuit.
        - If less than 1 V, replace the K36 Inflatable Restraint Sensing and Diagnostic Module.

    - **If less than 1 V**

NOTE: **When using the MIN MAX function, autorange on the DMM may not function properly. To ensure accurate test results, turn off autorange and manually set the DMM range to 000.0 V.**

6. Ignition OFF, install a DMM between the appropriatesignal circuit terminal B and ground. Set the DMM to capture DC voltage using the MIN MAX function. Turn off autorange and manually set the DMM range to 000.0 V. Ignition ON.
7. Verify the MAX voltage captured by the DMM is between 4-9V.
    - **If less than 4 V**

    1. Disconnect the appropriate harness connector at the K36 Inflatable Restraint Sensing and Diagnostic Module.
    2. Test for infinite resistance between the signal circuit and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance
    3. Test for less than 2 Ω in the signal circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the Inflatable Restraint Sensing and Diagnostic Module.

    - **If greater than 9V**

    1. Ignition OFF. Disconnect the appropriate harness connector at the K36 Inflatable Restraint Sensing and Diagnostic Module. Ignition ON.
    2. Test for less than 1 V between the signal circuit terminal B and ground.
        - If 1 V or greater, repair the short to voltage on the circuit.
        - If less than 1 V, replace the K36 Inflatable Restraint Sensing and Diagnostic Module.

    - **If between 4-9V**

8. Ignition OFF, connect all harness connectors, press in the CPA (if equipped) until an audible and/or tactile

click is heard.

9. Ignition ON, clear DTCs. Operate the vehicle within the Conditions for Running the DTC.
10. Verify the DTC does not set.
    - **If the DTC sets**

      Replace the appropriate Impact Sensor.

    - **If the DTC does not set**
11. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the diagnostic procedure.

- **Airbag Front End Sensor Replacement**
- **Airbag Side Impact Sensor Replacement (Impala Limited)**
- **SIR/SRS Wiring Repairs**

DTC B1001: SDM OPTION CONFIGURATION ERROR (SDM)

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

DTC B1001 00

SDM Option Configuration Error

Circuit/System Description

The inflatable restraint sensing and diagnostic module (SDM) stores a primary data key, which is a 4-digit number, and a secondary data key, which is a portion of the vehicle identification number (VIN). When the ignition is turned ON, the SDM compares this information to the information stored in the body control module (BCM) over the serial data communication circuit. If there is a mismatch between the information stored in the SDM and BCM, DTC B1001 will set.

Conditions for Running the DTC

Ignition voltage is between 9-16 volts.

Conditions for Setting the DTC

- The 4-digit primary data key stored in the SDM does not match the 4 digits stored in the BCM.
- The VIN stored in the BCM does not match that of the vehicle.

Action Taken When the DTC Sets

- The SDM requests the instrument panel cluster (IPC) to illuminate the AIR BAG indicator.
- The SDM disables all deployments.

Conditions for Clearing the DTC

- The last 4-digit Primary Data Key in the SDM match the last 4 digits stored in the BCM.
- The VIN that is stored in the SDM matches the VIN stored in the BCM.

Diagnostic Aids

This DTC is an indication that an incorrect SDM is installed in the vehicle, or that the SDM and/or the BCM was replaced without reprogramming the BCM with the new information.

Circuit/System Testing

NOTE: **When removing connectors inspect for damage or corrosion. Damage or corrosion in the following requires repair or replacement of the affected.**

- **SDM**
- **SDM wiring harness**

1. Ignition ON, verify the scan tool Secondary Key Status displays Valid.

- If not the specified value, verify the scan tool Received VIN Digits 2-7 match the vehicle VIN , if the VIN does not match, reprogram the BCM. If the VIN matches, reprogram the SDM.

2. Ignition ON, verify the scan tool Primary Key Status displays Valid.
   - If not the specified value, verify the scan tool SDM Primary Key matches the Received Primary Key, if the key does not match, perform the Setup SDM Primary Key in BCM procedure.
3. With a scan tool, verify DTC B1001 is not set as current.
   - If DTC is set as current, replace the SDM.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the diagnostic procedure.

Control Module References for SDM or BCM replacement, setup, and programming

DTC B1001: OPTION CONFIGURATION ERROR (PPS)

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

DTC B1001 00

Option Configuration Error

Circuit/System Description

The inflatable restraint sensing and diagnostic module (SDM) stores a 4-digit primary key for the inflatable restraint passenger presence system (PPS). The SDM sends the PPS module the primary key. If the PPS module determines that it is the wrong primary key, the PPS module will set DTC B1001 and send the SDM a vehicle mismatch message. The SDM then will set DTC B0081 and illuminate the SIR warning indicator. The PPS module does not use a secondary key.

Conditions for Running the DTC

Ignition voltage is between 9-16 volts.

Conditions for Setting the DTC

The 4-digit primary key stored in the SDM does not match the 4-digit key stored in the PPS module.

Action Taken When the DTC Sets

- The SDM requests the instrument panel cluster (IPC) to illuminate the AIR BAG indicator.
- The passenger instrument panel air bag deployment is disabled.

Conditions for Clearing the DTC

The 4-digit Primary Key in the SDM and in the PPS module match.

Diagnostic Aids

This DTC is an indication that the PPS module was not set-up correctly, is not the correct part number or that the PPS module is defective.

Circuit/System Verification

IMPORTANT:

When removing connectors inspect for damage or corrosion. Damage or corrosion in the following requires repair or replacement of the affected.

- PPS module
- PPS module wiring harness

1. Verify the correct PPS module part number has been installed
   - If the wrong PPS module part number was installed, replace with the correct PPS module.
2. Verify that DTC B1001 is not set as current in the PPS module.
   - If DTC is set as current, perform the PPS Preload procedure. Verify the SDM is sending the correct key. If DTC resets replace the PPS module.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the diagnostic procedure.

Control Module References for PPS module replacement, setup, and programming

DTC B1019: SDM SYSTEM CONFIGURATION ERROR

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptors

DTC B1019 00

SDM System Configuration Error

DTC B1019 3A

SDM System Configuration Error Incorrect Component Installed

Circuit/System Description

The passenger air bag ON/OFF indicators are used to notify the driver when the Passenger Presence System (PPS) has enabled or disabled the passenger instrument panel air bag . When the ignition is turned ON, the ignition voltage is supplied to the passenger air bag ON/OFF indicators and to the PPS module. The instrument panel cluster (IPC) grounds all indicator control circuits to the passenger air bag ON/OFF indicators for illumination. The IPC receives serial data messages from the supplemental inflatable restraints system to illuminate the indicators as necessary.

After the SDM is programmed, the SDM setup procedure is required. During this set up procedure, the SDM will compare the content that was just programmed to the actual components that are installed on the vehicle. If the SDM detects that there are too few or too many components on the system, DTC B1019 00 will set and not allow the setup procedure to complete.

Conditions for Running the DTC

Ignition voltage is between 9-16 volts.

Conditions for Setting the DTC

B1019 00

- The SDM was programmed with the wrong options for the vehicle.
- The wrong components were installed for the content of the vehicle.
- SDM connector may have bent pins or shorting bars causing the SDM to learn deployment loops that are not actually present.

B1019 3A

- The vehicle was configured for passenger presence system (PPS) but the SDM does not detect that all the PPS indicators are present due to loss of power at indicator, or an open indicator control circuit.
- The vehicle is not configured for PPS and the SDM detects that the PPS indicator is present.

Action Taken When the DTC Sets

- The SDM requests the instrument panel cluster (IPC) to illuminate the AIR BAG warning lamp.
- The SDM disables all deployments when B1019 00 DTC is set as current.

Conditions for Clearing the DTC

- The correct SDM must be installed.
- The correct components must be installed.
- The PPS indicator operates as indicated in the **Seat Belt System Description and Operation** , and **Supplemental Inflatable Restraint System Description and Operation**.

Diagnostic Aids

- If the SDM has been replaced, make sure that the correct part number was installed for this vehicle. If after programming the SDM DTC B1019 00 sets as current, check for bent pins or shorting bars at the SDM connector.
- DTC B1019 3A can be set if any of the passenger air bag ON/OFF indicators, including the passenger seat belt buckle indicator are inoperative.

Circuit/System Verification

B1019 3A

1. With a scan tool, verify DTC B1370 is not set as current in the SDM.
   - If DTC is current refer to **DTC B1370**.
2. If equipped with PPS, verify the appropriate PPS indicator segments illuminate by occupying and unoccupying the passenger seat.
   - If the PPS indicator segments do not illuminate properly, refer to **Seat Belt Indicator Malfunction - Passenger** .

Circuit/System Testing

IMPORTANT:

When removing connectors inspect for damage or corrosion. Damage or corrosion in the following requires repair or replacement of the affected.

- PPS module
- SDM
- PPS module wiring harness connector
- SDM wiring harness connector

B1019 00

1. Ignition ON, verify the scan tool SDM End Model Part Number is correct for the vehicle.
   - If the part number is incorrect, reprogram the SDM.

IMPORTANT:

- If not equipped with PPS, the scan tool parameter should display Not Present and the PPS indicator should not be present on the vehicle
- If equipped with PPS, the scan tool parameter should display Auto, Manual, or Auto + Man and the PPS indicator should be present on the vehicle

2. Observe the scan tool PPS Options parameter to determine how the vehicle PPS is currently configured in the SDM. Verify the actual vehicle equipment and the current configuration indicated by the scan tool parameter are the same.
   - If the original configuration does not match the actual vehicle equipment, reprogram the SDM with the correct configuration.
3. Ignition OFF, disconnect the harness connectors at the SDM and verify the connector is in good condition and has no bent pins, terminals or shorting bars
   - If damage is found, repair the bent pins, terminals or shorting bars as needed and perform the Setup New SDM procedure.
4. Connect the harness connector at the SDM.
5. Ignition ON, verify the scan tool System Configuration matches the actual components installed on the vehicle.

- If the System Configuration does not match the actual components installed, reprogram the SDM with the correct components.

6. Ignition ON, clear all PPS module and SDM DTCs.
7. Verify DTC B1019 does not set.
    - If DTC sets, replace the SDM.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the diagnostic procedure.

- **SIR/SRS Wiring Repairs**
- **Control Module References** for PPS module or SDM replacement, setup, and programming

DTC B101D, B101E, OR B1089: AIR BAG DEPLOYMENT LOOP INVALID

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptors

DTC B101D

Driver Steering Wheel Air Bag Deployment Loop Invalid Configuration

DTC B101E

Passenger Instrument Panel Air Bag Deployment Loop Invalid Configuration

DTC B1089

Deployment Loops Signals Cross Coupled

Circuit/System Description

When the ignition switch is turned to ON, the sensing and diagnostic module (SDM) will perform a turn - on test to diagnose critical malfunctions within the SDM itself.

Conditions for Running the DTC

- The ignition switch is in the ON position.
- Battery voltage must be between 9-16 V.

Conditions for Setting the DTC

B101D

The configuration of the driver steering wheel air bag deployment loop is invalid.

B101E

The configuration of the passenger instrument panel air bag deployment loop is invalid is invalid.

B1089

A cross-link of the deployment loop circuit has been detected.

Action Taken When the DTC Sets

The SDM will command the Air Bag Warning indicator to illuminate

Conditions for Clearing the DTC

- Installing a compatible air bag switch for that specific make and model vehicle.
- Installing a compatible air bag squib circuit for that specific make and model vehicle.
- Installing a compatible steering wheel air bag or passenger instrument panel air bag for that specific make and model vehicle.

DTC B1370: DEVICE IGNITION 1 CIRCUIT

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using the diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

DTC B1370 06

Device Ignition 1 Circuit Short to Ground or Open

Circuit/System Description

The inflatable restraint sensing and diagnostic module (SDM) monitors the ignition 1 signal from the ignition switch. When the vehicle ignition switch is placed in the RUN or CRANK position, the switch supplies voltage to the SDM ignition 1 input terminal. If an open or short to ground in this SDM ignition 1 circuit is detected, then DTC B1370 will set.

Conditions for Running the DTC

Ignition voltage is between 9-16 volts.

Conditions for Setting the DTC

The SDM detects a short to ground or an open in the ignition 1 voltage circuit for at least 10 seconds when the ignition switch is in RUN or CRANK .

Action Taken When the DTC Sets

- The SDM requests the instrument panel cluster (IPC) to illuminate the AIR BAG indicator.
- The SDM determines its power mode only from the GMLAN power mode messages and discards the ignition 1 input for the remainder of the ignition cycle.

Conditions for Clearing the DTC

- The condition for setting the DTC no longer exists.
- A history DTC will clear once 100 malfunction-free ignition cycles have occurred.

Circuit/System Testing

IMPORTANT:

When removing connectors inspect for damage or corrosion. Damage or corrosion in the following requires repair or replacement of the affected.

- SDM
- SDM wiring harness

1. Ignition OFF, remove the AIRBAG/DISPLAY fuse.
2. Ignition ON, with a DMM, test for 9-16 V between the voltage supply side and ground.
   - If not the specified range, refer to **DTC B1370-B1379, B1380-B1389, or B1440-B1443** .
3. Ignition OFF, disconnect the harness connector at the SDM.
4. Ignition OFF, disconnect the X4 harness connector at the Underhood Fuse Block.
5. Ignition OFF, test for less than 1 ohm between the ignition 1 voltage circuit terminal 32 and the underhood fuse block terminal K4 X4.
   - If greater then the specified range, test the circuit for an open/high resistance.
6. Ignition ON, test for less than 1 volt between the ignition 1 voltage circuit terminal 32 and the underhood fuse block K4 X4.

- If greater then the specified value, test the circuit for a short to voltage.

7. If all circuits test normal, replace the SDM.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the diagnostic procedure.

- **SIR/SRS Wiring Repairs**
- **Control Module References** for SDM replacement, setup, and programming

PASSENGER PRESENCE SYSTEM PRELOAD TEST

The passenger presence system consists of an electronic control module, a conductive based sensor mat, wiring harness, and PASSENGER AIR BAG ON/OFF indicators. The sensor mat is made up of several flexible conductive metal strips placed underneath the seat cushion trim. These sensor strips transmit and receive a low level electric field. The weight of the occupant sitting in the front passenger seat is measured as a change in current flow within the sensor mat. If the passenger seat bottom cushion, seat bottom trim, or heater pad has been serviced, reinstalled, or removed for any reason, the procedure below will check for any preloads on the passenger presence system. A service replacement passenger presence module does not require an unlock procedure prior to an initial preload test.

Passenger Presence System Preload System Test

NOTE:

- **Before the passenger presence system can be checked for preloads the front passenger seat must be completely empty of all items. The presence of any items on the front passenger seat will affect the calibration and operation of the passenger presence system. When the preload test is performed, the instrument cluster and dash lights will begin illuminating at varying intensity. This is normal operation during the Passenger Presence Sensor Learn procedure and does not indicate additional system faults.**
- **The Diagnostic System Check - Vehicle must be performed after successfully completing the preload test procedure to ensure the system is functioning properly.**

1. Empty the front passenger seat, this system is susceptible to conductive material.
2. With the scan tool, perform the Passenger Presence Sensor Learn procedure.
3. Using the scan tool, check for DTC B0081 in history. If the Passenger Presence Sensor Learn procedure fails or DTC B0081 is current, confirm that there is no conductive material on the seat. Perform the Passenger Presence Sensor Learn test again. If the test fails again, for heated seats, ensure that the sensor pad is on top of the heater element. Once the test successfully completes, cycle the ignition OFF.
4. Perform the **Diagnostic System Check - Vehicle** after successfully completing the Passenger Presence Sensor Learn procedure to ensure the system is functioning properly.

SYMPTOMS - SIR

IMPORTANT: Complete the following steps before using the symptom tables:

1. Perform **Diagnostic System Check - Vehicle** before using the symptom tables in order to verify that all of the following are true:
    - There are no DTCs set.
    - The inflatable restraint sensing and diagnostic module (SDM) can communicate via the serial data link.
2. Review the SIR system description and operation in order to familiarize yourself with the system functions. Refer to **Supplemental Inflatable Restraint System Description and Operation**.

Visual/Physical Inspection

- Inspect for aftermarket devices which could affect the operation of the SIR system. Refer to **Checking Aftermarket Accessories** .
- Inspect the easily accessible or visible system components for obvious damage or conditions which could cause the symptom.

Intermittent

Faulty electrical connections or wiring may be the cause of intermittent conditions. Refer to **Testing for Intermittent Conditions and Poor Connections** .

Symptom List

Refer to a symptom diagnostic procedure from the following list in order to diagnose the symptom:

Airbag Indicator Malfunction (Driver)Airbag Indicator Malfunction (Passenger) in order to diagnose the symptom.

AIRBAG INDICATOR MALFUNCTION (DRIVER)

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

Circuit/System Description

When the ignition is turned ON, the instrument panel cluster (IPC) flashes the air bag indicator 7 times for a bulb check. The inflatable restraint sensing and diagnostic module (SDM) performs diagnostic tests on the SIR system during the bulb check. If any malfunction exists the SDM will request the IPC to illuminate the air bag indicator steady, via serial data. If a preexisting malfunction exists, the air bag indicator will illuminate steady immediately after the ignition is turned ON. If the ignition 1 voltage is outside of the normal operating voltage range 9-16 volts, the SDM will command the IPC to illuminate the air bag indicator with no DTCs present, then disables all deployment loops.

Diagnostic Aids

A DTC B1370 may set if the ignition 1 circuit is outside the 9-16 volts range.

Circuit/System Testing

1. Ignition ON, with a scan tool, verify the Battery Voltage Parameter is 9-16 volts.
    - If not the specified range, refer to **Diagnostic System Check - Vehicle** .
2. Ignition OFF, monitor the IPC, ignition ON. The SIR warning indicator should flash then turn OFF.
    - If the SIR warning indicator continually flashes, program the SDM.
    - If the SIR warning indicator remains on steady, test for DTCs and refer to **Diagnostic Trouble Code (DTC) List - Vehicle** . If no DTC is current, proceed to the next step.
3. With a scan tool, perform the Display Test in Instrument Panel Cluster/Special Functions. The Air Bag indicator should turn ON and OFF as commanded.
    - If the air bag indicator does not illuminate as expected, replace the IPC.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the diagnostic procedure.

- **SIR/SRS Wiring Repairs**
- **Control Module References** for IPC or SDM replacement, setup, and programming

AIRBAG INDICATOR MALFUNCTION (PASSENGER)

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.

- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

Diagnostic Fault Information

Circuit	Short to Ground	High Resistance	Open	Short to Voltage
Ignition 1 Voltage	1	1*	1	-
Passenger Air Bag OFF Indicator Control	4	2*	2	-
Passenger Air Bag ON Indicator Control	5	3*	3	-
1. No indicators will illuminate. 2. The OFF indicator will not illuminate. 3. The ON indicator will not illuminate. 4. The OFF indictor will illuminate any time the ignition is ON. 5. The ON indictor will illuminate any time the ignition is ON. * High resistance may cause any or all indicators to illuminate less bright than normal.				

Circuit/System Description

The passenger air bag ON/OFF indicators are used to notify the driver when the Passenger Presence System (PPS) has enabled or disabled the passenger instrument panel air bag. When the ignition is turned ON, the ignition voltage is supplied to the passenger air bag ON/OFF indicators and to the passenger presence module. The passenger presence module communicates with the SDM indicating if the passenger seat is occupied or not. The IPC receives serial data messages from the SDM to illuminate the appropriate passenger instrument panel air bag indicator. The instrument panel cluster (IPC) grounds the appropriate indicator control circuit to the passenger air bag ON or OFF indicator for illumination.

Circuit/System Verification

NOTE: **The passenger air bag ON and OFF indicators may not operate as expected if there are supplemental inflatable restraint (SIR) DTCs. Repair all SIR DTC before proceeding with this diagnostic.**

1. Ignition ON, the passenger air bag ON and OFF indicators should both illuminate for approximately 5 seconds for a bulb check.
2. Monitor the parameter Passenger Classification in Passenger Presence System with a scan tool. With the passenger seat unoccupied, the parameter should display Empty Seat. The passenger air bag OFF indicator should illuminate.
3. Have an adult sit in the passenger seat. The passenger air bag indicator should switch from OFF to ON within 5 seconds.

Circuit/System Testing

NOTE: **When removing connectors inspect for damage or corrosion. Damage or corrosion in the following requires repair or replacement of the affected.**

- **Passenger air bag on/off indicator.**
- **Passenger air bag on/off indicator wiring harness.**

1. Ignition OFF, disconnect the harness connector at the inflatable restraint passenger air bag ON/OFF indicator.
2. Ignition ON, verify a test lamp illuminates between the ignition circuit terminal 4 and ground.
   - If the test lamp does not illuminate, test the ignition circuit for a short to ground or an open/high resistance. If the circuit tests normal and the ignition circuit fuse is open, test or replace the inflatable restraint passenger air bag ON/OFF indicator.
3. Connect a test lamp between the ignition circuit terminal 4 and the control circuit terminal 3.
4. With the passenger seat unoccupied, then occupied the test lamp should switch states within 5 seconds.
   - If the test lamp is always on, test the control circuit for a short to ground. If the circuit tests normal replace the IPC.
   - If the test lamp is always off, test the control circuit for a short to voltage or an open/high resistance. If the circuit tests normal replace the IPC.
5. Connect a test lamp between the ignition circuit terminal 4 and the control circuit terminal 1.
6. With the passenger seat unoccupied, then occupied the test lamp should switch states within 5 seconds.
   - If the test lamp is always on, test the control circuit for a short to ground. If the circuit tests normal replace the IPC.
   - If the test lamp is always off, test the control circuit for a short to voltage or an open/high resistance. If the circuit tests normal replace the IPC.
7. If all circuits test normal, replace the inflatable restraint passenger air bag ON/OFF indicator.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the diagnostic procedure.

- **SIR/SRS Wiring Repairs**
- **Instrument Panel Airbag Arming Status Display Replacement**
- **Control Module References** for instrument panel cluster (IPC) replacement, setup, and programming

SIR DISABLING AND ENABLING

SIR component location affects how a vehicle should be serviced. There are parts of the SIR system installed in various locations around a vehicle. To find the location of the SIR components refer to **Supplemental Inflatable Restraint System Description and Operation**.

There are several reasons for disabling the SIR system, such as repairs to the SIR system or servicing a component near or attached to an SIR component. There are several ways to disable the SIR system depending on what type of service is being performed. The following information covers the proper procedures for disabling/enabling the SIR system.

Condition	Action
If the vehicle was involved in an accident with an air bag deployment.	Disconnect the negative battery cable(s) *. Refer to **Repairs and Inspections Required After a Collision**.
When performing SIR diagnostics.	Follow the appropriate SIR service manual diagnostic procedure(s) *
When moving, removing or replacing an SIR component or a component attached to an SIR component. (Anytime you remove fasteners.)	Disconnect the negative battery cable(s) *
If the vehicle is suspected of having shorted electrical wires.	Disconnect the negative battery cable(s) *
When performing electrical diagnosis on components other than the SIR system.	Remove the SIR/Airbag fuse(s) when indicated by the diagnostic procedure to disable the SIR system
* DTC's may be lost when the negative battery cable is disconnected.	

SIR Service Precautions

WARNING: When performing service on or near the SIR components or the SIR wiring, the SIR system must be disabled. Failure to observe the correct procedure could cause deployment of the SIR components. Serious injury can occur. Failure to observe the correct procedure could also result in unnecessary SIR system repairs.

The Inflatable Restraint Sensing and Diagnostic Module (SDM) maintains a reserved energy supply. The reserved energy supply provides deployment power for the air bags if the Inflatable Restraint Sensing and Diagnostic Module loses battery power during a collision. Deployment power is available for as much as 2 minutes after disconnecting the vehicle power. Waiting 2 minutes before working on the system after disabling the SIR system prevents deployment of the air bags from the reserved energy supply.

General Service Instructions

The following are general service instructions which must be followed in order to properly repair the vehicle and return it to its original integrity:

- Do not expose air bags to temperatures above 85Â°C (185Â°F).
- Verify the correct replacement part number. Do not substitute a component from a different vehicle.
- Use only original GM replacement parts available from your authorized GM dealer. Do not use salvaged parts for repairs to the SIR system.

Discard any of the following components if it has been dropped from a height of 80 cm (31.5 Inches) or greater:

- Inflatable Restraint Sensing and Diagnostic Module (SDM)
- Any air bag
- Driver steering wheel air bag coil
- Any impact sensor
- Seat belt anchor and/or retractor pretensioners
- Passenger presence module and/or occupant sensor

Disabling Procedure - Air Bag Fuse

1. Turn the steering wheel so that the vehicles wheels are pointing straight ahead.
2. Place the ignition in the OFF position.

WARNING: The SDM may have more than one fused power input. To ensure there is no unwanted SIR deployment, personal injury, or unnecessary SIR system repairs, remove all fuses supplying power to the SDM. With all SDM fuses removed and the ignition switch in the ON position, the AIR BAG warning indicator illuminates. This is normal operation, and does not indicate a SIR system malfunction.

3. Locate and remove the fuse(s) supplying power to the Inflatable Restraint Sensing and Diagnostic Module. Refer to **SIR Schematics**, or **Electrical Center Identification Views** .
4. Wait 2 minutes before working on the system.

Enabling Procedure - Air Bag Fuse

1. Place the ignition in the OFF position.
2. Install the fuse(s) supplying power to the Inflatable Restraint Sensing and Diagnostic Module. Refer to **SIR Schematics**, or **Electrical Center Identification Views** .
3. Turn the ignition switch to the ON position. The AIR BAG indicator will illuminate or flash then turn OFF.
4. Perform the Diagnostic System Check - Vehicle if the AIR BAG warning indicator does not operate as described. Refer to **Diagnostic System Check - Vehicle** .

Disabling Procedure - Negative Battery Cable

1. Turn the steering wheel so that the vehicles wheels are pointing straight ahead.

2. Place the ignition in the OFF position.
3. Disconnect the negative battery cable from the battery. Refer to **Battery Negative Cable Disconnection and Connection** .
4. Wait 2 minutes before working on system.

Enabling Procedure - Negative Battery Cable

1. Place the ignition in the OFF position.
2. Connect the negative battery cable to the battery. Refer to **Battery Negative Cable Disconnection and Connection** .
3. Turn the ignition switch to the ON position. The AIR BAG indicator will illuminate or flash then turn OFF.
4. Perform the Diagnostic System Check - Vehicle if the AIR BAG warning indicator does not operate as described. Refer to **Diagnostic System Check - Vehicle** .

REPAIR INSTRUCTIONS

SIR SERVICE PRECAUTIONS

General Service Instructions

WARNING: When performing service on or near the SIR components or the SIR wiring, the SIR system must be disabled. Refer to SIR Disabling and Enabling . Failure to observe the correct procedure could cause deployment of the SIR components, personal injury, or unnecessary SIR system repairs.

WARNING: Do not strike or jolt the inflatable restraint sensing and diagnostic module (SDM). Before applying power to the SDM, make sure that it is securely fastened with the arrow facing toward the front of the vehicle. Failure to observe the correct installation procedure could cause SIR deployment, personal injury, or unnecessary SIR system repairs.

NOTE: The Inflatable Restraint Sensing and Diagnostic Module (SDM) maintains a reserved energy supply. The reserved energy supply provides deployment power for the SIR air bags. Deployment power may be available for up to 2 minutes after disconnecting the vehicle power. Disabling the SIR system prevents deployment of the SIR air bags from the reserved energy supply.

NOTE: The following are general service instructions which must be followed in order to properly repair the vehicle and return it to its original integrity:

- Do not expose air bags to temperatures above 85 Â°C (185 Â°F)
- Verify the correct replacement part number. Do not substitute a component from a different vehicle
- Use only original GM replacement parts available from your authorized GM dealer. Do not use salvaged parts for repairs to the SIR system

NOTE: Discard any of the following components if it has been dropped from a height of

80 cm (31.49 in) or greater:

- Inflatable Restraint Sensing and Diagnostic Module
- Passenger instrument panel air bag
- Driver steering wheel air bag
- Driver steering wheel air bag coil
- Roof rail air bags
- Front and /or side impact sensors
- Seat belt achor and/or retractor pretensioners
- Front seat side air bag
- Knee air bag

AIRBAG FRONT END SENSOR REPLACEMENT

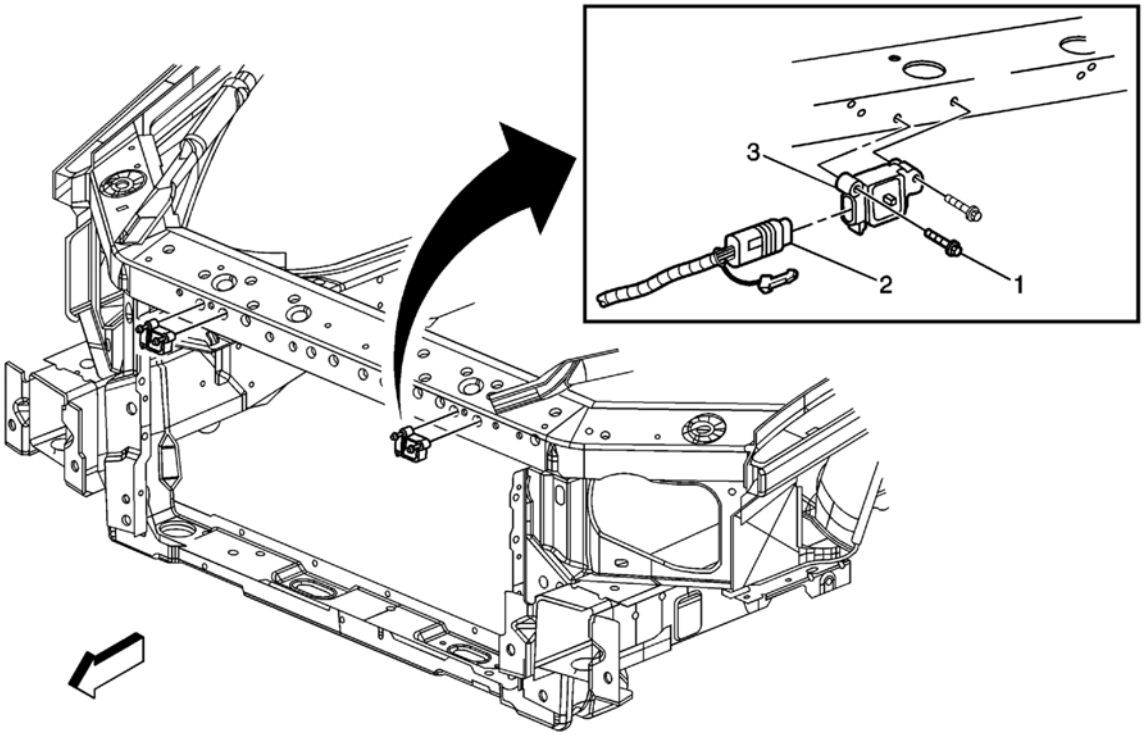

Fig. 4: Identifying Inflatable Restraint Front End Sensor
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
WARNING: **Refer to SIR Warning .** **Preliminary Procedures** 1. Disable the supplemental inflatable restraint (SIR) system. Refer to **SIR Disabling and Enabling**.	

Callout	Component Name
2. Remove the upper air baffle and deflector. Refer to **Radiator Air Upper Baffle and Deflector Replacement** . 3. Remove both headlamps. Refer to **Headlamp Replacement** . 4. Remove the fascia grille support bolts, 8 total. DO NOT remove the bumper fascia. Refer to **Front Bumper Fascia Energy Absorber Replacement** . 5. Remove the retainers from fascia to grille support, 4 total. 6. Pull the grille support forward to gain clearance to the sensors.	
1	Inflatable Front End Sensor Mounting Bolts (Qty: 2) **CAUTION:** **Refer to Fastener Caution .** **Tighten** 11 N.m (97 lb in)
2	Connector Position Assurance (CPA) Connector
3	Inflatable Front End Sensor

AIRBAG SIDE IMPACT SENSOR REPLACEMENT (IMPALA LIMITED)

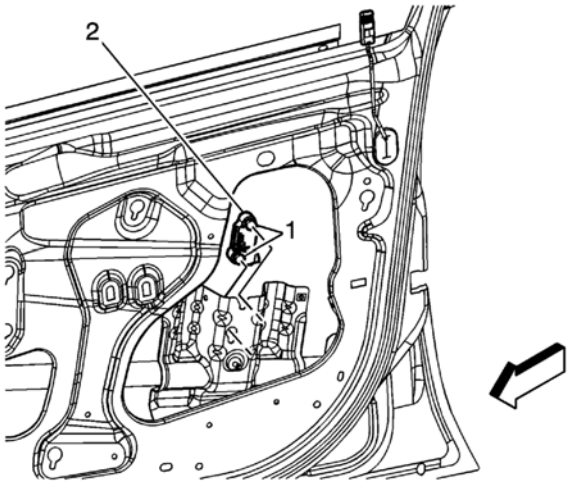

Fig. 5: Inflatable Restraint Side Impact Sensor (Impala Limited)
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
WARNING: **Do not strike or jolt the inflatable**	

Callout	Component Name
restraint side impact sensor (SIS). Before applying power to the SIS make sure that it is securely fastened. Failure to observe the correct installation procedures could cause SIR deployment, personal injury, or unnecessary SIR system repairs. **WARNING:** **Refer to SIR Warning .** **Preliminary Procedure** 1. Disable the SIR system. Refer to **SIR Disabling and Enabling**. 2. Remove the front door panel. Refer to **Front Side Door Trim Panel Replacement** .	
1	Inflatable Restraint Side Impact Sensor Assembly Bolt/Screw (Qty: 2) **CAUTION:** **Refer to Fastener Caution .** **TIP:** Loosen the fasteners and slide the sensor out of the keyhole slots. **Tighten** 10 N.m (89 lb in)
2	Inflatable Restraint Side Impact Sensor Assembly

AIRBAG SENSING AND DIAGNOSTIC MODULE REPLACEMENT

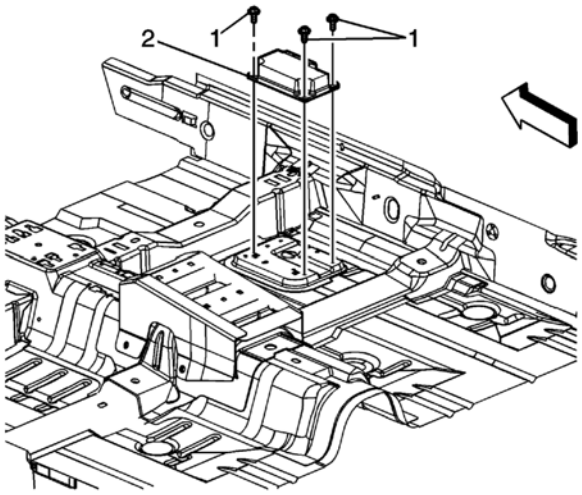

Fig. 6: Inflatable Restraint Sensing And Diagnostic Module
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
WARNING: **Do not strike or jolt the inflatable restraint sensing and diagnostic module (SDM). Before applying power to the SDM, make sure that it is securely fastened with the arrow facing toward the front of the vehicle. Failure to observe the correct installation procedure could cause SIR deployment, personal**	

Callout	Component Name
injury, or unnecessary SIR system repairs. **WARNING:** **Refer to SIR Warning .** **Preliminary Procedure** 1. Disable the supplemental inflatable restraint (SIR) system. Refer to **SIR Disabling and Enabling**. 2. Remove the right front seat. Refer to **Front Seat Removal and Installation - Bucket (Impala Limited)** . 3. Pull the carpeting back in order to access the sensing and diagnostic module (SDM). Refer to **Floor Panel Carpet Replacement (Impala Limited)** . 4. Program the inflatable restraint SDM after replacement. Refer to **Control Module References** .	
1	Inflatable Restraint Sensing and Diagnostic Module Bolt/Screw (Qty: 3) **CAUTION:** **Refer to Fastener Caution .** **Tighten** 10 N.m (88 lb in)
2	Inflatable Restraint Sensing and Diagnostic Module Assembly

AIRBAG STEERING WHEEL MODULE REPLACEMENT

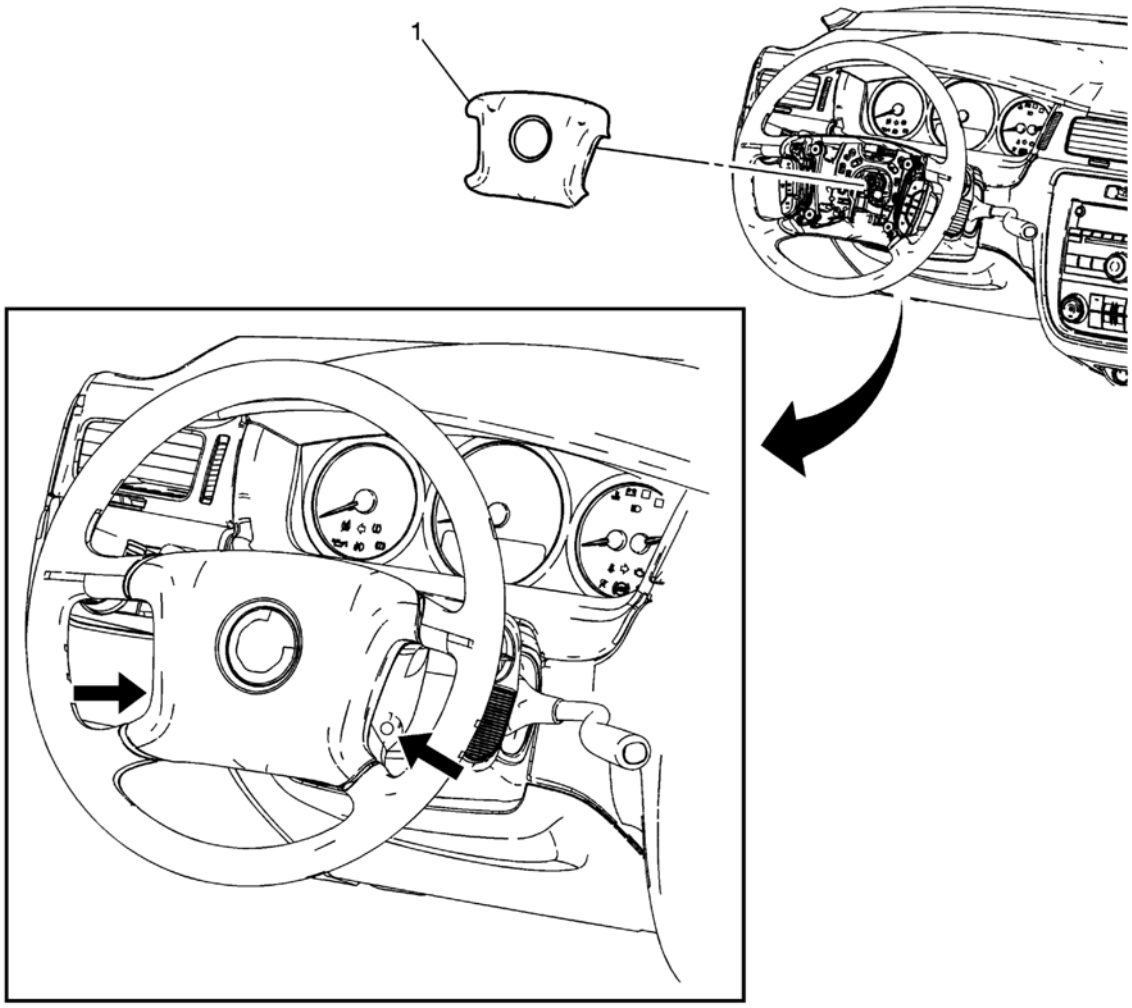

Fig. 7: Inflatable Restraint Steering Wheel Module
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
WARNING: Refer to SIR Warning .	
WARNING: Refer to SIR Inflator Module Handling and Storage Warning .	
Preliminary Procedure Disable the supplemental inflatable restraint (SIR) system. Refer to SIR Disabling and Enabling.	

Callout	Component Name
1	Inflatable Restraint Steering Wheel Module Assembly **WARNING:** **After installation of the steering wheel airbag module to the steering wheel, slightly pull the module outward. If there is no give on the airbag module then it is secured correctly. If the airbag module is not fully attached personal injury could result.** **Procedure** Insert a small blunt-ended tool through the access openings, on the left and right of the steering wheel, push on the blunt-ended tool to release the steering wheel inflator from the steering wheel.

STEERING WHEEL AIRBAG COIL REPLACEMENT

Special Tools

J 42640 Steering Column Anti Rotation Pin

Removal Procedure

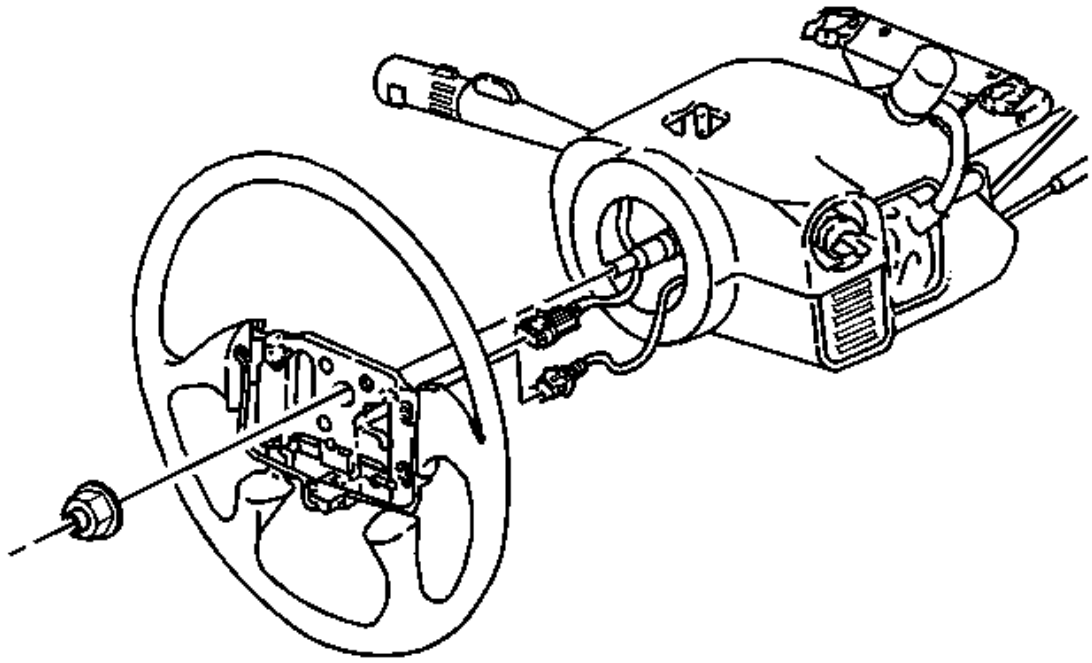

Fig. 8: Steering Wheel, Shaft & Nut
Courtesy of GENERAL MOTORS COMPANY

WARNING: Refer to SIR Warning .

1. Disable the SIR System. Refer to **SIR Disabling and Enabling**.

CAUTION: With wheels of the vehicle facing straight ahead, secure the steering wheel utilizing steering column anti-rotation pin, steering column lock, or a strap to prevent rotation. Locking of the steering column will prevent damage and a possible malfunction of the SIR system. The steering wheel must be secured in position before disconnecting the following components:

- **The steering column**
- **The intermediate shaft(s)**
- **The steering gear**

After disconnecting these components, do not rotate the steering wheel or move the front tires and wheels. Failure to follow this procedure may

cause the SIR coil assembly to become un-centered and cause possible damage to the SIR coil. If you think the SIR coil has became un-centered, refer to your specific SIR coil's centering procedure to re-center SIR Coil.

2. Verify the following before removing the SIR coil:
   - The wheels on the vehicle are straight ahead.
   - That **J 42640** Steering Column Anti Rotation Pin is installed or the ignition switch is in the LOCK position.
3. Remove the steering wheel from the steering shaft. Refer to **Steering Wheel Replacement** .

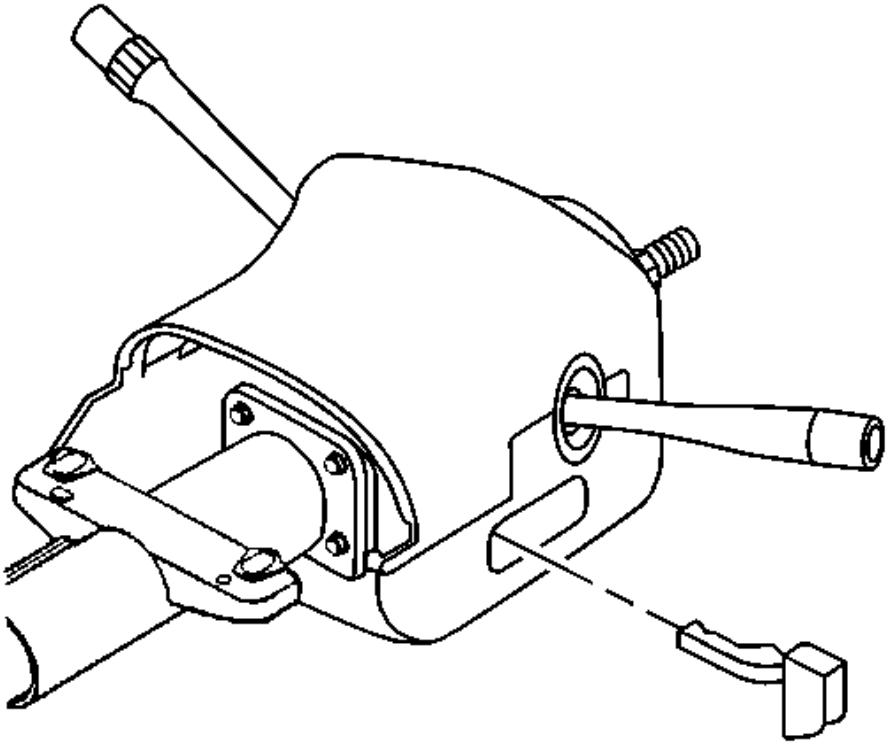

Fig. 9: Removing/Installing Tilt Lever
Courtesy of GENERAL MOTORS COMPANY

4. On vehicles with a tilt column, pull the tilt lever straight out from the steering column.

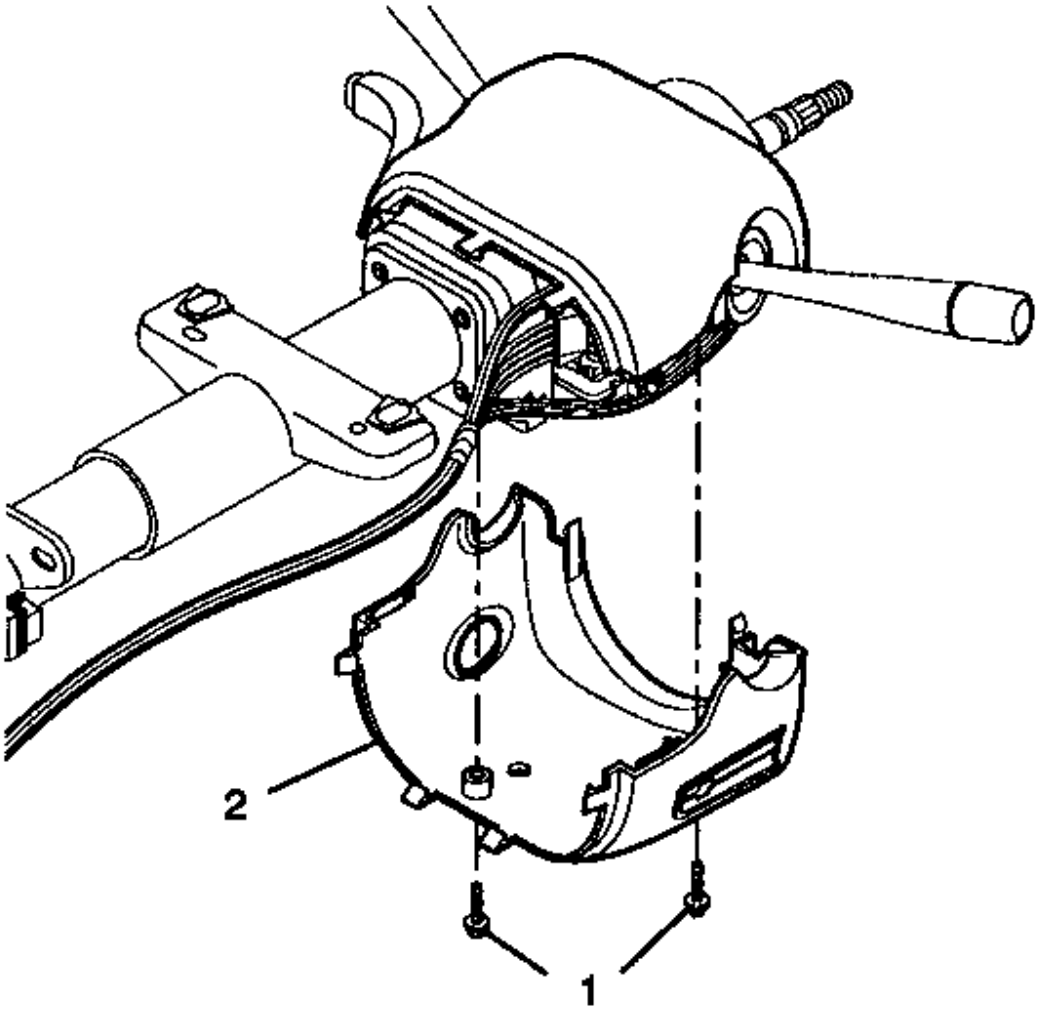

Fig. 10: Identifying Lower Trim Cover
Courtesy of GENERAL MOTORS COMPANY

5. Remove 2 TORXÂ® head screws (1) from the lower trim cover (2).
6. Remove the lower trim cover (2).

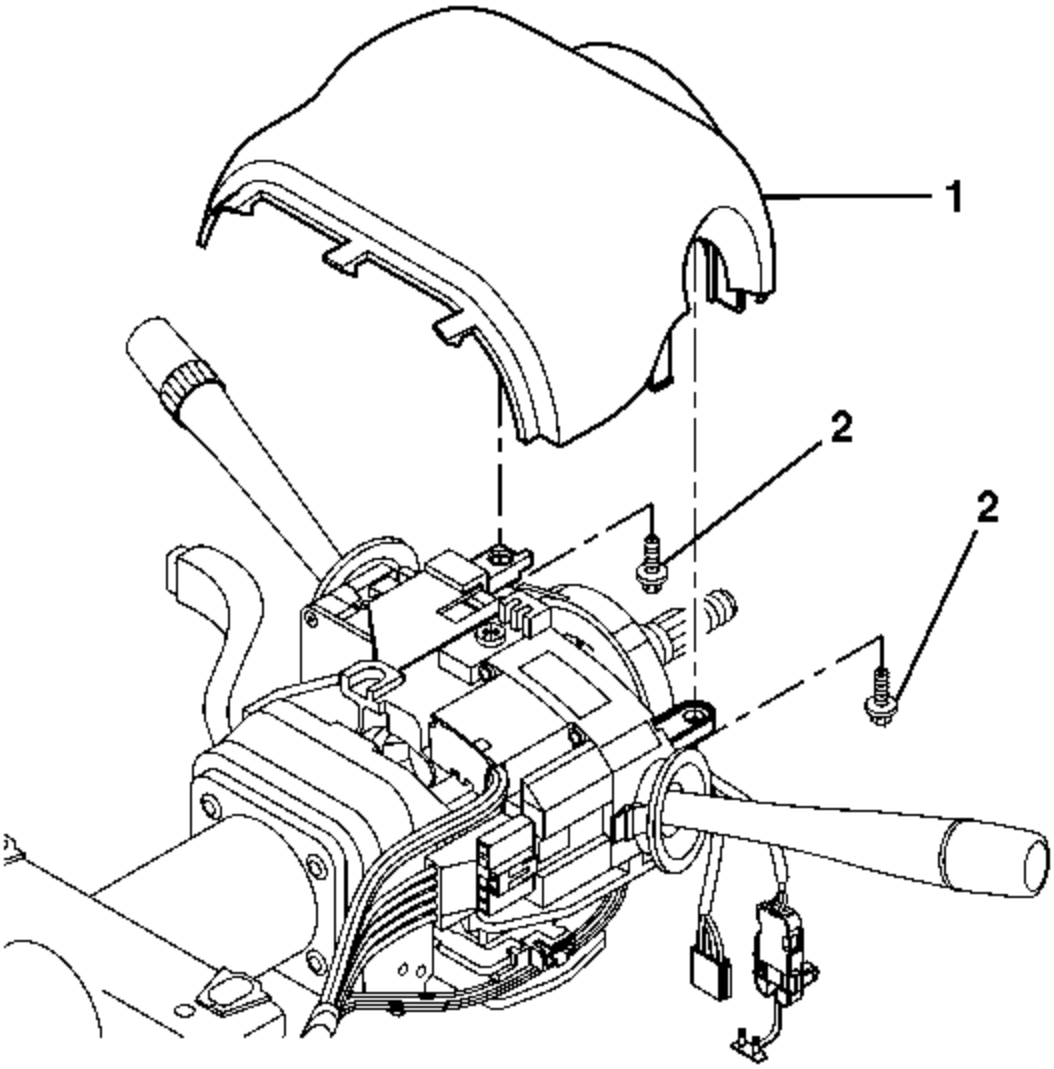

Fig. 11: Identifying Upper Trim Cover
Courtesy of GENERAL MOTORS COMPANY

7. Remove 2 TORXÂ® head screws (2) from the upper trim cover (1).
8. Remove the upper trim cover (1).

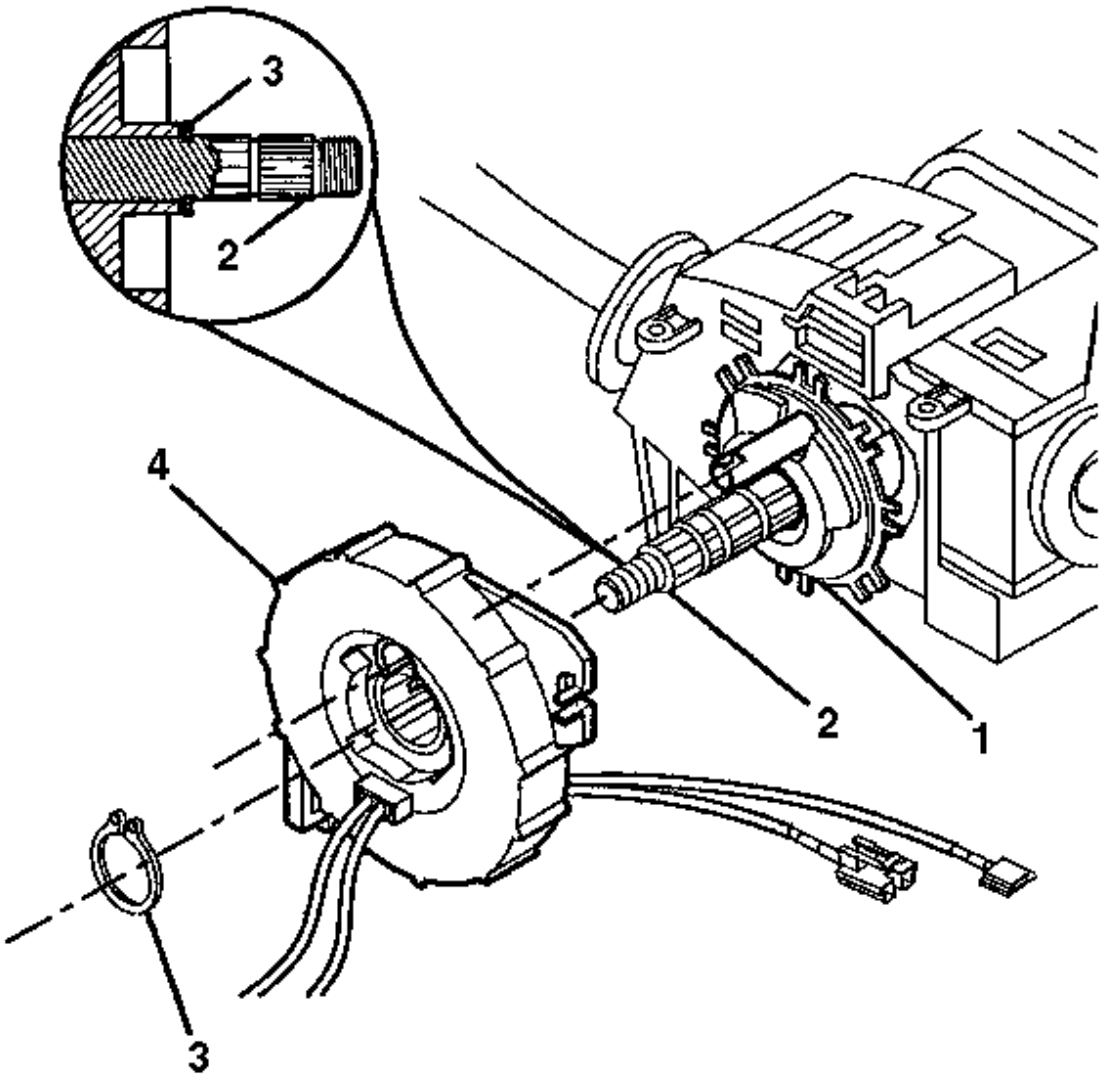

Fig. 12: Identifying SIR Coil, Steering Shaft Assembly & Retaining Ring
Courtesy of GENERAL MOTORS COMPANY

9. Remove the wire harness straps from the steering wheel column wire harness.
10. Remove the retaining ring (3).
11. Remove the SIR coil (4) from the steering shaft.
12. If replacing, discard the SIR coil.

Installation Procedure

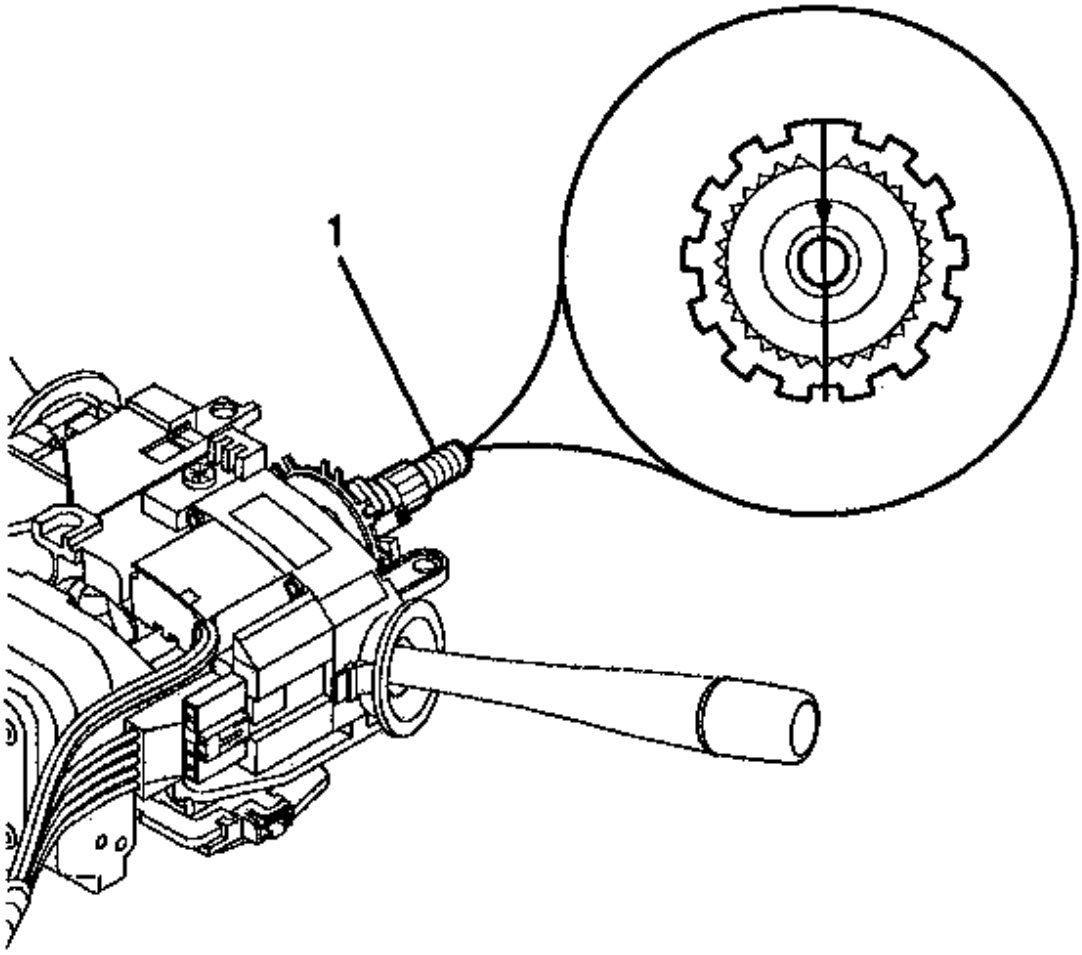

Fig. 13: View Of Block Tooth Of Steering Shaft Assembly In 12 O'clock Position
Courtesy of GENERAL MOTORS COMPANY

CAUTION: **The new SIR coil assembly will be centered. Improper alignment of the SIR coil assembly may damage the unit, causing an inflatable restraint malfunction.**

CAUTION: **With wheels of the vehicle facing straight ahead, secure the steering wheel utilizing steering column anti-rotation pin, steering column lock, or a strap to prevent rotation. Locking of the steering column will prevent damage and a possible malfunction of the SIR system. The steering wheel must be secured in position before disconnecting the following components:**

- **The steering column**
- **The intermediate shaft(s)**
- **The steering gear**

After disconnecting these components, do not rotate the steering wheel or move the front tires and wheels. Failure to follow this procedure may

cause the SIR coil assembly to become un-centered and cause possible damage to the SIR coil. If you think the SIR coil has became un-centered, refer to your specific SIR coil's centering procedure to re-center SIR Coil.

1. Verify the following:
   - The wheels on the vehicle are straight ahead.
   - That **J 42640** Steering Column Anti Rotation Pin is installed or the ignition switch is in the LOCK position.

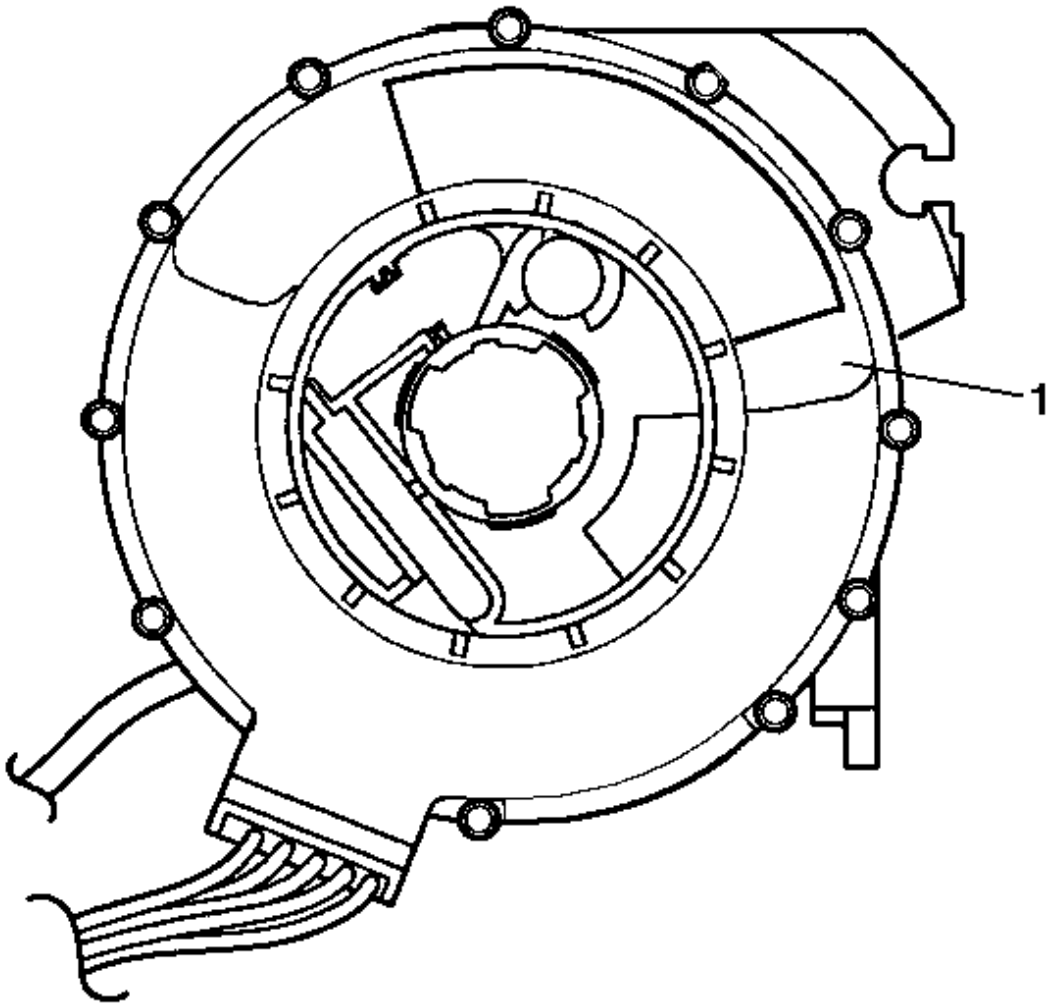

Fig. 14: View Of SIR Coil
Courtesy of GENERAL MOTORS COMPANY

NOTE: **Do not remove the centering tab from the new SIR coil until the installation is complete. If the SIR coil does not come with a centering tab, you must center the SIR coil.**

2. If reusing the existing coil it MUST be centered, refer to **Airbag Steering Wheel Module Coil Centering**.

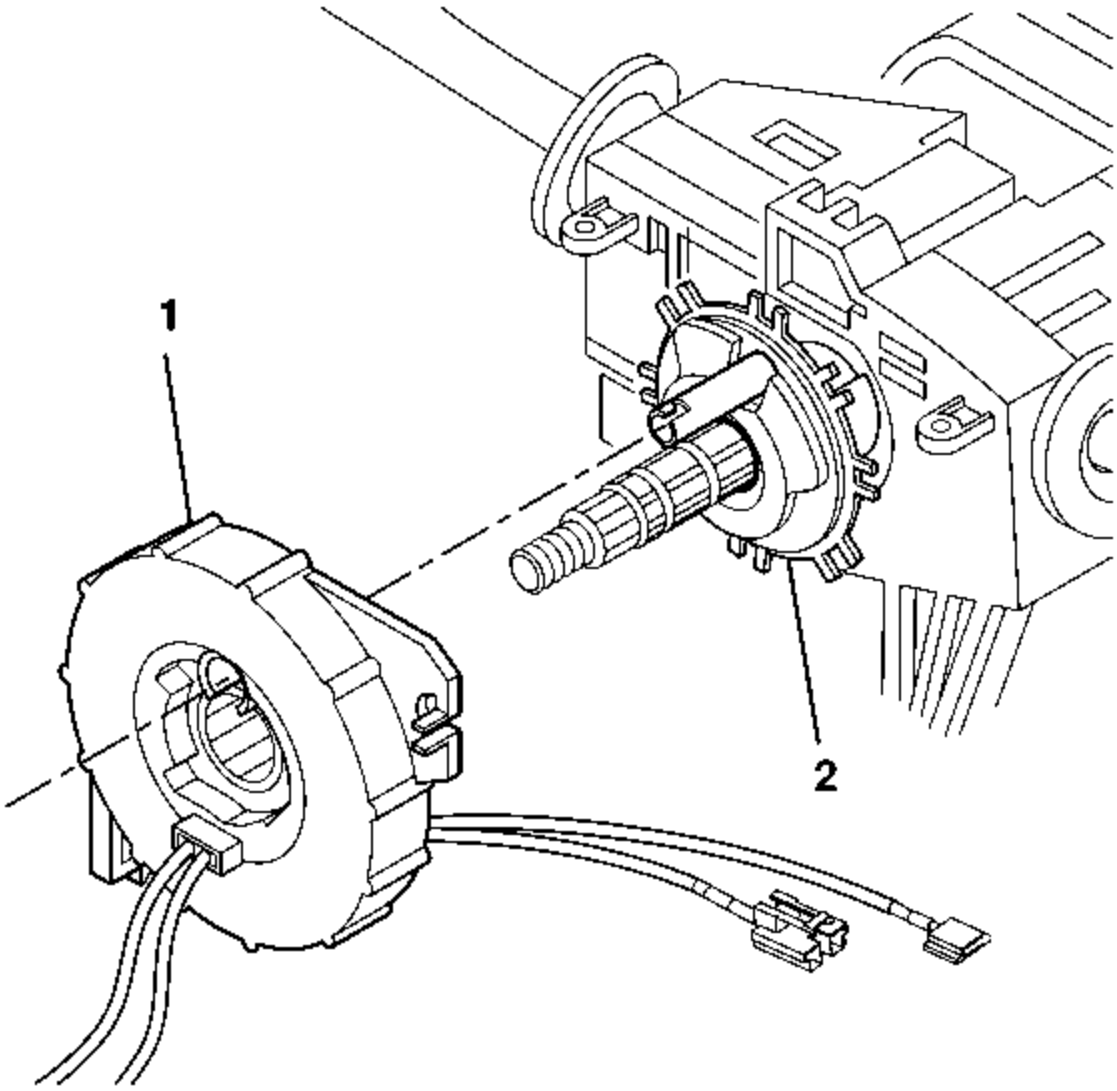

Fig. 15: Aligning SIR Coil Assembly With Horn Tower
Courtesy of GENERAL MOTORS COMPANY

3. Align the SIR coil assembly (1) with the horn tower on the turn signal cancel cam assembly (2).

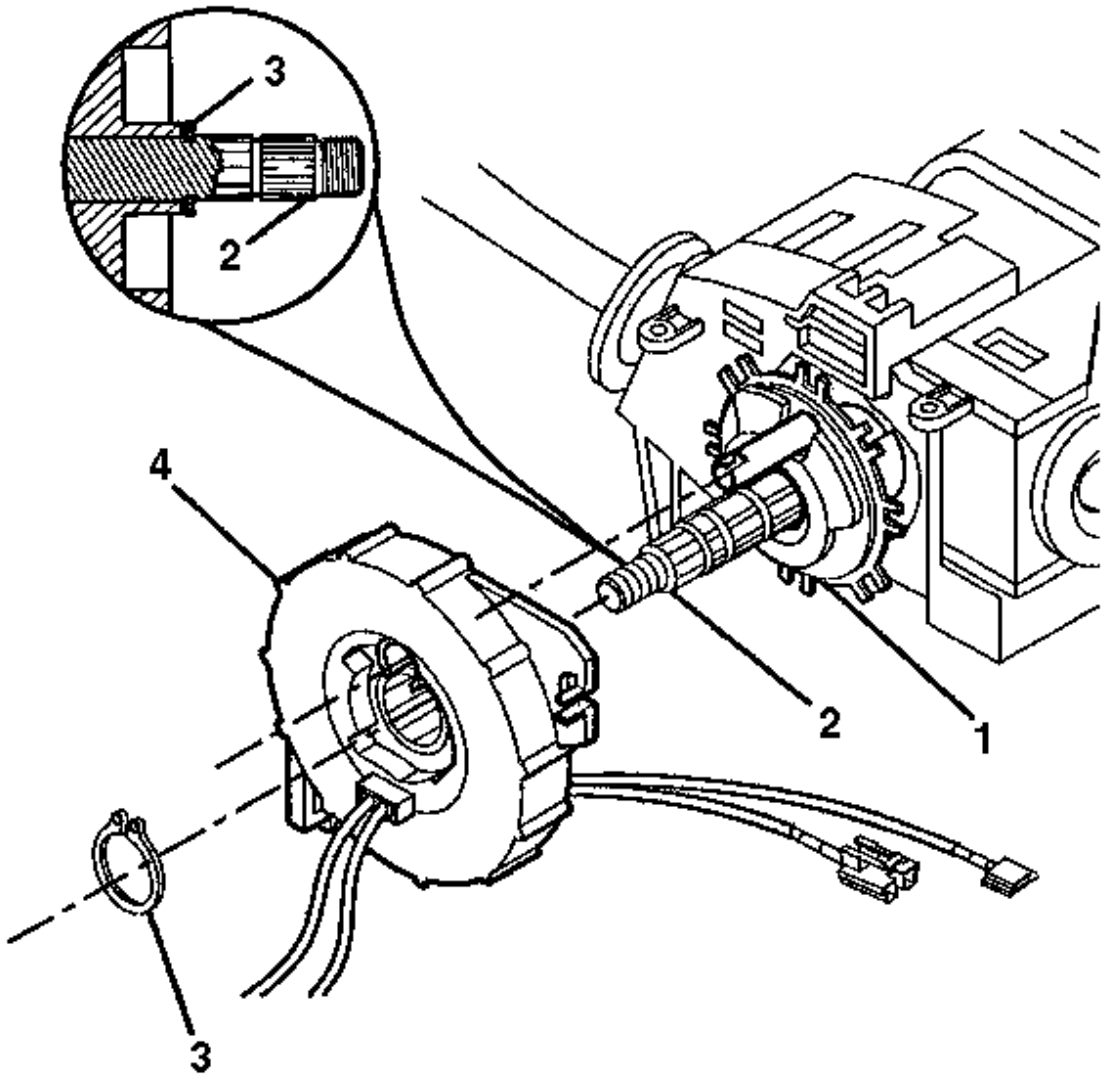

Fig. 16: Identifying SIR Coil, Steering Shaft Assembly & Retaining Ring
Courtesy of GENERAL MOTORS COMPANY

4. Slide the SIR coil (4) onto the steering shaft assembly (2).
5. Firmly seat the retaining ring (3) into the groove on the steering shaft assembly (2).
6. Remove and discard the centering tab from the new SIR coil (4).

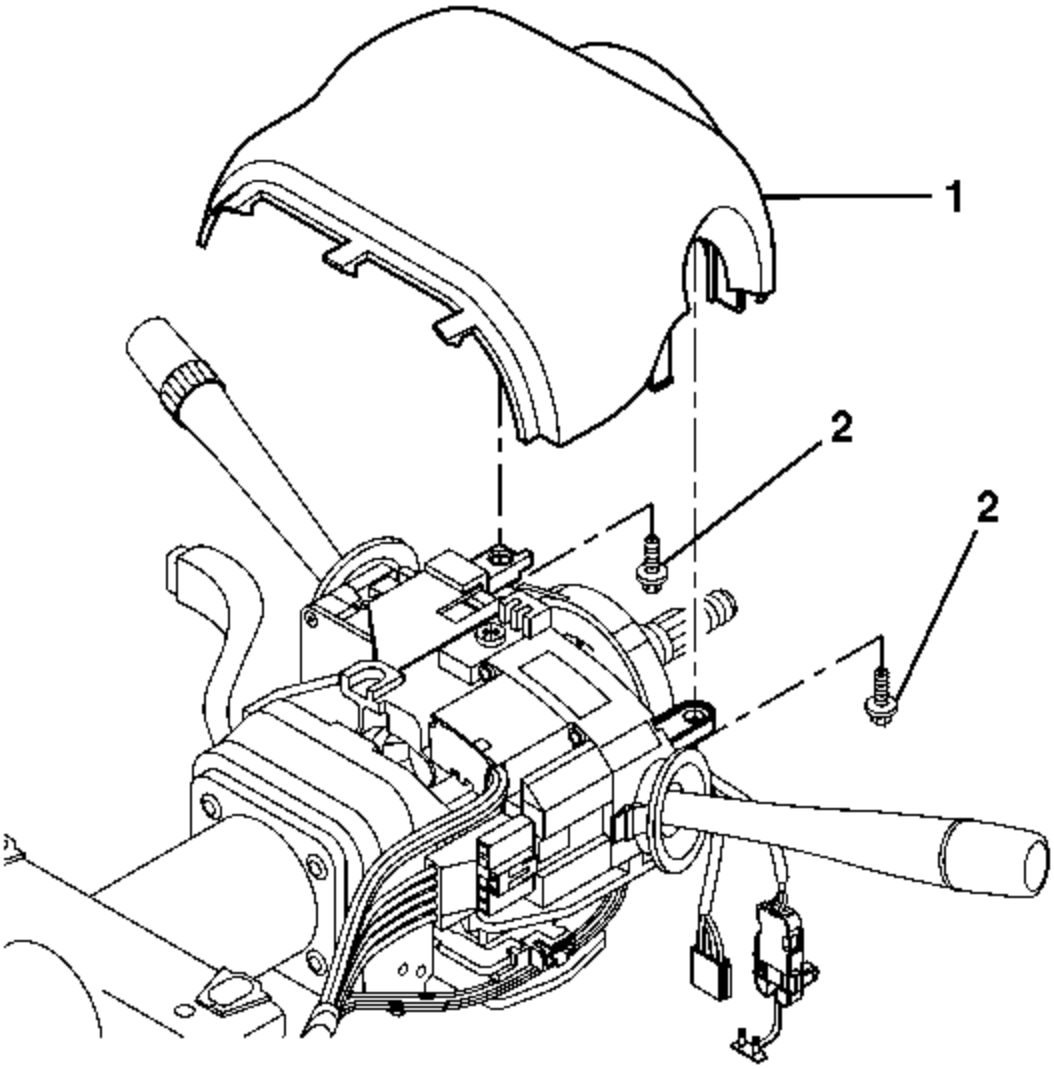

Fig. 17: Identifying Upper Trim Cover
Courtesy of GENERAL MOTORS COMPANY

CAUTION: Refer to Fastener Caution .

7. Install the upper trim cover (1) and secure by using 2 TORXÂ® head screws (2).

Tighten

Tighten the screws to 1.5 N.m (13 lb in).

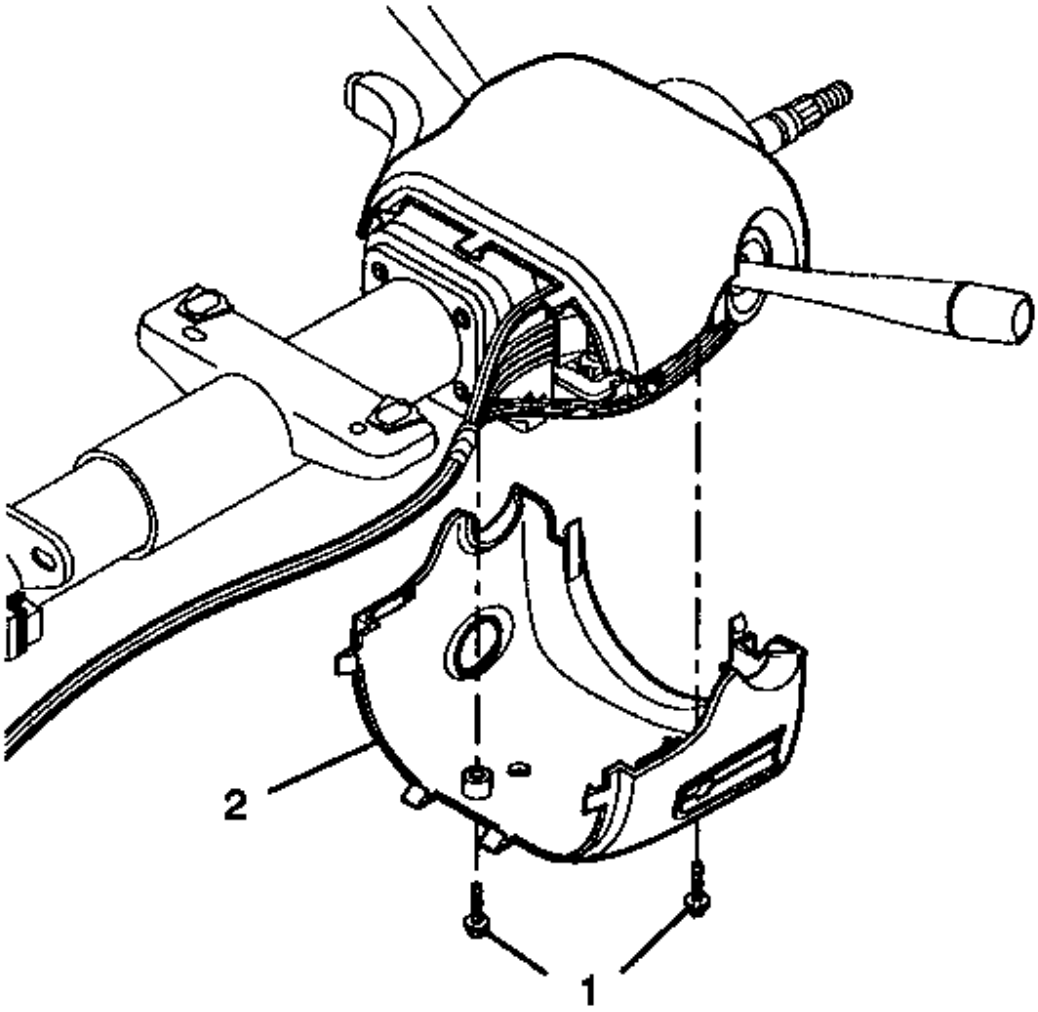

Fig. 18: Identifying Lower Trim Cover
Courtesy of GENERAL MOTORS COMPANY

8. Install the lower trim cover (2) and secure by using 2 TORXÂ® head screws (1).

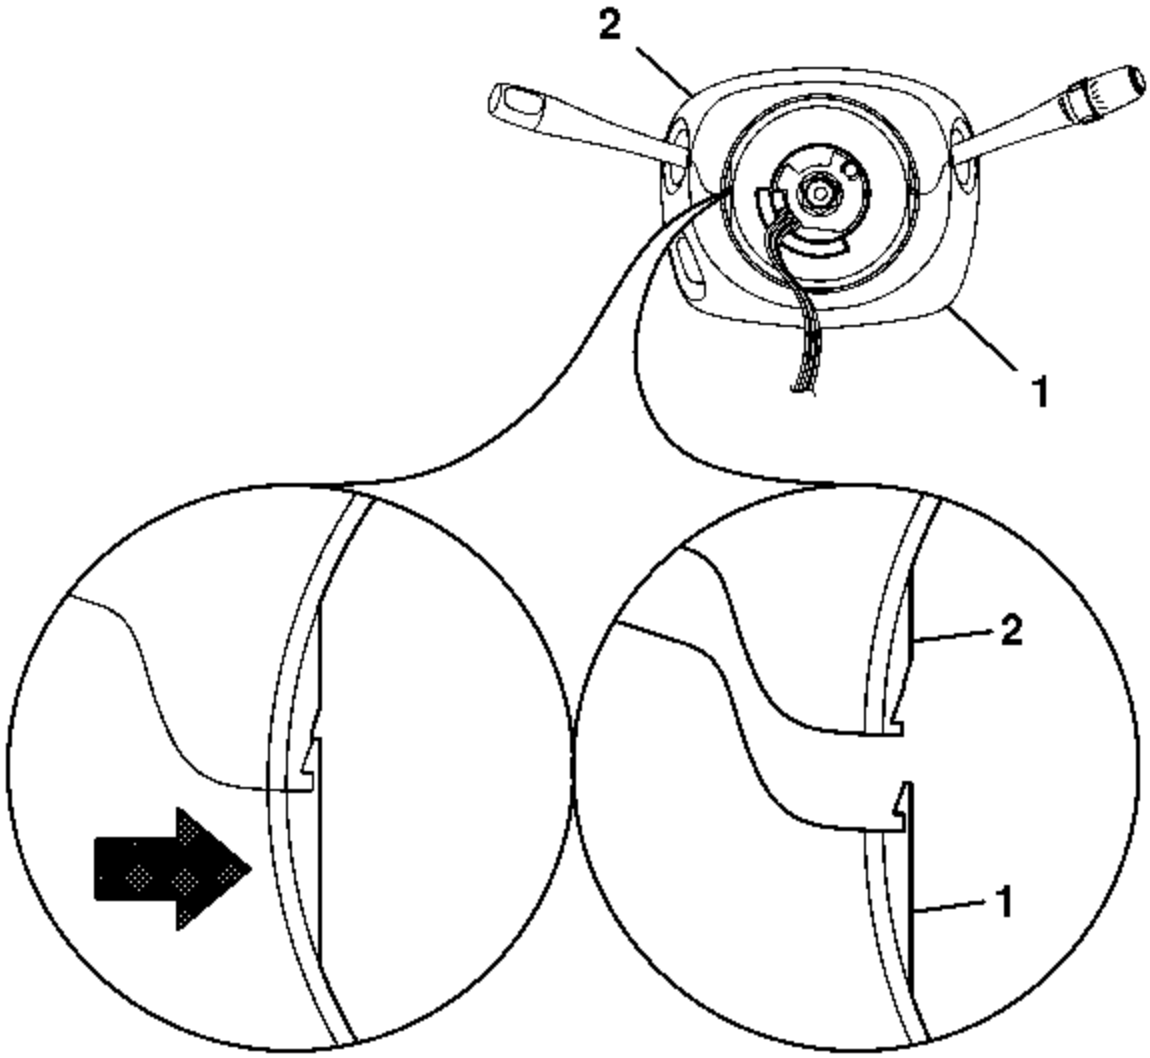

Fig. 19: Upper & Lower Trim Cover Tabs
Courtesy of GENERAL MOTORS COMPANY

9. Verify that the tabs on the lower trim cover (1) engage with the tabs on the upper trim cover (2). Snap the tabs together.

Tighten

Tighten the screws to 1.5 N.m (13 lb in).

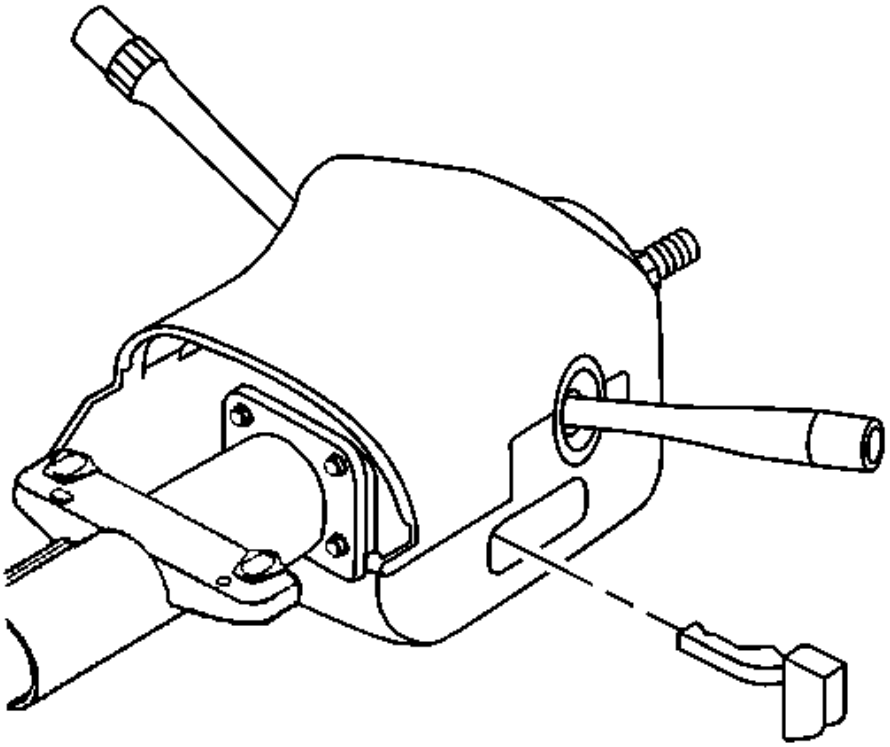

Fig. 20: Removing/Installing Tilt Lever
Courtesy of GENERAL MOTORS COMPANY

10. On vehicles with a tilt column, align the tilt lever into the steering column.
11. Slide the tilt lever handle into the steering column until the handle locks into position.

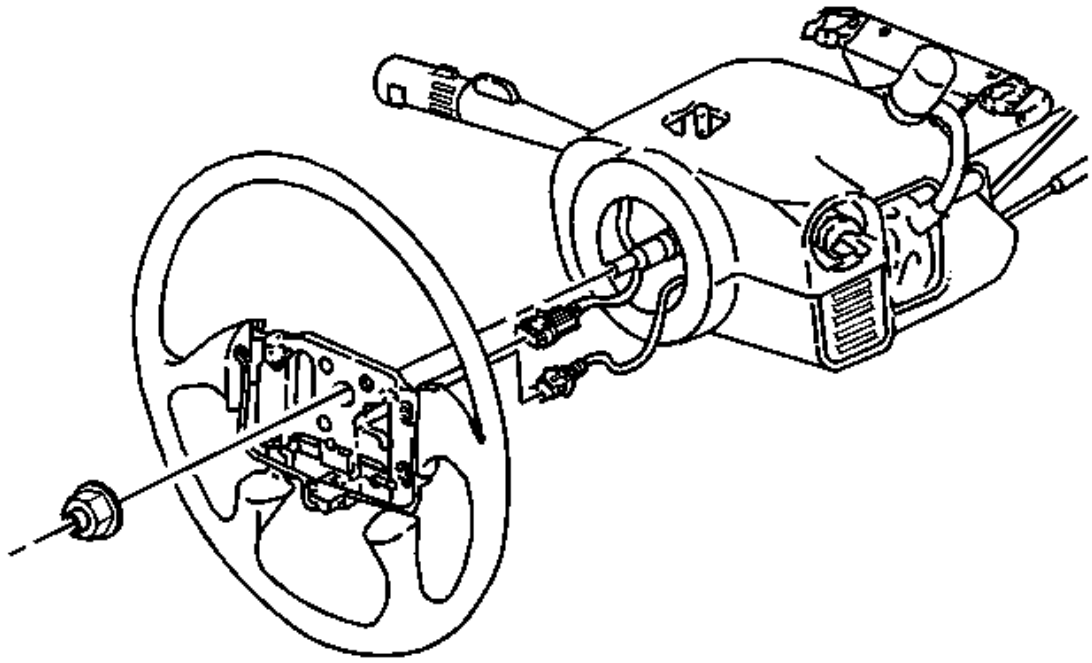

Fig. 21: Steering Wheel, Shaft & Nut
Courtesy of GENERAL MOTORS COMPANY

12. Install the steering wheel onto the steering shaft. Refer to **Steering Wheel Replacement** .
13. Enable the SIR system. Refer to **SIR Disabling and Enabling**.

AIRBAG STEERING WHEEL MODULE COIL CENTERING

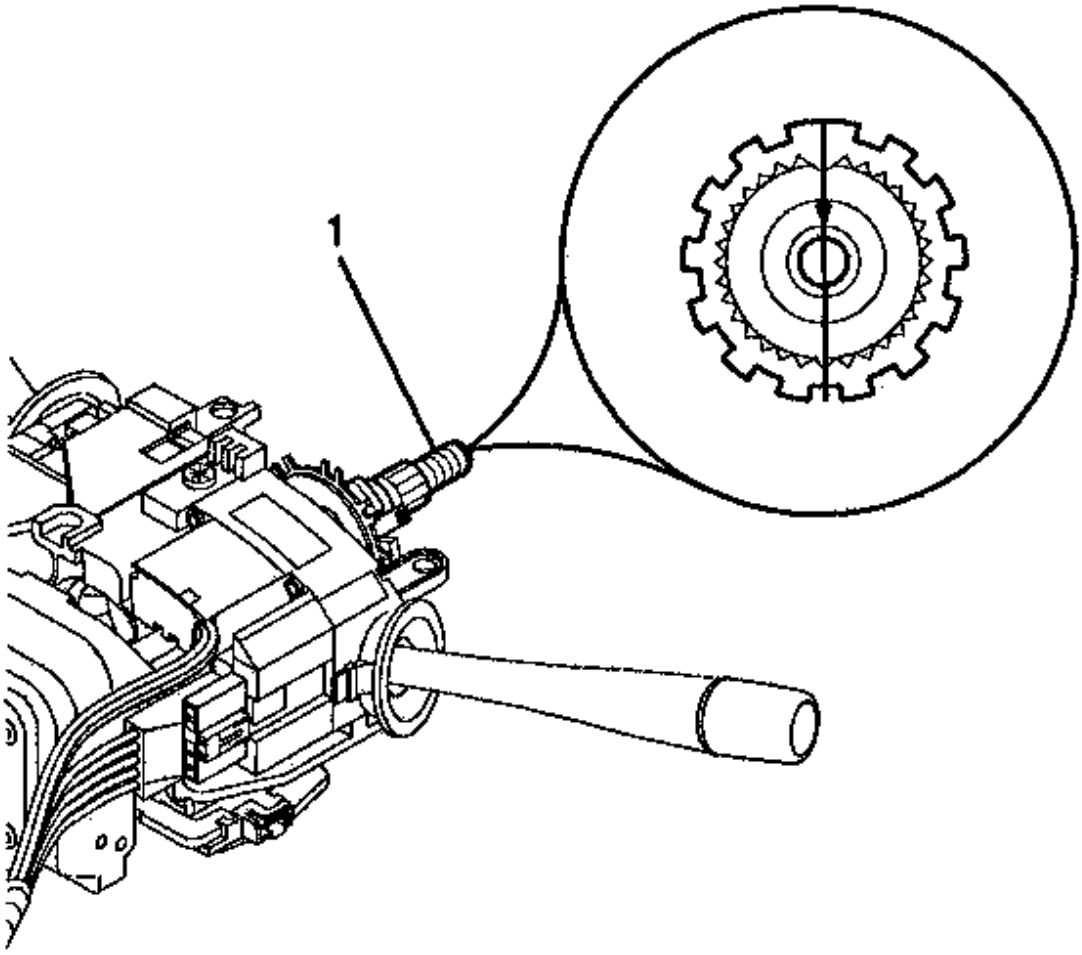

Fig. 22: View Of Block Tooth Of Steering Shaft Assembly In 12 O'clock Position
Courtesy of GENERAL MOTORS COMPANY

CAUTION: **The new SIR coil assembly will be centered. Improper alignment of the SIR coil assembly may damage the unit, causing an inflatable restraint malfunction.**

NOTE: **If double wire harness strap is installed onto the wire harness assembly and column, you must reuse the holder for the wire straps during installation.**

Remove the wire harness strap(s) where necessary.

1. Verify the following conditions before centering the SIR coil:
    - The wheels on the vehicle are straight ahead.
    - The block tooth (1) of the steering shaft assembly is in the 12 o'clock position.
    - The ignition switch is in the LOCK position.

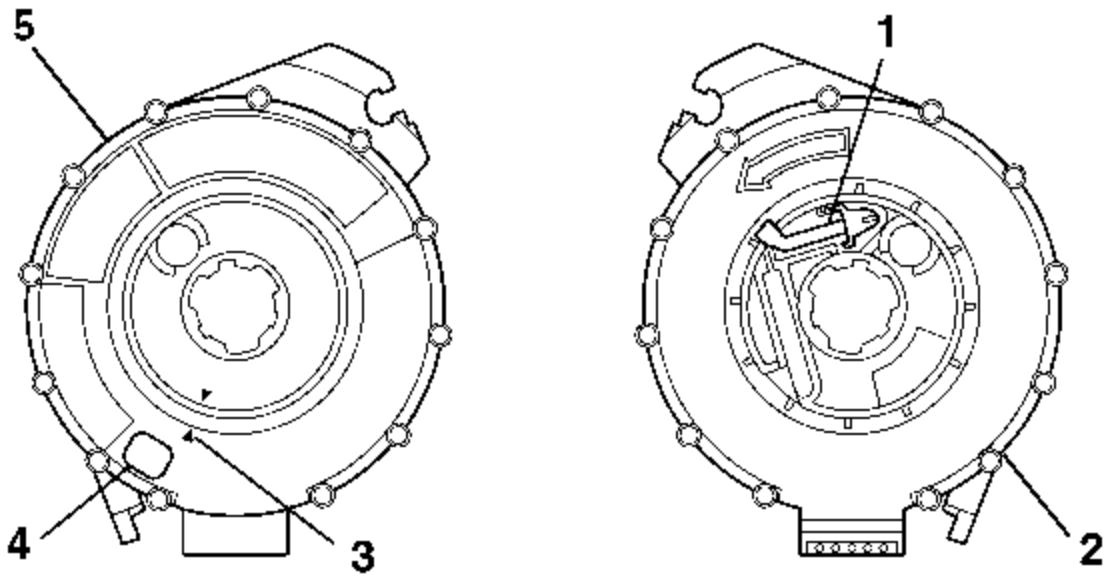

Fig. 23: Centering SIR Coil (With Centering Window & Spring Service Lock)
Courtesy of GENERAL MOTORS COMPANY

2. If the front (5) of the SIR coil has a centering window (4), and the back side (2) includes a spring service lock (1), perform the following steps:
    1. Hold the SIR coil with the face up.
    2. While depressing the spring service lock, rotate the coil hub clockwise until the coil ribbon stops.
    3. Rotate the coil hub slowly, counterclockwise, until the centering window appears yellow and both arrows (3) line up.
    4. Release spring service lock between the locking tab. The SIR coil is now centered.
    5. Align the centered SIR coil with the horn tower and slide onto the steering shaft assembly.

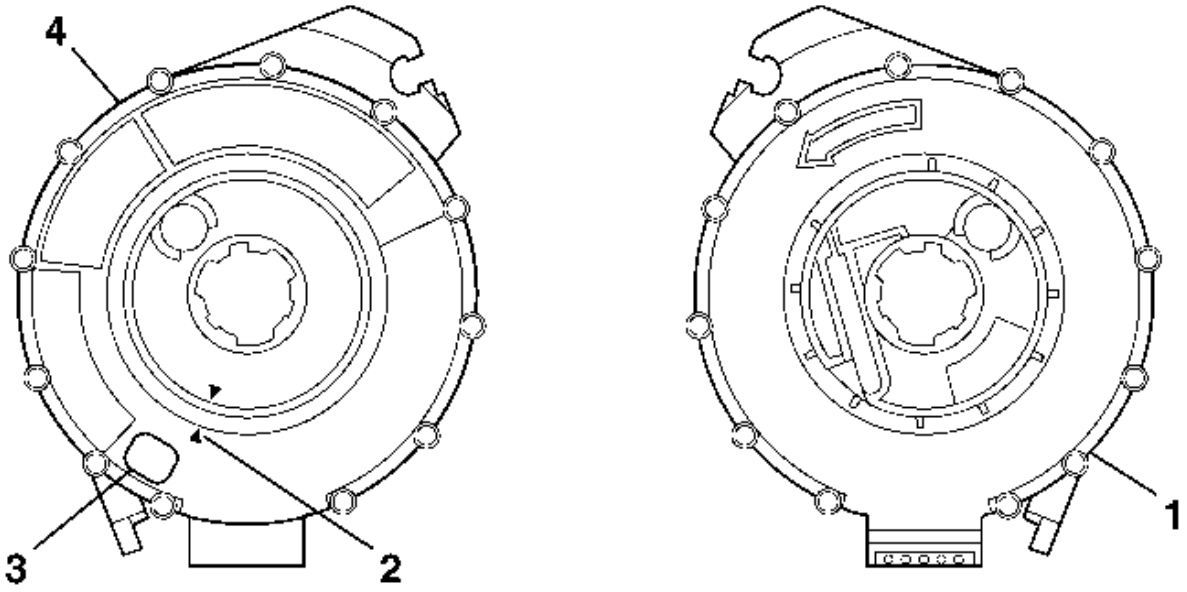

Fig. 24: Centering SIR Coil (With Centering Window, Without Spring Service Lock)
Courtesy of GENERAL MOTORS COMPANY

3. If the front (4) of the SIR coil has a centering window (3), and the back side (1) includes NO spring service lock, perform the following steps:
    1. Hold the SIR coil with the face up.
    2. Rotate the coil hub clockwise until the coil ribbon stops.
    3. Rotate the coil hub slowly, counterclockwise until the centering window appears yellow and both arrows (2) line up. This is the CENTER position.
    4. While holding the coil hub in the CENTER position, align the SIR coil with the horn tower and slide onto the steering shaft assembly.

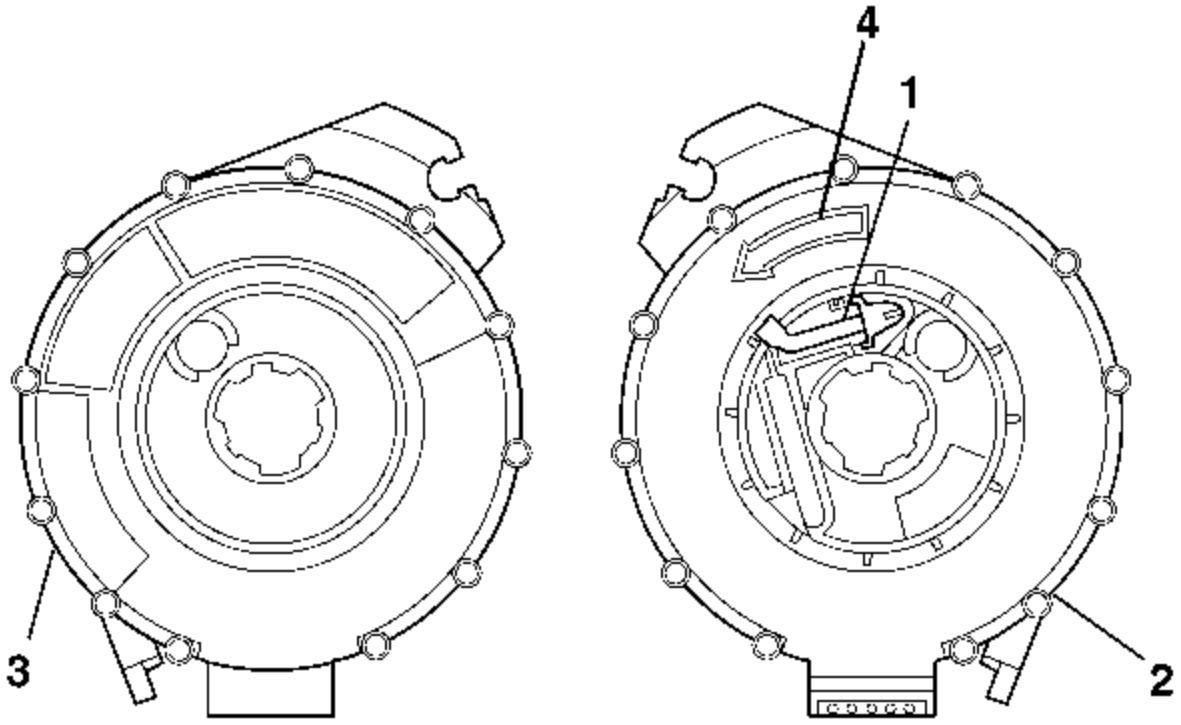

Fig. 25: Centering SIR Coil (No Centering Window, But Back Side Includes A Spring Service Lock)
Courtesy of GENERAL MOTORS COMPANY

4. If the front side (3) of the SIR coil has NO centering window, but the back side (2) includes a spring service lock (1), perform the following steps:
    1. Hold the SIR coil with the back side up.
    2. While depressing the spring service lock, rotate the coil hub in the direction of the arrow (4) until the coil ribbon stops.
    3. Still pressing the spring service lock, rotate the coil hub in the opposite direction 2 1/2 revolutions.
    4. Release the spring service lock between locking tabs. The SIR coil is now centered.
    5. Align the centered SIR coil with the horn tower and slide onto the steering shaft assembly.

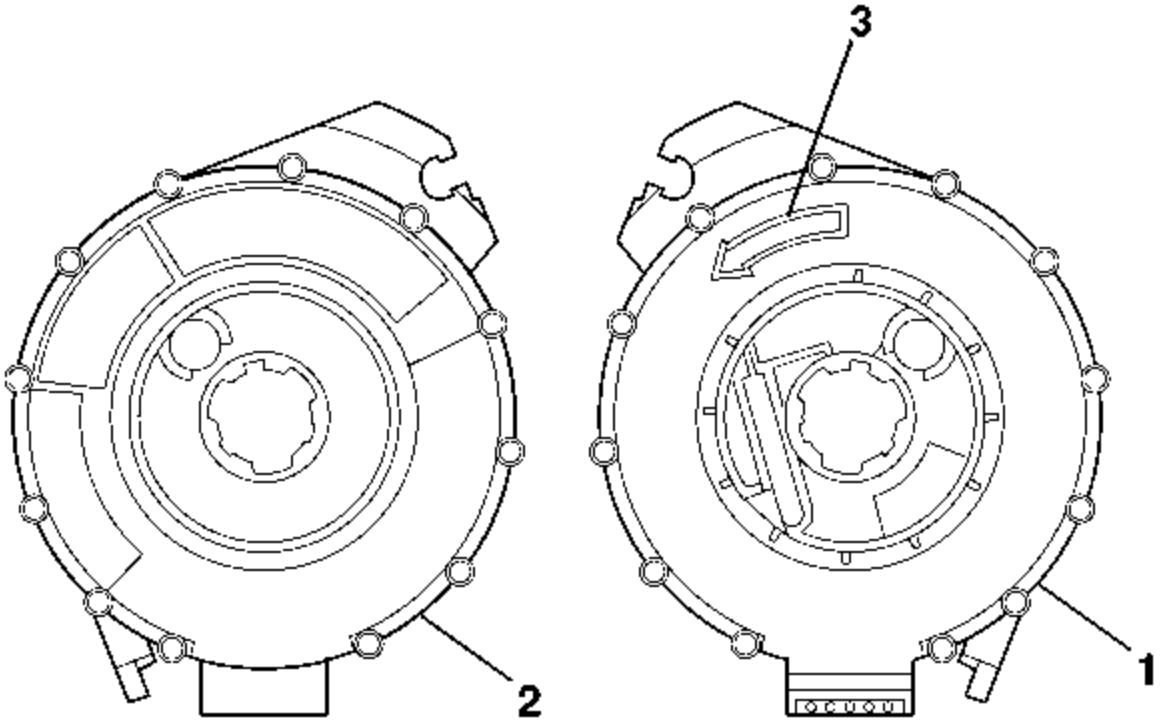

Fig. 26: Centering SIR Coil (Without Centering Window, Without Spring Service Lock)
Courtesy of GENERAL MOTORS COMPANY

5. If the front side (2) of the SIR coil has NO centering window, and the back side (1) includes NO spring service lock, perform the following steps:
    1. Hold the SIR coil with the face up.
    2. Rotate the coil hub in the direction of the arrow until the coil ribbon stops.
    3. Rotate the coil hub, slowly, counterclockwise, for 2 1/2 revolutions. This is the CENTER position.
    4. While maintaining the coil hub in the CENTER position, align the centered SIR coil with the horn tower and slide onto the steering shaft assembly.
6. If double wire harness strap is installed onto the wire harness assembly and column, you must route the wires up against the steering column. One wire harness strap will surround one lead from the coil to the steering column. The other wire harness strap will surround all leads to the steering column.

AIRBAG INSTRUMENT PANEL MODULE REPLACEMENT (IMPALA LIMITED)

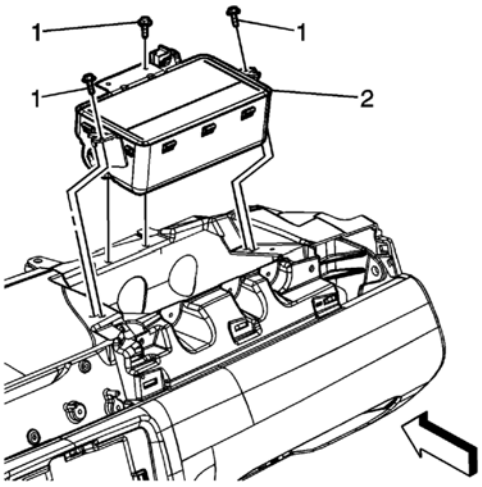

Fig. 27: Inflatable Restraint Instrument Panel Module (Impala Limited)
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
WARNING: **Refer to SIR Warning .** **WARNING:** **Refer to SIR Inflator Module Handling and Storage Warning .** **Preliminary Procedures** 1. Disable the SIR. Refer to **SIR Disabling and Enabling**. 2. Remove the instrument panel (I/P) upper trim panel. Refer to **Instrument Panel Upper Trim Pad Replacement** .	
1	Inflatable Restraint I/P Module Bolts (Qty: 3) **CAUTION:** **Refer to Fastener Caution .** **Tighten** 10 N.m (89 lb in)
2	Inflatable Restraint I/P Module Assembly

INFLATABLE RESTRAINT PASSENGER PRESENCE SYSTEM REPLACEMENT - FRONT

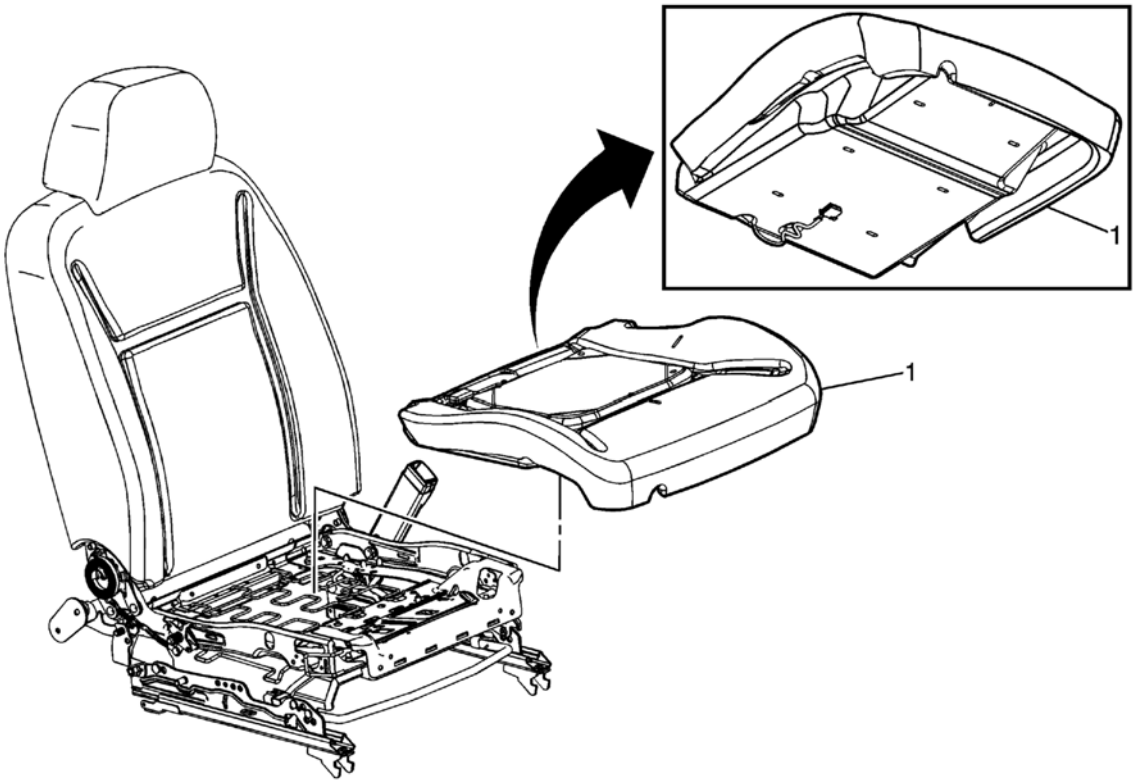

Fig. 28: Identifying Inflatable Restraint Passenger Presence System
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure 1. Remove the front seat. Refer to **Front Seat Removal and Installation - Bucket (Impala Limited)** . 2. Remove the seat cushion cover. Refer to **Front Seat Cushion Cover and Pad Replacement (Impala Limited)** .	
1	Inflatable Restraint Front Passenger Presence System Assembly **WARNING:** **Replace the passenger presence system as a complete assembly to prevent possible injury to the occupant. All the**

Callout	Component Name
	components in the service kit are assembled and calibrated as a unit. Using only some of the components in the service kit will cause the passenger presence system to operate improperly. **WARNING:** **To avoid personal injury, perform a preload test on the passenger presence system whenever you remove or replace the seat cushion trim. Failure to do so may cause the system to malfunction.** **Procedures** 1. Passenger Presence System Preload Test the inflatable restraint passenger presence system whenever the seat cushion or any component of the passenger presence system is removed. Refer to **Passenger Presence System Preload Test**

Callout	Component Name
	2. Program the inflatable restraint passenger presence system after replacement. Refer to **Control Module References** . • The passenger presence system is an integral part of the pad on the passenger seat cushion. • The seat cushion heater is attached directly to the pad, then the sensor goes on top of the heater (if equipped). • The sensor, module and seat cushion pad must be replaced as a unit. • Note the routing of the wiring harness and connector location for installation.

FRONT SEAT OUTBOARD SEAT BACK AIRBAG REPLACEMENT

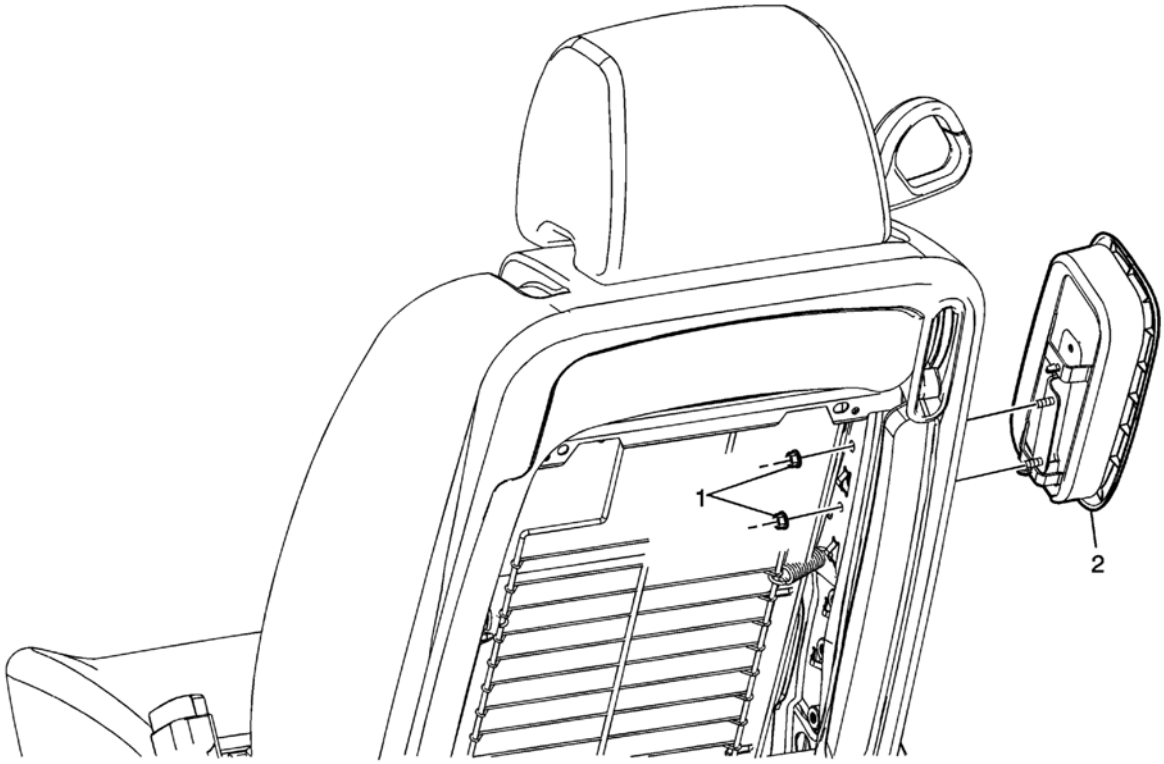

Fig. 29: Inflatable Restraint Side Impact Module
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
WARNING: **Following the deployment of a side impact air bag, inspect the following parts for**	

Callout	Component Name
damage. Replace these parts if necessary: • **The seat cushion frame** • **The seat recliner, if equipped** • **The seat adjuster** • **The seat back frame** **Failure to do so may cause future personal injury.** **WARNING:** **Do not strike or jolt the inflatable restraint side impact sensor (SIS). Before applying power to the SIS make sure that it is securely fastened. Failure to observe the correct installation procedures could cause SIR deployment, personal**	

Callout	Component Name
injury, or unnecessary SIR system repairs. **Preliminary Procedure** 1. Disable the SIR system. Refer to **SIR Disabling and Enabling**. 2. Remove the front seat. Refer to **Front Seat Removal and Installation - Bucket (Impala Limited)** . 3. Remove the front seat back cushion finish panel. Refer to **Front Seat Back Cushion Finish Panel Replacement (Impala Limited)** .	
1	Inflatable Restraint Front Seat Side Module Nut (Qty: 2) **CAUTION:** **Refer to Fastener Caution .** **Tighten** 3.5 N.m (31 lb in)
2	Inflatable Restraint Front Seat Side Module **Procedure** 1. Remove the connector position assurance (CPA) from the module electrical connector. 2. Disconnect the electrical connector. 3. Refer to **Inflatable Restraint Module Handling and Scrapping**.

INSTRUMENT PANEL AIRBAG ARMING STATUS DISPLAY REPLACEMENT

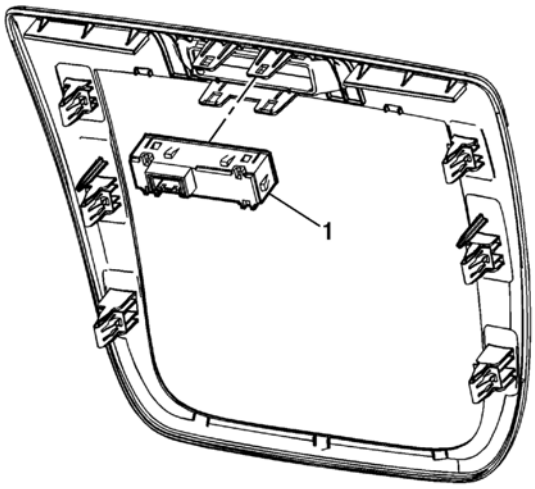

Fig. 30: Inflatable Restraint IP Module Indicator

Callout	Component Name
WARNING: **In order to prevent SIR deployment,**	

Callout	Component Name
personal injury, or unnecessary SIR system repairs, do not strike the door or the door pillar in the area of the side impact sensor (SIS). Turn OFF the ignition and remove the key when performing service in the area of the SIS. **WARNING: When installing the roof rail airbag, do not twist or turn the airbag 360 degrees. Securing the roof rail airbag with an airbag twisted or turned 360 degrees may cause the airbag not to deploy correctly and could cause personal injury.** **WARNING:**	

Callout	Component Name
Refer to SIR Warning . **WARNING:** **Refer to SIR Inflator Module Handling and Storage Warning .** **Preliminary Procedures** 1. Disable the SIR system. Refer to **SIR Disabling and Enabling**. 2. Remove the windshield pillar garnish molding. Refer to **Windshield Pillar Garnish Molding Replacement** . 3. Remove the center pillar trim. Refer to **Center Pillar Upper Trim Panel Replacement** . 4. Remove the rear quarter upper trim panel. Refer to **Quarter Upper Trim Panel Replacement** . 5. Remove the assist handles. Refer to **Assist Handle Replacement** . 6. Lower the side of the headliner. Refer to **Headlining Trim Panel Replacement** .	
1	Inflatable Restraint Roof Side Rail Bolt **CAUTION:** **Refer to Fastener Caution .** **Tighten** 9 N.m (80 lb in)
2	Inflatable Restraint Roof Side Rail Module Assembly
3	Assist Handle Bracket Assembly

FRONT SEAT BELT ANCHOR PLATE TENSIONER REPLACEMENT

Removal Procedure

WARNING: **Refer to SIR Warning .**

WARNING: **In order to prevent accidental deployment and the risk of personal injury, do not dispose of an undeployed inflatable restraint seat belt pretensioner as normal shop waste. Undeployed seat belt pretensioners contain substances that could cause severe illness or personal injury if their sealed containers are damaged during disposal. Use the following deployment procedures to safely dispose of an undeployed seat belt**

pretensioner. Failure to observe the following disposal methods may be a violation of appropriate country, regional or local laws.

WARNING: When carrying an undeployed inflatable restraint seat belt pretensioner:

- **Do not carry the seat belt pretensioner by the wires or connector.**
- **Carry the seat belt pretensioner by the piston tube, keeping hands and fingers away from the cable.**
- **Make sure the open end of the seat belt pretensioner piston tube points away from you and other people.**
- **Do not cover the seat belt pretensioner piston tube opening with your hand.**

Failure to observe these guidelines may result in personal injury.

1. Move the front seat all the way forward.
2. Disable the SIR. Refer to **SIR Disabling and Enabling**.
3. Remove the seat cushion outer trim panel. Refer to **Seat Cushion Outer Trim Panel Replacement** .

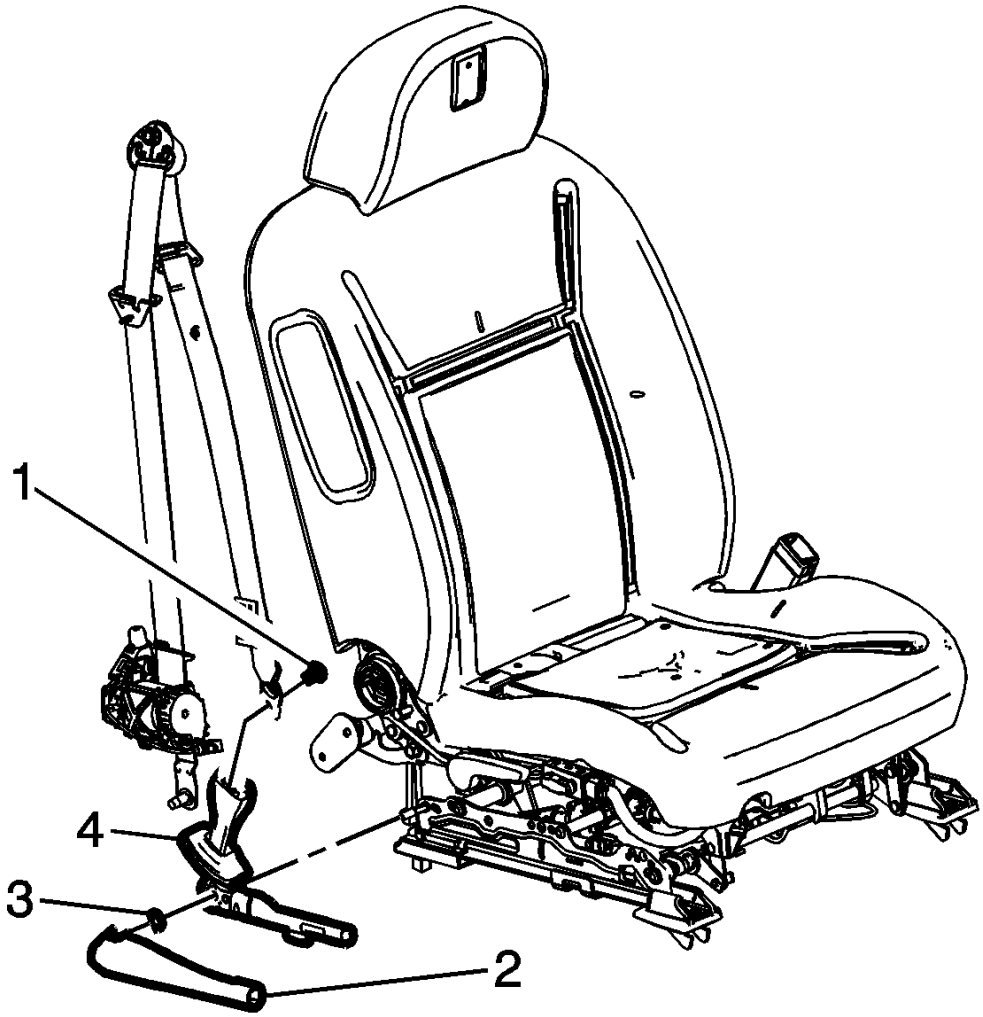

Fig. 32: Identifying Seat Belt Retractor Pretensioner
Courtesy of GENERAL MOTORS COMPANY

4. Unsnap the upper sleeve from the linkage cover and slide down.
5. Remove the linkage screw. Then push the screw through the hole using the small access hole on the opposite side of the linkage cover bolt/screw (1).
6. If the screw does not come out, the cover halves can be separated with a flat-head screwdriver to access and hold the nut.
7. Pull the anchor linkage plate from the linkage cover.
8. Remove the tensioner cover (2).
9. Remove the seat belt tensioner assembly nut (3).

NOTE: **The tensioner is on the opposite side of the seat belt buckle.**

10. Remove the seat belt (anchor side) tensioner assembly (4).

Installation Procedure

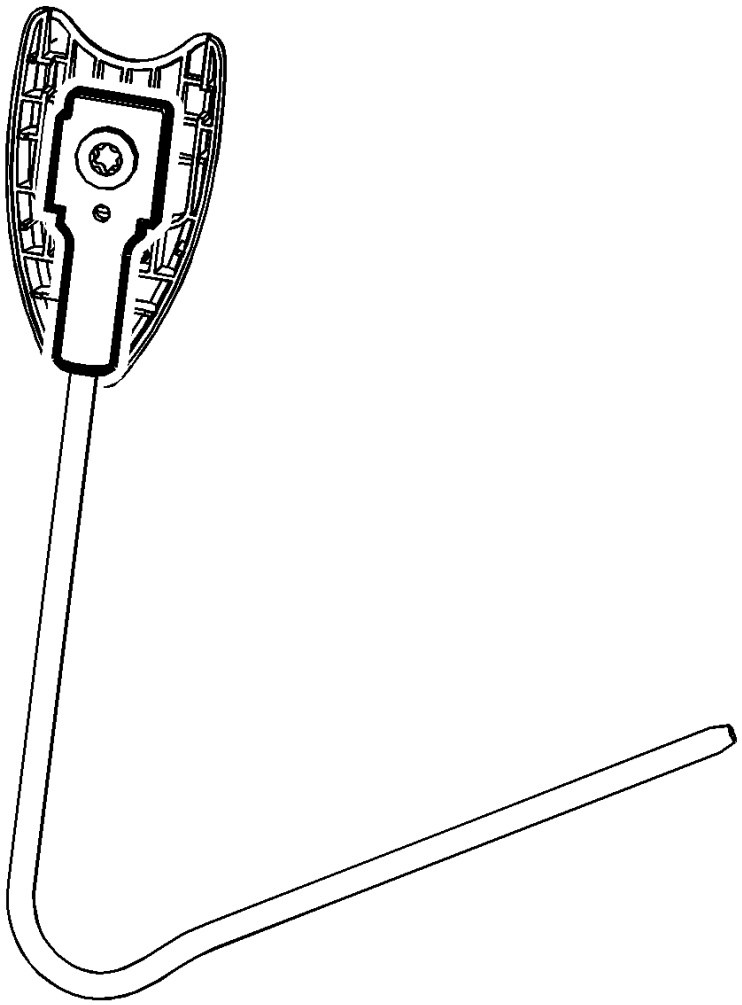

Fig. 33: Seat Belt Anchor Plate Tensioner (First Design)

Courtesy of GENERAL MOTORS COMPANY

NOTE: **First Design**

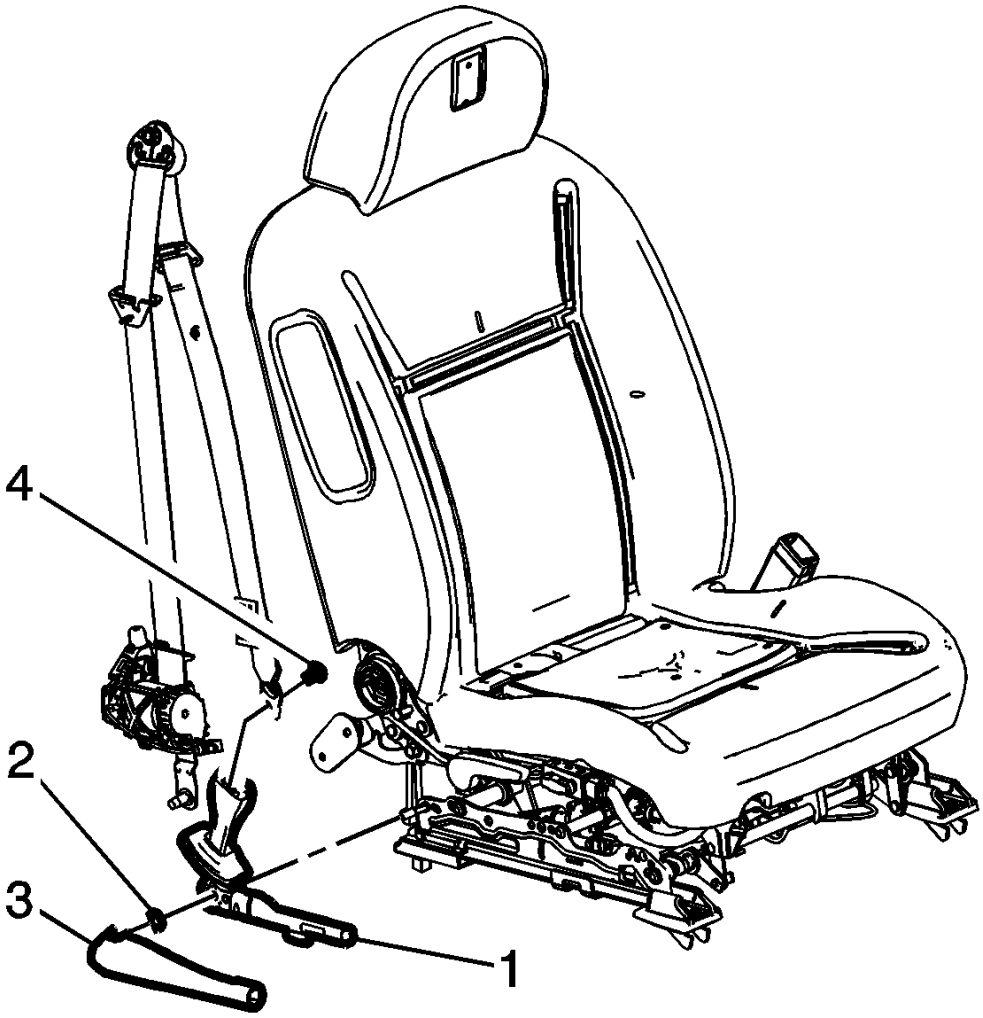

Fig. 34: Seat Belt (Anchor Side) Tensioner Assembly
Courtesy of GENERAL MOTORS COMPANY

1. Install the seat belt (anchor side) tensioner assembly (1).

CAUTION: **Refer to Fastener Caution .**

2. Install the seat belt tensioner assembly nut (2) and tighten to 42 N.m (31 lb ft).
3. Install the tensioner cover (3).
4. Install the anchor linkage plate with the seat belt webbing label facing the occupant. Ensure there is no twist in webbing from the D ring to the anchor linkage plate.
5. Push the anchor linkage plate into linkage cover past the white stamped markings.
6. Install the anchor linkage plate bolt/screw (4) and tighten to 6 N.m (53 lb in).
7. Pull linkage sleeve upwards, and snap into place.

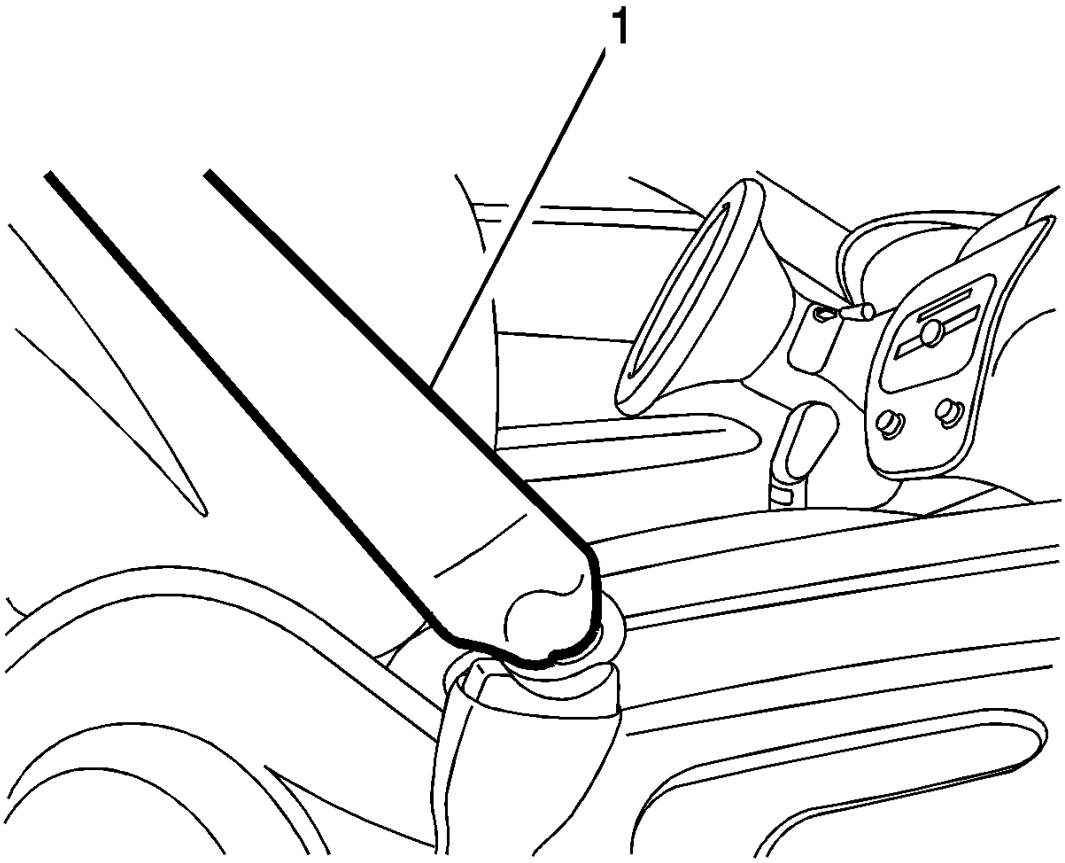

Fig. 35: Seat Belt Webbing
Courtesy of GENERAL MOTORS COMPANY

8. Check for label facing inward toward occupant and no twisting in the seat belt webbing (1).

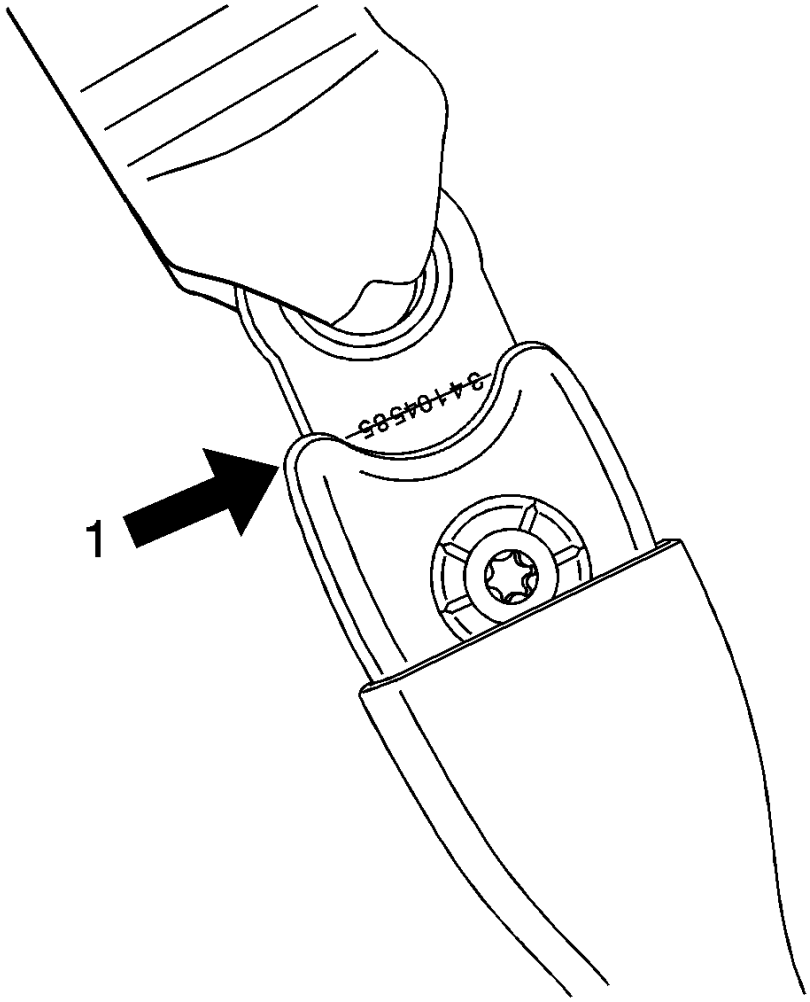

Fig. 36: Anchor Linkage Plate Cover
Courtesy of GENERAL MOTORS COMPANY

9. Check that NO white line and stamping numbers are visible above the anchor linkage plate cover (1).

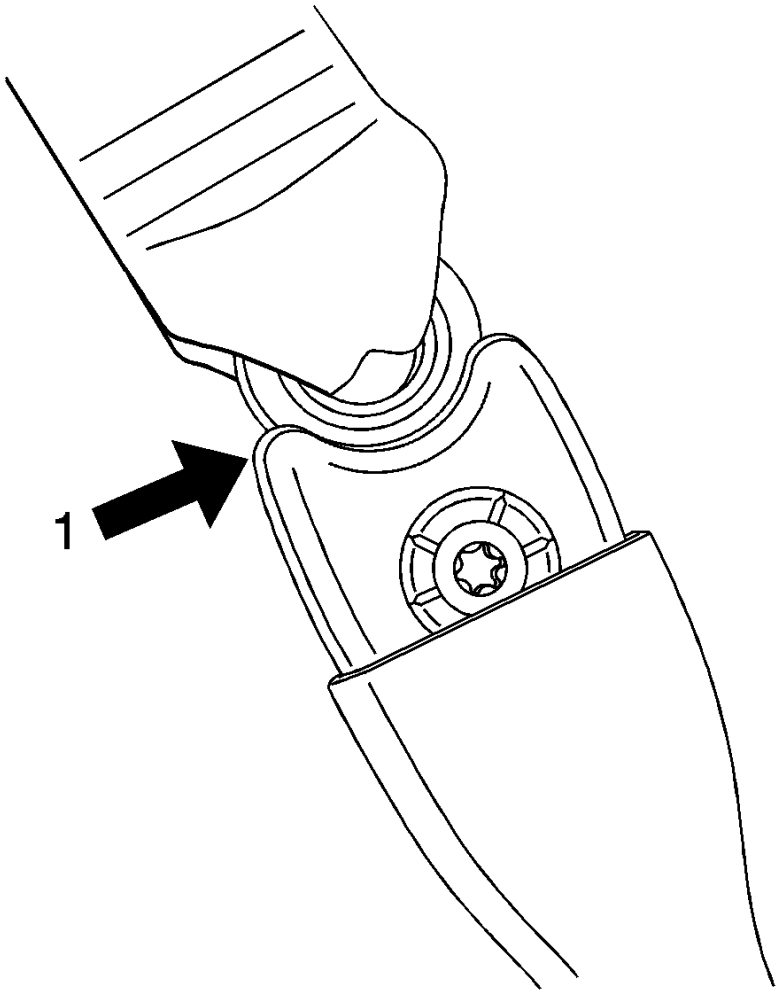

Fig. 37: Anchor Linkage Plate Cover
Courtesy of GENERAL MOTORS COMPANY

10. This illustration shows proper installation of anchor linkage plate cover (1).
11. Install the seat cushion outer trim panel. Refer to **Seat Cushion Outer Trim Panel Replacement** .
12. Enable the SIR. Refer to **SIR Disabling and Enabling**.

Installation Procedure

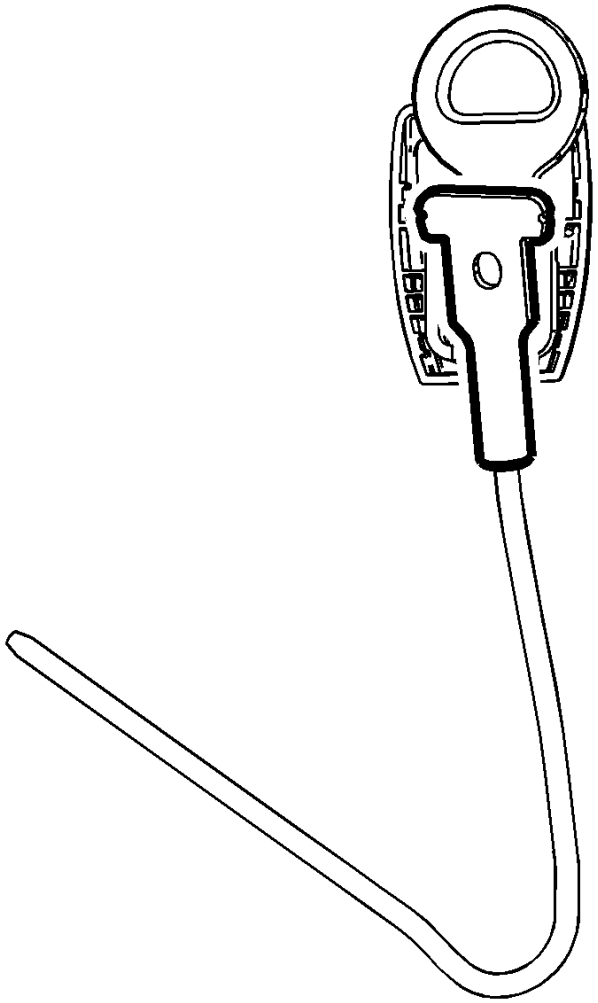

Fig. 38: Seat Belt Anchor Plate Tensioner (Second Design)
Courtesy of GENERAL MOTORS COMPANY

NOTE: **Second Design**

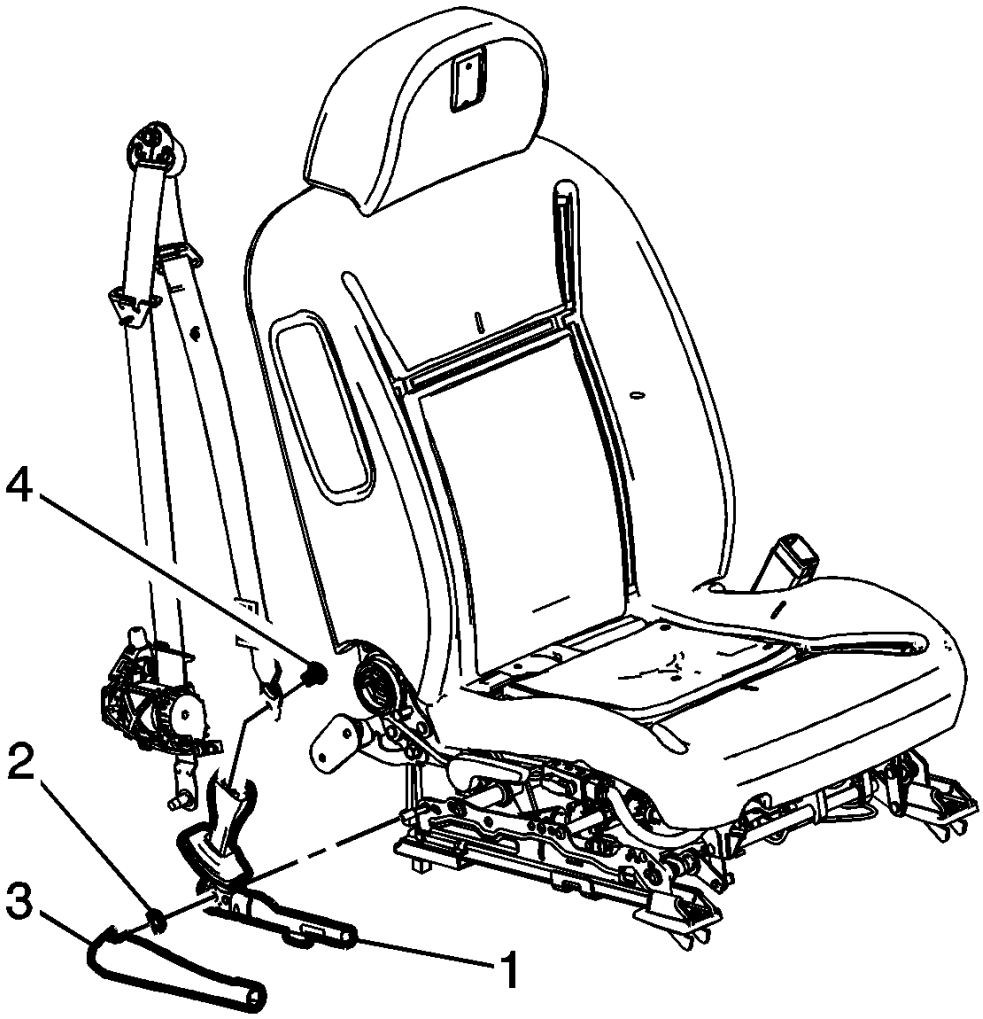

Fig. 39: Seat Belt (Anchor Side) Tensioner Assembly
Courtesy of GENERAL MOTORS COMPANY

1. Install the seat belt (anchor side) tensioner assembly (1).

CAUTION: Refer to Fastener Caution .

2. Install the seat belt tensioner assembly nut (2) and tighten to 42 N.m (31 lb ft).
3. Install the tensioner cover (3).
4. Install the anchor linkage plate with the seat belt webbing label facing the occupant. Ensure there is no twist in webbing from the D ring to the anchor linkage plate.
5. Remove the inner cover and interlock the anchor linkage plate with seat belt webbing and tighten to 6 N.m (53 lb in).

SEAT BELT RETRACTOR PRETENSIONER REPLACEMENT - FRONT

Removal Procedure

WARNING: Refer to SIR Warning .

WARNING: **In order to prevent accidental deployment and the risk of personal injury, do not dispose of an undeployed inflatable restraint seat belt pretensioner as normal shop waste. Undeployed seat belt pretensioners contain substances that could cause severe illness or personal injury if their sealed containers are damaged during disposal. Use the following deployment procedures to safely dispose of an undeployed seat belt pretensioner. Failure to observe the following disposal methods may be a violation of appropriate country, regional or local laws.**

WARNING: **When carrying an undeployed inflatable restraint seat belt pretensioner:**

- **Do not carry the seat belt pretensioner by the wires or connector.**
- **Carry the seat belt pretensioner by the piston tube, keeping hands and fingers away from the cable.**
- **Make sure the open end of the seat belt pretensioner piston tube points away from you and other people.**
- **Do not cover the seat belt pretensioner piston tube opening with your hand.**

Failure to observe these guidelines may result in personal injury.

1. Move the front seat all the way forward.
2. Disable the SIR. Refer to **SIR Disabling and Enabling**.
3. Remove the lower center pillar trim. Refer to **Center Pillar Lower Trim Panel Replacement** .

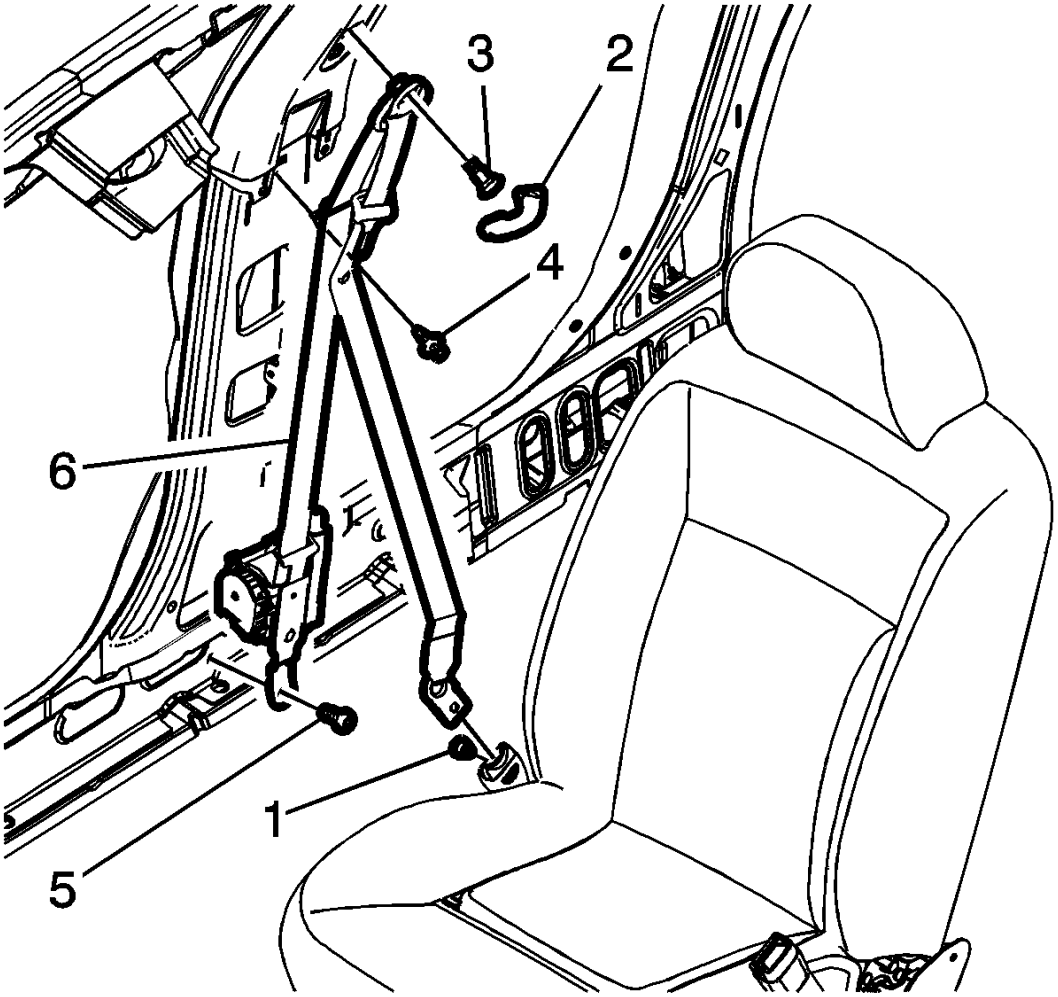

Fig. 40: Seat Belt Retractor Pretensioner - Front
Courtesy of GENERAL MOTORS COMPANY

4. Unsnap the upper sleeve from the linkage cover and slide down.
5. Remove the linkage screw then push the screw through the hole using the small access hole on the opposite side of the linkage cover (1).
6. Pull the anchor linkage plate from the linkage cover.
7. Remove the seat shoulder belt guide adjustable cover (2).
8. Remove the upper seat shoulder belt retractor bolt (3).
9. Remove the seat shoulder belt anchor pushpin retainer (4).
10. Remove the lower seat shoulder belt retractor bolt (5).
11. Remove the seat shoulder belt retractor (6).

Installation Procedure

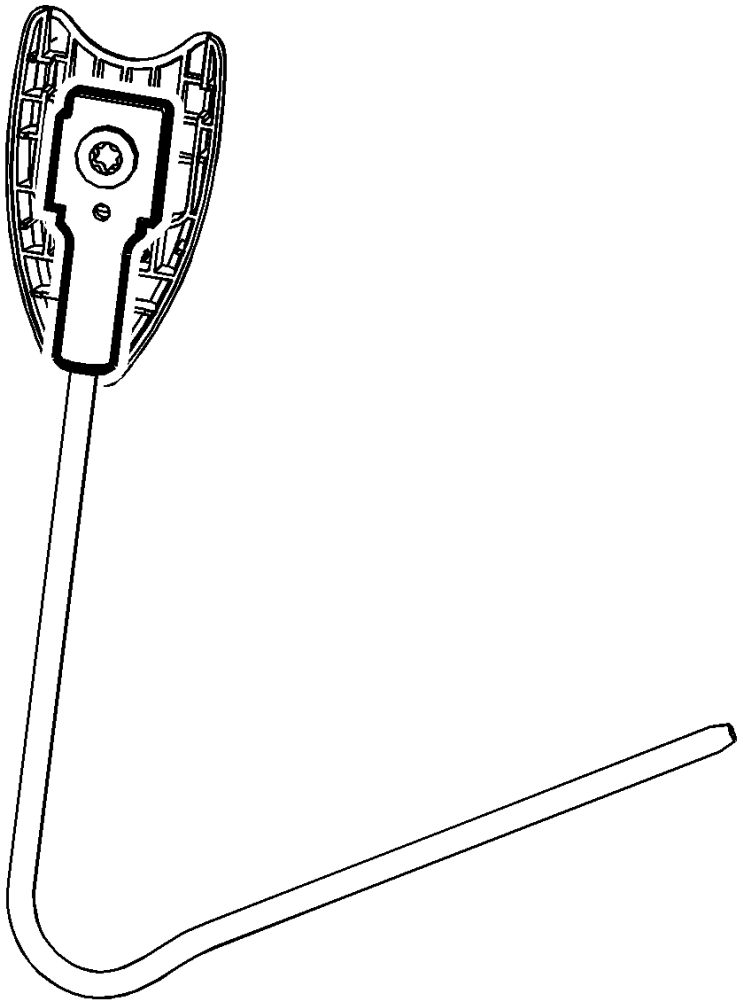

Fig. 41: Seat Belt Anchor Plate Tensioner (First Design)
Courtesy of GENERAL MOTORS COMPANY

NOTE: **First Design**

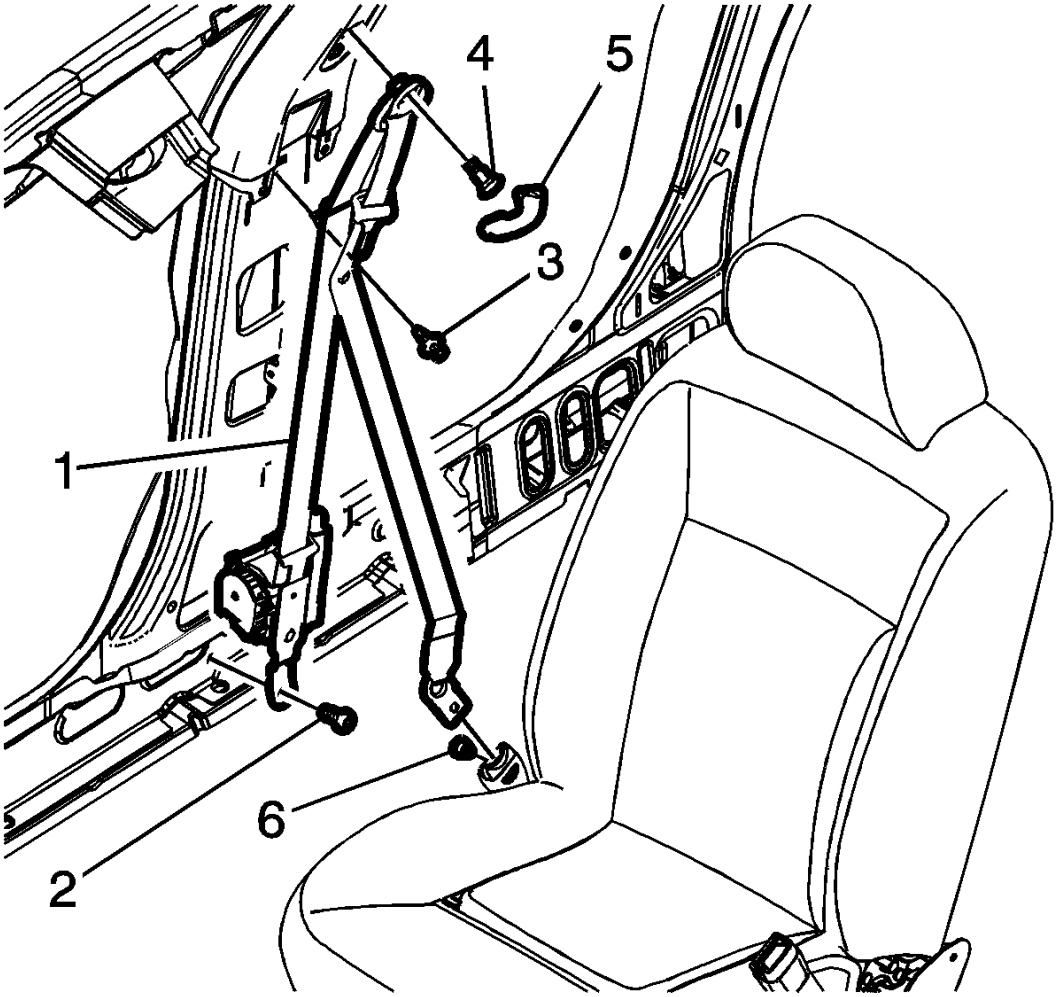

Fig. 42: Seat Shoulder Belt Retractor
Courtesy of GENERAL MOTORS COMPANY

1. Install the seat shoulder belt retractor (1).

CAUTION: Refer to Fastener Caution .

2. Install the lower seat shoulder belt retractor bolt (2) and tighten to 68 N.m (50 lb ft).
3. Install the seat shoulder belt anchor pushpin retainer (3).
4. Install the upper seat shoulder belt retractor bolt (4) and tighten to 42 N.m (31 lb ft)
5. Install the seat shoulder belt guide adjustable cover (5).
6. Install the anchor linkage plate with the seat belt webbing label facing the occupant. Ensure there is no twist in webbing from the D ring to the anchor linkage plate.
7. Push the anchor linkage plate into linkage cover past the white stamped markings.
8. Install the anchor linkage plate bolt/screw (6) and tighten to 6 N.m (53 lb in).

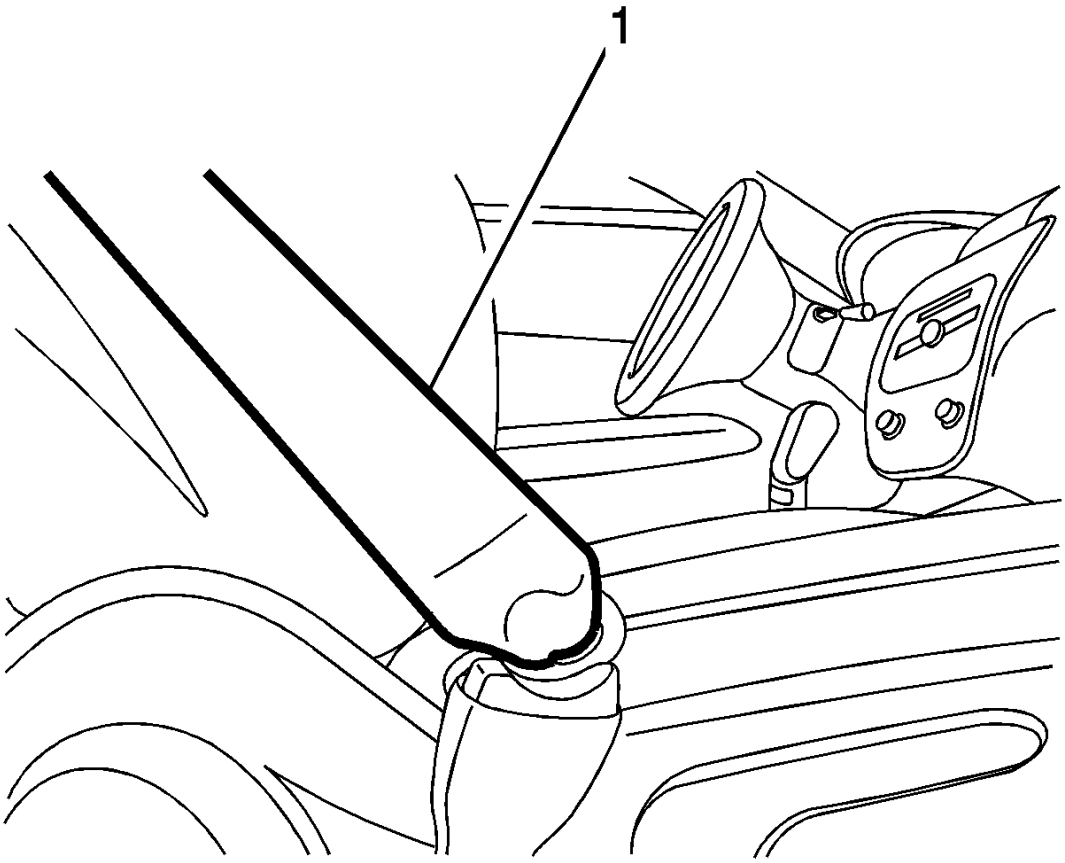

Fig. 43: Seat Belt Webbing
Courtesy of GENERAL MOTORS COMPANY

9. Check for label facing inward toward occupant and no twisting in the seat belt webbing (1).

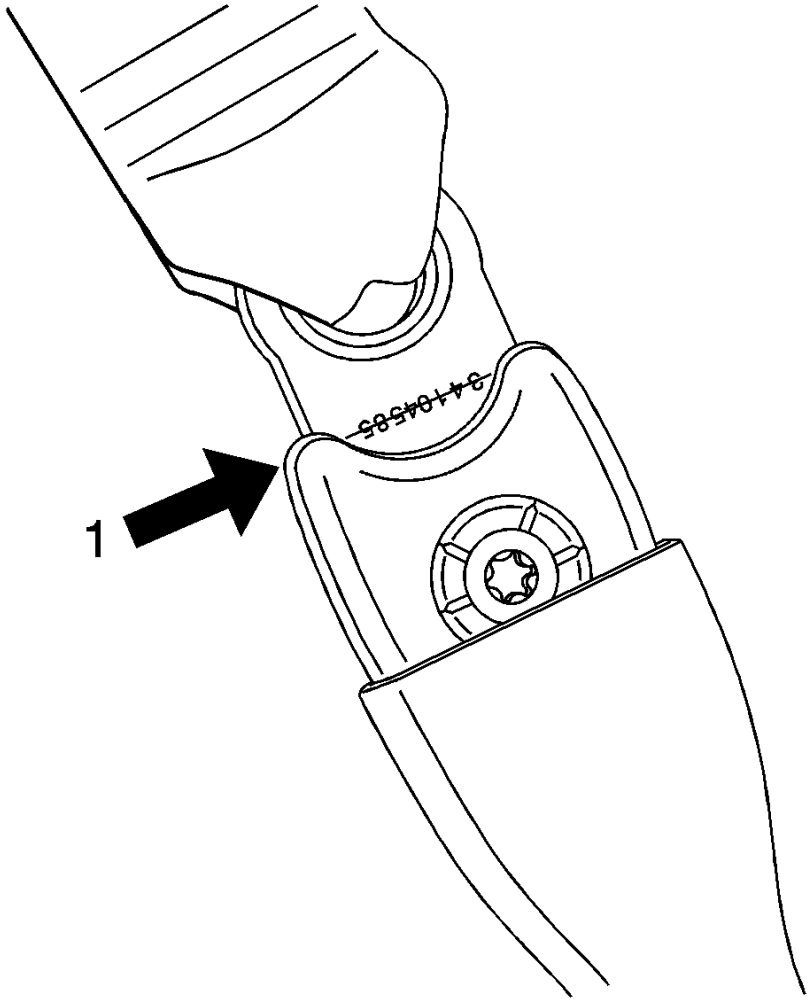

Fig. 44: Anchor Linkage Plate Cover
Courtesy of GENERAL MOTORS COMPANY

10. Check that NO white line and stamping numbers are visible above the anchor linkage plate cover (1).

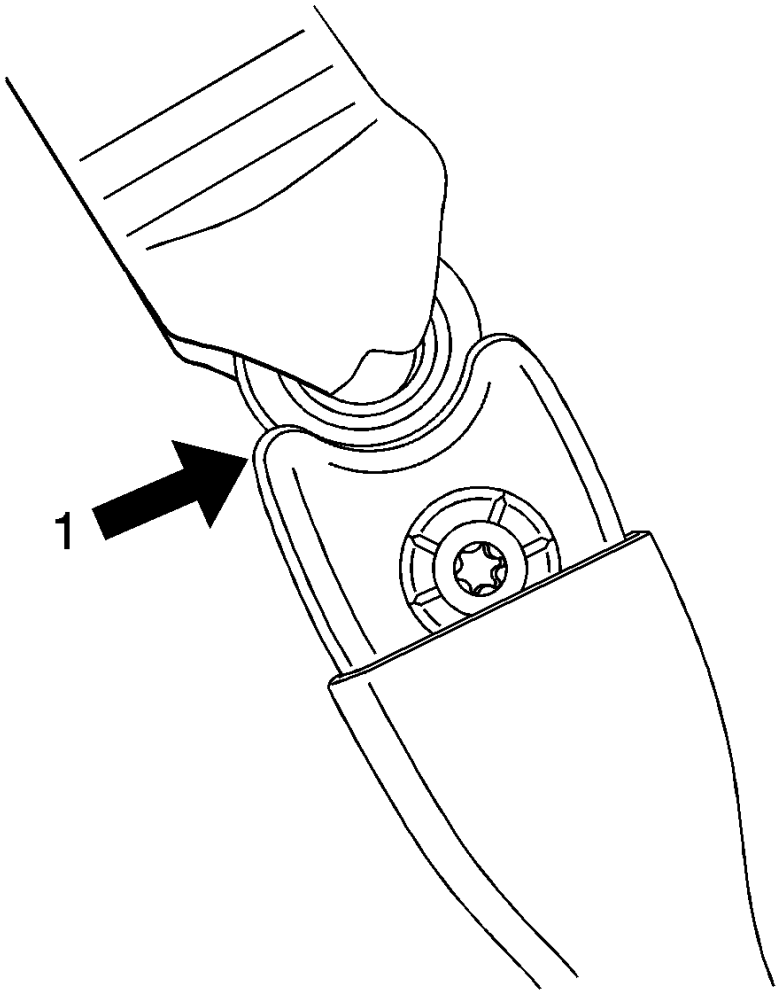

Fig. 45: Anchor Linkage Plate Cover
Courtesy of GENERAL MOTORS COMPANY

11. This illustration shows proper installation of anchor linkage plate cover (1).
12. Install the lower center pillar trim. Refer to **Center Pillar Lower Trim Panel Replacement** .
13. Enable the SIR. Refer to **SIR Disabling and Enabling**.

Installation Procedure

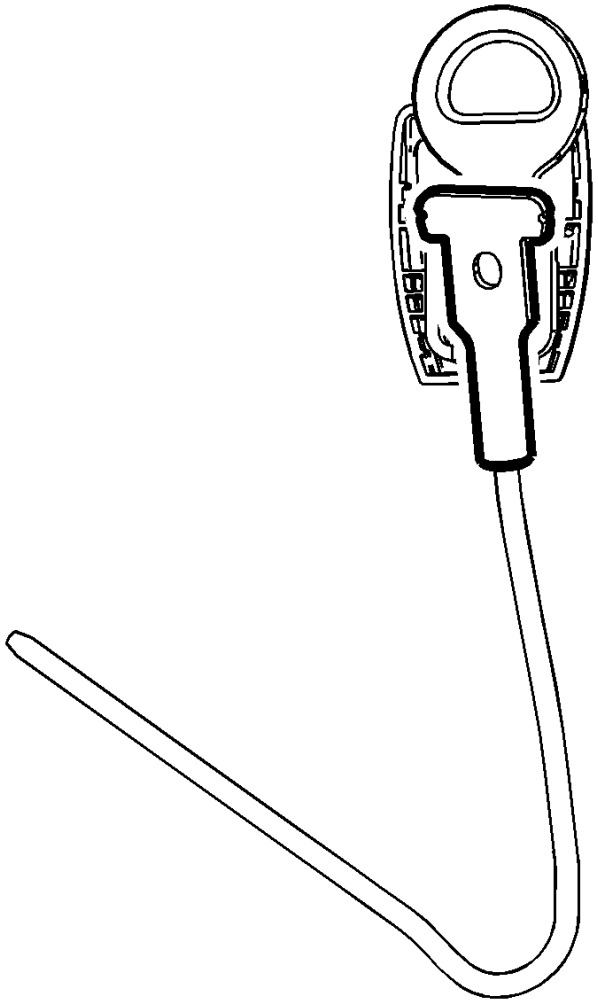

Fig. 46: Seat Belt Anchor Plate Tensioner (Second Design)
Courtesy of GENERAL MOTORS COMPANY

NOTE: **Second Design**

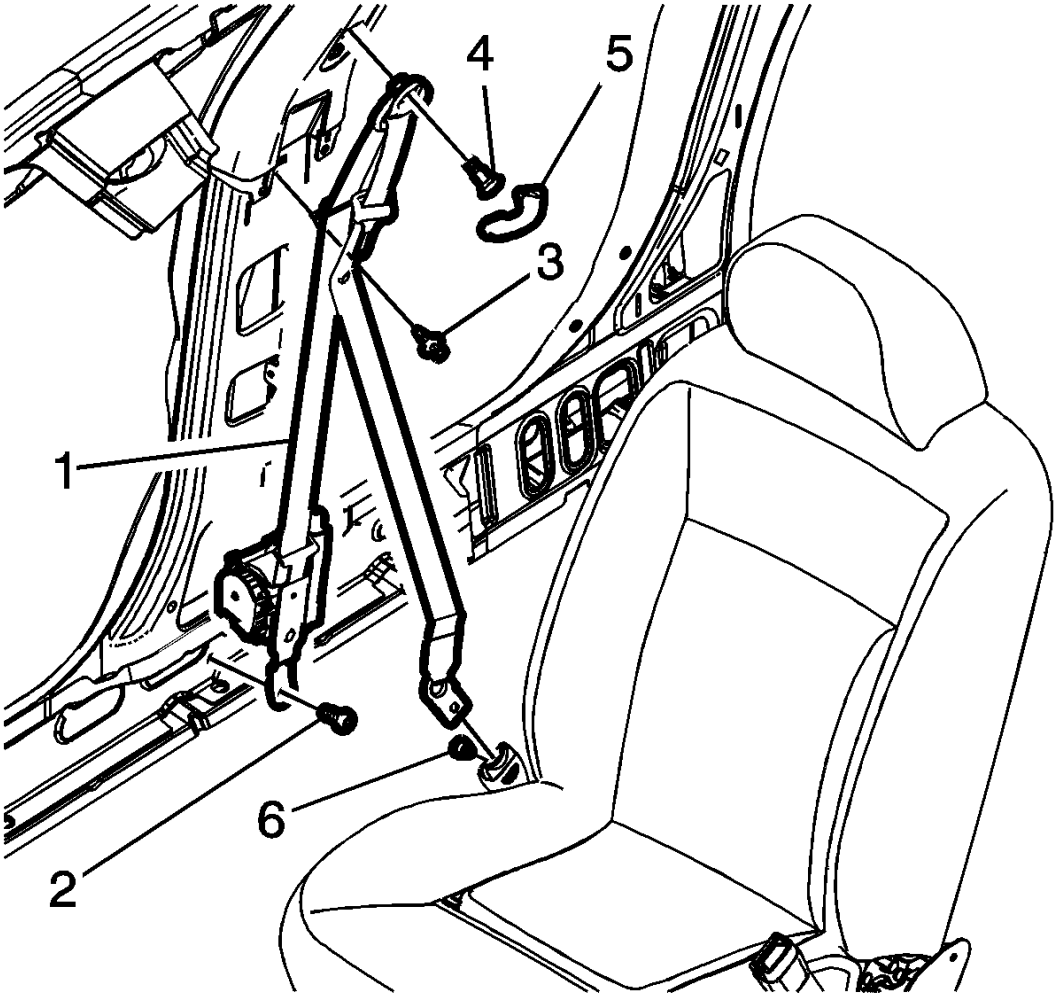

Fig. 47: Seat Shoulder Belt Retractor
Courtesy of GENERAL MOTORS COMPANY

1. Install the seat shoulder belt retractor (1).

CAUTION: Refer to Fastener Caution .

2. Install the lower seat shoulder belt retractor bolt (2) and tighten to 68 N.m (50 lb ft).
3. Install the seat shoulder belt anchor pushpin retainer (3).
4. Install the upper seat shoulder belt retractor bolt (4) and tighten to 42 N.m (31 lb ft)
5. Install the seat shoulder belt guide adjustable cover (5).
6. Install the anchor linkage plate with the seat belt webbing label facing the occupant. Ensure there is no twist in webbing from the D ring to the anchor linkage plate.
7. Remove the inner cover and interlock the anchor linkage plate with seat belt webbing and tighten to 6 N.m (53 lb in).

REPAIRS AND INSPECTIONS REQUIRED AFTER A COLLISION

Accident With or Without Air Bag Deployment - Component Inspections

WARNING: Proper operation of the Supplemental Inflatable Restraint (SIR) sensing system requires that any repairs to the vehicle structure return the vehicle structure to the original production configuration. Not properly repairing the vehicle structure could cause non-deployment of the air bag(s) in a frontal collision or deployment of the air bag(s) for conditions less severe than intended.

After any collision, inspect the following components as indicated. If you detect any damage, replace the component. If you detect any damage to the mounting points or mounting hardware, repair the component or replace the hardware as needed.

- The steering column-Inspect the steering column for bending, twisting, buckling or any type of damage.
- The instrument panel knee bolsters and mounting points-Inspect the knee bolsters for bending, twisting, buckling, or any other type of damage.
- The instrument panel brackets, braces, etc.-Inspect for bending, twisting, buckling, or any other type of damage.
- The seat belts-Perform the seat belt operational and functional checks. Refer to **Repairs and Inspections Required After a Collision** .
- The instrument panel cross car beam-Inspect for bending, twisting, buckling, or any other type of damage.
- The instrument panel mounting points and brackets-Inspect for bending, twisting, buckling, or any other type of damage.
- The seats and seat mounting points-Inspect for bending, twisting, buckling, or any other type of damage.
- The roof and headliner mounting points.
- The brake pedal --Inspect the brake pedal for bending, twisting, buckling or any type of damage.

Accident With Frontal Air Bag Deployment - Component Replacement and Inspections

After a collision involving air bag deployment, replace the following components.

- Driver Steering Wheel Air Bag
- Passenger instrument panel air bag, if deployed
- Inflatable Restraint Sensing and Diagnostic Module (SDM), if the Inflatable Restraint Sensing and Diagnostic Module has set DTC B0052 and will not clear
- Front and/or Side Impact Sensors
- Driver/Passenger Seat Side Air Bag, if deployed
- Seat back cover if Side Seat Air Bag is deployed
- Driver/Passenger Seat Belt Anchor and/or Retractor Pretensioners

Perform additional inspections on the following components.

- Steering wheel air bag coil and the coil wiring pigtail-Inspect for melting, scorching, or other damage due to excessive heat.
- Mounting points or mounting hardware for the passenger instrument panel air bag, steering wheel air bag, Inflatable Restraint Sensing and Diagnostic Module, seat side air bag (if deployed) and seat belt anchor and/or retractor pretensioners-Inspect for any damage and repair or replace each component as needed.

Accident With Side Seat Air Bag Deployment - Component Replacement and Inspections

After a collision involving driver/passenger side seat air bag deployment, replace the following components.

- Left/right side impact sensors on the side of the impact.
- Left/right roof rail air bag on the side of the impact.
- Inflatable Restraint Sensing and Diagnostic Module (SDM), if the Inflatable Restraint Sensing and Diagnostic Module has set DTC B0052 and will not clear.
- Inflatable Restraint Seat Belt Anchor and/or Retractor Pretensioner.
- Driver or passenger seat back cushion cover replacement.

WARNING: Do not repair or replace the seat stitching or seams in the seat back trim cover with an internal mounted seat side airbag module. Replace the complete seat back trim cover from the OEM. Non-OEM seat stitching may cause improper airbag deployment which could result in personal injury.

Perform additional inspections on the following components.

- Mounting points or mounting hardware for the side impact sensors, and driver/passenger side seat air bags on the side of impact-Inspect for any damage and repair or replace each component as needed.
- Mounting points, mounting hardware, headliner and trim pieces for the left/right roof rail air bag on the side of impact-Inspect for any damage and repair or replace each component as needed.
- Mounting points or mounting hardware for the Inflatable Restraint Sensing and Diagnostic Module and seat belt anchor and/or retractor pretensioners-Inspect for any damage and repair or replace each component as needed.
- The seat cushion frame
- The seat recliner and cover, if equipped
- The seat adjuster
- The seat back frame
- Door trim assembly
- Impacted seat cushion side covers and switches

Accident With Seat Belt Pretensioner Deployment Only - Component Replacement and Inspections

After a collision involving driver/passenger Seat Belt Retractor or Anchor Pretensioner deployment, replace the following components.

- Driver and Passenger Inflatable restraint seat belt anchor pretensioner and/or retractor pretensioner
- Inflatable Restraint Sensing and Diagnostic Module (SDM), if the Inflatable Restraint Sensing and Diagnostic Module has set DTC B0052 and will not clear

Perform additional inspections for any damage and repair or replace each component as needed on the following components.

- Mounting points or mounting hardware for the Inflatable Restraint Sensing and Diagnostic Module
- Mounting points or mounting hardware for the Seat Belt Anchor Pretensioners

- Mounting points or mounting hardware for the Seat Belt Retractor Pretensioners

Impact Sensor Replacement Guidelines

The impact sensor replacement policy requires replacing sensors in the area of the accident damage. The area of accident damage is defined as the portion of the vehicle which is crushed, bent, or damaged due to a collision. An example of this would be a moderate collision where the front of the vehicle impacts a object. If the vehicle has an impact sensor mounted forward of the radiator, it must be replaced.

- Replace the impact sensor whether or not the air bags have deployed.
- Replace the impact sensor even if it appears to be undamaged.

Impact sensor damage which is not visible, such as slight bending of the mounting bracket or cuts in the wire insulation, can cause improper operation of the SIR system. Do not try to determine whether the impact sensor is undamaged, replace the impact sensor. Also, if you follow a diagnostic trouble code (DTC) procedure and a malfunctioning impact sensor is indicated, replace the impact sensor.

INFLATABLE RESTRAINT MODULE HANDLING AND SCRAPPING

Special Tools

- **EL-38826** SIR Deployment Harness
- **EL-39401-B** SIR Deployment Fixture

For equivalent regional tools, refer to **Special Tools**.

Live and Undeployed Air Bag

WARNING: Refer to SIR Inflator Module Handling and Storage Warning .

Take special care when handling or storing an undeployed air bag. An air bag deployment produces a rapid generation of gas. This may cause the air bag, or an object in front of the air bag, to project through the air in the event of an unlikely deployment.

Dual Stage Air Bags

Dual stage air bags have two deployment stages. If stage 1 was used to deploy a dual stage air bag, stage 2 may still be active. Therefore, a deployed dual stage air bag must be treated as an active air bag. If disposal of a dual stage air bag is required, both deployment loops must be energized to deploy the air bag.

Scrapping Procedure

During the course of a vehicle's useful life, certain situations may arise which will require the disposal of a live and undeployed air bag. Do NOT dispose a live and undeployed air bag through normal disposal channels until the air bag has been deployed.

Do not deploy the air bag in the following situations:

- After replacement of an air bag under warranty-the air bag may need to be returned undeployed to the manufacturer.
- If the vehicle is the subject of a product liability claim, related to the SIR system and is subject to a

preliminary investigation - do NOT alter the SIR system in any manner.

- If the vehicle is involved in a campaign affecting the air bags - follow the instructions in the campaign service bulletin for proper SIR handling procedures.

Deployment Procedures

NOTE: **Some countries, states or localities may not allow service deployment of air bags without special permission or training. Local laws regarding deploying and scrapping of air bags/devices with pyrotechnics must be followed.**

You can deploy the air bag either inside or outside of the vehicle. The method used depends upon the final disposition of the vehicle. Review the following procedures in order to determine which will work best in a given situation:

Deployment Outside Vehicle - Steering Wheel Air Bag, Instrument Panel Air Bag, and Roof Rail Air Bag

Deploy the air bag outside of the vehicle when the vehicle will be returned to service. Situations that require deployment outside of the vehicle include the following:

- Using the SIR diagnostics, you determine that the air bag is malfunctioning.
- The air bag is cosmetically damaged, scratched, or ripped.
- The air bag pigtail is damaged.
- The air bag connector is damaged.
- The air bag connector terminals are damaged.

Deployment and disposal of a malfunctioning air bag is subject to any required retention period.

WARNING: **Refer to SIR Inflator Module Disposal Warning .**

1. Turn OFF the ignition.

   WARNING: **Refer to SIR Inflator Module Handling and Storage Warning .**

2. Remove the air bag.

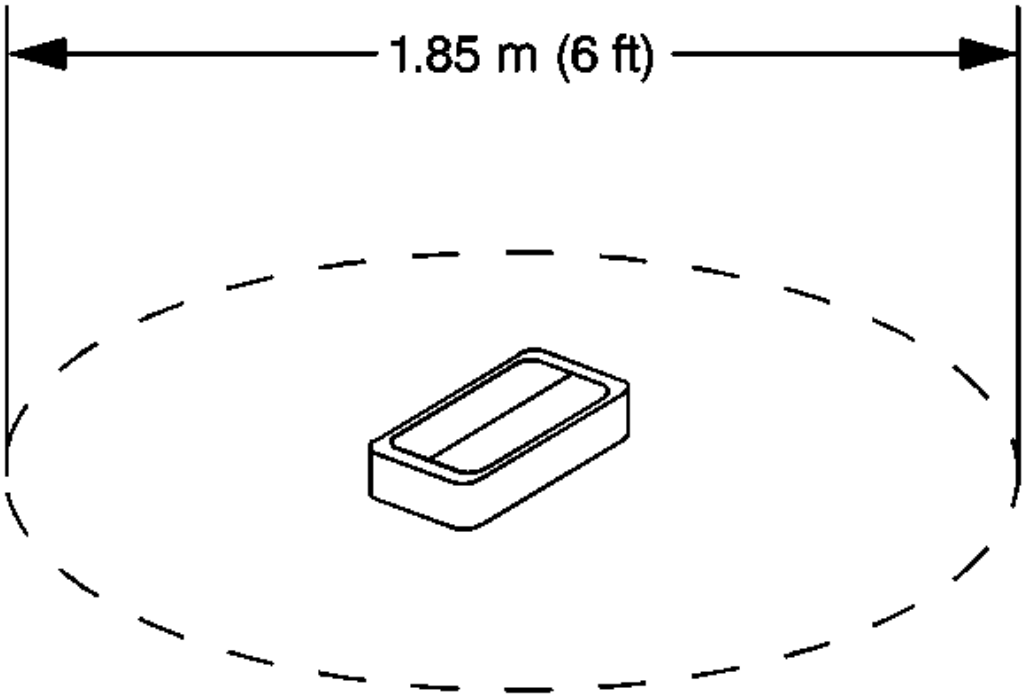

Fig. 48: Identifying Clearance For Deployment Of Inflator Module
Courtesy of GENERAL MOTORS COMPANY

3. Clear a space on the ground about 1.85 m (6 ft) in diameter for deployment of the air bag or deployment fixture. If possible, use a paved, outdoor location free of activity. Otherwise, use a space free of activity on the shop floor. Ensure you have sufficient ventilation.
4. Clear the area of loose or flammable objects.

NOTE: **Dual stage deployments are only used in steering wheel and instrument panel air bags. If stage 1 was used to deploy a dual stage air bag, stage 2 may still be active. If disposal of a dual stage air bag is required, both deployment loops must be energized to deploy the air bag.**

5. If you are deploying a steering wheel air bag, place the air bag in the center of the space with the vinyl trim cover facing up and away from the surface.

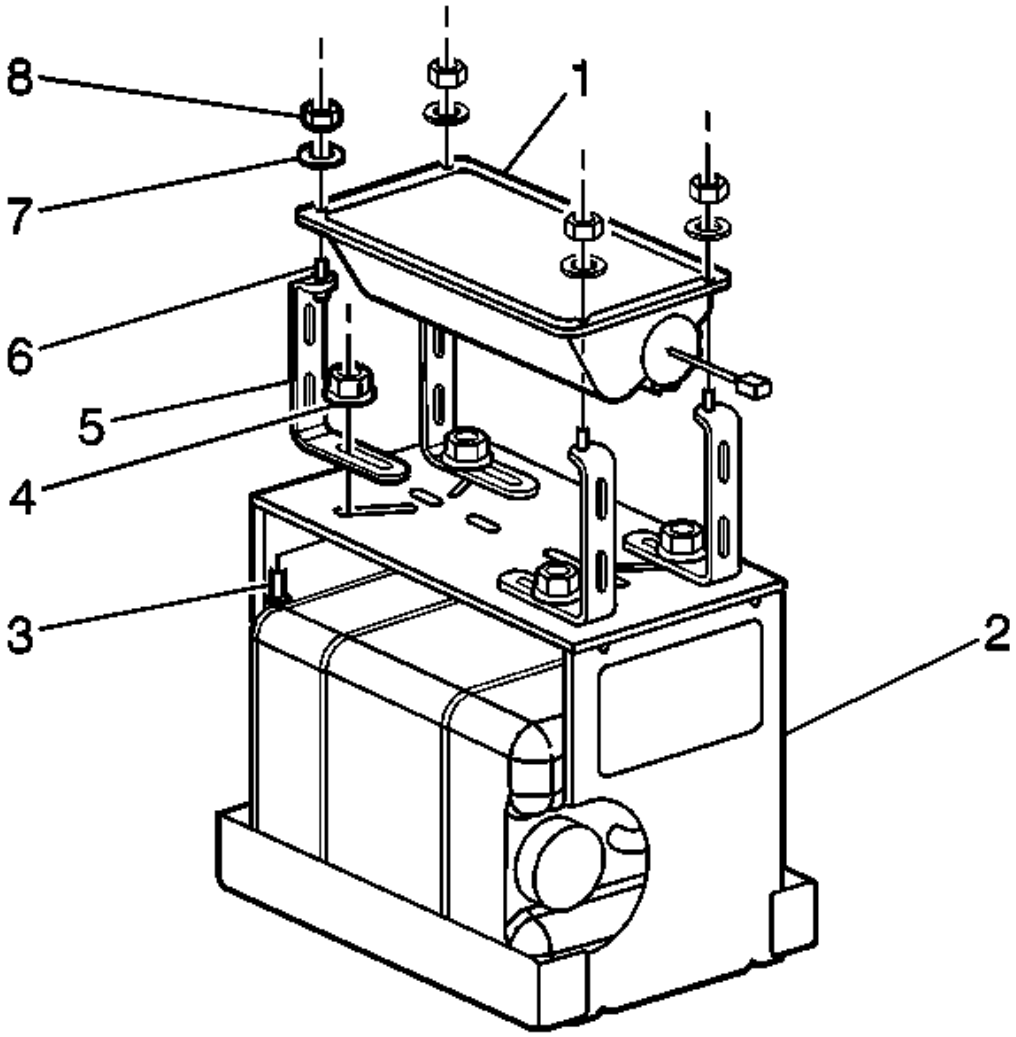

Fig. 49: Identifying I/P Module Components
Courtesy of GENERAL MOTORS COMPANY

6. When deploying an instrument panel air bag, perform the following instructions:
    1. Place the **EL-39401-B** fixture in the center of the cleared area.
    2. Fill the deployment fixture with water or sand.
    3. Using the proper nuts and bolts, mount the instrument panel air bag (1) to the deployment fixture (2), with the vinyl trim facing up.
    4. Securely tighten all fasteners that hold the instrument panel air bag (1) to the deployment fixture (2).

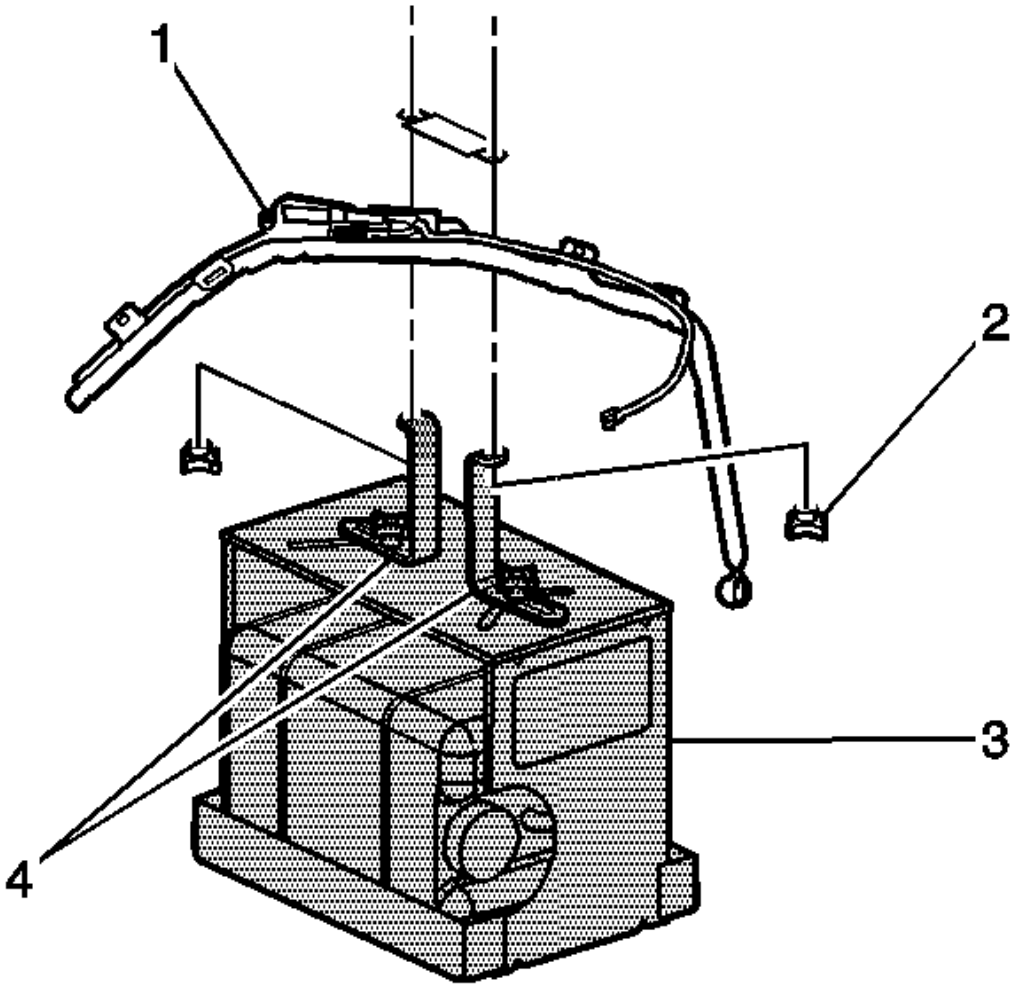

Fig. 50: Identifying Fasteners Holding Side Impact Module To Deployment Fixture
Courtesy of GENERAL MOTORS COMPANY

7. When deploying a roof rail air bag, perform the following instructions:
    1. Place the **EL-39401-B** fixture (3) in the center of the cleared area.
    2. Fill the deployment fixture with water or sand to provide sufficient stabilization of fixture during deployment.
    3. Adjust and secure the fixture arms (4) to the deployment fixture (3), using the proper nuts and bolts.
    4. Attach the roof rail air bag in the deployment fixture and securely tighten all fasteners.

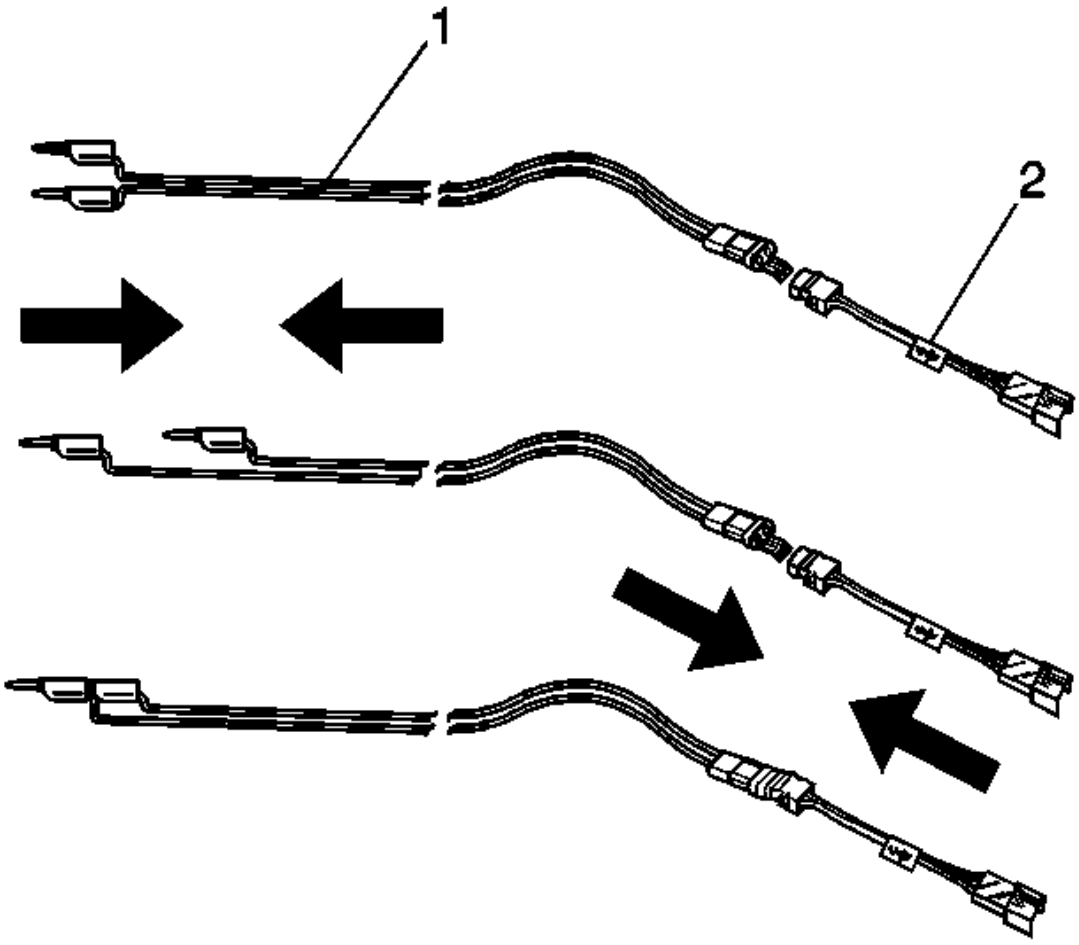

Fig. 51: Identifying SIR Deployment Harness & Adapter
Courtesy of GENERAL MOTORS COMPANY

8. Inspect the **EL-38826** harness and the appropriate pigtail adapter (2) for damage. Replace as needed.
9. Short the 2 SIR deployment harness leads (1) together using one banana plug seated into the other.
10. Connect the appropriate pigtail adapter (2) to the SIR deployment harness (1).

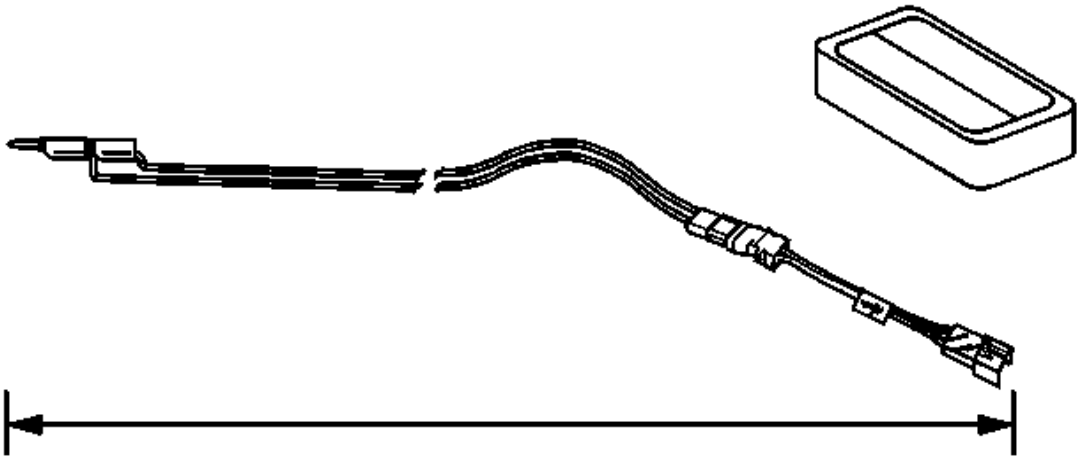

Fig. 52: Extending SIR Deployment Harness & Adapter
Courtesy of GENERAL MOTORS COMPANY

11. Extend the SIR deployment harness and adapter to the full length from the deployment fixture or area.

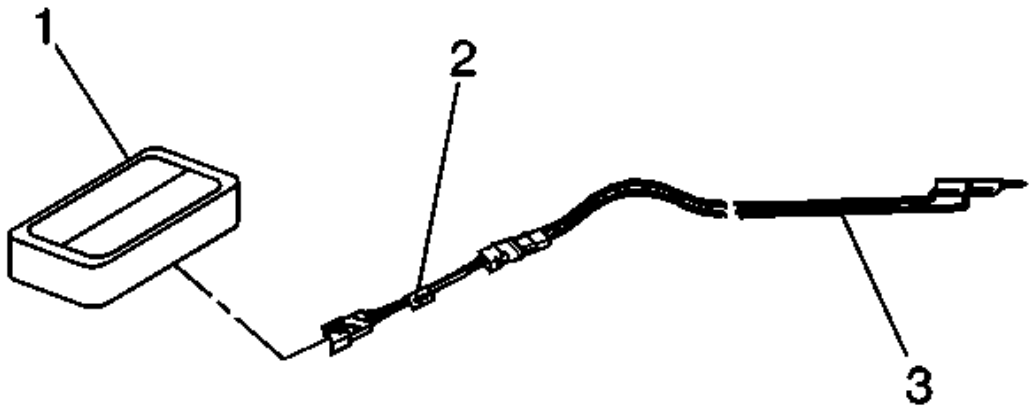

Fig. 53: Identifying Inflator Module, SIR Deployment Harness & Adapter
Courtesy of GENERAL MOTORS COMPANY

NOTE: **On a dual stage air bag, both connectors must be attached to the deployment harness adapter. This will ensure that both stage 1 and stage 2 of the deployment loops are energized, regardless of the deployment state.**

12. Connect the air bag (1) to the adapter (2) on the SIR deployment harness (3).

NOTE:

- **The rapid expansion of gas involved with deploying an air bag is very loud. Notify all the people in the immediate area that you intend to deploy the air bag.**
- **When the air bag deploys, the deployment fixture may jump about 30 cm (1 ft) vertically. This is a normal reaction of the air bag due to the force of the rapid expansion of gas inside the air bag.**
- **If you are deploying a dual stage air bag with stage 1 already deployed, the fixture may not move and the noise may have been**

reduced.

13. Clear the area of people.

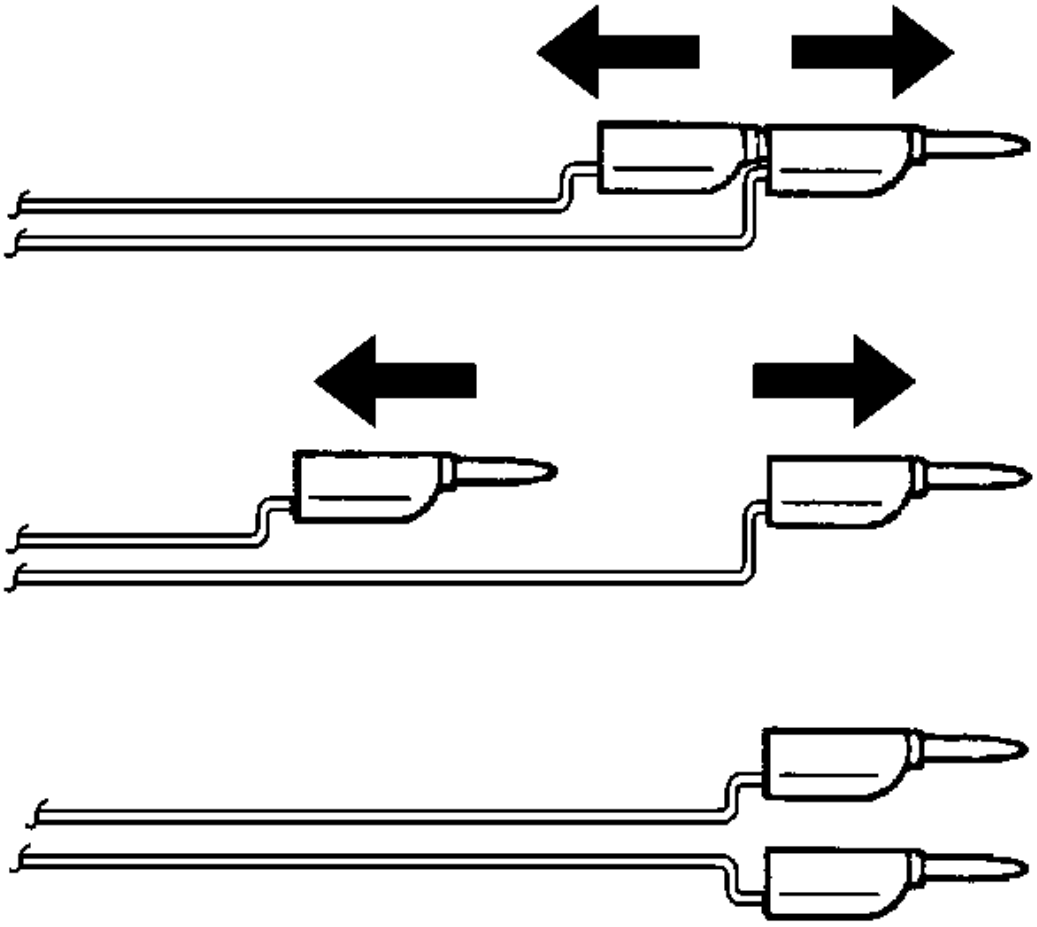

Fig. 54: Separating Banana Plugs
Courtesy of GENERAL MOTORS COMPANY

14. Separate the 2 banana plugs on the SIR deployment harness that were shorted together earlier in the procedure.

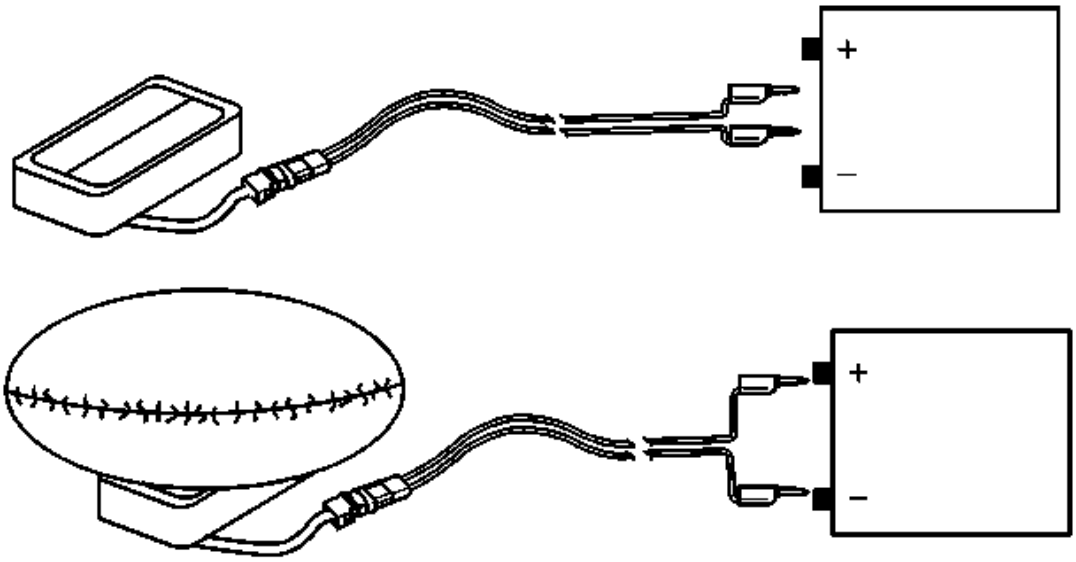

Fig. 55: Identifying SIR Deployment Harness Wires To Power Source
Courtesy of GENERAL MOTORS COMPANY

15. Place a 12 V minimum/2A minimum power source, such as a vehicle battery, near the shorted end of the harness.
16. Connect the SIR deployment harness wires to the power source. Deployment of the air bag will occur when contact is made.

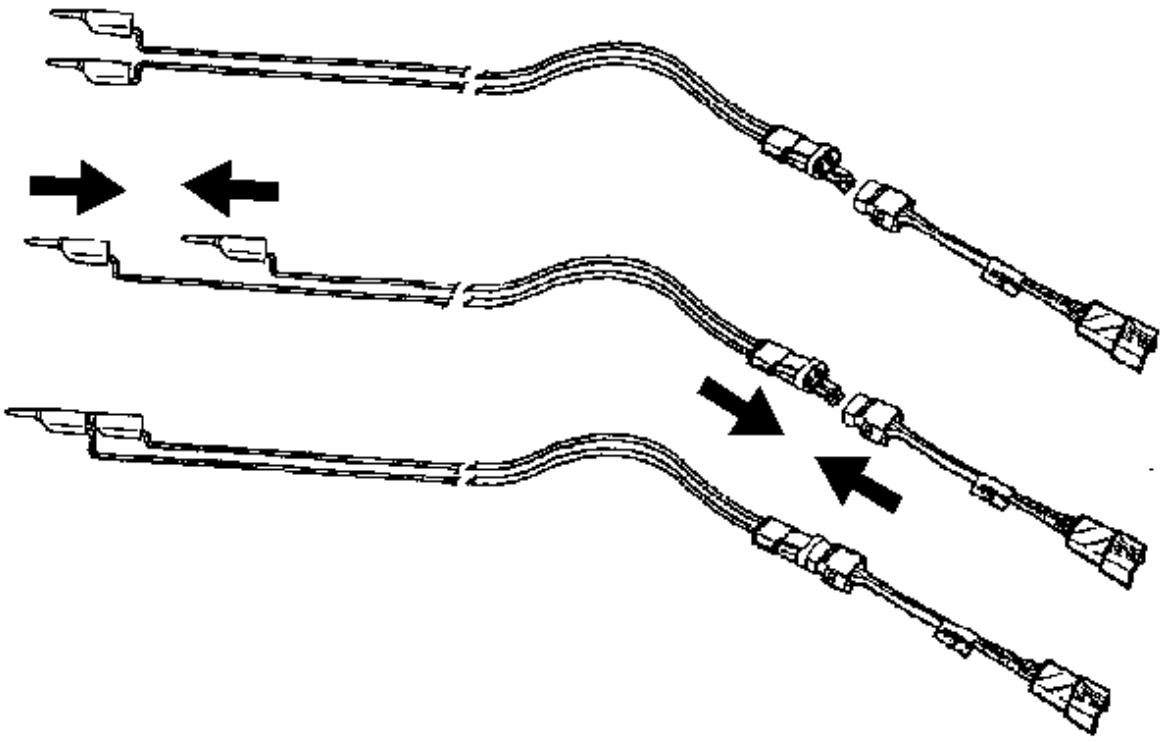

Fig. 56: View Of Deployment Harness Leads
Courtesy of GENERAL MOTORS COMPANY

17. Disconnect the SIR deployment harness from the power source after the air bag deploys.
18. If the air bag did not deploy, disconnect the adapter and discontinue the procedure and contact the Technical Assistance Group.

    If deployment was successful, proceed to the following steps.

WARNING: Refer to SIR Deployed Inflator Modules Are Hot Warning .

19. Seat one banana plug into the other in order to short the deployment harness leads.
20. Put on a pair of shop gloves.
21. Disconnect the pigtail adapter from the air bag as soon as possible.
22. Inspect the pigtail adapter and the SIR deployment harness. Replace as needed.
23. Dispose of the deployed air bag through normal refuse channels.

24. Wash your hands with a mild soap.

Deployment Inside Vehicle - Vehicle Scrapping Procedure

Deploy the air bags inside of the vehicle when destroying the vehicle or when salvaging the vehicle for parts. This includes, but is not limited to, the following situations:

- The vehicle has completed all useful life.
- Irrepairable damage occurred to the vehicle in a non-deployment type accident.
- Irrepairable damage occurred to the vehicle during a theft.
- The vehicle is being salvaged for parts to be used on a vehicle with a different VIN, as opposed to rebuilding as the same VIN.

WARNING: Refer to SIR Inflatable Module Deployment Outside Vehicle Warning .

1. Lower the driver and passenger windows.
2. Turn the ignition switch to the OFF position and remove the ignition key.
3. Check that all air bags which will be deployed are mounted securely.
4. Remove all loose objects from the front seats.

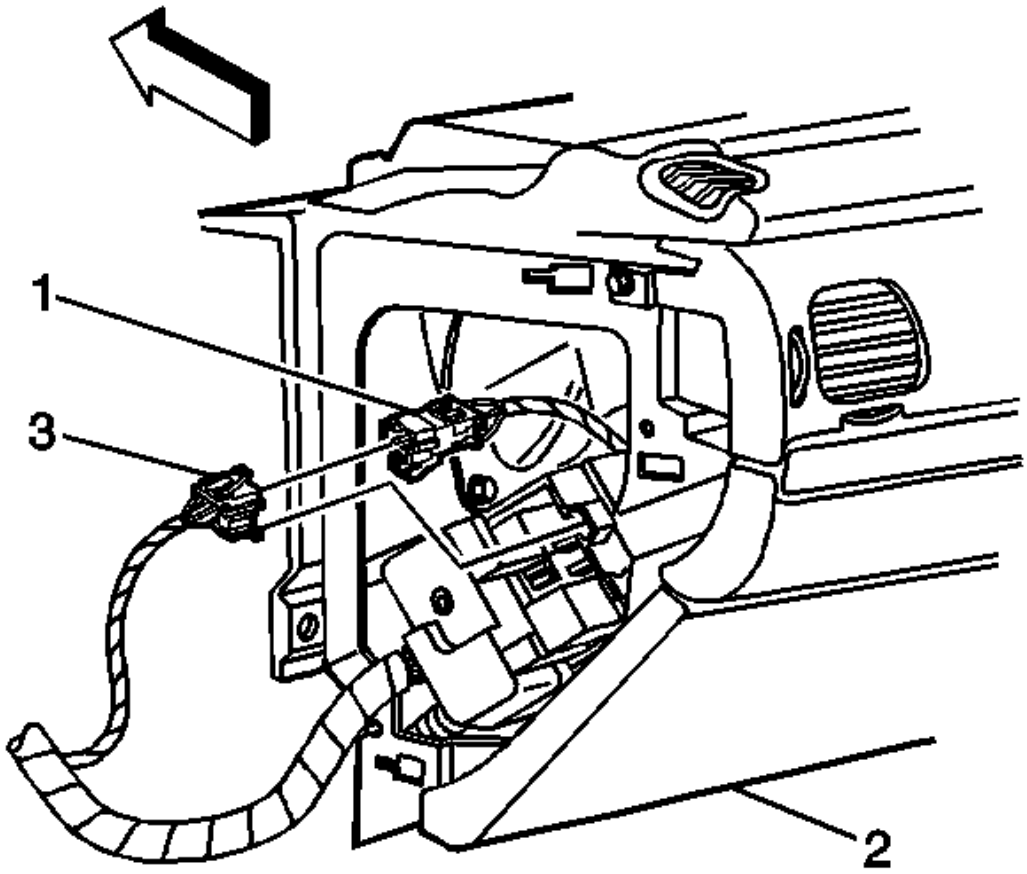

Fig. 57: Identifying I/P Module Connector To Vehicle Harness Connector (LH Side I/P)
Courtesy of GENERAL MOTORS COMPANY

WARNING: A deployed dual stage inflator module will look the same whether one or both stages were used. Always assume a deployed dual stage inflator module has an active stage 2. Improper handling or servicing can activate the inflator module and cause personal injury.

5. Disconnect the steering wheel air bag yellow connector (1) from vehicle harness yellow connector (3).

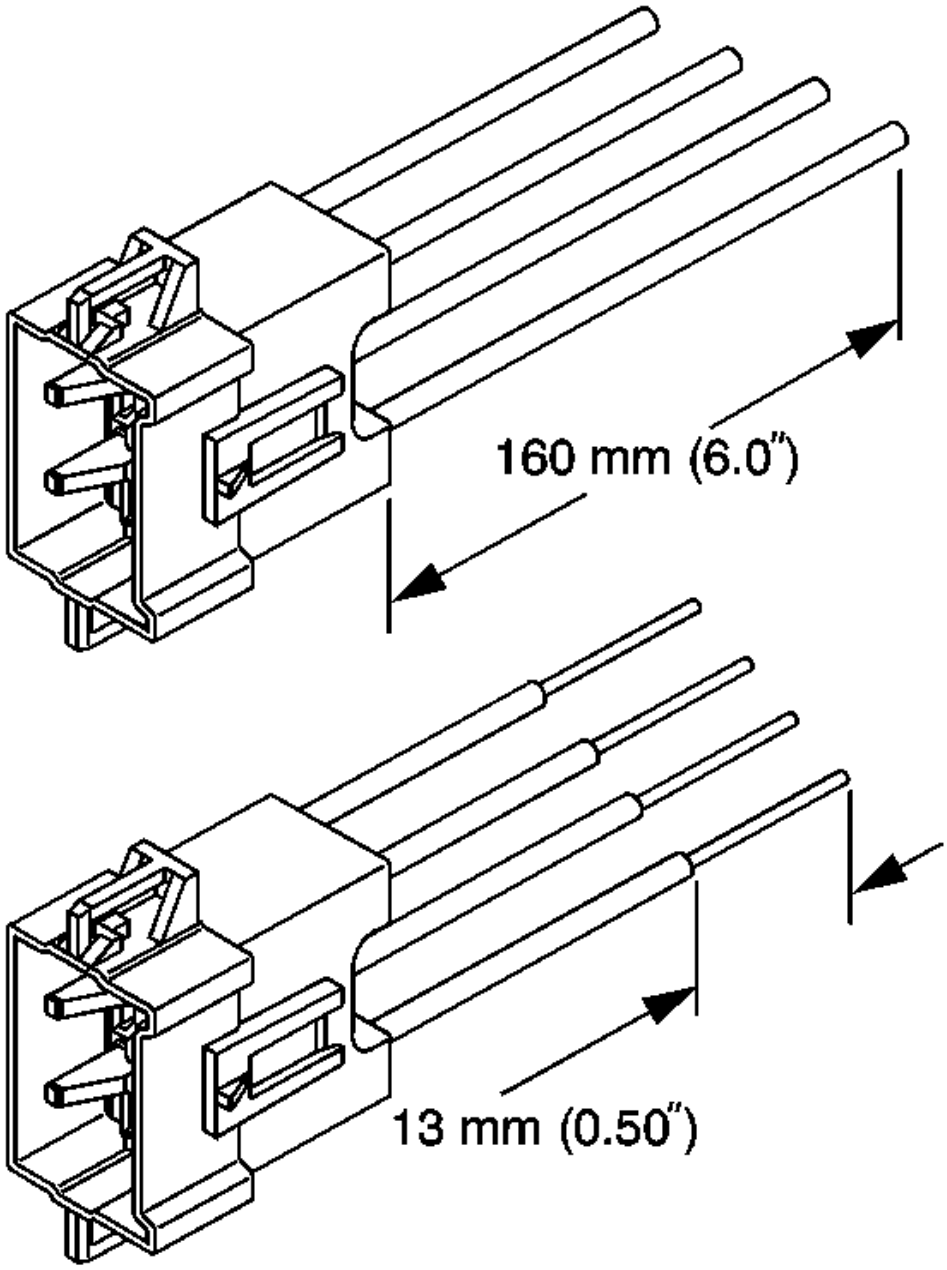

Fig. 58: Stripping SIR Wires
Courtesy of GENERAL MOTORS COMPANY

NOTE: **If the vehicle is equipped with dual stage air bags the steering wheel air bag and instrument panel air bag will each have 4 wires. Refer to COMPONENT CONNECTOR END VIEWS - INDEX for determining high and low circuits.**

6. Cut the yellow harness connector out of the vehicle, leaving at least 16 cm (6 in) of wire at the connector.
7. Strip 13 mm (0.5 in) of insulation from each of the connector wire leads.

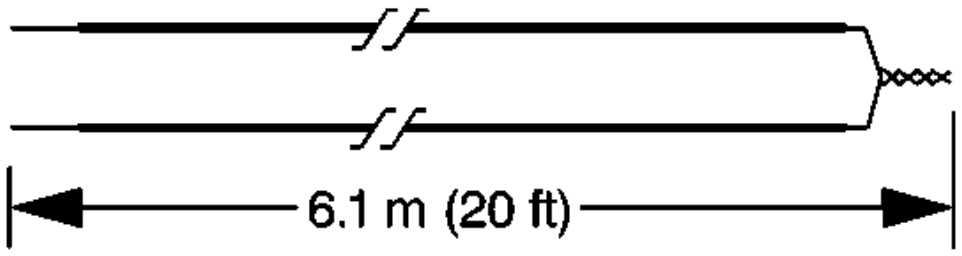

Fig. 59: Fabricating 20 Ft. Deployment Harness
Courtesy of GENERAL MOTORS COMPANY

8. Cut two 6.1 m (20 ft) deployment wires from a 0.8 mm (18 gauge) or thicker multi-strand wire. Use these wires to fabricate the driver deployment harness.
9. Strip 13 mm (0.5 in) of insulation from both ends of the wires.
10. Twist together one end from each of the wires in order to short the wires. Deployment wires shall remain shorted, and not connected to a power source until you are ready to deploy the air bag.

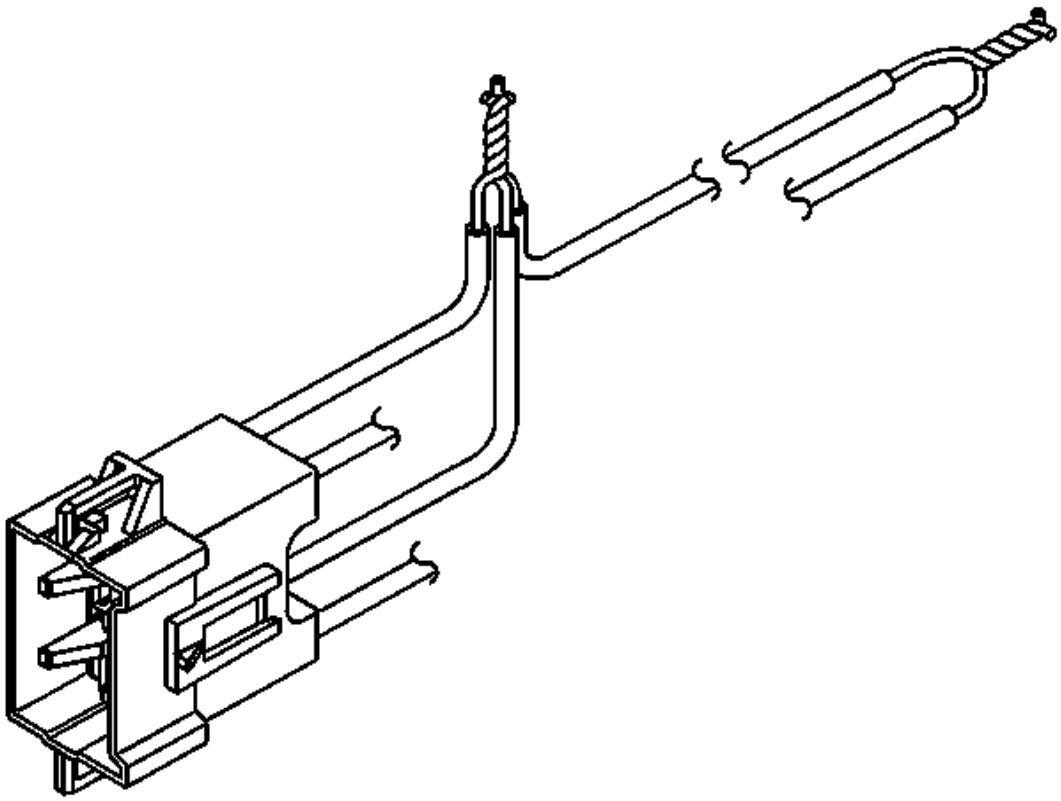

Fig. 60: Twisting Connector Wire Leads (High Circuits) To Deployment Harness Wire
Courtesy of GENERAL MOTORS COMPANY

11. Twist together the 2 connector wire leads from the high circuits from both stages of the steering wheel air bag, to one set of deployment wires. Refer to **COMPONENT CONNECTOR END VIEWS - INDEX** in order to determine the correct circuits.
12. Inspect that the 3-wire connection is secure.
13. Secure and insulate the 3-wire connection to the deployment harness using electrical tape.

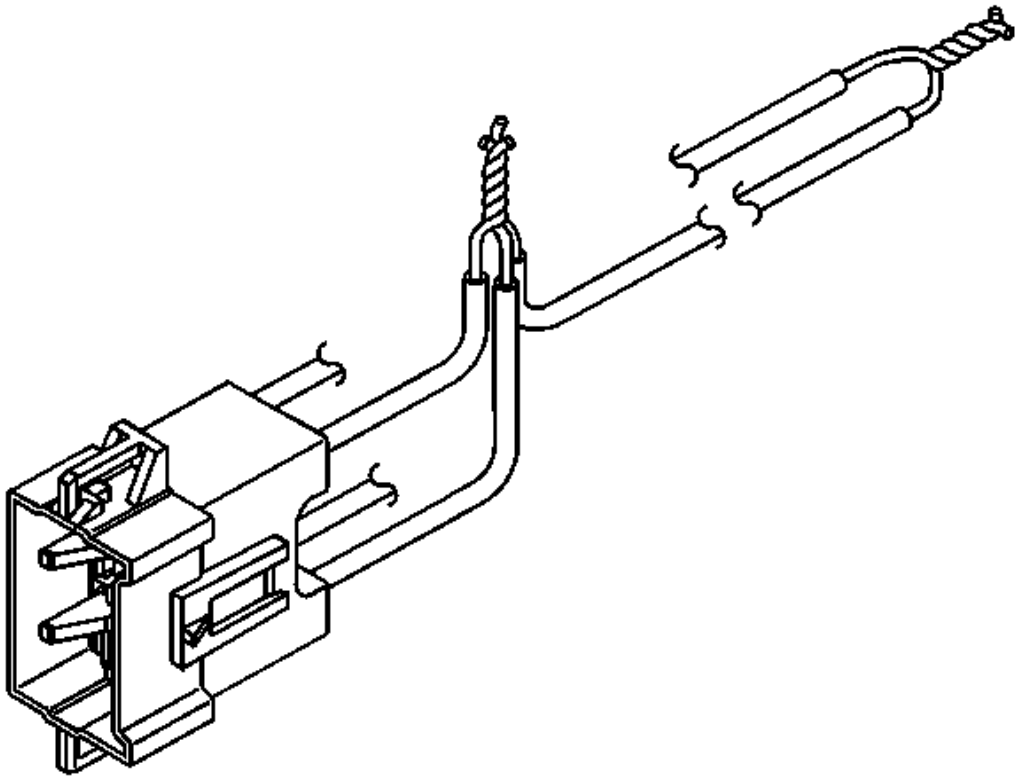

Fig. 61: Twisting Connector Wire Leads (Low Circuits) To Deployment Harness Wire
Courtesy of GENERAL MOTORS COMPANY

14. Twist together the 2 connector wire leads from the low circuits from both stages of the steering wheel air bag, to one set of deployment wires. Refer to **COMPONENT CONNECTOR END VIEWS - INDEX** in order to determine the correct circuits.
15. Inspect that the 3-wire connection is secure.
16. Secure and insulate the 3-wire connection to the deployment harness using electrical tape.
17. Connect the deployment harness to the connector on the steering wheel air bag.
18. Route the deployment harness out of the driver side of the vehicle.
19. Disconnect the yellow left roof rail harness connector from the vehicle harness connector.
20. Cut the harness connector out of the vehicle, leaving at least 16 cm (6 in) of wire at the connector.
21. Strip 13 mm (0.5 in) of insulation from each of the connector wire leads.
22. Cut two 6.1 m (20 ft) deployment wires from a 0.8 mm (18 gauge) or thicker multi-strand wire. These wires will be used to fabricate the roof rail air bag deployment harness.
23. Strip 13 mm (0.5 in) of insulation from both ends of the wires.
24. Twist together one end from each of the wires in order to short the wires.

25. Twist together one connector wire lead to one deployment wire.
26. Secure and insulate the connection using electrical tape.
27. Twist together and tape the remaining connector wire lead to the remaining deployment wire.
28. Connect the deployment harness to the yellow connector of the roof rail air bag.
29. Route the deployment harness out of the driver side of the vehicle.

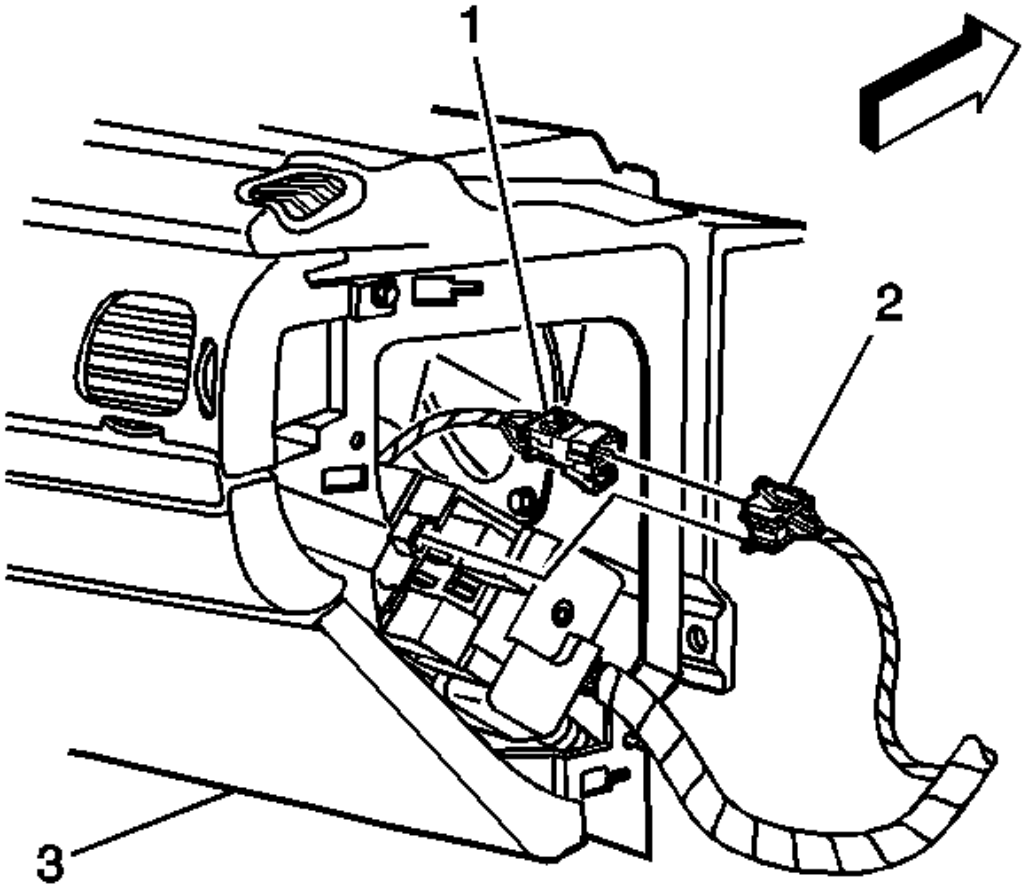

Fig. 62: Identifying I/P Module Connector To Vehicle Harness Connector
Courtesy of GENERAL MOTORS COMPANY

30. Disconnect the instrument panel air bag yellow harness connector (1) from the vehicle harness connector (2).

NOTE: **If the vehicle is equipped with dual stage air bags the steering wheel air bag and instrument panel air bag will each have 4 wires. Refer to COMPONENT CONNECTOR END VIEWS - INDEX for determining high and low circuits.**

31. Cut the yellow harness connector out of the vehicle, leaving at least 16 cm (6 in) of wire at the connector.
32. Strip 13 mm (0.5 in) of insulation from each of the connector wire leads.

33. Cut two 6.1 m (20 ft) deployment wires from a 0.8 mm (18 gauge) or thicker multi-strand wire. These wires will be used to fabricate the passenger deployment harness.
34. Strip 13 mm (0.5 in) of insulation from both ends of the wires.
35. Twist together one end from each of the wires in order to short the wires.
36. Twist together the 2 connector wire leads from the high circuits from both stages of the instrument panel air bag to one set of deployment wires. Refer to **COMPONENT CONNECTOR END VIEWS - INDEX** in order to determine the correct circuits.
37. Inspect that the 3-wire connection is secure.
38. Secure and insulate the 3-wire connection to the deployment harness using electrical tape.
39. Twist together the 2 connector wire leads from the low circuits from both stages of the instrument panel air bag to one set of deployment wires. Refer to **COMPONENT CONNECTOR END VIEWS - INDEX** in order to determine the correct circuits.
40. Inspect that the 3-wire connection is secure.
41. Secure and insulate the 3-wire connection to the deployment harness using electrical tape.
42. Connect the deployment harness to the instrument panel air bag in-line connector.
43. Route the deployment harness out of the passenger side of the vehicle.
44. Disconnect the yellow harness connector to the right roof rail air bag from the vehicle harness connector.
45. Cut the harness connector out of the vehicle, leaving at least 16 cm (6 in) of wire at the connector.
46. Strip 13 mm (0.5 in) of insulation from each of the connector wire leads.
47. Cut two 6.1 m (20 ft) deployment wires from a 0.8 mm (18 gauge) or thicker multi-strand wire. These wires will be used to fabricate the roof rail air bag deployment harness.
48. Strip 13 mm (0.5 in) of insulation from both ends of the wires.
49. Twist together one end from each of the wires in order to short the wires.
50. Twist together one connector wire lead to one deployment wire.
51. Secure and insulate the connection using electrical tape.
52. Twist together and tape the remaining connector wire lead to the remaining deployment wire.
53. Connect the deployment harness to the roof rail air bag yellow connector.
54. Route the deployment harness out of the passenger side of the vehicle.
55. Completely cover the windshield and the front door window openings with a drop cloth.
56. Stretch to the full length all of the deployment harness wires on the right side of the vehicle.
57. Deploy each deployment loop one at a time.
58. Place a power source, 12 V minimum/2A minimum, such as a vehicle battery, near the shorted end of the harnesses.
59. Separate one set of wires and touch the wire ends to the power source in order to deploy the selected air bag.
60. Disconnect the deployment harness from the power source and twist the wire ends together.
61. Continue the same process with the remaining deployment harnesses.
62. Disconnect all harnesses from the vehicle.
63. Discard the harnesses.
64. Scrap the vehicle in the same manner as a non-SIR equipped vehicle.

65. If one or all of the air bags did not deploy, remove the undeployed air bags from the vehicle.

PRETENSIONER HANDLING AND SCRAPPING

Scrapping Procedure

During the course of a vehicles useful life, certain situations may arise which will necessitate the disposal of a live (undeployed) pretensioner. The following information covers the proper procedures for the disposing of a live (undeployed) pretensioner. Deploy the pretensioner before disposal. Do not dispose of a live (undeployed) pretensioner through normal disposal channels until the pretensioner has been deployed. The following information covers the proper procedures for the disposing of a live (undeployed) pretensioner.

- After replacement of a pretensioner under warranty. The pretensioner may need to be returned undeployed to the original manufacturer of pretensioner.
- If the vehicle is the subject of a Product Liability report related to the SIR system and is subject to a Preliminary Investigation (GM-1241). Do not alter the SIR system in any manner.
- If the vehicle is involved in a campaign affecting the pretensioners. Follow the instructions in the Campaign Service Bulletin for proper SIR handling procedures.

Deployment Procedures

NOTE: **Some countries, states or localities may not allow service deployment of air bags without special permission or training. Local laws regarding deploying and scrapping of air bags/devices with pyrotechnics must be followed.**

The pretensioner can be deployed inside or outside of the vehicle. The method used depends upon the final disposition of the vehicle. Review the following procedures in order to determine which will work best in a given situation.

Deployment Inside the Vehicle

Refer to **Inflatable Restraint Module Handling and Scrapping** for deploying the pretensioner inside vehicle under Vehicle Scrapping Procedure.

Deployment Outside Vehicle for Seat Belt Pretensioners

Deploy the seat belt pretensioners outside of the vehicle when the vehicle will be returned to service. Situations that require deployment outside of the vehicle include the following:

- Using the SIR diagnostics, you determine that the seat belt pretensioner is malfunctioning.
- The pretensioner pigtail (if equipped) is damaged.
- The pretensioner connector is damaged.
- The pretensioner connector terminal is damaged.

Deployment and disposal of a malfunctioning seat belt pretensioner is subject to any required retention period.

WARNING: **In order to prevent accidental deployment of the pretensioner which could cause personal injury, do not dispose of an undeployed pretensioner as normal shop waste. The undeployed pretensioner contains substances that could**

cause severe illness or personal injury if the sealed container is damaged during disposal. Use the following deployment procedures to safely dispose of an undeployed pretensioner. Failure to dispose of a pretensioner as instructed may be a violation of federal, state, or local laws.

WARNING: When you are deploying a pretensioner for disposal, perform the deployment procedures in the order listed. Failure to follow the procedures in the order listed may result in personal injury.

Special Tools

- **EL-39401-B** SIR Deployment Fixture
- **EL-38826** SIR Deployment Harness

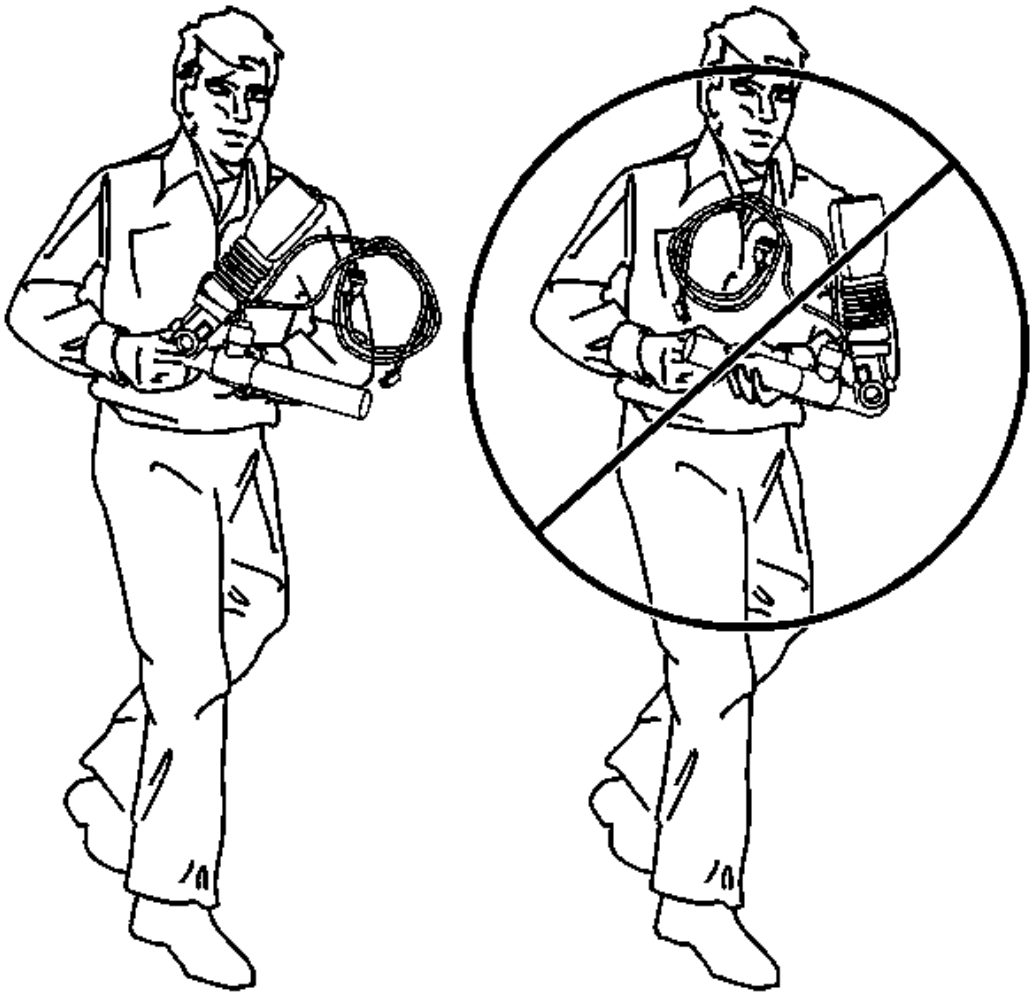

Fig. 63: Proper Pretensioner Carrying
Courtesy of GENERAL MOTORS COMPANY

1. Turn the ignition switch to the OFF position.
2. Remove the ignition key.

3. Put on safety glasses.
4. Remove the seat belt pretensioner from the vehicle.
5. When carrying a pretensioner to the deployment area keep the open end of pretensioner pointed away from the body.

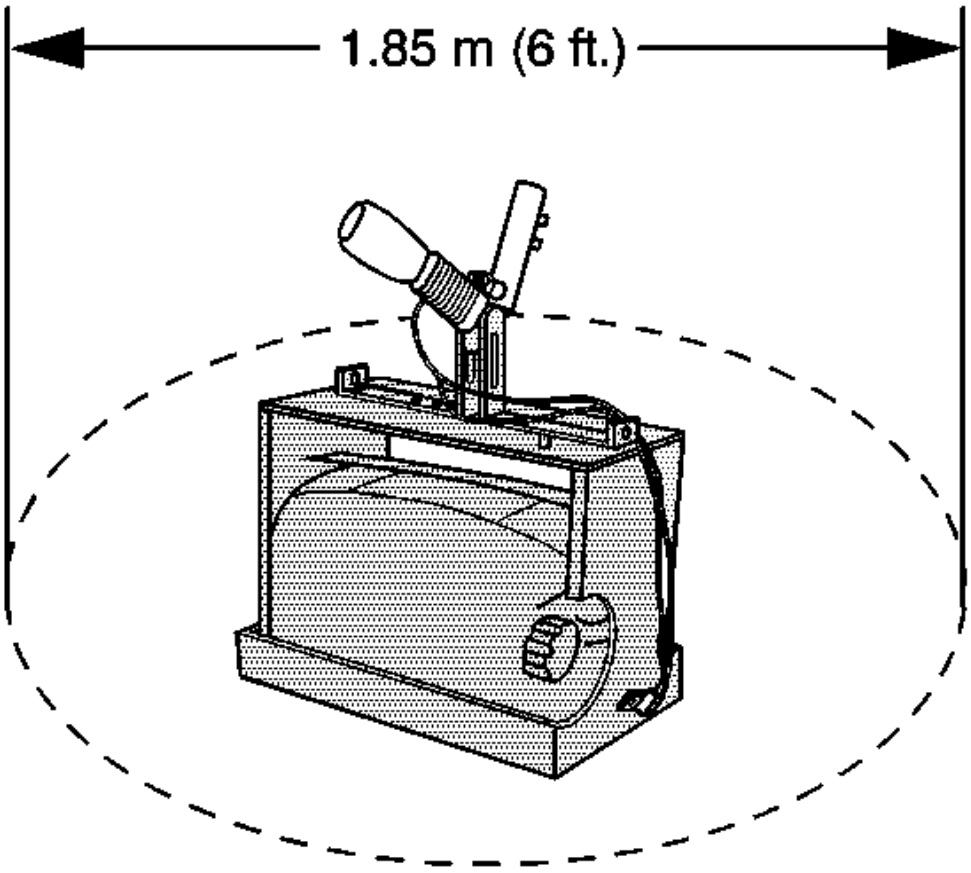

Fig. 64: Pretensioner Deployment Area
Courtesy of GENERAL MOTORS COMPANY

6. Clear a space on the ground about 1.85 M (6 ft) in diameter for deployment of the pretensioner. If possible, use a paved, outdoor location free of activity. Otherwise, use a space free of activity on the shop floor. Make sure you have sufficient ventilation.
7. Make sure no loose or flammable objects are in the area.
8. Place the **EL-39401-B** SIR deployment fixture in the center of the cleared area.
9. Fill the fixture plastic reservoir with water or sand.

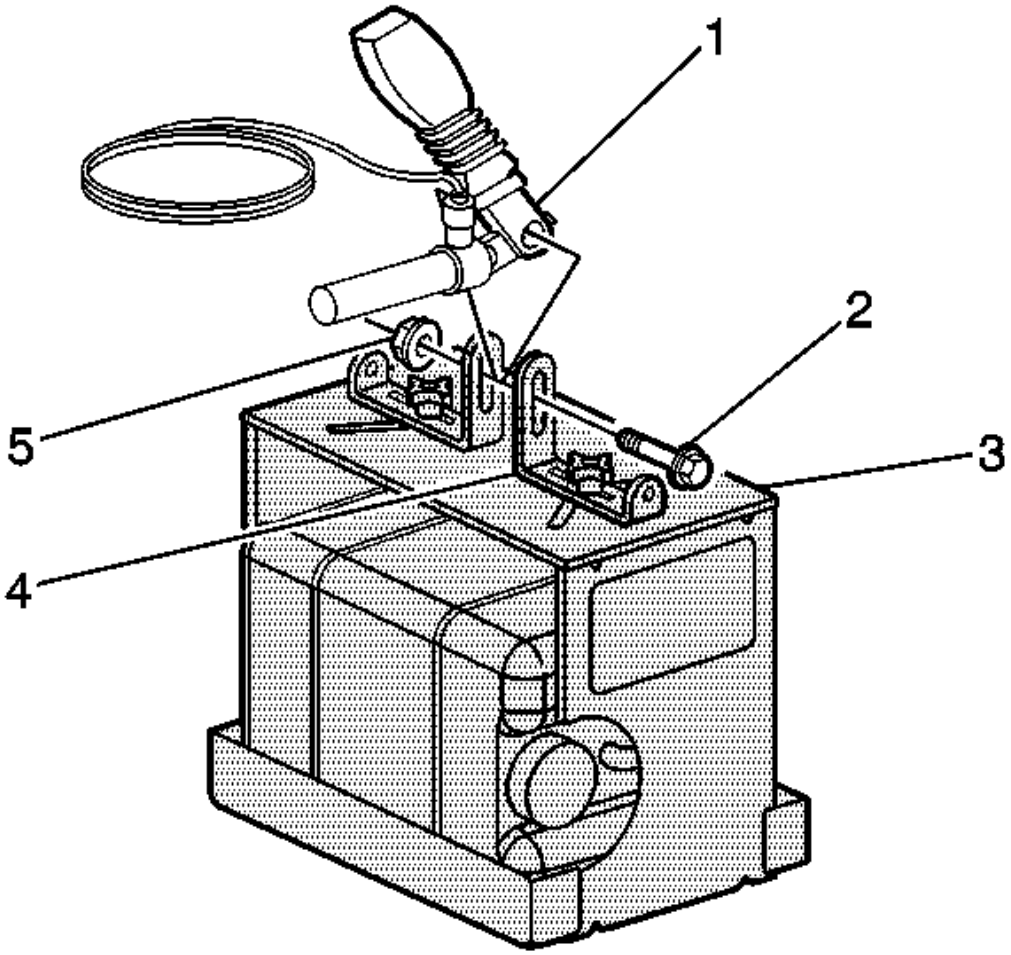

Fig. 65: Mounting Pretensioner In SIR Deployment Fixture
Courtesy of GENERAL MOTORS COMPANY

10. Mount the pretensioner (1) in the SIR deployment fixture (3) with the open end facing up using the following mounting method.
    1. Adjust and secure the EL-39401-B arms (4) to the deployment fixture (3).
    2. To mount, use the proper size bolt (2) and nut (5) with washers in order to secure the pretensioner (1) to the deployment fixture brackets (4).
    3. Securely tighten all fasteners prior to deployment.

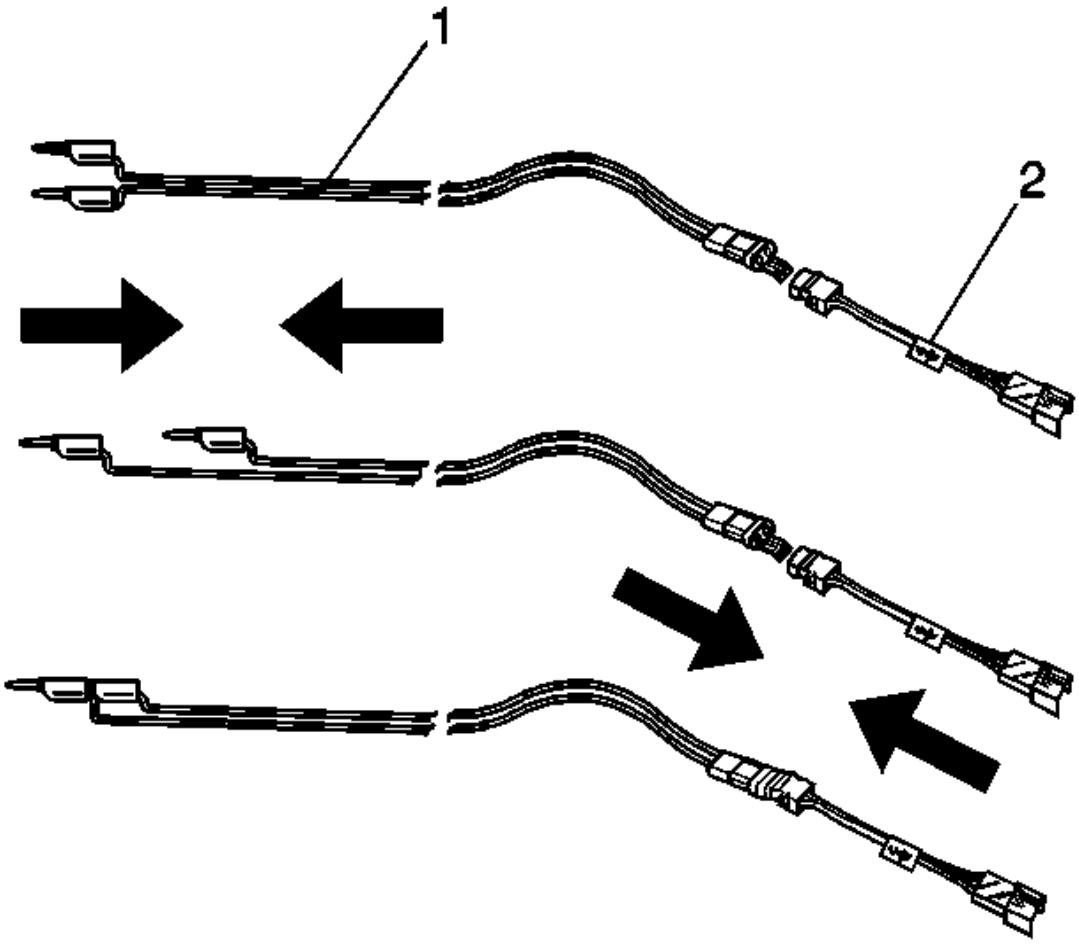

Fig. 66: Identifying SIR Deployment Harness & Adapter
Courtesy of GENERAL MOTORS COMPANY

11. Inspect the **EL-38826** SIR deployment harness and the appropriate pigtail adapter for damage. Replace as needed.
12. Short the 2 SIR deployment harness (1) leads together using one banana plug seated into the other.
13. Connect the appropriate pigtail adapter (2) to the SIR deployment harness (1).

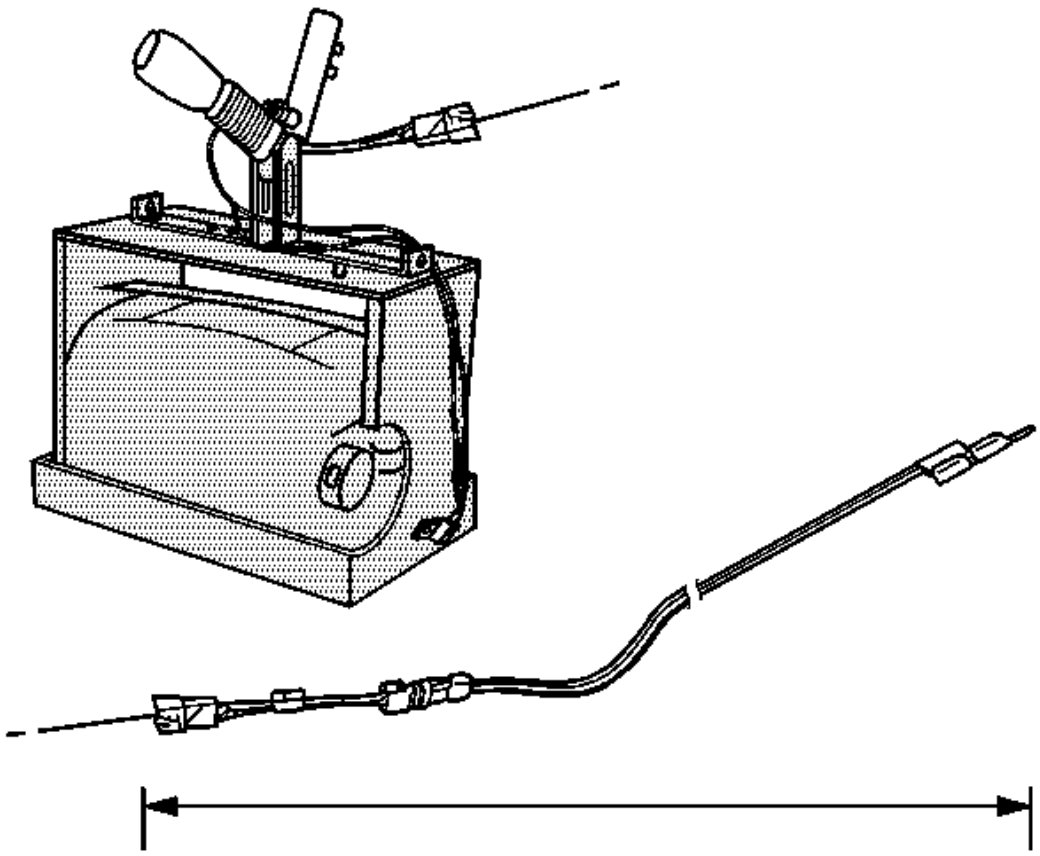

Fig. 67: Extending SIR Deployment Harness & Adapter
Courtesy of GENERAL MOTORS COMPANY

14. Extend the SIR deployment harness and adapter to full length from the deployment fixture.

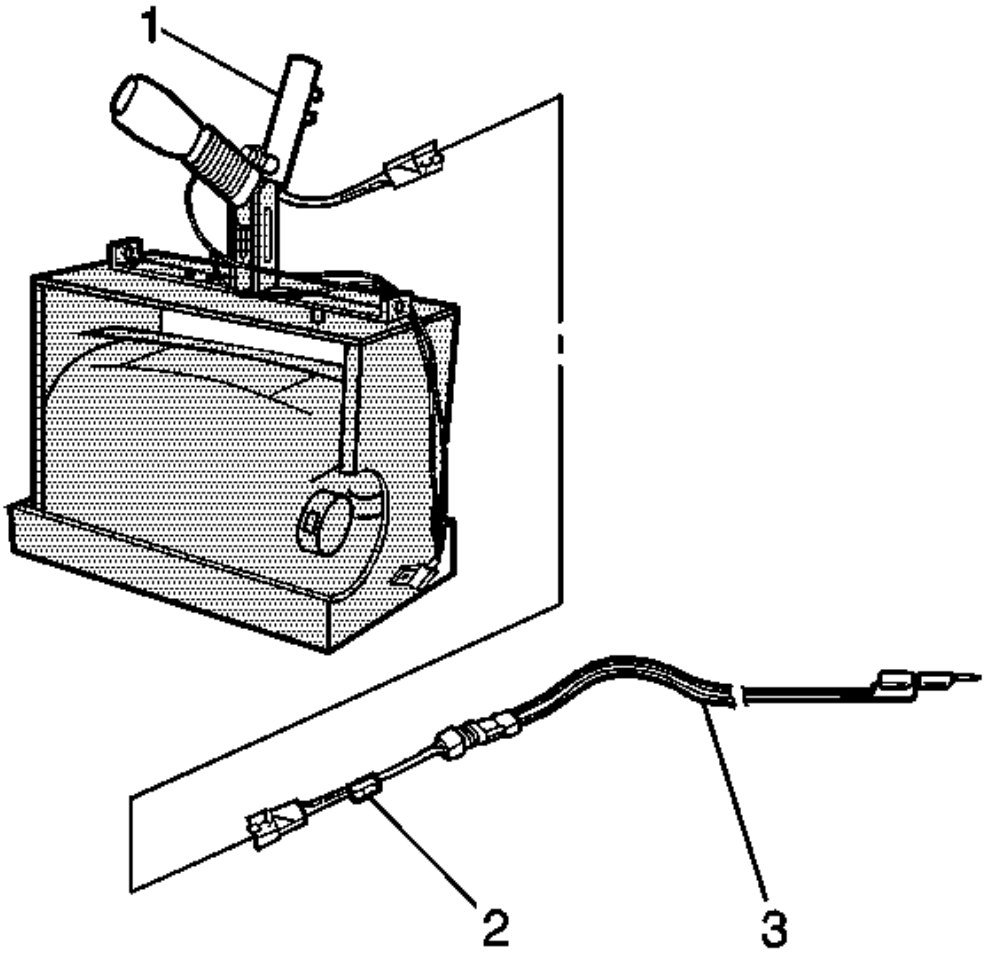

Fig. 68: Connecting Pretensioner To Adapter
Courtesy of GENERAL MOTORS COMPANY

15. Connect the pretensioner (1) to the adapter (2) on the deployment harness (3).

NOTE: **The rapid gas expansion involved with deploying a pretensioner is very loud. Notify all the people in the immediate area that you intend to deploy the seat belt pretensioner.**

16. Clear the area of people.

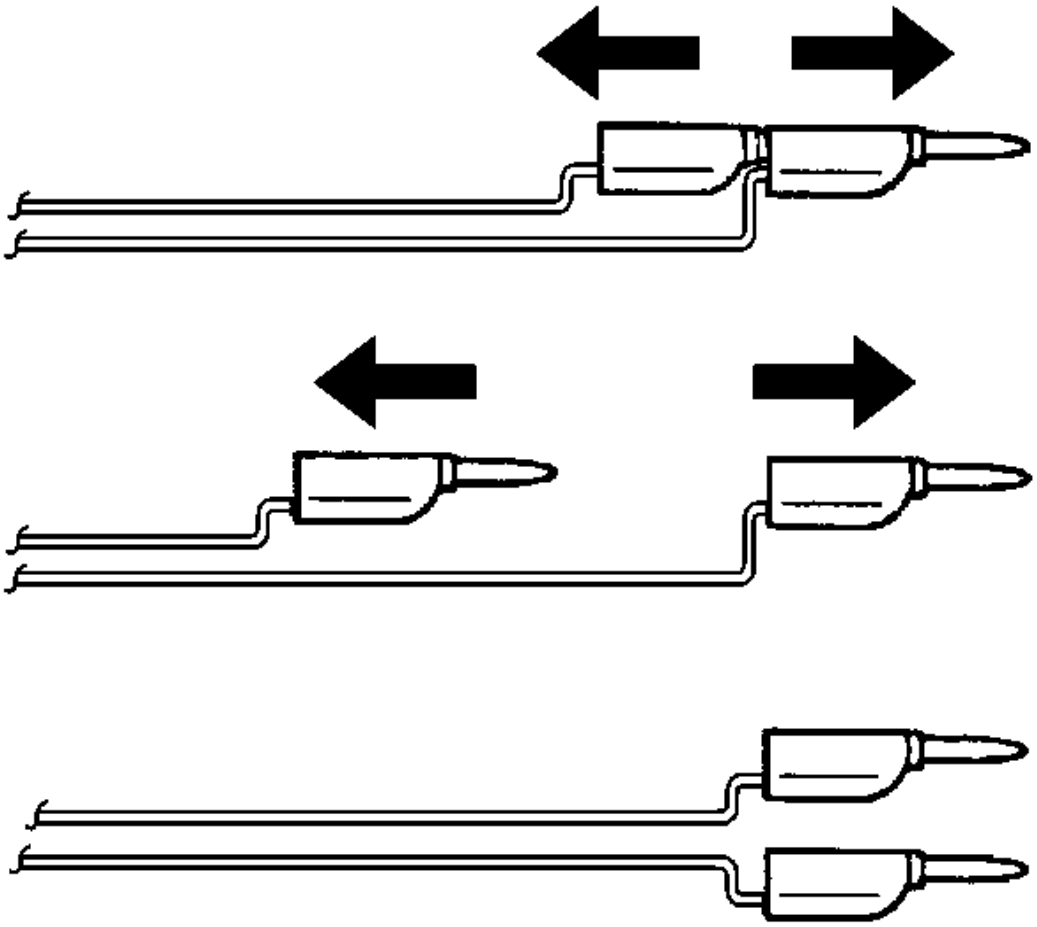

Fig. 69: Separating Banana Plugs
Courtesy of GENERAL MOTORS COMPANY

WARNING: When you are deploying a pretensioner for disposal, perform the deployment procedures in the order listed. Failure to follow the procedures in the order listed may result in personal injury.

17. Separate the 2 banana plugs on the SIR deployment harness.

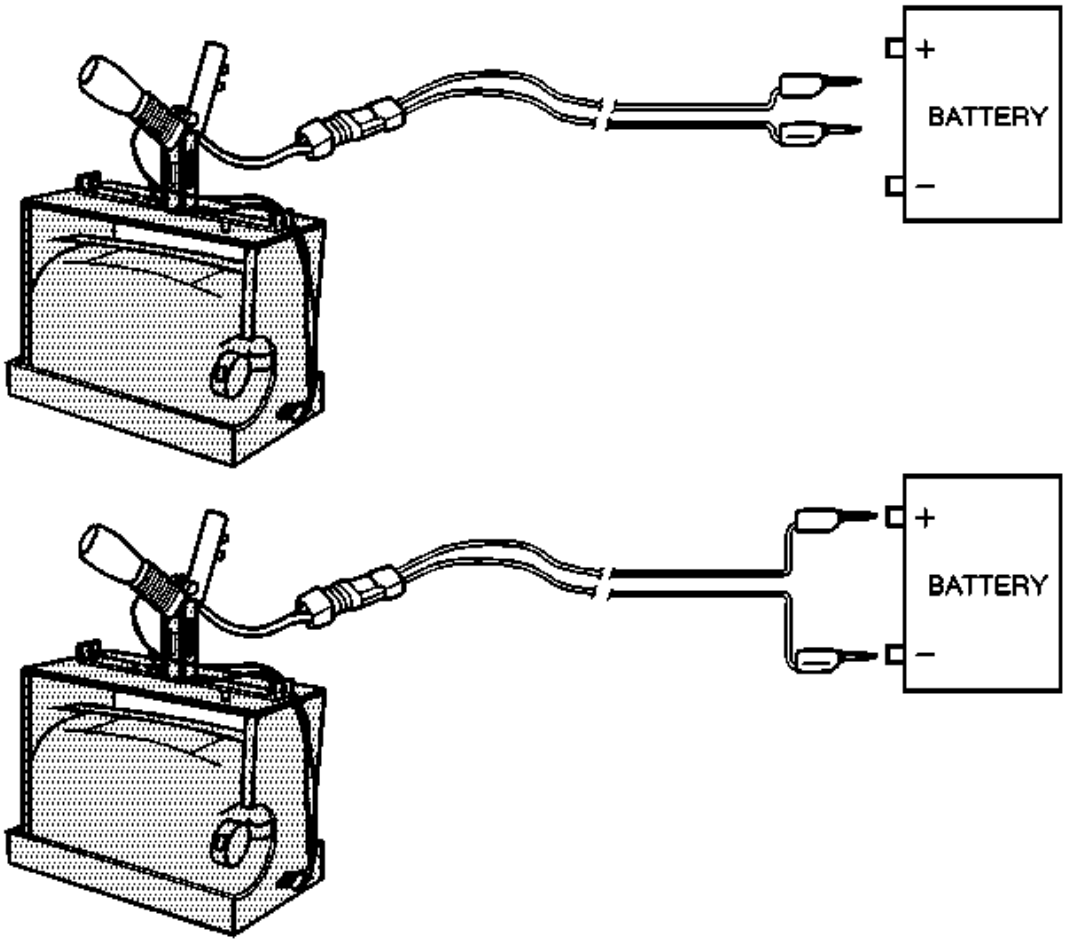

Fig. 70: Deploying Pretensioner
Courtesy of GENERAL MOTORS COMPANY

NOTE: **When the seat belt pretensioner deploys, the deployment fixture may jump about 30 cm (1 ft) vertically. This is a normal reaction of the seat belt pretensioner due to the force of the rapid expansion of gas inside the pretensioner.**

18. Place a 12 V minimum/2 A minimum power source (i.e., vehicle battery) near the shorted end of the harness.
19. Connect the SIR deployment harness wires to the power source. Pretensioner deployment will occur when contact is made.
20. Disconnect the SIR deployment harness from the power source after the pretensioner deploys.

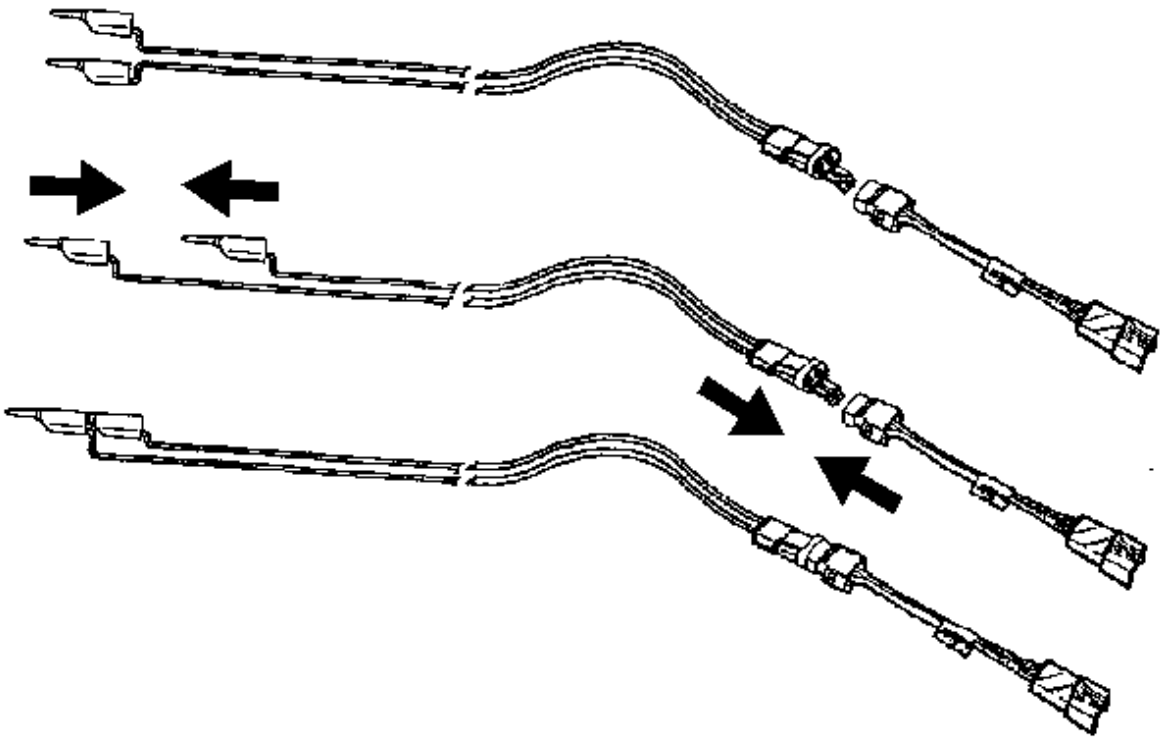

Fig. 71: View Of Deployment Harness Leads
Courtesy of GENERAL MOTORS COMPANY

21. Seat one banana plug into the other in order to short the deployment harness leads.
22. If the pretensioner did not deploy, disconnect the adapter and discontinue the procedure. Contact the Technical Assistance Group. Otherwise, proceed to the following steps.
23. Put on a pair of shop gloves.
24. Disconnect the pigtail adapter from the pretensioner as soon as possible.
25. Inspect the pigtail adapter and the SIR deployment harness. Replace as needed.
26. Dispose of the deployed pretensioner through normal refuse channels.
27. Wash hands with a mild soap.

DESCRIPTION AND OPERATION

SUPPLEMENTAL INFLATABLE RESTRAINT SYSTEM DESCRIPTION AND OPERATION

SIR System Overview

The supplemental inflatable restraint (SIR) system supplements the protection offered by the seat belts. The SIR system contains an inflatable restraint sensing and diagnostic module (SDM), air bags, seat belt pretensioners (retractor), and impact sensors. The SDM determines the severity of a collision with the assistance of impact sensors located at strategic points on the vehicle. When the SDM detects a collision, the SDM will process the information provided by the sensors to further support air bag or pretensioner deployment. The SDM will deploy the air bags and pretensioners if it detects a collision of sufficient force. If the force of the impact is not sufficient to warrant air bag deployment, the SDM may still deploy the seat belt pretensioners. The SDM contains a sensing device that converts vehicle velocity changes to an electrical signal. The SDM compares these signals to values stored in memory. If the signals exceed a stored value, the SDM will determine the severity of the impact and either cause current to flow through the frontal deployment loops deploying the frontal air bags and pretensioners, or it will deploy the pretensioners only. The SDM continuously monitors the deployment loops for malfunctions and illuminates the SIR system AIR BAG indicator if a fault is detected. The SDM performs continuous diagnostic monitoring of the SIR system electrical components. Upon detection of a circuit malfunction, the SDM will set a DTC and inform the driver by illuminating the SIR system AIR BAG indicator. The steering column and knee bolsters are designed to absorb energy and compress during frontal collisions in order to limit leg movement and decrease the chance of injury to the driver and passenger.

SIR System AIR BAG Indicator

The SIR system AIR BAG indicator, located in the instrument cluster, is used to notify the driver of SIR system malfunctions and to verify that the inflatable restraint sensing and diagnostic module (SDM) is communicating with the instrument cluster. When the ignition is turned ON, the SDM is supplied with ignition positive voltage. The instrument cluster will momentarily turn on the SIR system AIR BAG indicator. While the indicator is on, the SDM conducts tests on all SIR system components and circuits. If no malfunctions are detected the SDM will communicate with the instrument cluster through the serial data circuit and command the SIR system AIR BAG indicator OFF. The SDM provides continuous monitoring of the air bag circuits by conducting a sequence of checks. If a malfunction is detected the SDM will store a diagnostic trouble code (DTC) and command the instrument cluster to illuminate the SIR system AIR BAG indicator via serial data. The presence of a SIR system malfunction could result in non-deployment of the air bags or deployment in conditions less severe than intended. The SIR system AIR BAG indicator will remain ON until the malfunction has been repaired.

Inflatable Restraint Sensing and Diagnostic Module (SDM)

The inflatable restraint sensing and diagnostic module (SDM) is a microprocessor and the control center for the supplemental inflatable restraint (SIR) system. The SDM contains internal sensors along with external impact sensors, mounted at strategic locations on the vehicle. In the event of a collision, the SDM compares the signals from the internal and external impact sensors to a value stored in memory. When the generated signals exceed the stored value, the SDM will cause current to flow through the appropriate deployment loops to deploy the air bags. The SDM records the SIR system status when a deployment occurs and illuminates the SIR system AIR BAG indicator located in the instrument cluster. The SDM performs continuous diagnostic monitoring of the SIR system electrical components and circuitry when the ignition is turned ON. If the SDM detects a malfunction, a DTC will be stored and the SDM will request the instrument cluster to illuminate the SIR system AIR BAG indicator, notifying the driver that a malfunction exists. In the event that ignition positive voltage is lost during a collision, the SDM maintains a 23-volt loop reserve for deployment of the air bags. It is important when disabling the SIR system for servicing or rescue operations to allow the 23-volt loop reserve to dissipate, which could take up to 2 min.

Air Bags

This vehicle contains 6 air bags. The 6 air bags are located in the driver steering wheel (dual air bags), passenger instrument panel (passenger side) (dual air bags), driver seat side (B-pillar), passenger seat side (B-pillar), left roof rail, and right roof rail. To view the locations of the air bags refer to **Master Electrical Component List** . Air bags contain a housing, inflatable air bag, two initiating devices (if dual air bags), canister of gas generating material and, in some cases, stored compressed gas. The deployment loops supply current to deploy the air bags. The steering wheel and passenger instrument panel air bags have two stages of deployment, which varies the amount of restraint to the occupant according to the collision severity. For moderate frontal collisions the air bags deploy at less than full deployment which consists of stage 1 of the air bag. For more severe frontal collisions a full deployment is initiated which consists of stage 1 and stage 2 of the air bag. The current passing through the air bags ignite the material in the canister producing a rapid generation of gas and is some cases, the release of compressed gas. The gas produced from this reaction rapidly inflates the air bag. Once the air bag is inflated it quickly deflates through the air bag vent holes and/or the bag fabric. A shorting bar (if equipped) is located in the connector.

Seat Belt Pretensioners (Anchor and Retractor)

The seat belt pretensioners (driver and passenger) consist of a housing, seat belt retractor (located in the B-pillar), seat belt anchor (located on the outboard side of the seat), seat belt webbing, an initiator, and a canister of gas generating materials. To view the locations of the seat belt pretentioners refer to **Master Electrical Component List** . The initiator is part of the seat belt pretensioner deployment loop. When the vehicle is involved in a collision of sufficient force, the SDM causes current to flow through the seat belt deployment loops to the initiator. Current passing through the initiator ignites the material in the canister producing a rapid generation of gas. The gas produced from this reaction deploys the seat belt pretensioners which removes all of the slack in the seat belts. Depending on the severity of the collision, the seat belt pretensioners may deploy without the front air bags deploying, or they will deploy immediately before the front air bags deploy. A shorting bar (if equipped) is located in the connector.

Impact Sensors

This vehicle contains 4 impact sensors. The 4 impact sensors are located in the front of the vehicle (2, left and right), and 2 in the front doors (left and right). To view the locations of the impact sensors refer to **Master Electrical Component List** . The impact sensors contain a sensing device which monitors vehicle acceleration and velocity changes to detect side collisions that are severe enough to warrant air bag deployment. The impact sensors are not part of the deployment loop, but instead provide input to the SDM. The SDM contains a microprocessor that performs calculations using the measured accelerations and compares these calculations to a value stored in memory. When the generated calculations exceed the stored value, the SDM will cause current to flow through the deployment loops deploying the appropriate air bags.

Passenger Presence Detection System and Passenger Air Bag Indicator

NOTE: **The Passenger Presence System (PPS) and the seat bottom foam cushion is a calibrated unit and cannot be service separately. After repairing or replacing the PPS, the system must be checked for preload in order to function properly.**

The PPS is used to monitor the pressure profile of an occupant on the front outboard passenger seat and communicate the status to the sensing and diagnostic module (SDM) whether to enable or suppress the deployment of the instrument panel (I/P) module. The PPS consists of an electronic control module and sensor mat assembly attached to the bottom seat cushion, wiring harness, and PASSENGER AIR BAG ON/OFF

indicators. The PPS measures the weight of the occupant sitting in the front passenger seat as a pressure change. If the pressure from the occupant's weight is less than a specified value, the PPS module will send a suppress signal to the SDM to disable the I/P module. If the pressure from the occupant's weight is higher than a specified value, the PPS module will send an enable signal to the SDM to enable the I/P module. The PPS module will notify the customer of the enable/disable status by turning ON one of the PASSENGER AIR BAG ON/OFF indicators. The PPS monitors itself for faults and will set diagnostic trouble codes (DTCs) if a fault is detected. The PPS will also notify the SDM of a fault. The SDM will respond by requesting the instrument panel cluster (IPC) to turn the SIR system AIR BAG indicator ON.

Seat Belt Indicators

The seat belt indicators are controlled through the inflatable restraint sensing and diagnostic module (SDM). For further information on seat belt indicators refer to **Seat Belt System Description and Operation** .

DIAGNOSTIC INFORMATION AND PROCEDURES

SYMPTOMS - POWER STEERING SYSTEM

IMPORTANT: Review the system description and operation in order to familiarize yourself with the system functions. Refer to **Power Steering System Description and Operation**.

Visual/Physical Inspection

- Inspect for aftermarket devices which could affect the operation of the power steering system.
- Inspect the easily accessible or visible system components for obvious damage or conditions which could cause the symptom.
- Inspect for leaking power steering components. If necessary, refer to **Power Steering Fluid Leaks**.
- Verify the power steering fluid level per operating specification. Refer to **Checking and Adding Power Steering Fluid**.
- Inspect the power steering fluid for the following indications of contamination:
  - Milky fluid - water
  - Brown fluid - burnt
  - Debris in fluid - plastic or dirt
- If necessary, flush the power steering system. Refer to **Power Steering System Flushing**.

Symptoms List

Refer to a symptom diagnostic procedure from the following list in order to diagnose the symptom:

- **Power Steering Fluid Leaks**
- **Rattle, Clunk, Pop or Shudder Noise from the Power Steering System**
- **Whine or Growl Noise from the Power Steering System**
- **Steering Effort Hard or Too Easy in One or Both Directions**

POWER STEERING SYSTEM TEST

Rack and Pinion System

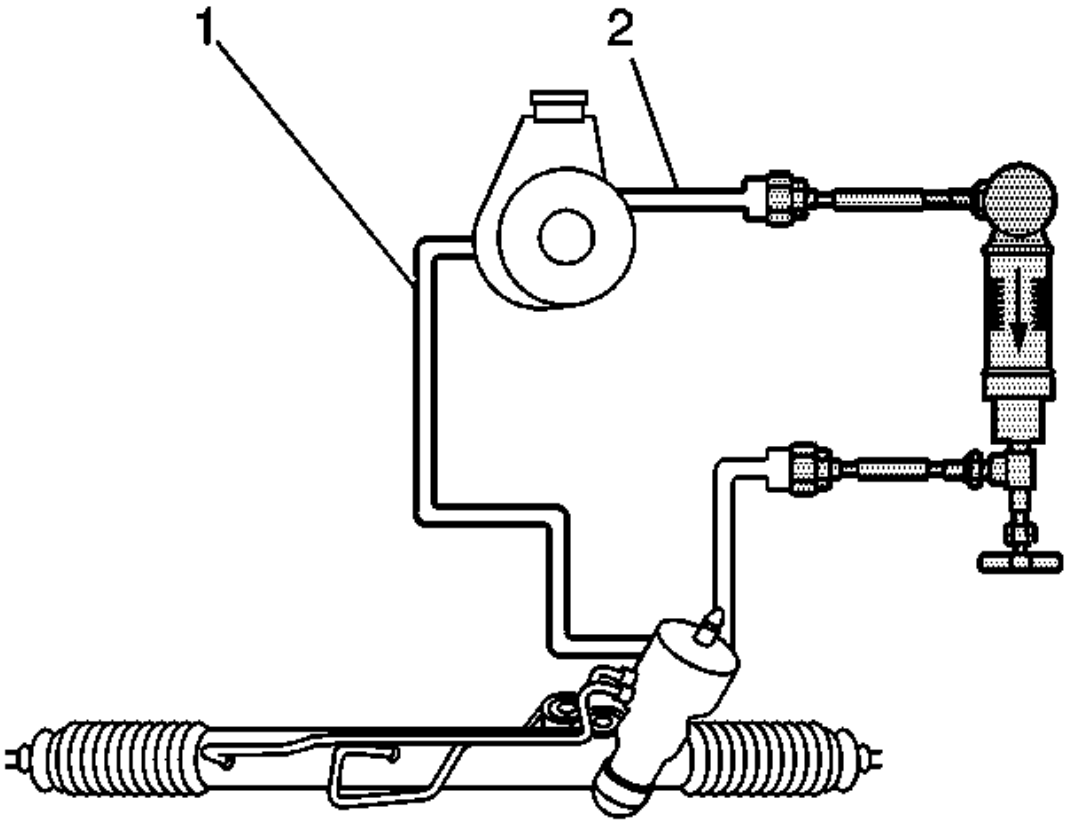

Fig. 1: Testing Rack and Pinion System Pressures
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Power Steering Return Hose
2	Power Steering Pressure Hose

Test Description

The numbers below refer to the step numbers on the diagnostic table.

5

This step tests the system for restrictions.

7

This step tests the following components for the following conditions:

- The pump for internal leaks
- The power steering pipes for kinks

8

This step tests the ability of the pump to regulate flow at maximum pressure.

10

This step tests the ability of the pump to regulate flow under normal operating conditions.

12

This step tests the internal components of the pump and the gear.

Step	Action	Value(s)	Yes	No
DEFINITION: The Power Steering System Test Procedure will perform the following functions: • Test the operation of the hydraulic power steering system. • Test the operation of the power steering pump and power steering gear. • Identify restrictions in the system.				
1	Inspect the power steering fluid for the following indications of contamination: • Milky fluid - water • Brown fluid - burnt • Debris in fluid - plastic or dirt Is the fluid free of contamination?	-	Go to **Step 3**	Go to **Step 2**
2	Flush the power steering system. Refer to **Power Steering System Flushing**. Did you complete the procedure?	-	Go to **Step 3**	-
3	**NOTE:** **In order to accurately diagnose the system, the malfunction must be present during the test procedure.** Attempt to duplicate the condition.Is the condition present?	-	Go to **Step 4**	System OK
4	1. Turn the ignition switch to the OFF position.	-	Go to **Step 5**	-

Step	Action	Value(s)	Yes	No
	2. Place a drain pan under the vehicle in order to catch any power steering fluid. 3. Disconnect the power steering pressure pipe/hose from the power steering pump or the power steering gear as necessary. 4. Install the **J-44721** Power Steering System Analyzer. 5. Fill the power steering system. Refer to **Checking and Adding Power Steering Fluid**. Did you complete the installation?			
5	1. Fully open the **J-44721** Power Steering System Analyzer valve. 2. Start the engine. **CAUTION:** **Do not hold the steering wheel in the full turn position longer than 5 seconds, as damage to the steering pump may result.** 3. Turn the steering wheel and BRIEFLY hold the steering wheel against the steering stop in order to release any trapped air from the system. 4. Inspect and ensure that all of the power steering pipe/hose connections are not leaking. 5. Making sure the steering wheel is OFF the steering stop, observe the pressure reading. Is the pressure reading greater than the specified value?	1379 kPa (200 psi)	Go to **Step 6**	Go to **Step 7**

Step	Action	Value(s)	Yes	No
6	**NOTE:** **A restriction may be present in the power steering system. Turn OFF the engine IMMEDIATELY.** Locate and repair the restriction.Did you complete the repair?	-	Go to **Step 15**	-
7	1. Allow the engine to run until the engine reaches full operating temperature. 2. Record the pressure reading and flow reading. 3. Partially close the **J-44721** Power Steering System Analyzer valve until the system pressure reaches the specified value, then record the FLOW reading. 4. Subtract second flow reading from the first flow reading. Is the flow DECREASE greater than 3.8 L (1 gal) per minute?	4827 kPa (700 psi)	Go to **Step 11**	Go to **Step 8**
8	**NOTE:** **Do not leave the valve closed for more than 5 seconds, or internal pump damage could accrue.** Fully close then open the **J-44721** Power Steering System Analyzer valve 3 times. Record all of the high pressure readings. Refer to **Power Steering Pump Specifications** for power steering system pressure relief specifications.Are the 3 high pressure readings within specifications?	-	Go to **Step 9**	Go to **Step 13**

Step	Action	Value(s)	Yes	No
9	Are the three high pressure readings within 245 kPa (50 psi) of each other?	-	Go to **Step 10**	Go to **Step 13**
10	1. Increase the engine speed to approximately 1,500 RPM. 2. Record the flow reading. Refer to **Power Steering Pump Specifications** for power steering system pressure specifications. Is the actual flow reading within specifications?	-	Go to **Step 11**	Go to **Step 13**
11	Is the difference between the actual flow reading and the maximum flow specification more than 3.8 L (1 gal) per minute?	-	Go to **Step 13**	Go to **Step 12**
12	Turn the steering wheel from steering stop to steering stop and record the FLOW readings at each stop. Is the flow LOWER than 3.8 L (1 gal) per minute?	-	Go to **Step 15**	Go to **Step 14**
13	Replace the power steering pump. Refer to **Power Steering Pump Replacement**. Did you complete the replacement?	-	Go to **Step 15**	-
14	The power steering gear is leaking across the piston or bypassing the valve circuit. Replace the power steering gear. Refer to **Steering Gear Replacement**. Did you complete the replacement?	-	Go to **Step 15**	-
15	Test the power steering system for the original condition. Does the original condition still exist?	-	Go to **Step 5**	Go to **Step 16**
16	1. Disconnect and remove the **J-44721** Power Steering System Analyzer from the vehicle. 2. Connect the vehicle power steering pipes/hoses. 3. Fill and bleed the power steering system. Refer to **Power Steering System Bleeding**. Did you complete the procedure?	-	System OK	-

POWER STEERING FLUID LEAKS

Special Tools

GE-28431-6 Fluorescent Dye

For equivalent regional tools, refer to **Special Tools**.

NOTE:

- **If fluid is found on a manual steering gear or on an electronic power steering gear, do not replace steering gear. Vehicles equipped with these systems do not use hydraulic power steering fluid. The fluid may be assembly fluid or another system fluid.**
- **Clean the components and identify the sources of the leaks before attempting to repair or replace any power steering components. Clearly mark all locations of leaks with paint, marker, or equivalent for warranty identification and engineering root cause analysis.**

Some customers may comment on a fluid LEAK or NOISY power steering pump. Upon inspection, the technician may find power steering fluid leaking from the hydraulic power steering system. Use the following inspection procedure in order to diagnose the source of the leak and take appropriate action to correct the condition.

1. Inspect the fluid level in the power steering fluid reservoir. Refer to **Checking and Adding Power Steering Fluid**. If the fluid level is NOT low, a careful analysis of the condition is necessary to confirm that the type of fluid is actually power steering fluid.
2. Visually inspect the power steering system and components where the fluid has accumulated.

CAUTION: **Do not clean using brake cleaner or other reactive solvents as these solvents can damage rubber gaskets, seals and bushings.**

3. Use a clean towel or a rag in order to completely clean off all residual fluid from the power steering components.
4. Add 30 cc (1 oz) of **GE-28431-6** dye to the power steering fluid.
5. Start the vehicle and warm the steering system by turning to the left steering stop and to the right steering stop 10 times with the weight of the vehicle on the front tires.
6. Turn vehicle engine OFF.
7. Shine a black light on the area where the residual fluid accumulated. Identify the sources of the leaks.
8. Mark all locations of leaks with paint, marker, or equivalent.
9. Repair or replace all affected components.

RATTLE, CLUNK, POP OR SHUDDER NOISE FROM THE POWER STEERING SYSTEM

Step	Action	Yes	No
1	Did you review the Power Steering System Description and Operation and perform the necessary inspections?	Go to **Step 2**	Go to **Symptoms - Power Steering System**
2	Verify that a rattle, clunk or shudder noise is present. Is a rattle, clunk or shudder noise present?	Go to **Step 3**	System OK
3	Inspect the power steering hoses for proper routing and clearance. Is the routing or clearance of the power steering hoses	Go to **Step 11**	Go to **Step 4**

Step	Action	Yes	No
	incorrect?		
4	Inspect the engine drive belt for cracking or excessive wear. Refer to **Drive Belt Falls Off and Excessive Wear Diagnosis** . Is the drive belt cracked or excessively worn?	Go to **Step 12**	Go to **Step 5**
5	Inspect the power steering pump pulley for damage. Is the power steering pump pulley damaged?	Go to **Step 13**	Go to **Step 6**
6	Inspect the power steering pump for the proper installation. Refer to **Power Steering Pump Replacement**. Is the power steering pump installation incorrect?	Go to **Step 14**	Go to **Step 7**
7	Inspect the power steering gear for the proper installation. Refer to **Steering Gear Replacement**. Is the power steering gear installation incorrect?	Go to **Step 15**	Go to **Step 8**
8	Inspect for looseness in the inner tie rods or in the outer tie rods. Refer to **Steering Linkage Inner Tie Rod Inspection**, and to **Steering Linkage Outer Tie Rod Inspection**. Are the inner tie rods or the outer tie rods loose?	Go to **Step 16**	Go to **Step 9**
9	Inspect the front frame mounts and the front suspension. Refer to **Noise Diagnosis - Front Suspension** . Are the front frame mounts worn or is the front suspension worn?	Go to **Step 17**	Go to **Step 10**
10	Inspect the intermediate shaft. Is the intermediate shaft worn?	Go to **Step 18**	Go to **Step 3**
11	Adjust or replace the hoses. Refer to the appropriate procedures: • **Power Steering Fluid Cooling Pipe Replacement** • **Power Steering Fluid Cooler Replacement** • **Power Steering Fluid Reservoir Hose Replacement** • **Power Steering Gear Inlet Pipe/Hose Replacement** Did you complete the repair?	Go to **Step 19**	-
12	Replace the drive belt. Refer to **Drive Belt Replacement** . Did you complete the repair?	Go to **Step 19**	-
13	Replace the power steering pump pulley. Refer to **Power Steering Pump Pulley Replacement**.	Go to **Step 19**	-

Step	Action	Yes	No
	Did you complete the repair?		
14	Install the power steering pump correctly. Refer to **Power Steering Pump Replacement**. Did you complete the repair?	Go to **Step 19**	-
15	Install the power steering gear correctly. Refer to **Steering Gear Replacement**. Did you complete the repair?	Go to **Step 19**	-
16	Replace either the worn inner tie rod or the worn outer tie rod. Refer to **Steering Linkage Inner Tie Rod Replacement**, or to **Steering Linkage Outer Tie Rod Replacement**. Did you complete the repair?	Go to **Step 19**	-
17	Replace the worn front frame mount or the worn front suspension components. Did you complete the repair?	Go to **Step 19**	-
18	Replace the intermediate shaft. Refer to **Intermediate Steering Shaft Replacement** . Did you complete the repair?	Go to **Step 19**	-
19	Operate the system in order to verify the repair. Did you correct the condition?	System OK	Go to **Step 3**

WHINE OR GROWL NOISE FROM THE POWER STEERING SYSTEM

Step	Action	Yes	No
1	Did you review the Power Steering System Description and Operation and perform the necessary inspections?	Go to **Step 2**	Go to **Symptoms - Power Steering System**
2	Verify that a whine or growl noise is present. Is a whine or growl noise present?	Go to **Step 3**	System OK
3	Inspect the power steering fluid for the following indications of contamination: • Milky fluid - water • Brown Fluid - burnt • Debris in fluid - plastic or dirt Is the fluid free of contamination?	Go to **Step 4**	Go to **Step 9**
4	Inspect the power steering fluid temperature and level. Refer to **Checking and Adding Power Steering Fluid**. Is the fluid level between the MIN mark and the MAX mark?	Go to **Step 5**	Go to **Step 10**

Step	Action	Yes	No
5	1. Bleed the power steering system. Refer to **Power Steering System Bleeding**. 2. Verify that a whine or growl noise is present. Is a whine or growl noise present?	Go to **Step 6**	System OK
6	Using the **J-39570** Chassis Ear , inspect the steering gear for a whine or growl noise. Is the noise present at the steering gear?	Go to **Step 11**	Go to **Step 7**
7	Using the **J-39570** Chassis Ear , inspect the power steering pump for a whine or growl noise. Is the noise present at the power steering pump?	Go to **Step 12**	Go to **Step 8**
8	Using the **J-39570** Chassis Ear , inspect the power steering hoses for a whine or growl noise. Is the noise present at the power steering hoses?	Go to **Step 13**	Go to **Step 1**
9	Flush the power steering system. Refer to **Power Steering System Flushing**. Did you complete the procedure?	Go to **Step 14**	-
10	Inspect the power steering system for leaks. Repair or replace all affected components. Refer to **Power Steering Fluid Leaks**. Did you complete the inspection and repairs?	Go to **Step 14**	-
11	Replace the steering gear. Refer to **Steering Gear Replacement**. Did you complete the repair?	Go to **Step 14**	-
12	Replace the power steering pump. Refer to **Power Steering Pump Replacement**. Did you complete the repair?	Go to **Step 14**	-
13	Adjust the routing of the power steering hoses. Did you complete the repair?	Go to **Step 14**	-
14	Operate the system in order to verify the repair. Did you correct the condition?	System OK	Go to **Step 3**

POOR RETURN OF STEERING WHEEL

Step	Action	Yes	No
DEFINITION: After completing a turn, extra steering input is required for the steering wheel to return to center.			
1	Did you review the Power Steering System Description and Operation and perform the necessary inspections?	Go to **Step 2**	Go to **Symptoms - Power Steering System**
2	Verify that poor return of the steering wheel is present. Does the system operate normally?	System OK	Go to **Step 3**

Step	Action	Yes	No
3	1. Raise and support the vehicle. Refer to **Lifting and Jacking the Vehicle** . 2. Lubricate the tie rod ends and ball joints, if applicable. 3. Inspect the suspension system for worn or damaged components. 4. Repair as necessary. Did you find and correct the condition?	Go to **Step 12**	Go to **Step 4**
4	1. Rotate the steering wheel ONE revolution in both directions. 2. Rotate the steering wheel back to the original position. Was the steering wheel abnormally difficult to rotate in either direction?	Go to **Step 5**	Go to **Step 10**
5	**NOTE:** **Position the wheels straight ahead. Do NOT rotate the steering wheel more than one complete revolution from center.** 1. Disconnect the intermediate shaft from the steering column. 2. Note the position of the steering wheel and rotate the steering wheel ONE revolution in both directions. 3. Rotate the steering wheel back to the original position. Was the steering wheel abnormally difficult to rotate in either direction?	Go to **Step 11**	Go to **Step 6**
6	Inspect the intermediate shaft for stiff or loose joints. Repair or replace as necessary. Did you find and complete the repair?	Go to **Step 12**	Go to **Step 7**
7	1. Remove the front tire and wheel assemblies. Refer to **Tire and Wheel Removal and**	Go to **Step 12**	Go to **Step 8**

Step	Action	Yes	No
	Installation . 2. Disconnect both outer tie rod ends from the steering knuckles. 3. Use your hands in order to move the tie rod end studs. 4. If abnormally difficult to move, replace the tie rod end. If equipped with recirculating ball steering, ensure that idler and pitman arm joints are not to stiff. Repair as necessary. Did you find and complete the repair?		
8	1. Use your hands to rotate the steering knuckle inboard and outboard in order to inspect for a binding strut bearings, ball joints, or axle. 2. Repair or replace any abnormally stiff or loose components. Did you find and complete the repair?	Go to **Step 12**	Go to **Step 9**
9	Inspect for binding in the steering gear. If a binding is present, repair or replace the steering gear. Did you find and complete the repair?	Go to **Step 12**	Go to **Step 10**
10	Inspect the wheel alignment and adjust as necessary. Refer to **Wheel Alignment Measurement** . Did you find and complete the repair?	Go to **Step 12**	-
11	Inspect the steering column for a binding. If a binding is present, repair or replace the steering column as necessary. Did you find and complete the repair?	Go to **Step 12**	-
12	Operate the system in order to verify the repair. Did you correct the condition?	System OK	-

STEERING EFFORT HARD OR TOO EASY IN ONE OR BOTH DIRECTIONS

Step	Action	Yes	No
1	Did you review the Power Steering System Description and Operation and perform the necessary inspections?	Go to **Step 2**	Go to **Symptoms - Power Steering System**
2	Verify that the steering effort is hard or too easy in one or both directions. Does the system operate normally?	System OK	Go to **Step 3**

Step	Action	Yes	No
3	1. Bleed the power steering system. Refer to **Power Steering System Bleeding**. 2. Perform the power steering test procedure. Refer to **Power Steering System Test**. Did you complete the procedure?	Go to **Step 4**	-
4	Operate the system in order to verify the repair. Did you correct the condition?	System OK	Go to **Step 3**

REPAIR INSTRUCTIONS

STEERING LINKAGE INNER TIE ROD INSPECTION

Special Tools

J-8001 Dial Indicator Set

For equivalent regional tools, refer to **Special Tools**.

NOTE: **This inspection procedure does not supersede local government required inspections that have more stringent requirements.**

1. Turn the ignition key to the ON position with the engine OFF.
2. With the aid of an assistant, turn the steering wheel to the full stop position and hold the steering wheel in that position until the test is complete. The tie rod being tested should be inside the steering gear housing seated against the steering stop.
3. Raise and support the vehicle. Refer to **Lifting and Jacking the Vehicle** .
4. If there is not a good location for the **J-8001** Dial Indicator pointer at the steering gear housing, install a large worm gear hose clamp to the steering gear housing over the larger steering gear boot clamp and align the clamp so that the screw can be a location for the **J-8001** Dial Indicator pointer.

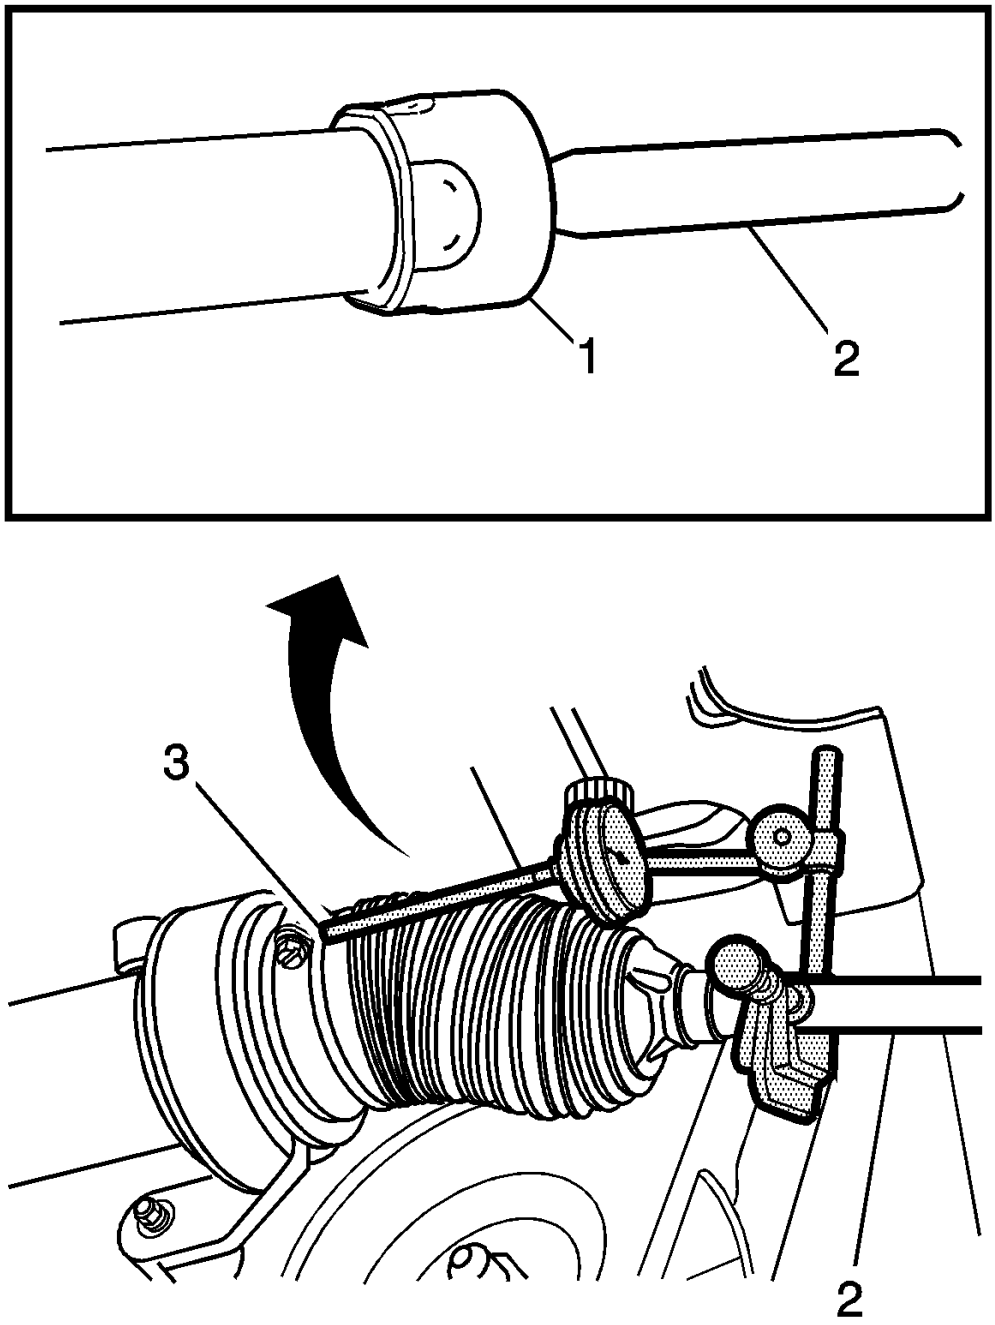

Fig. 2: Measuring Lash Between Inner Tie Rod & Steering Gear Housing
Courtesy of GENERAL MOTORS COMPANY

5. Install the **J-8001** Dial Indicator between the inner tie rod (2) and the steering gear housing or the worm gear clamp in such a way as to measure the lash between the inner tie rod and the steering gear housing.

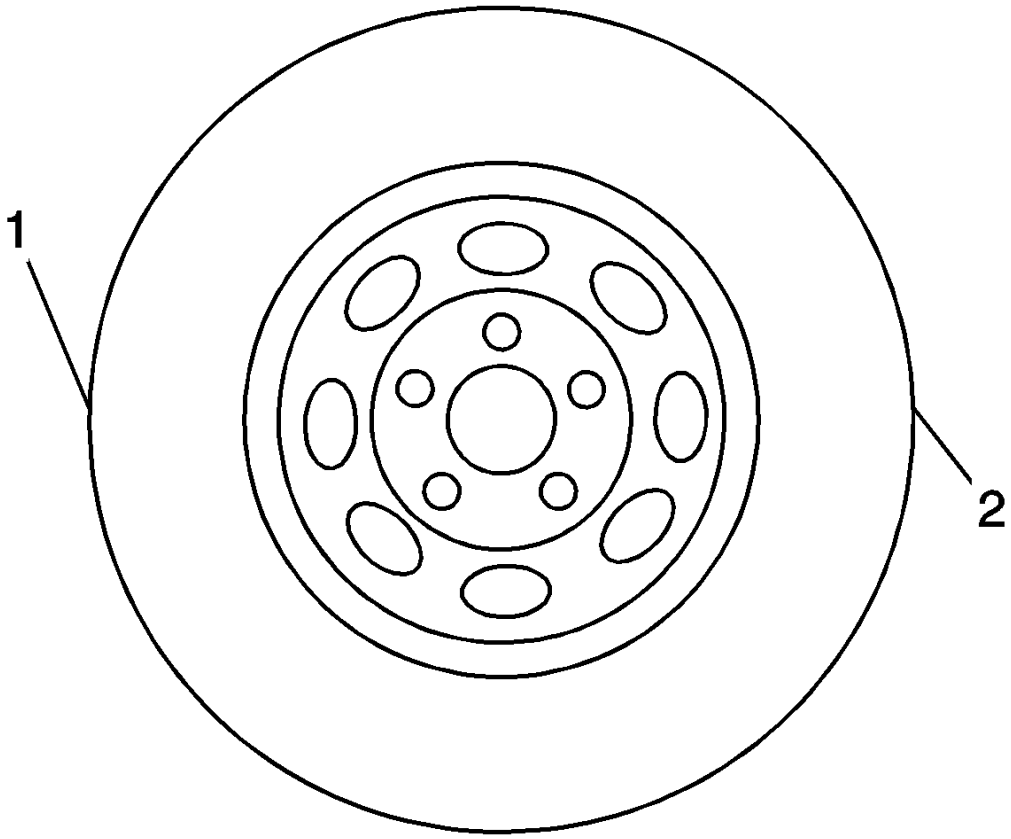

Fig. 3: Identifying Tire Grasping Positions
Courtesy of GENERAL MOTORS COMPANY

NOTE: **Only move the tire enough to feel any lash between the inner tie rod and the inner tie rod housing without moving the steering gear rack.**

6. Grasping the tire at the 3 o'clock (2) and 9 o'clock (1) positions, gently push in on one side of the tire in order to remove any lash.
7. Zero the **J-8001** Dial Indicator.
8. On the same side of the tire previously pushed in, gently pull out and measure the lash.
9. Record the measurement seen on the **J-8001** Dial Indicator.
10. If the measured value exceeds 0.5 mm (0.02 in), replace the steering gear. Refer to **Steering Gear Replacement**.
11. Repeat the procedure for the other side.

STEERING LINKAGE OUTER TIE ROD INSPECTION

Special Tools

J-8001 Dial Indicator Set

For equivalent regional tools, refer to **Special Tools**.

NOTE: **This inspection procedure does not supersede local government required inspections that have more stringent requirements.**

1. Inspect the outer tie rod end seal. If the outer tie rod end seal is torn, replace the outer tie rod end. Refer to **Steering Linkage Outer Tie Rod Replacement**.
2. Raise the side of the vehicle being inspected with a floor jack while maintaining contact between the opposite wheel and the shop floor. Support the lower control arm with a floor jack stand as far outboard as possible and remove the floor jack. Refer to **Lifting and Jacking the Vehicle** .

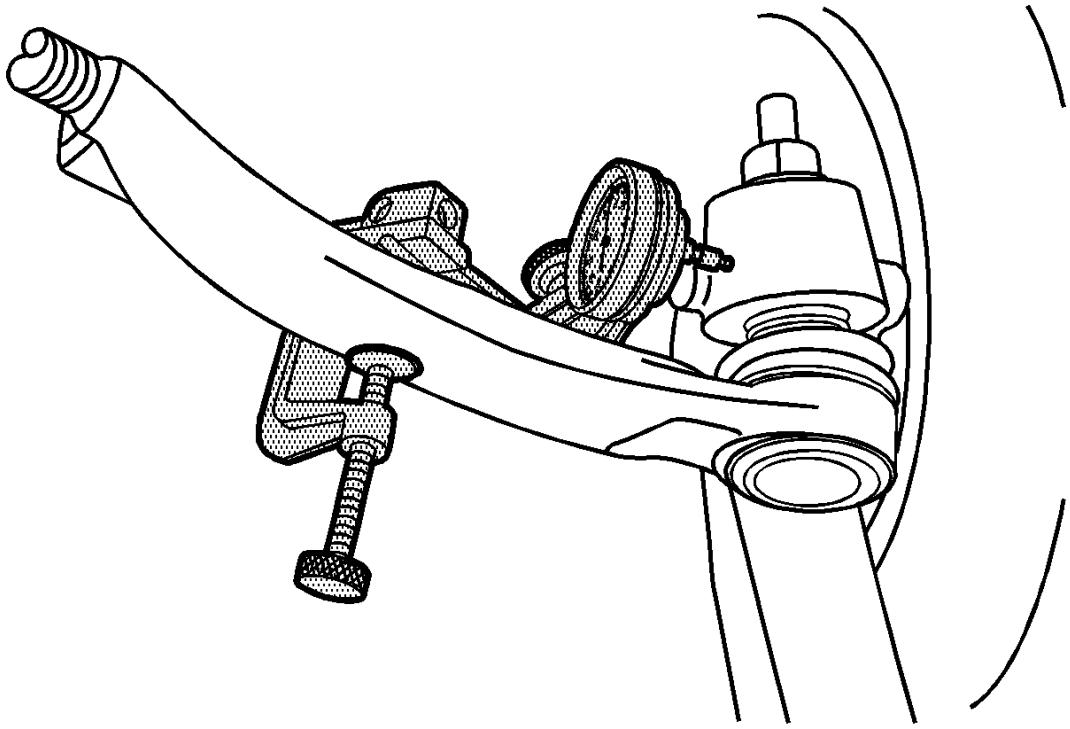

Fig. 4: Measuring Outer Tie Rod Lash
Courtesy of GENERAL MOTORS COMPANY

3. Install the **J-8001** Dial Indicator between the outer tie rod end and the steering knuckle as shown in the graphic. Note that the tire and wheel assembly is shown removed only for clarification of the **J-8001** Dial Indicator position.

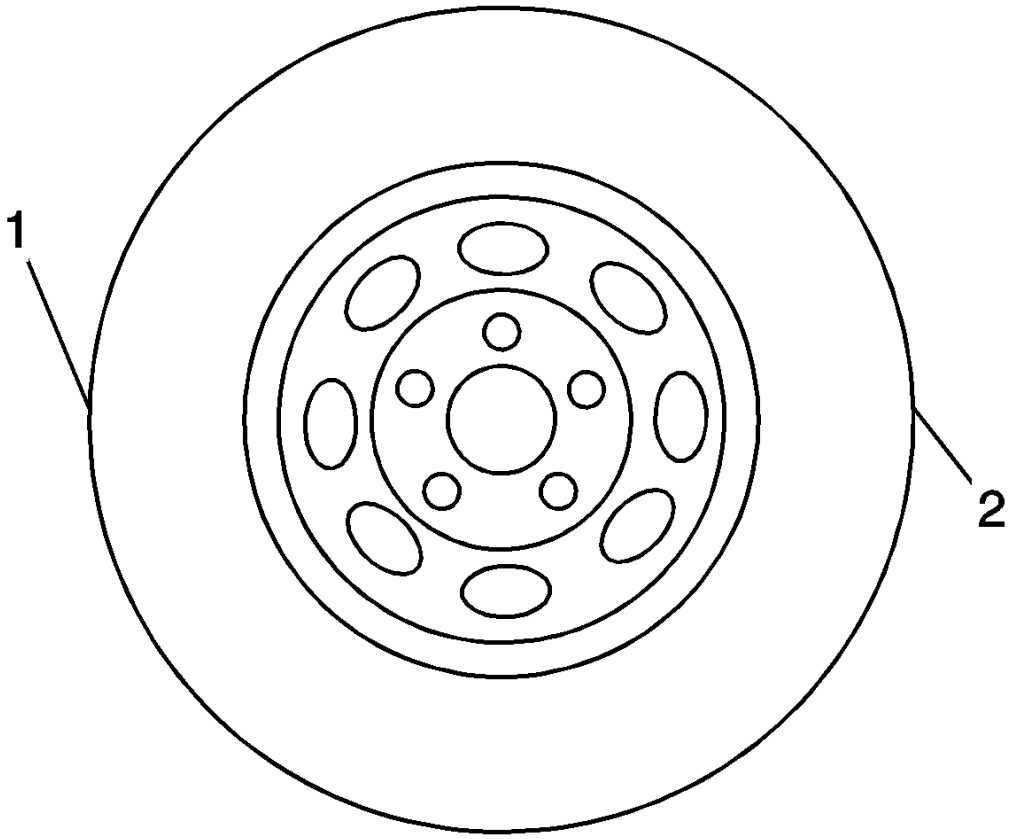

Fig. 5: Identifying Tire Grasping Positions
Courtesy of GENERAL MOTORS COMPANY

4. Grasping the tire at the 3 o'clock (2) and 9 o'clock (1) positions, gently push in on one side of the tire to remove any lash.
5. Zero the **J-8001** Dial Indicator.
6. On the same side of the tire previously pushed inwards, gently pull outwards and measure the lash.
7. Record the measurement seen on the **J-8001** Dial Indicator.
8. If the measured value exceeds 0.5 mm (0.02 in) then replace the outer tie rod. Refer to **Steering Linkage Outer Tie Rod Replacement**.
9. Repeat the procedure for the other side.

POWER STEERING SYSTEM BLEEDING

Special Tools

- **CH-43485** Power Steering Bleeder Adapter
- **GE-23738-A** Vacuum Pump

For equivalent regional tools, refer to **Special Tools**.

NOTE:

- **If you service the power steering system, you will not be able to obtain an accurate fluid level reading unless you bleed the air from the power steering system.**
- **Hoses touching the frame, body or engine may cause system noise. Ensure the hoses do not touch any other part of the vehicle.**
- **Loose connections may not leak, but could allow air into the steering system. Ensure all hose connections are tight.**
- **Maintain the power steering fluid level throughout the bleeding procedure.**
- **Use clean, new power steering fluid only. Refer to Fluid and Lubricant Recommendations .**
- **Introducing too much air into the power steering system will increase the amount of time required to bleed the system.**
- **DO NOT start the engine until instructed to do so.**
- **DO NOT use a hoist. Keep the rear tires on the ground.**

1. Apply the park brake.
2. Using a floor jack and jack stands, raise the front of the vehicle until the center of the front wheels are approximately 61 cm (24 in)off the ground. Refer to **Lifting and Jacking the Vehicle** .
3. Fill the power steering fluid reservoir with fluid to the bottom of the filler neck. Leave the cap off.
4. Place towels around the power steering fluid reservoir neck in order to catch any fluid flowing out of the reservoir.

NOTE: **The fluid level will rise and fall as you turn the steering wheel and you bleed air from the system. This step may take several minutes.**

5. With the key in the ON position and with the ENGINE OFF, turn the steering wheel from stop to stop until the fluid level stabilizes and there are fewer bubbles in the reservoir.
6. Ensure the fluid level is at the bottom of the filler neck.
7. Connect the **CH-43485** adapter to the **GE-23738-A** pump clear hose.
8. Hold the **CH-43485** adapter on the top of the reservoir filler neck.
9. Apply a vacuum of 68 kPa (20 in Hg, 10 psi).
10. Set the **GE-23738-A** pump down. The vacuum will hold the **CH-43485** adapter in place.

NOTE: **The vacuum gauge needle will fluctuate while the steering wheel is moving. This step may take several minutes.**

11. Maintain a vacuum of 68 kPa (20 in Hg, 10 psi)while turning the steering wheel from stop to stop. Hold the steering wheel at each steering stop until there are fewer bubbles in the **GE-23738-A** pump clear hose.
12. With the steering wheel in the straight ahead position, maintain a vacuum of 68 kPa (20 in Hg, 10 psi)for 5 minutes.
13. Inspect the condition of the fluid in the **GE-23738-A** pump clear hose. If any bubbles are in the fluid,

repeat steps 11 and 12.

14. Lower the vehicle.
15. Relieve the vacuum in the **GE-23738-A** pump.
16. Remove the **CH-43485** adapter from the reservoir filler neck.
17. Ensure the power steering fluid level is at the MAX mark on the capstick fluid level indicator.
18. With the reservoir cap off, start the engine. Slowly rotate the steering wheel from stop to stop 10 times. Hold the steering wheel at each stop for 2 seconds.
19. Verify the steering system does not shudder while turning the steering wheel. If the steering system exhibits a shudder condition, repeat steps 1 through 18.
20. Turn the engine OFF.
21. Ensure the power steering fluid level is at the MAX mark on the capstick fluid level indicator. Install the cap to the reservoir. Refer to **Checking and Adding Power Steering Fluid**.
22. Test drive the vehicle.

CHECKING AND ADDING POWER STEERING FLUID

CAUTION: **When adding fluid or making a complete fluid change, always use the proper power steering fluid. Failure to use the proper fluid will cause hose and seal damage and fluid leaks.**

1. Clean the area surrounding the reservoir cap.
2. Remove the reservoir cap.
3. Inspect the power steering pump fluid level at regular intervals. Use the appropriate procedure below.

   Add fluid when required. Refer to **Fluid and Lubricant Recommendations** .

   Fluid Is Hot

   1. Run the engine until the fluid reaches about 80Â°C (170Â°F).
   2. Turn the engine OFF.
   3. Remove the reservoir cap.
   4. Inspect the fluid level on the capstick.
   5. Ensure that the fluid level is at the HOT/FULL/MAX mark on the capstick.
4. If the fluid level is low, add power steering fluid to the proper level.
5. Install the reservoir cap.
6. When checking the fluid level after servicing the steering system, bleed the air from the system. Refer to **Power Steering System Bleeding**.

POWER STEERING SYSTEM FLUSHING

NOTE: **Do not reuse any drained power steering fluid regardless of appearance or condition.**

1. Raise the vehicle until the front wheels are off the ground. Refer to **Lifting and Jacking the Vehicle** .

2. Place a large drain pan under the vehicle in order to collect the draining fluid.
3. Remove the fluid return hose at the power steering fluid reservoir or the pump inlet connection, as applicable.
4. Plug the reservoir return hose inlet connection on the power steering fluid reservoir or the pump, as applicable.

NOTE: **This step may require 4 L (4 qt) of power steering fluid until the draining fluid appears clear.**

5. Have an assistant maintain the minimum fluid level in the reservoir using clean, new power steering fluid. Refer to **Checking and Adding Power Steering Fluid**.
6. With the key in the ON position and with the engine OFF, turn the steering wheel fully to the left and to the right. Continue until the fluid from the return hose runs clear.
7. Remove the plug and install the fluid return hose to the power steering fluid reservoir or the pump inlet connection, as applicable.
8. Bleed the power steering system. Refer to **Power Steering System Bleeding**.
9. Inspect the power steering fluid for the following indications of contamination:
    - Milky fluid - water
    - Brown fluid - burnt
    - Plastic debris or dirt chunks
10. If the fluid is contaminated, repeat steps 3-9.
11. Remove the drain pan.
12. Lower the vehicle.

POWER STEERING FLUID RESERVOIR REPLACEMENT

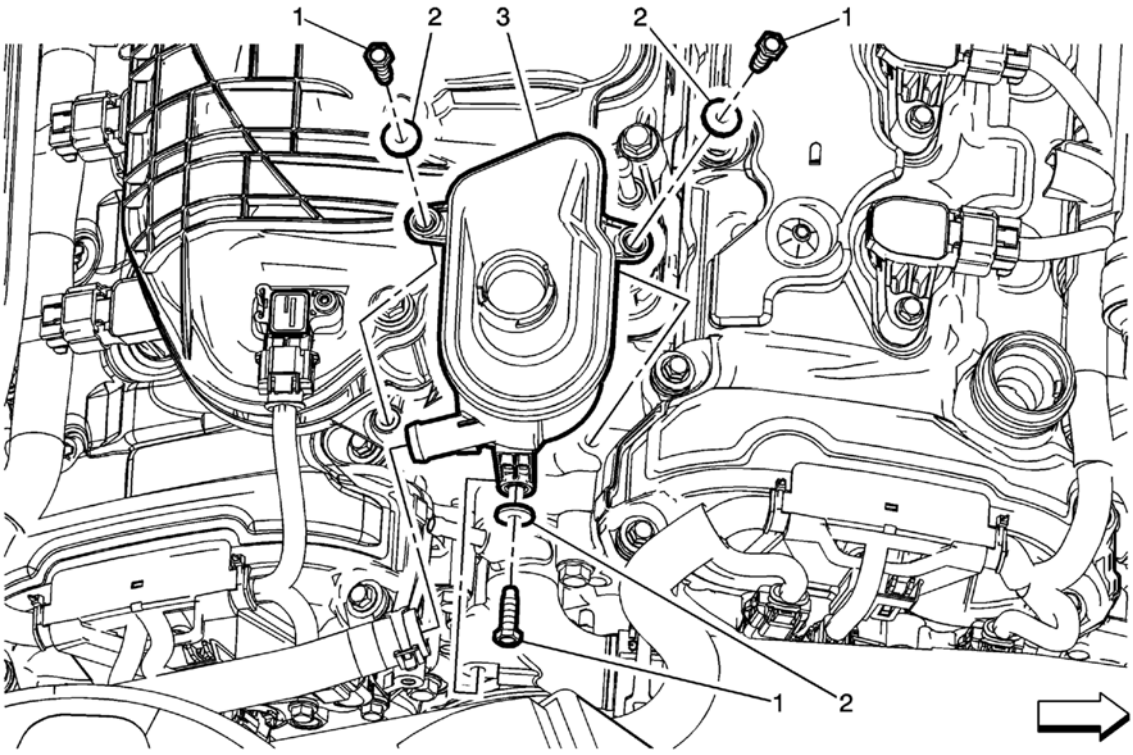

Fig. 6: Power Steering Fluid Reservoir Components
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedures 1. Place drain pans under the vehicle. 2. Remove the intake manifold cover. Refer to **Intake Manifold Cover Replacement** . 3. Remove as much power steering fluid from the power steering fluid reservoir as possible. 4. Position the surge tank inlet hose away from the power steering fluid reservoir. Refer to **Radiator Surge Tank Inlet Hose Replacement** . 5. Disconnect the power steering fluid reservoir hose from the power steering fluid reservoir.	
1	Power Steering Fluid Reservoir Bolt (Qty: 3) **CAUTION:** **Refer to Fastener Caution .** **Tighten** 6 N.m (53 lb in)
2	Power Steering Fluid Reservoir Washer (Qty: 3)

Callout	Component Name
3	Power Steering Fluid Reservoir **Procedure** 1. Fill and bleed the power steering system. Refer to **Power Steering System Bleeding**. 2. Clean any excess power steering fluid from the vehicle. 3. Remove the drain pans.

POWER STEERING PUMP PULLEY REPLACEMENT

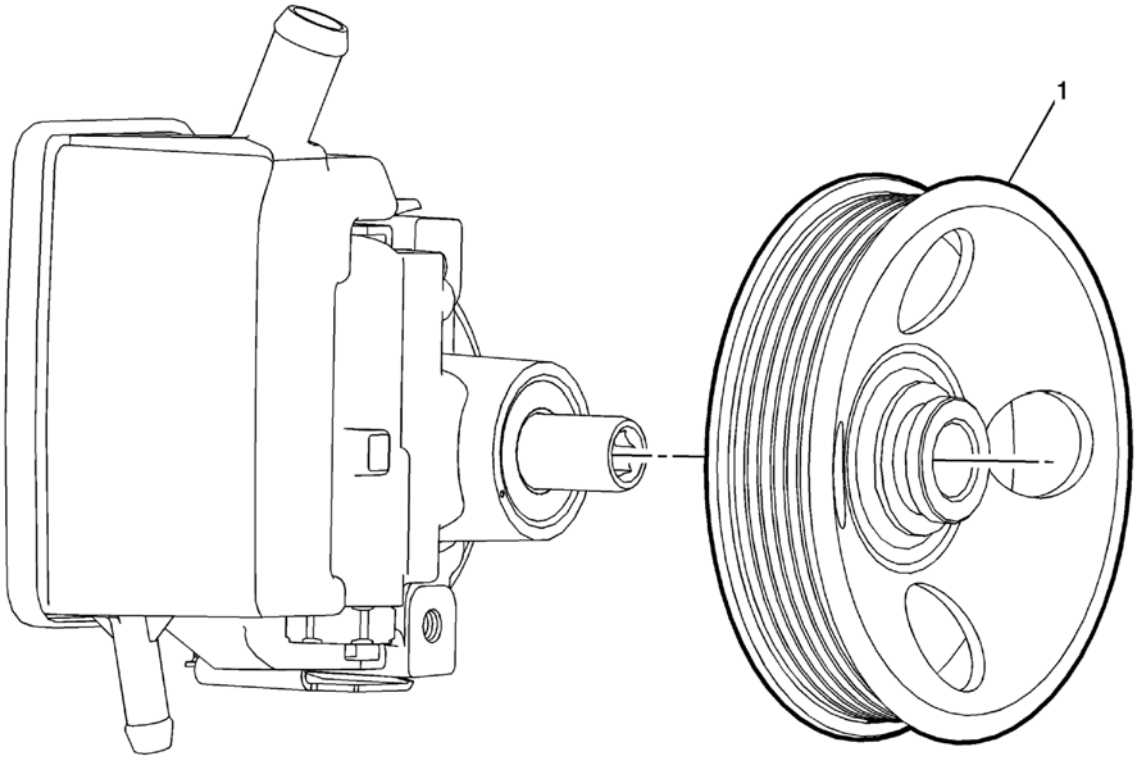

Fig. 7: Power Steering Pump Pulley Components
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure Remove the power steering pump. Refer to **Power Steering Pump Replacement**.	
1	Power Steering Pump Pulley **Procedure** 1. Use the **J-25034-C** Remover in order to remove the power steering pump pulley. 2. Use the **J-25033-C** Installer in order to install the power steering pump pulley. 3. Ensure the axial tolerance of the power steering pump pulley on the shaft is within 0.25 mm (0.010 in).

Callout	Component Name
	Special Tools • **J-25033-C** Pulley Installer • **J-25034-C** Pulley Remover For equivalent regional tools, refer to **Special Tools**.

POWER STEERING PUMP REPLACEMENT

Removal Procedure

1. Place drain pans under the vehicle.
2. Remove as much power steering fluid from the reservoir as possible.
3. Raise and support the vehicle. Refer to **Lifting and Jacking the Vehicle** .
4. Remove the right front tire and wheel assembly. Refer to **Tire and Wheel Removal and Installation** .
5. Disconnect the drive belt from the power steering pump pulley only. Refer to **Drive Belt Replacement** .
6. Disconnect the power steering gear inlet hose from the power steering pump. Refer to **Power Steering Gear Inlet Pipe/Hose Replacement**.

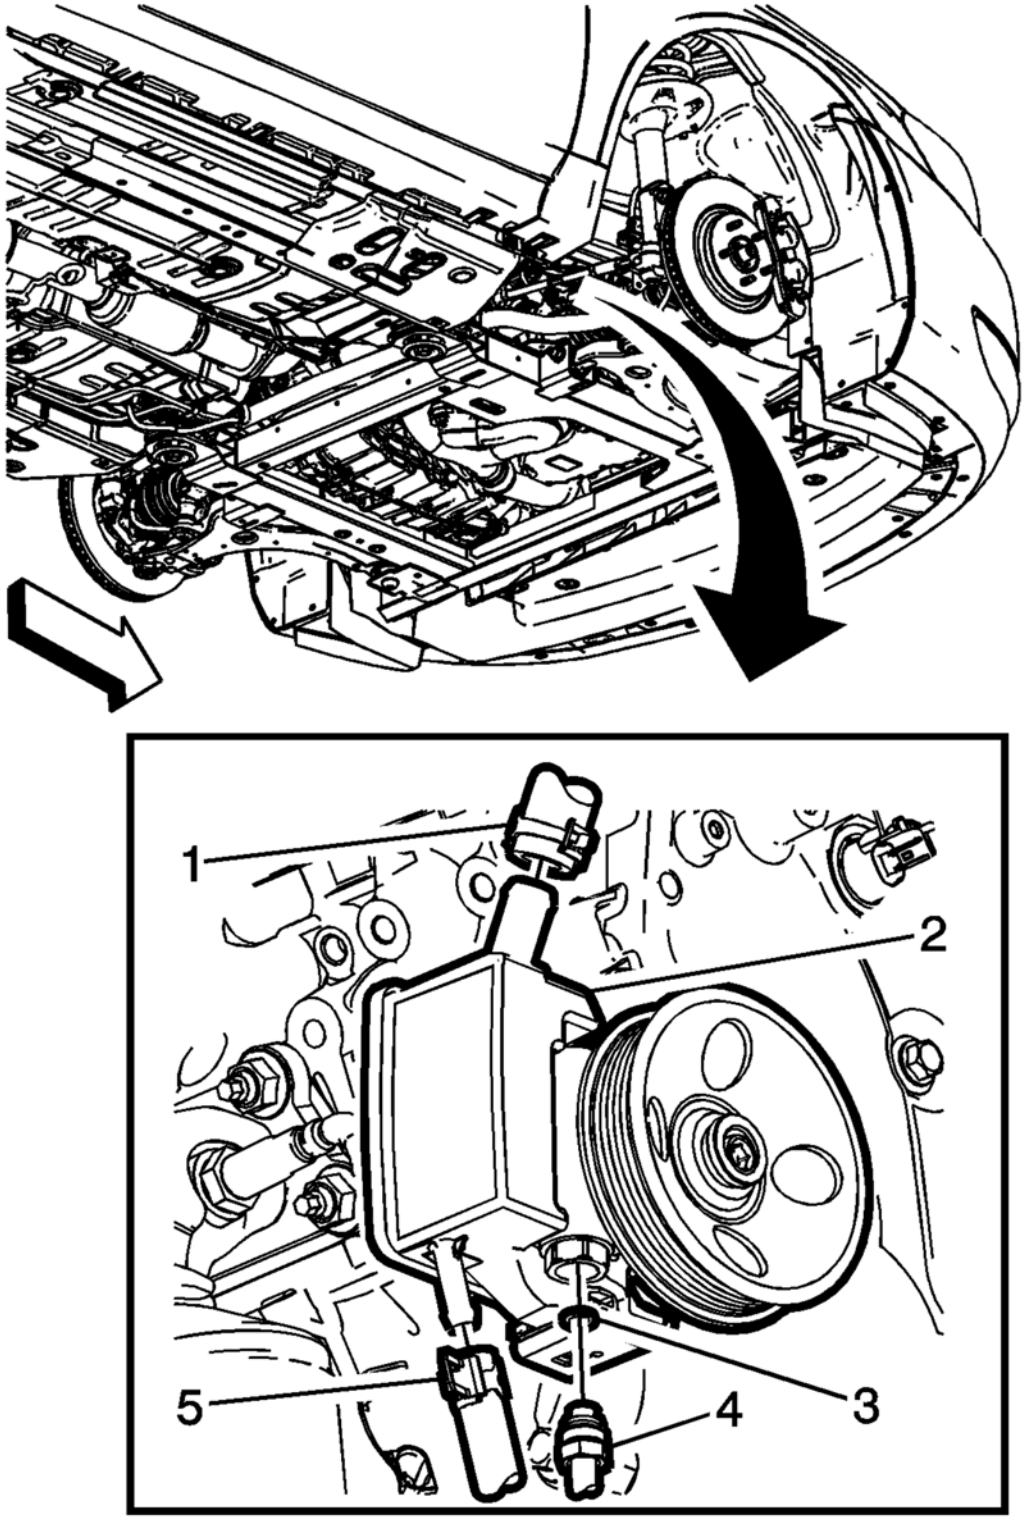

Fig. 8: Power Steering Pump Components
Courtesy of GENERAL MOTORS COMPANY

7. Remove the steering gear inlet hose O-ring seal (3).

   Discard the seal.

8. Disconnect the power steering fluid cooling pipe (5) from the power steering pump (2).
9. Disconnect the power steering fluid reservoir hose (1) from the power steering pump.

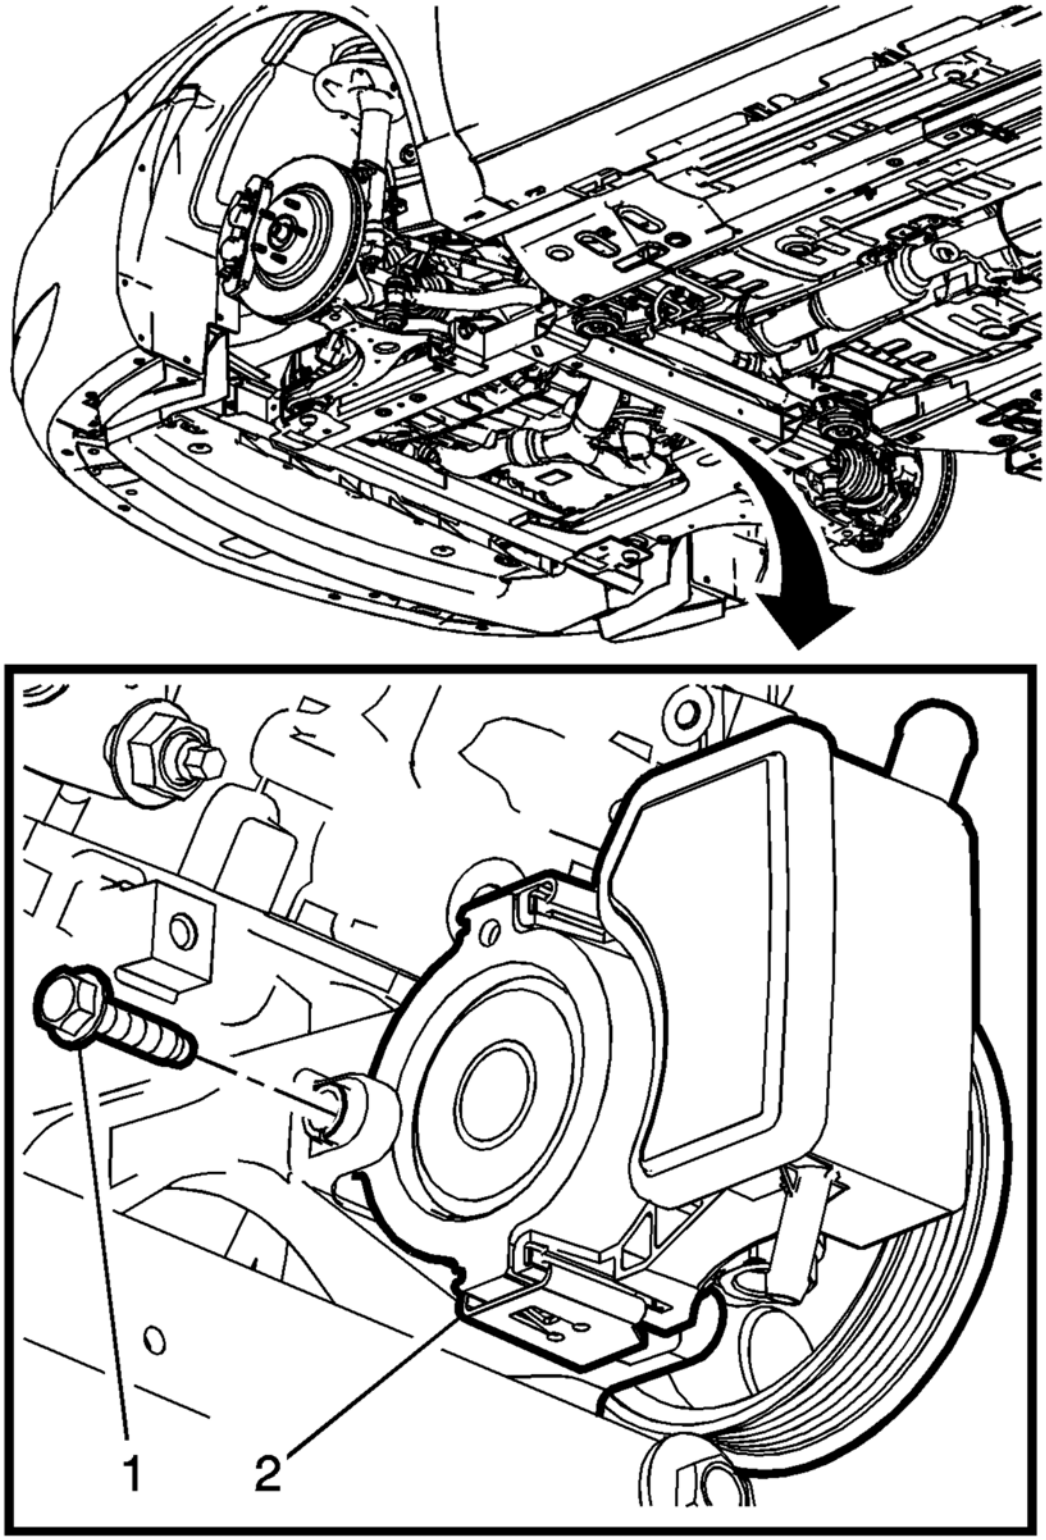

Fig. 9: Power Steering Pump And Bolt
Courtesy of GENERAL MOTORS COMPANY

10. Remove the bolt (1) from the left side of the power steering pump (2).

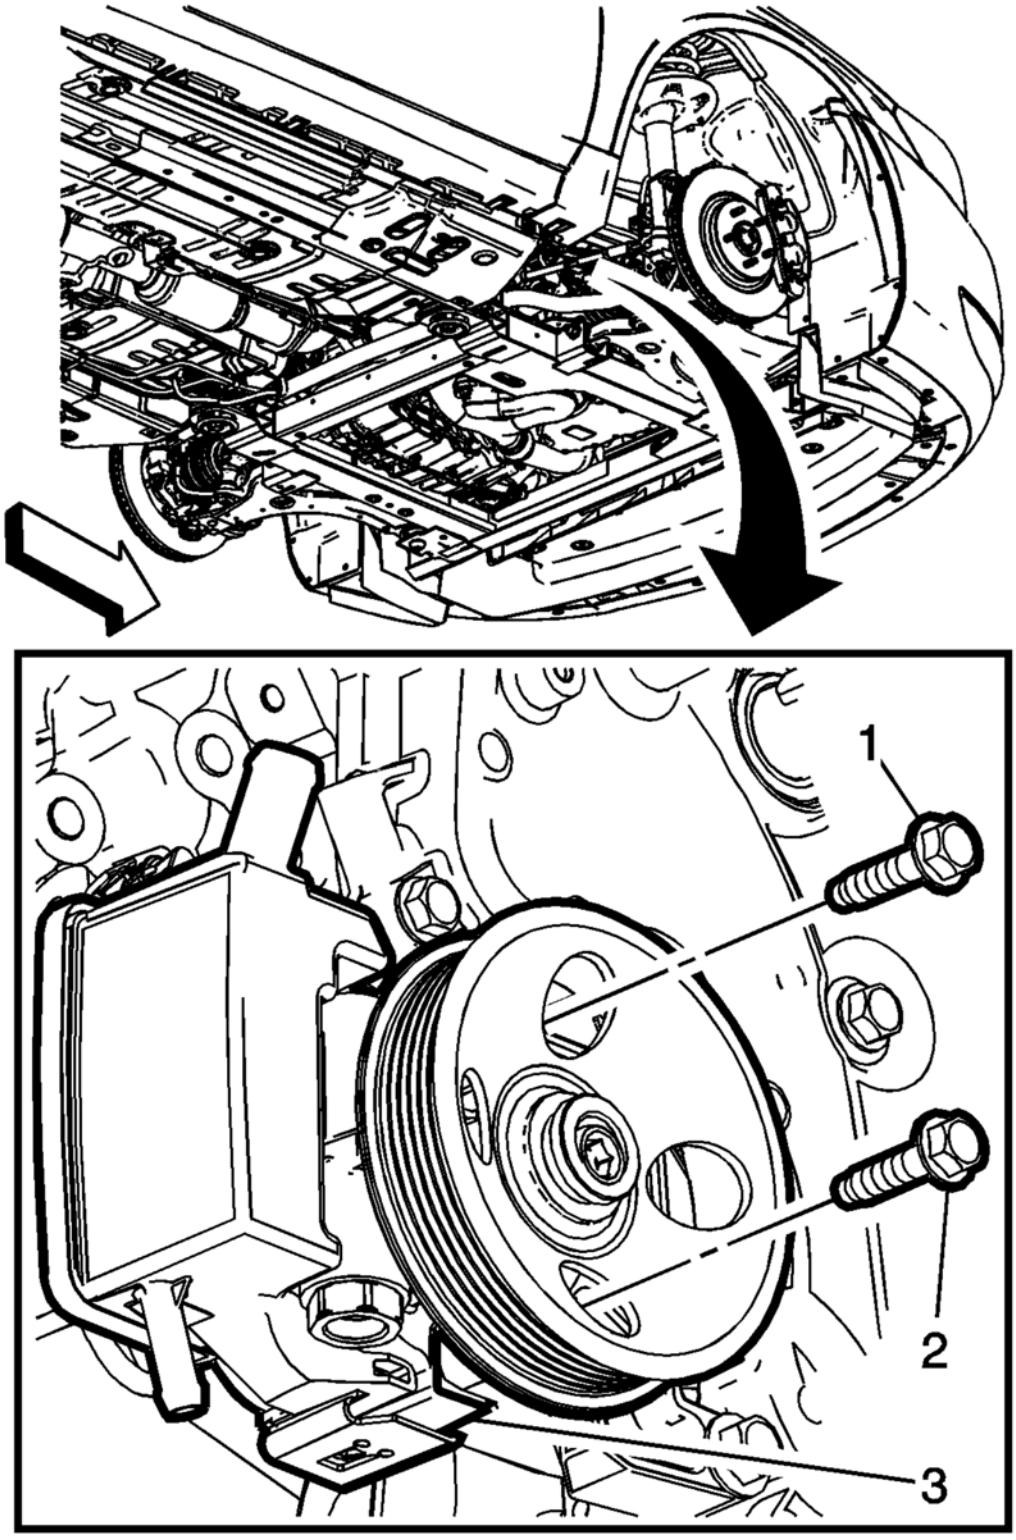

Fig. 10: Power Steering Pump And Bolts
Courtesy of GENERAL MOTORS COMPANY

NOTE: **The right side power steering pump bolts go through the holes in the right side of the bracket and fasten to the holes in the pump.**

11. Remove the 2 bolts (1, 2) from the right side of the power steering pump (3).

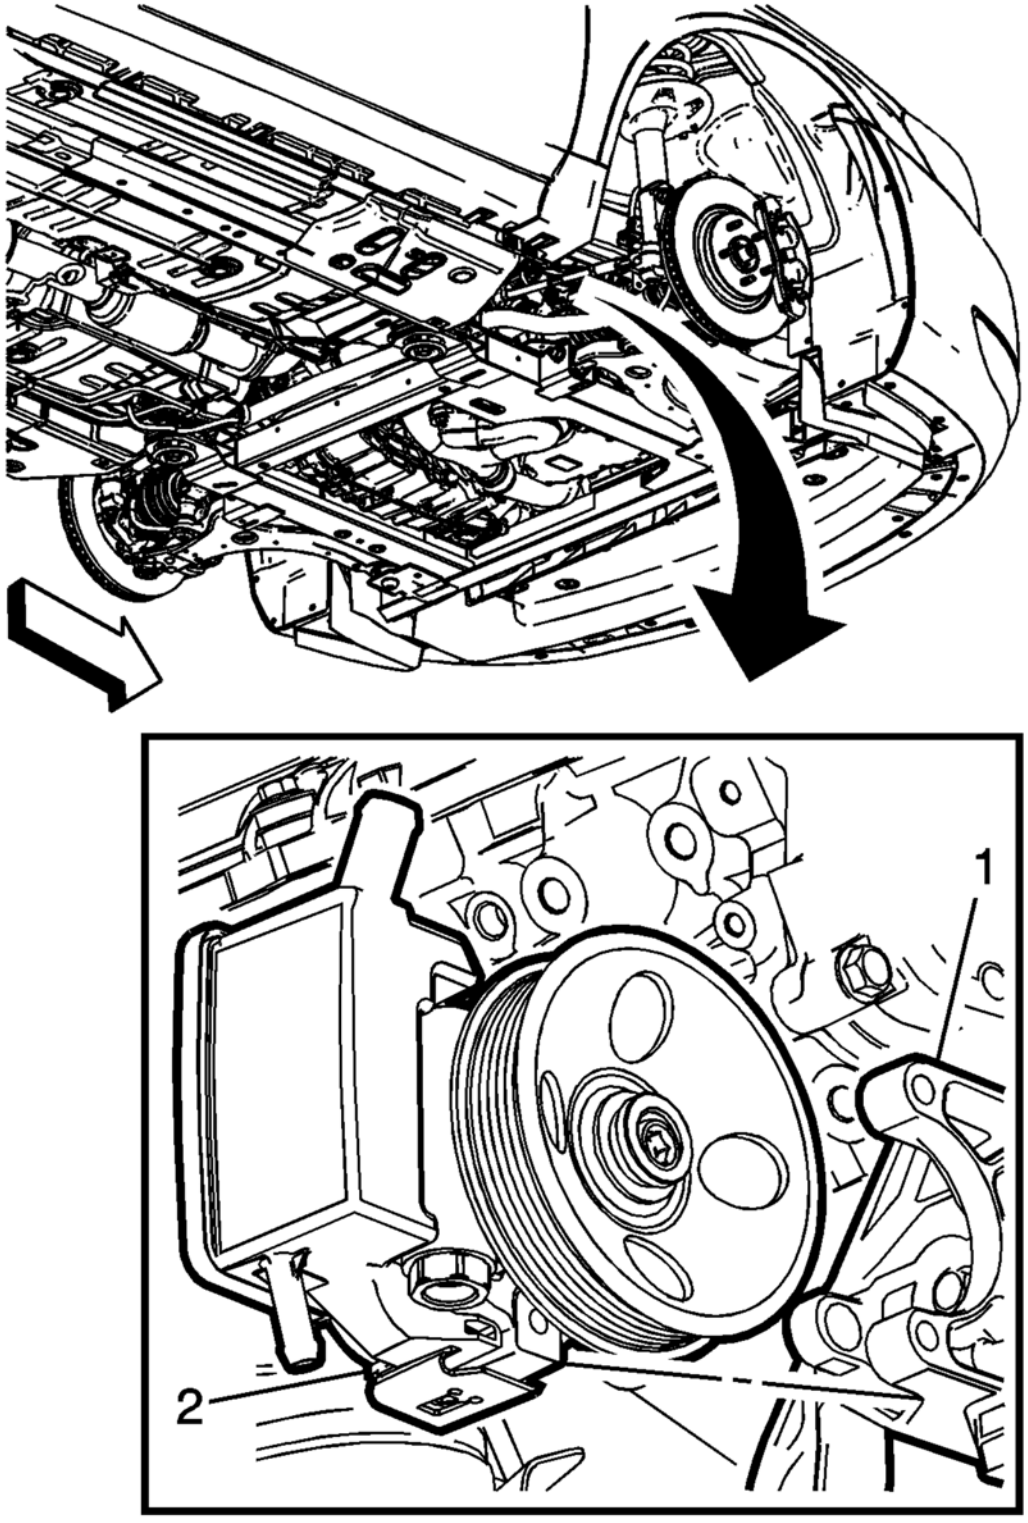

Fig. 11: Power Steering Pump
Courtesy of GENERAL MOTORS COMPANY

12. Remove the power steering pump (2) through the right wheel opening.
13. Transfer components as necessary.

Installation Procedure

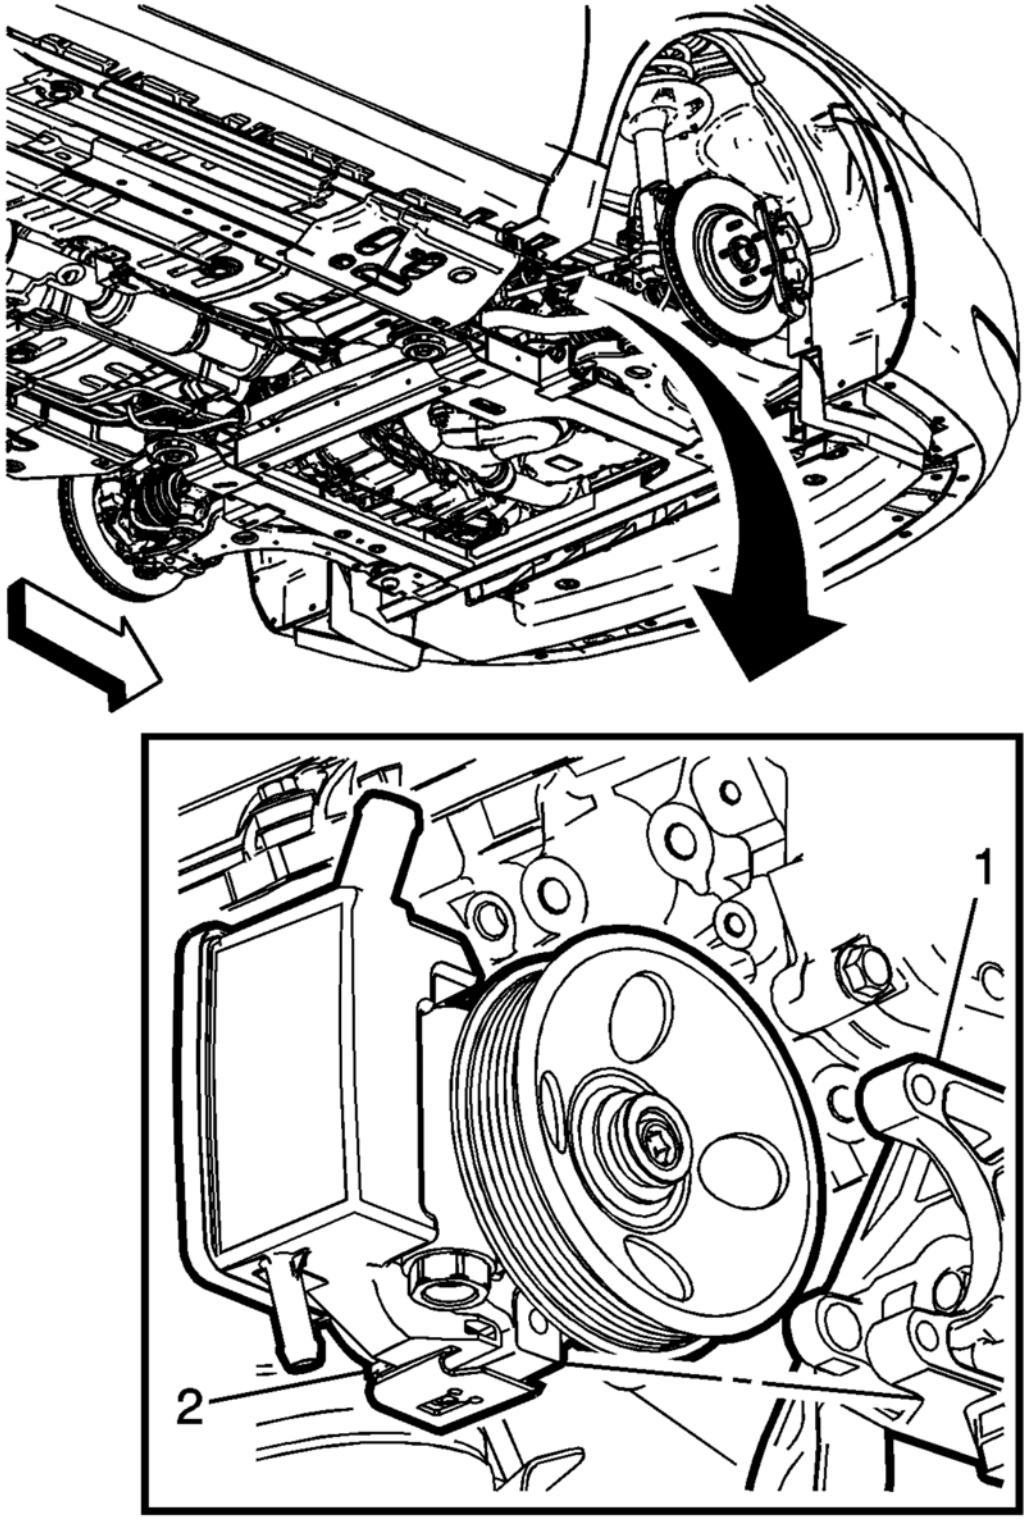

Fig. 12: Power Steering Pump
Courtesy of GENERAL MOTORS COMPANY

1. Position the power steering pump (2) in the vehicle through the right wheel opening.
2. Align the bolt holes in the power steering pump with the bolt holes in the bracket (1).

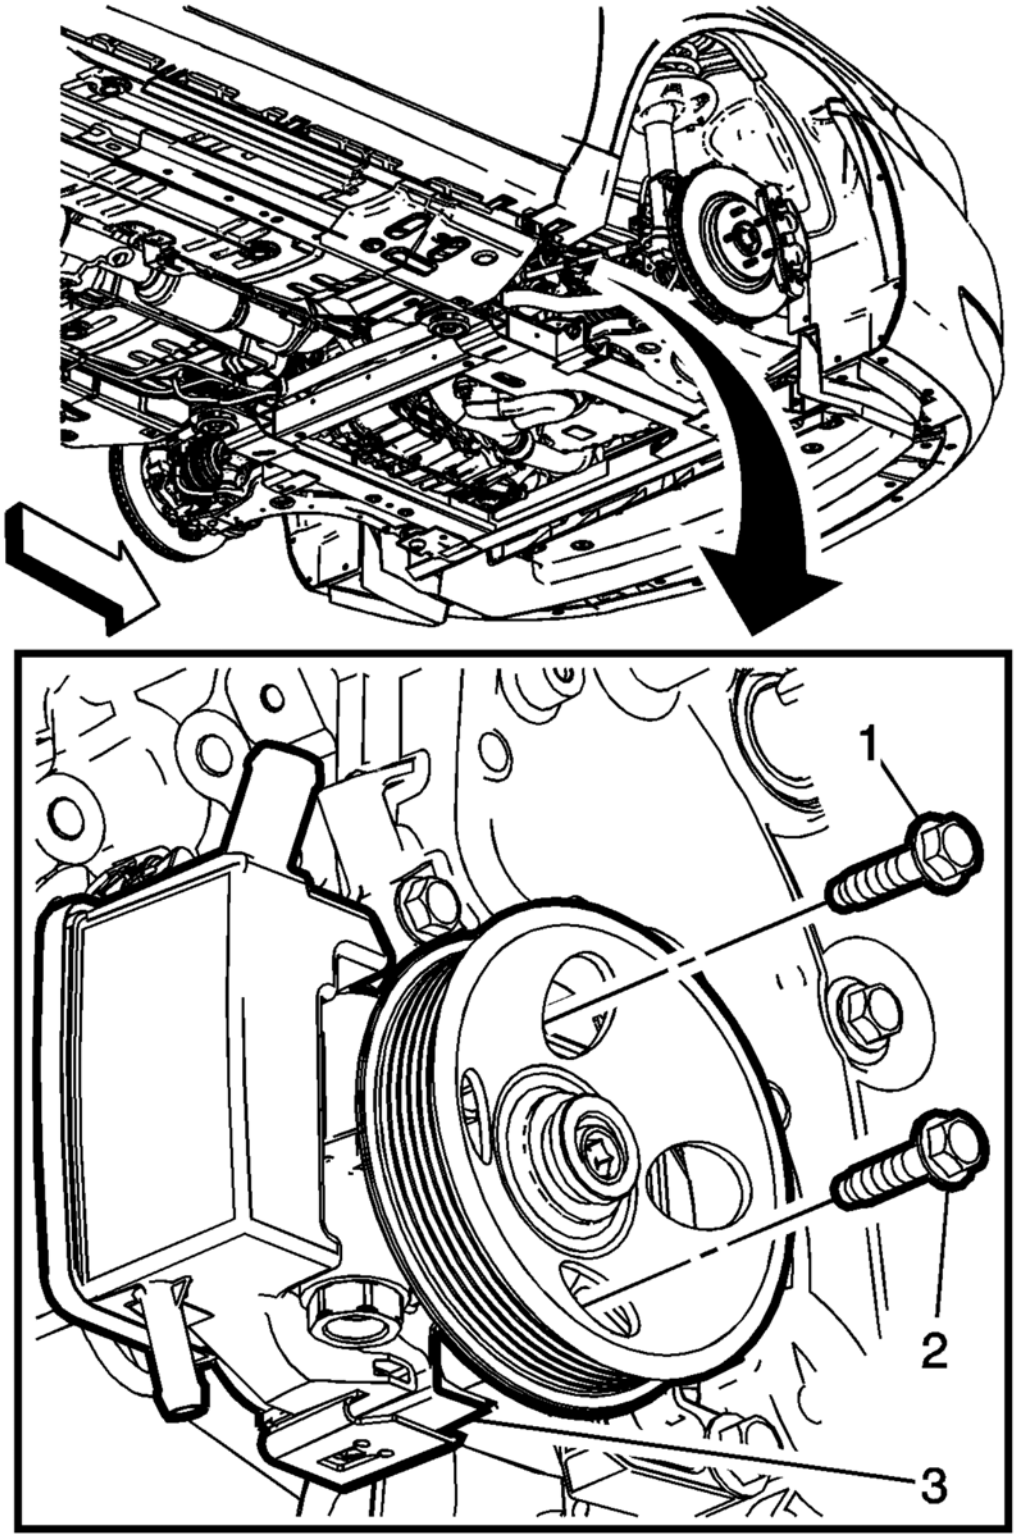

Fig. 13: Power Steering Pump And Bolts
Courtesy of GENERAL MOTORS COMPANY

CAUTION: Refer to Fastener Caution .

3. Install the 2 bolts (1, 2) to the right side of the power steering pump (3) and tighten to 22 N.m (16 lb ft).

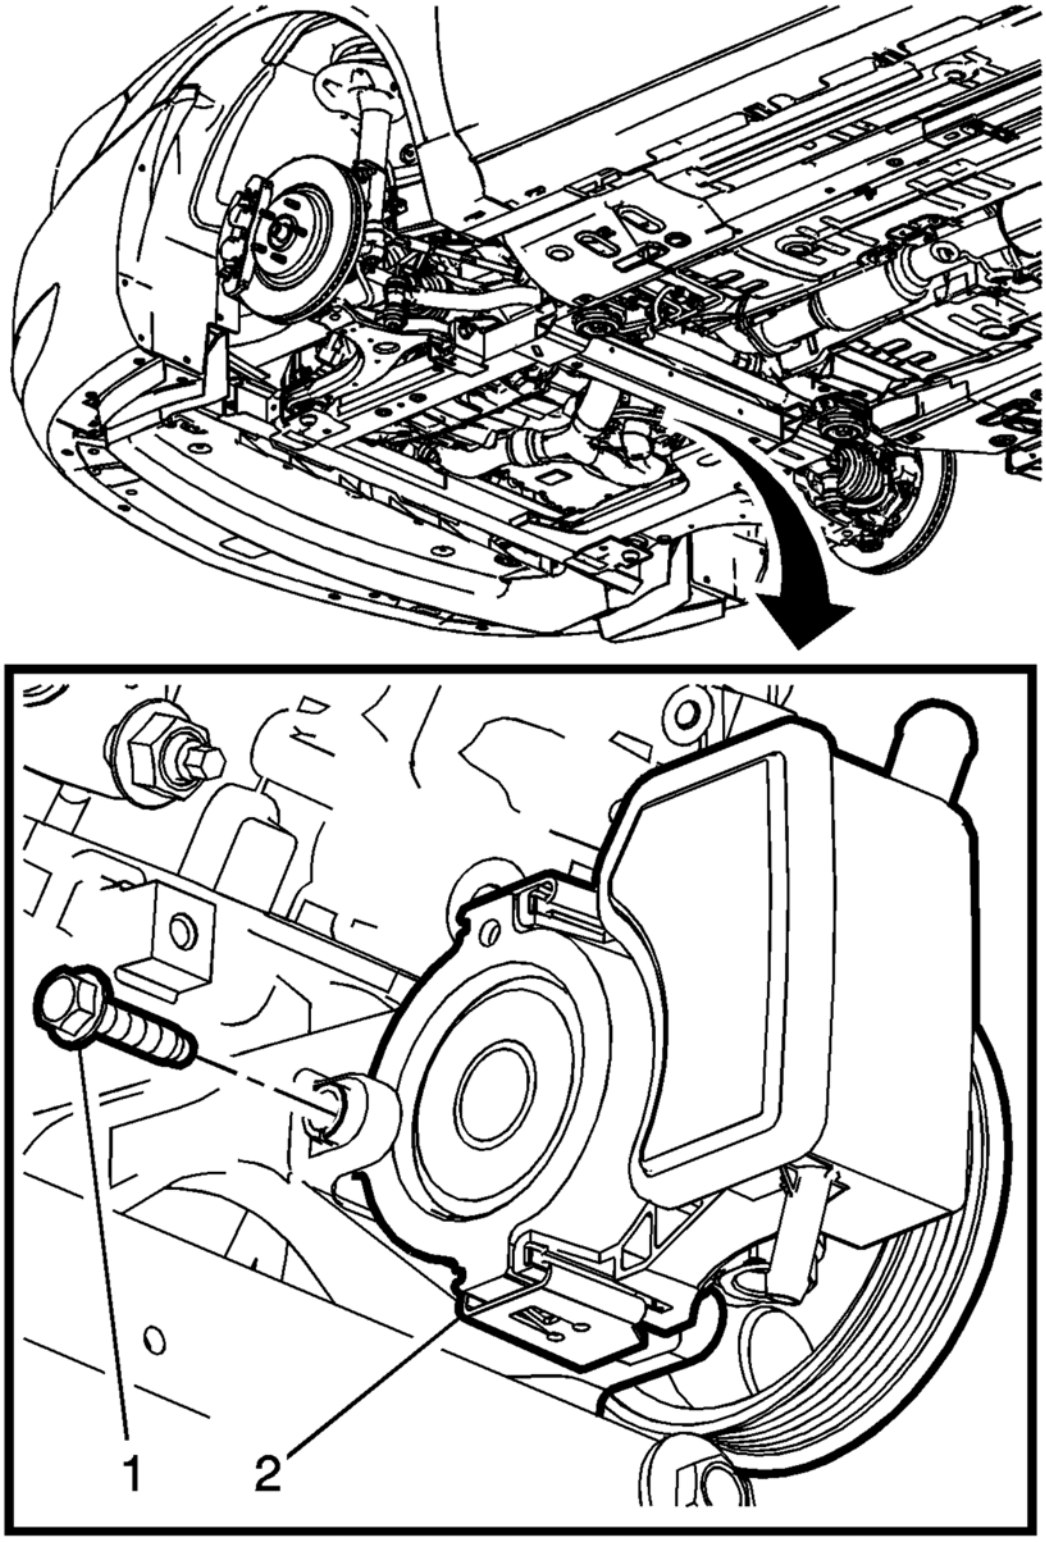

Fig. 14: Power Steering Pump And Bolt
Courtesy of GENERAL MOTORS COMPANY

4. Install the bolt (1) to the left side of the power steering pump (2) and tighten to 22 N.m (16 lb ft).

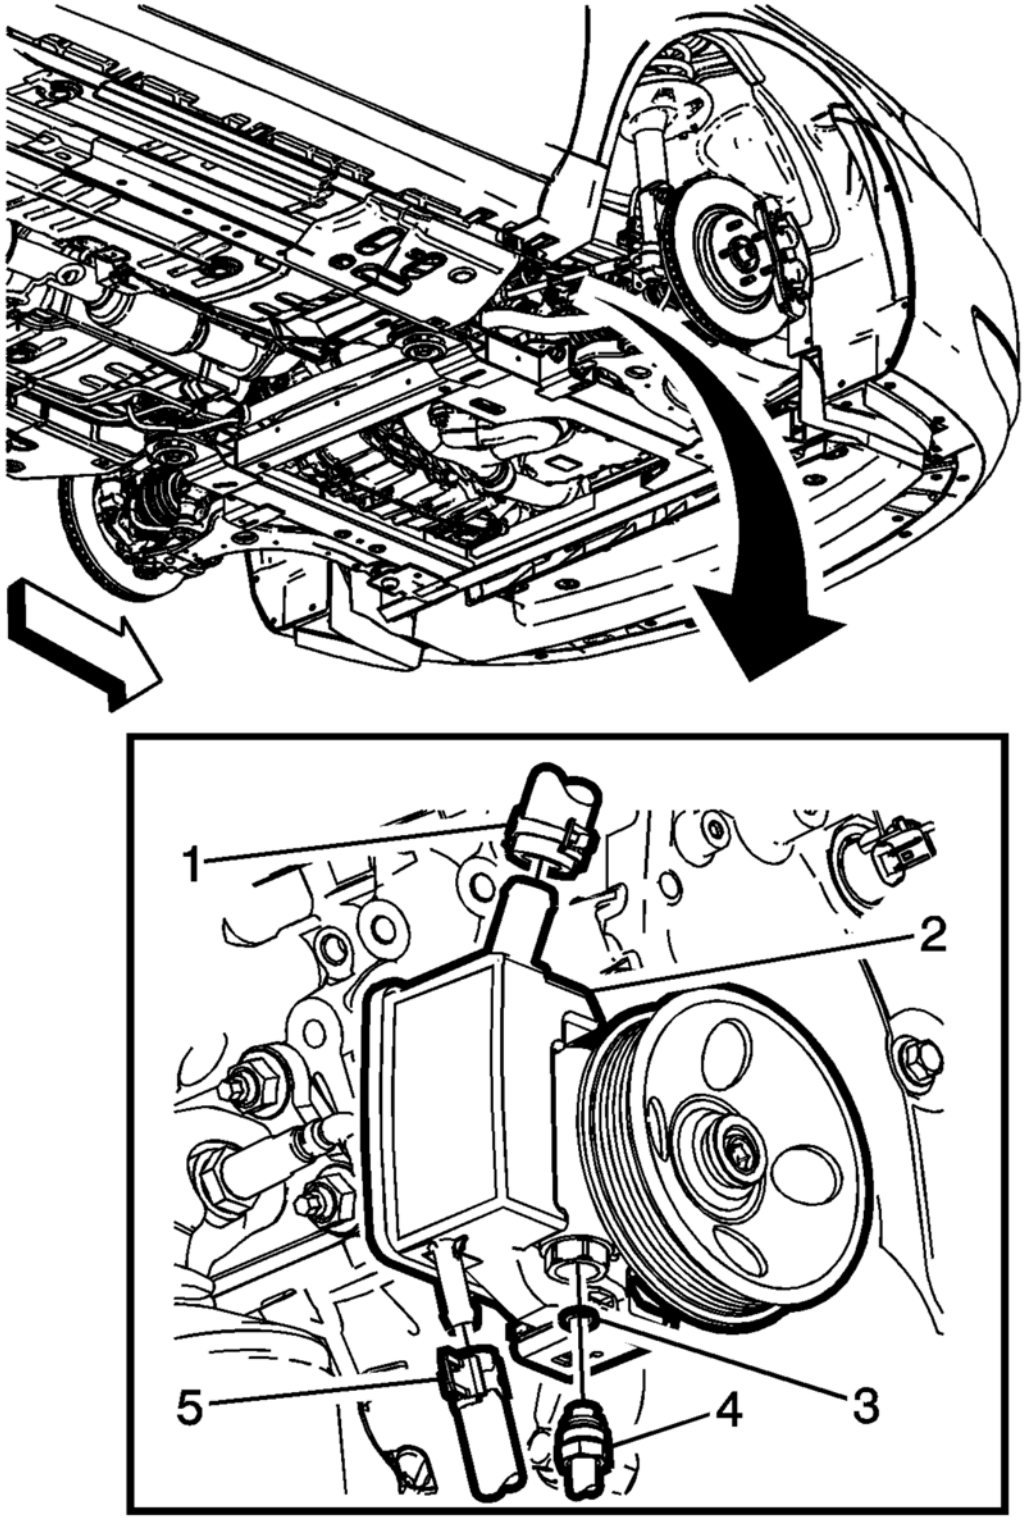

Fig. 15: Power Steering Pump Components
Courtesy of GENERAL MOTORS COMPANY

CAUTION: Refer to Installing Hoses without Twists or Bends Caution .

5. Connect the power steering fluid reservoir hose (1) to the power steering pump (2).
6. Connect the power steering fluid cooling pipe (5) to the power steering pump.

7. Install a NEW power steering gear inlet hose O-ring seal (3).
8. Connect the power steering gear inlet hose to the steering gear. Refer to **Power Steering Gear Inlet Pipe/Hose Replacement**.
9. Connect the drive belt to the power steering pump pulley. Refer to **Drive Belt Replacement** .
10. Install the right front tire and wheel assembly. Refer to **Tire and Wheel Removal and Installation** .
11. Lower the vehicle.
12. Fill and bleed the power steering system. Refer to **Power Steering System Bleeding**.
13. Clean any excess power steering fluid from the vehicle.
14. Remove the drain pans.

POWER STEERING FLUID RESERVOIR REPLACEMENT - OFF VEHICLE

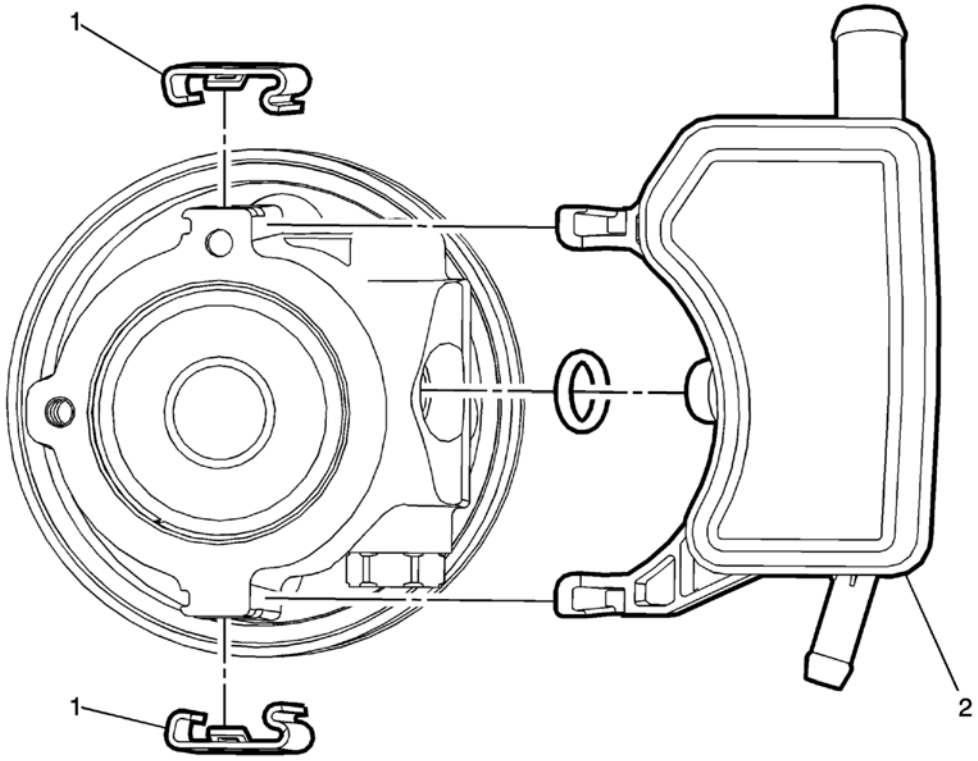

Fig. 16: Power Steering Fluid Reservoir & Clips
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure Remove the power steering pump and the lower reservoir as an assembly. Refer to **Power Steering Pump Replacement**.	
1	Power Steering Fluid Reservoir Clip (Qty: 2)
2	Power Steering Fluid Reservoir **Procedure** Install a NEW power steering pump seal.

STEERING LINKAGE OUTER TIE ROD REPLACEMENT

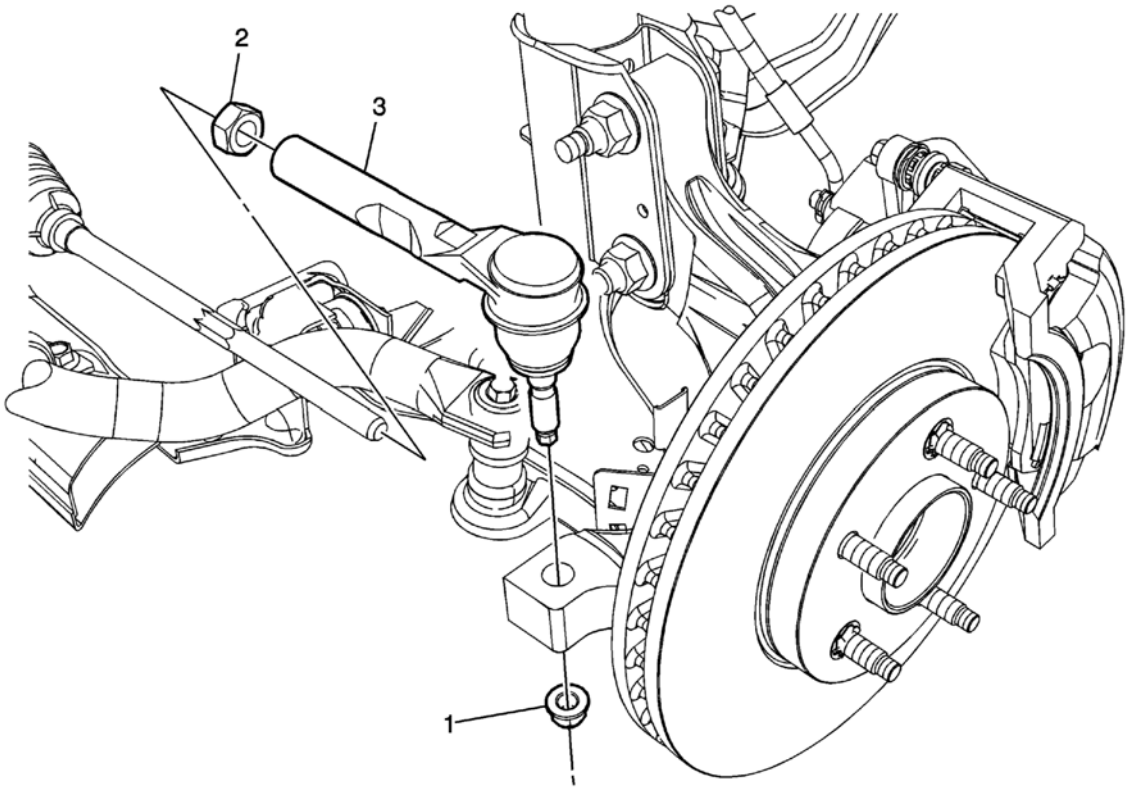

Fig. 17: View Of Rack and Pinion Outer Tie Rod End
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedures 1. Raise and support the vehicle. Refer to **Lifting and Jacking the Vehicle** . 2. Remove the front tire and wheel assembly. Refer to **Tire and Wheel Removal and Installation** .	
1	Steering Linkage Outer Tie Rod Nut **CAUTION:** **Refer to Fastener Caution .** **CAUTION:** **This vehicle is equipped with torque-to-yield or single use fasteners. Install a NEW torque-to-yield or**

Callout	Component Name
	single use fastener when installing this component. Failure to replace the torque-to-yield or single use fastener could cause damage to the vehicle or component. **Procedure** 1. Remove the steering linkage outer tie rod nut. Discard the nut. 2. Install a NEW steering linkage outer tie rod nut. Ensure that 2 1/2 to 4 1/2 threads are visible past the nylon washer. **Tighten** 1. 30 N.m (22 lb ft) 2. 120 degrees
2	Steering Linkage Inner Tie Rod Nut **Procedure** 1. Use paint in order to place match marks on the steering linkage inner tie rod nut and on the steering linkage inner tie rod. 2. During installation, align the match marks. 3. Do not tighten the nut during installation. Tighten the nut after adjusting the front toe. Refer to **Wheel Alignment - Steering Wheel Angle and/or Front Toe Adjustment** .
3	Steering Linkage Outer Tie Rod **CAUTION:**

Callout	Component Name
	Do not free the ball stud by using a pickle fork or a wedge-type tool. Damage to the seal or bushing may result. **Procedure** 1. Use the **J-24319-B** puller in order to disconnect the steering linkage outer tie rod from the steering knuckle. 2. After the installation is complete, measure and adjust the front toe. Refer to **Wheel Alignment - Steering Wheel Angle and/or Front Toe Adjustment** . **Special Tools** **J-24319-B** Steering Linkage and Tie Rod Puller For equivalent regional tools, refer to **Special Tools**.

STEERING GEAR BOOT REPLACEMENT

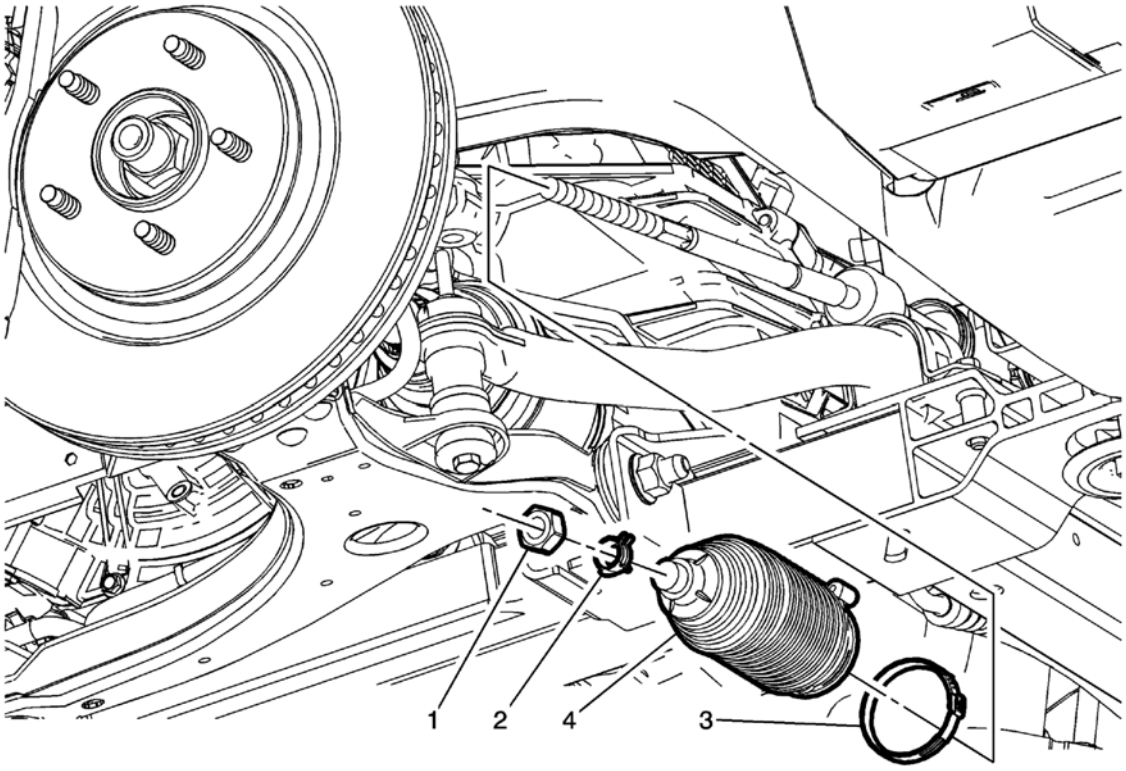

Fig. 18: Steering Gear Boot Components

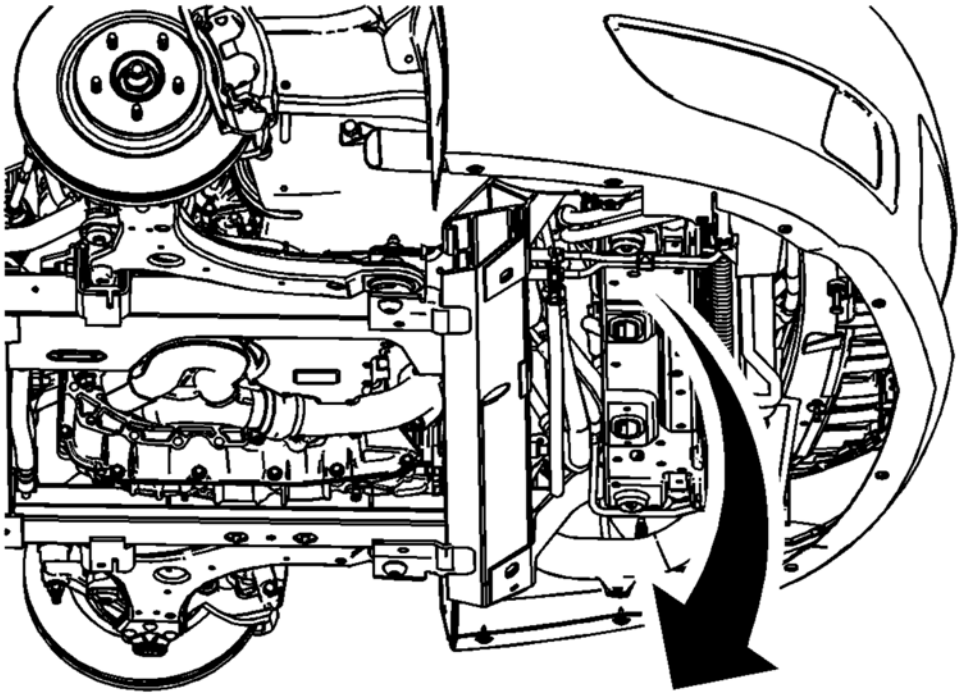
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedures 1. Raise and support the vehicle. Refer to **Lifting and Jacking the Vehicle** . 2. Remove the steering linkage outer tie rod. Refer to **Steering Linkage Outer Tie Rod Replacement**.	
1	Steering Linkage Inner Tie Rod Nut **Procedure** 1. Use paint in order to place match marks on the steering linkage inner tie rod nut and on the steering linkage inner tie rod. 2. During installation, align the match marks. 3. Do not tighten the nut during installation. Tighten the nut after adjusting the front toe. Refer to **Wheel Alignment - Steering Wheel Angle and/or Front Toe Adjustment**
2	Steering Gear Boot Outer Clamp
3	Steering Gear Boot Inner Clamp **Procedure** 1. Cut the old steering gear boot inner clamp. Discard the clamp. 2. Use the **J-22610** pliers in order to crimp the new steering gear inner boot clamp. **Special Tools** **J-22610** Keystone Clamp Pliers For equivalent regional tools, refer to **Special Tools**.
4	Steering Gear Boot **Procedure** 1. After removing the boot, inspect the inner tie rod for evidence of corrosion or contamination. If none is evident, continue with the repair. If corrosion or contamination is evident, replace the steering gear. Refer to **Steering Gear Replacement**. 2. Ensure the new steering gear boot is seated in the assembly groove of the steering gear.

POWER STEERING FLUID COOLING PIPE REPLACEMENT

Removal Procedure

1. Place drain pans under the vehicle.
2. Remove as much power steering fluid from the reservoir as possible.
3. Raise and support the vehicle. Refer to **Lifting and Jacking the Vehicle** .
4. Remove the radiator air lower baffle and deflector. Refer to **Radiator Air Lower Baffle and Deflector Replacement** .
5. Remove the right side engine splash shield. Refer to **Engine Splash Shield Replacement (Right)** .



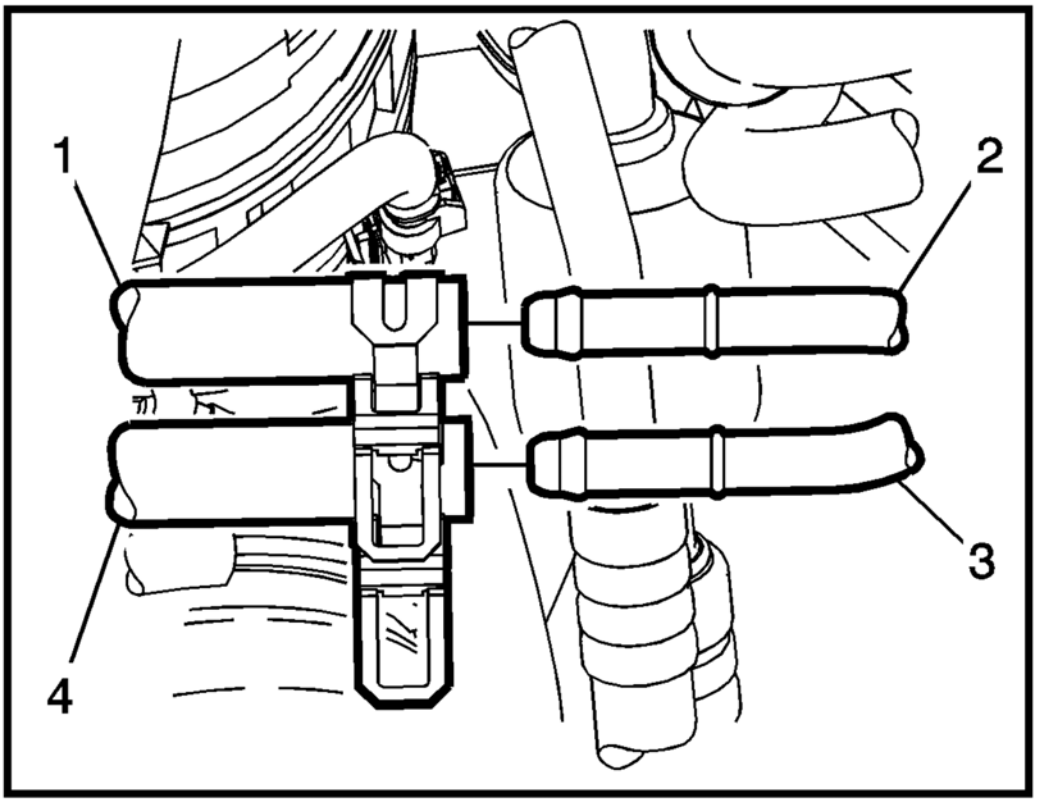


Fig. 19: Power Steering Fluid Cooler And Pipe
Courtesy of GENERAL MOTORS COMPANY

6. Loosen the 2 hose clamps and disconnect the power steering fluid cooling pipe (1, 4) from the power steering fluid cooler (2, 3).
7. On the right side of the frame, disconnect the wire harness retainers and position the wire harness out of the way in order to access the power steering fluid cooling pipe.

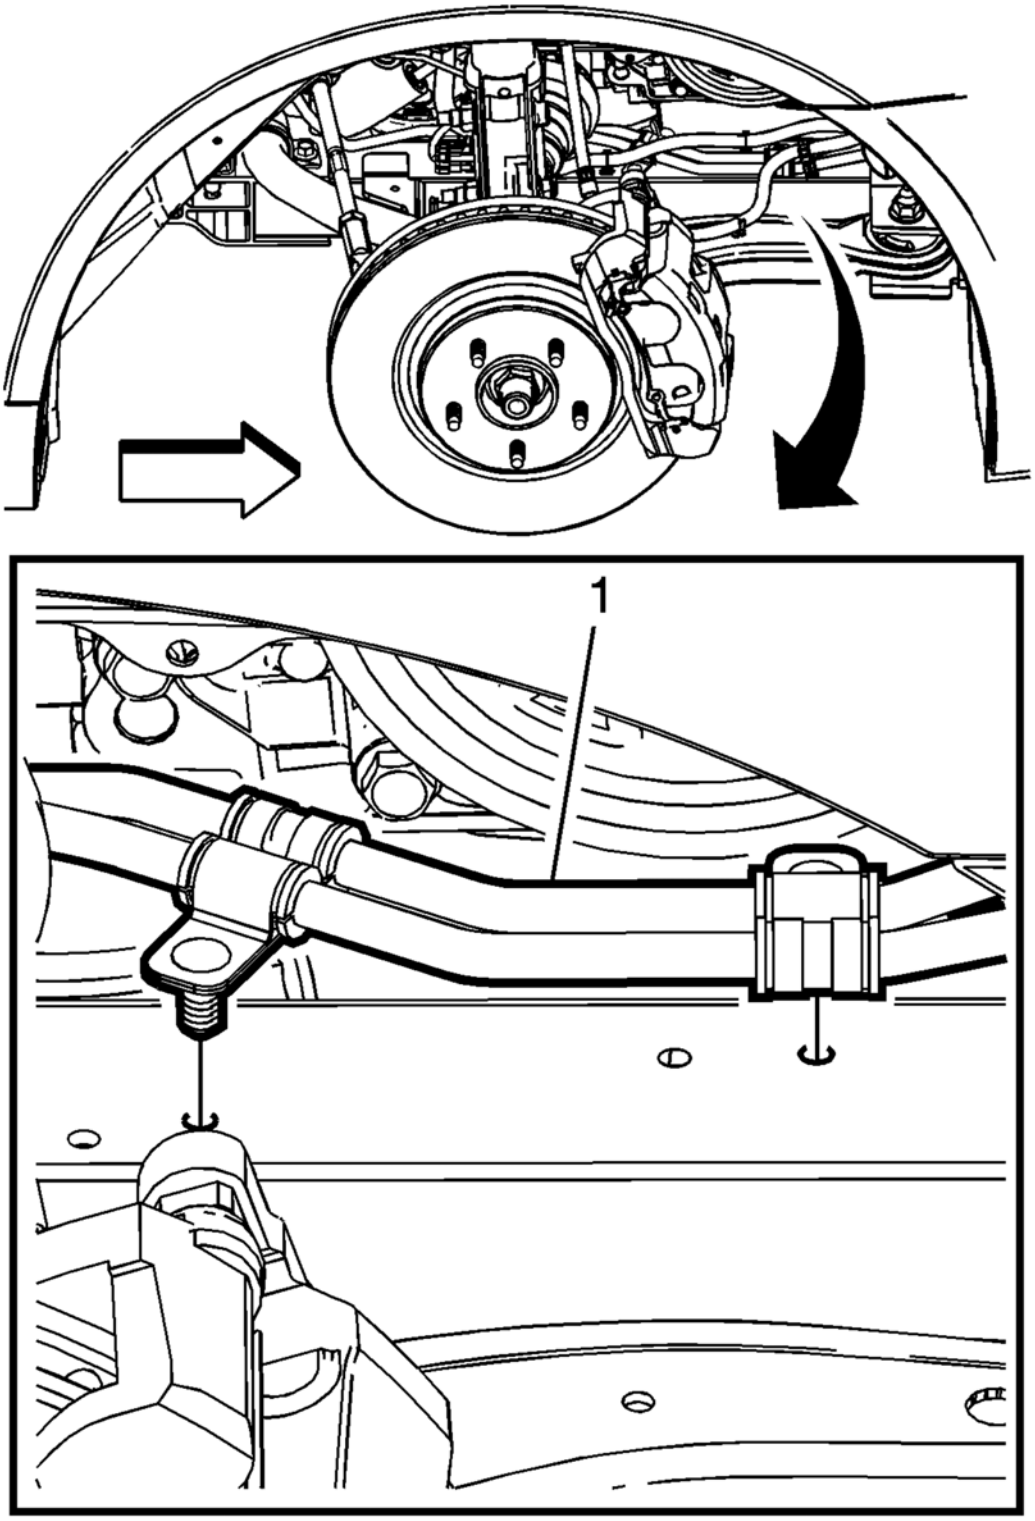

Fig. 20: Power Steering Fluid Cooling Pipe
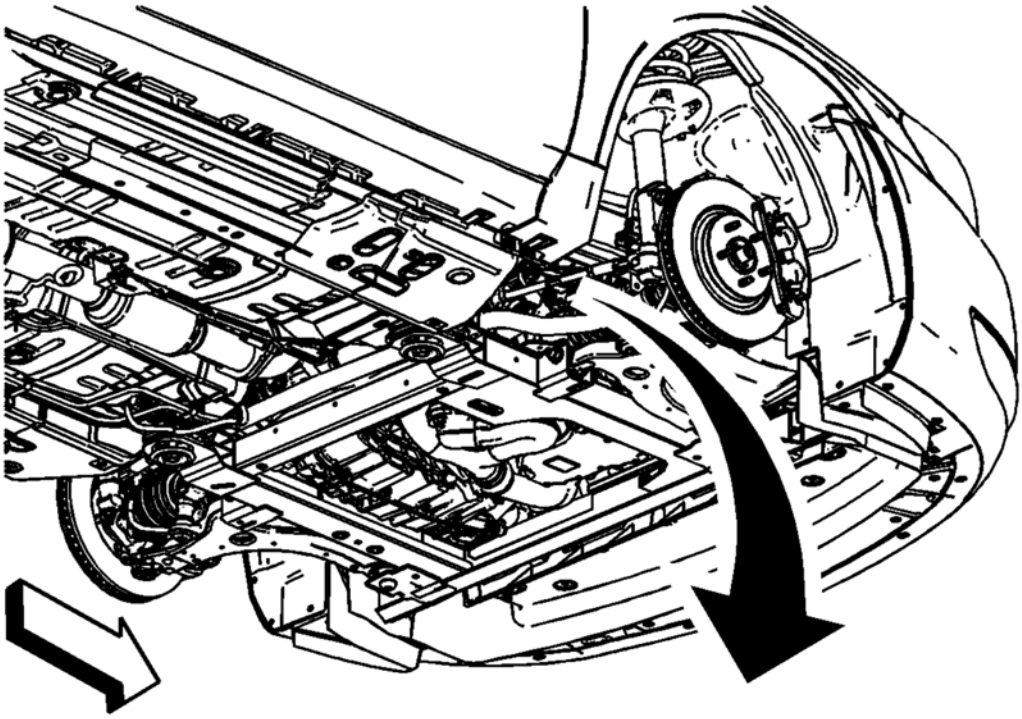
Courtesy of GENERAL MOTORS COMPANY

8. On the right side of the frame, disconnect the 2 retainers and the power steering fluid cooling pipe (1) from the frame.



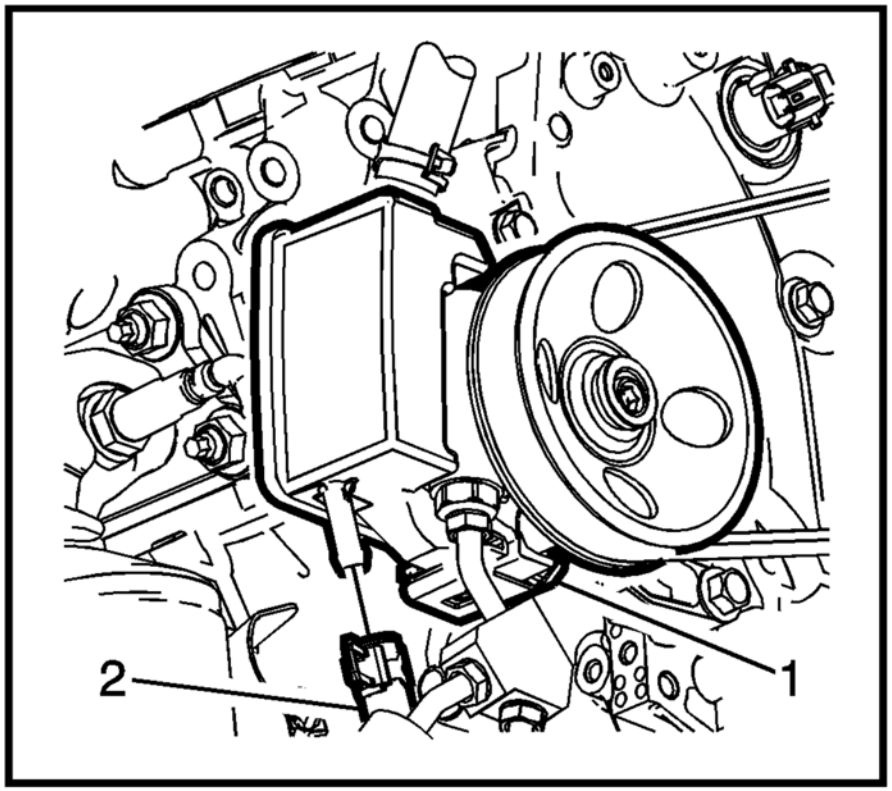


Fig. 21: Power Steering Pump And Power Steering Fluid Cooling Pipe

Courtesy of GENERAL MOTORS COMPANY

9. Disconnect the power steering fluid cooling pipe (2) from the lower power steering fluid reservoir, which is on the power steering pump (1).
10. Disconnect the power steering gear inlet hose from the steering gear. Refer to **Power Steering Gear Inlet Pipe/Hose Replacement**.
11. Position the power steering gear inlet hose out of the way in order to access the power steering fluid cooling pipe on the steering gear.

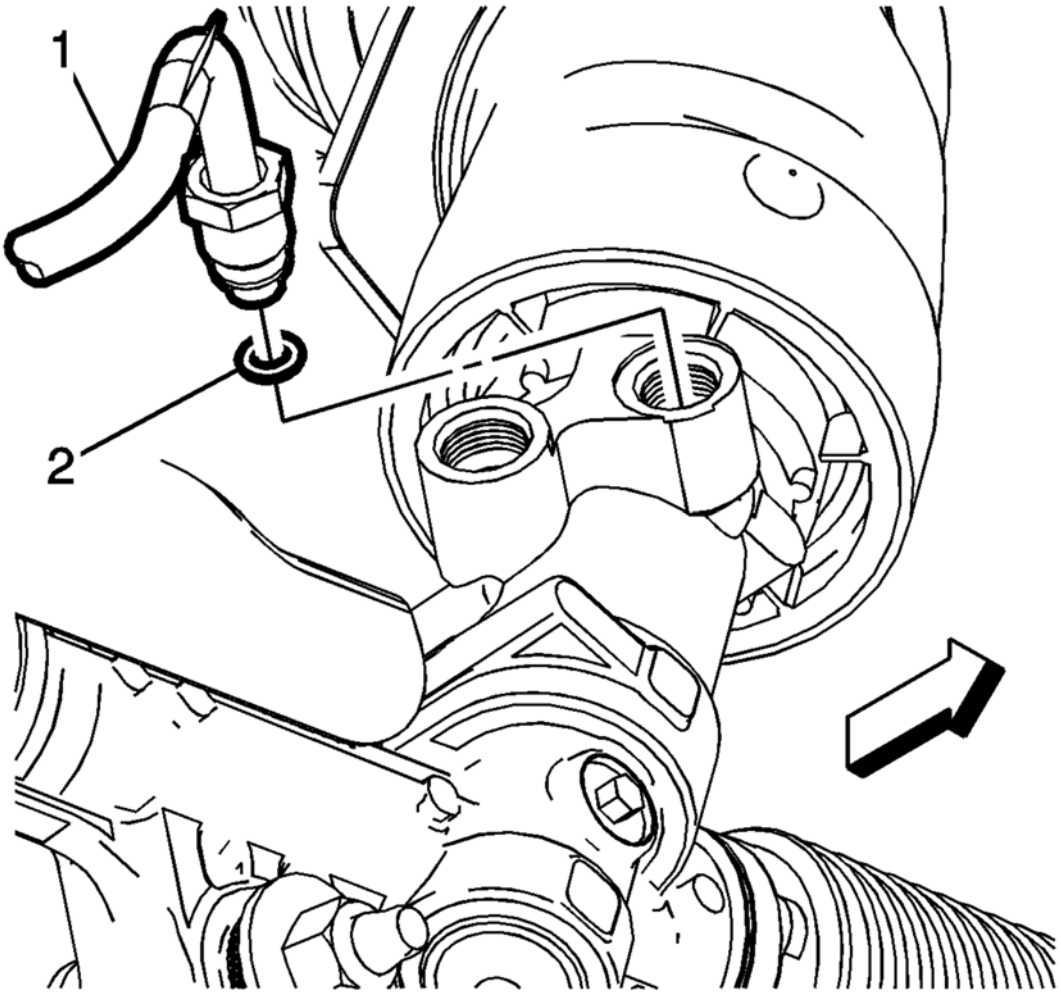

Fig. 22: Power Steering Fluid Cooling Pipe And O-Ring Seal
Courtesy of GENERAL MOTORS COMPANY

12. Disconnect the power steering fluid cooling pipe (1) from the steering gear.
13. Remove the power steering fluid cooling pipe O-ring seal (2).

    Discard the seal.

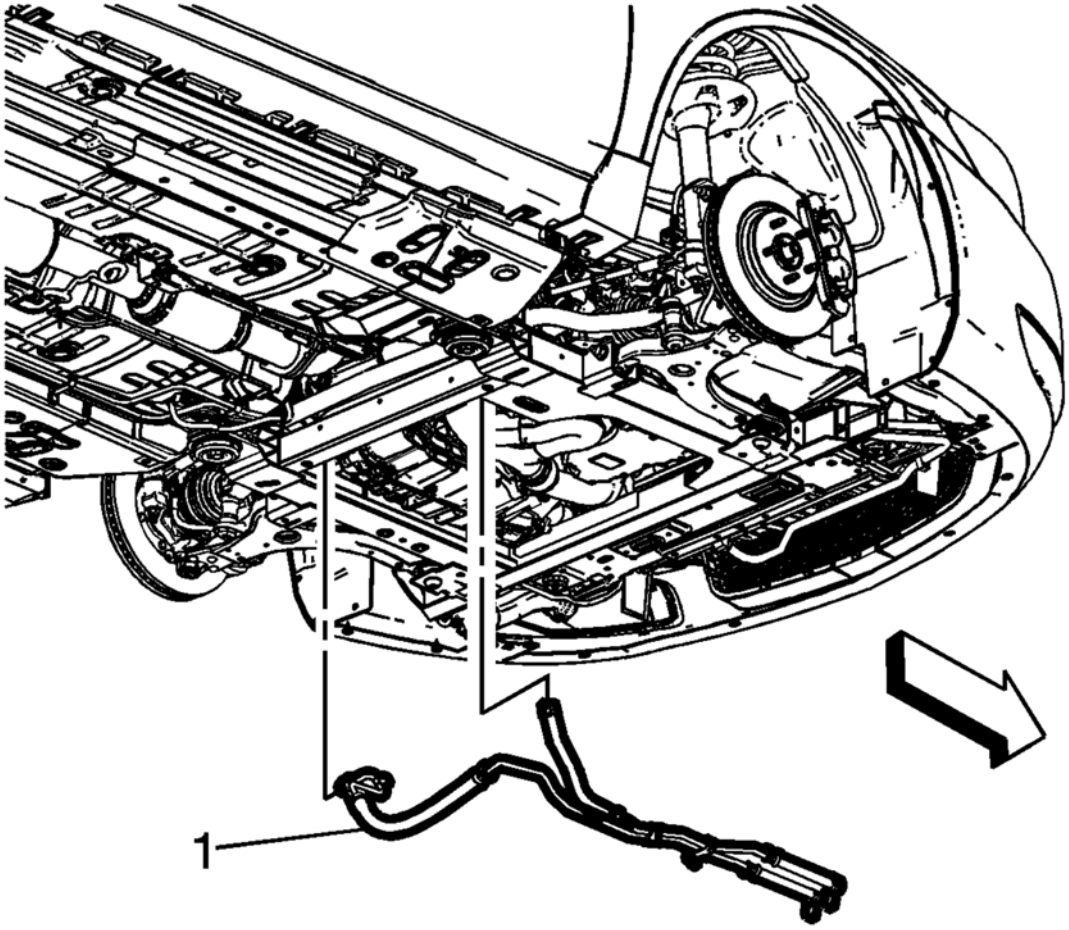

Fig. 23: Power Steering Fluid Cooling Pipe
Courtesy of GENERAL MOTORS COMPANY

14. Remove the power steering fluid cooling pipe (1) from the vehicle.

Installation Procedure

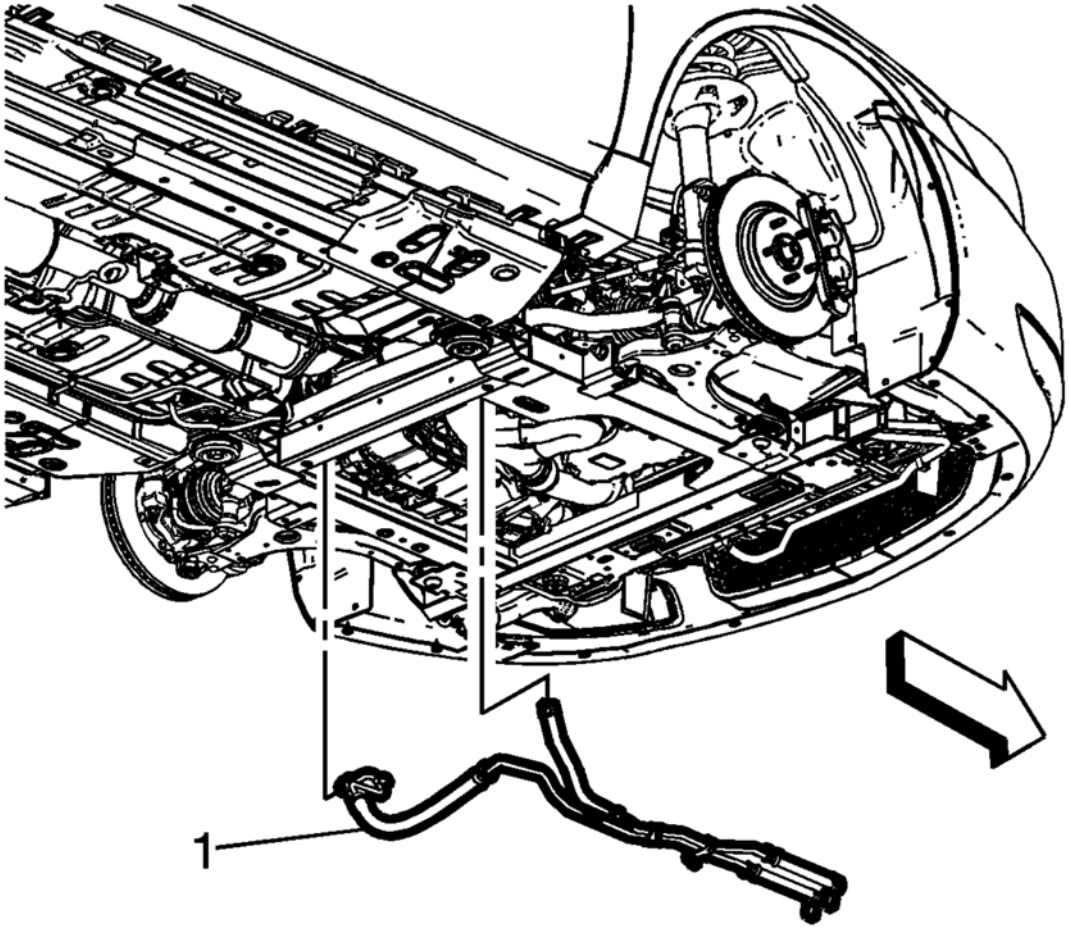

Fig. 24: Power Steering Fluid Cooling Pipe
Courtesy of GENERAL MOTORS COMPANY

CAUTION: Refer to Installing Hoses without Twists or Bends Caution .

1. Position the power steering fluid cooling pipe (1) in the vehicle.

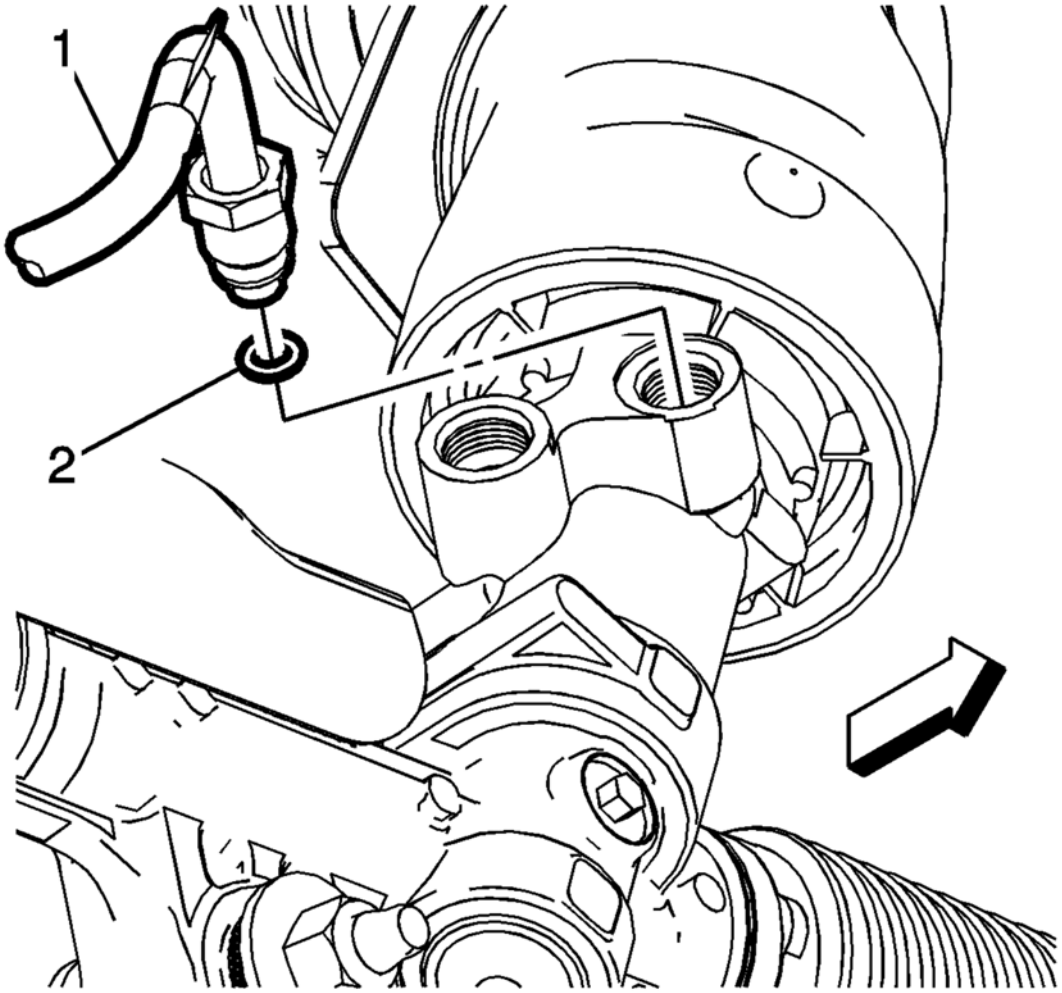

Fig. 25: Power Steering Fluid Cooling Pipe And O-Ring Seal
Courtesy of GENERAL MOTORS COMPANY

2. Install a NEW power steering fluid cooling pipe O-ring seal (2).

CAUTION: Refer to Fastener Caution .

3. Connect the power steering fluid cooling pipe (1) to the steering gear. Tighten the fitting to 34 N.m (25 lb ft).
4. Connect the power steering gear inlet hose to the steering gear. Refer to **Power Steering Gear Inlet Pipe/Hose Replacement**.

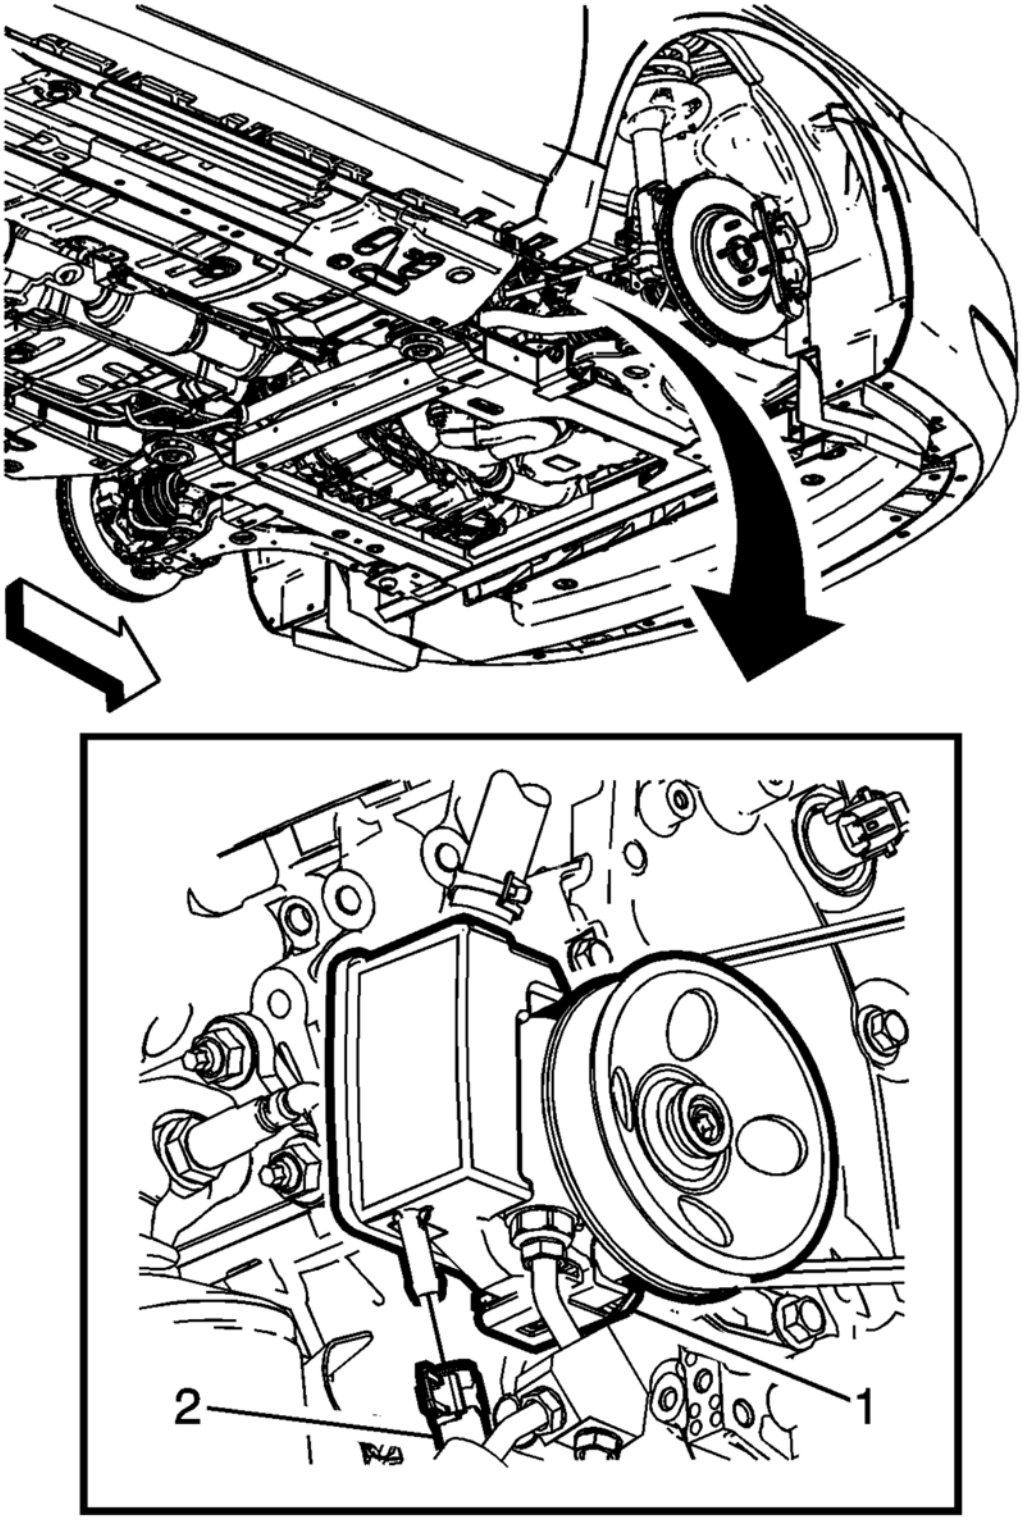

Fig. 26: Power Steering Pump And Power Steering Fluid Cooling Pipe
Courtesy of GENERAL MOTORS COMPANY

5. Connect the power steering fluid cooling pipe (2) to the lower power steering fluid reservoir, which is on the power steering pump (1). Secure the pipe with the hose clamp.

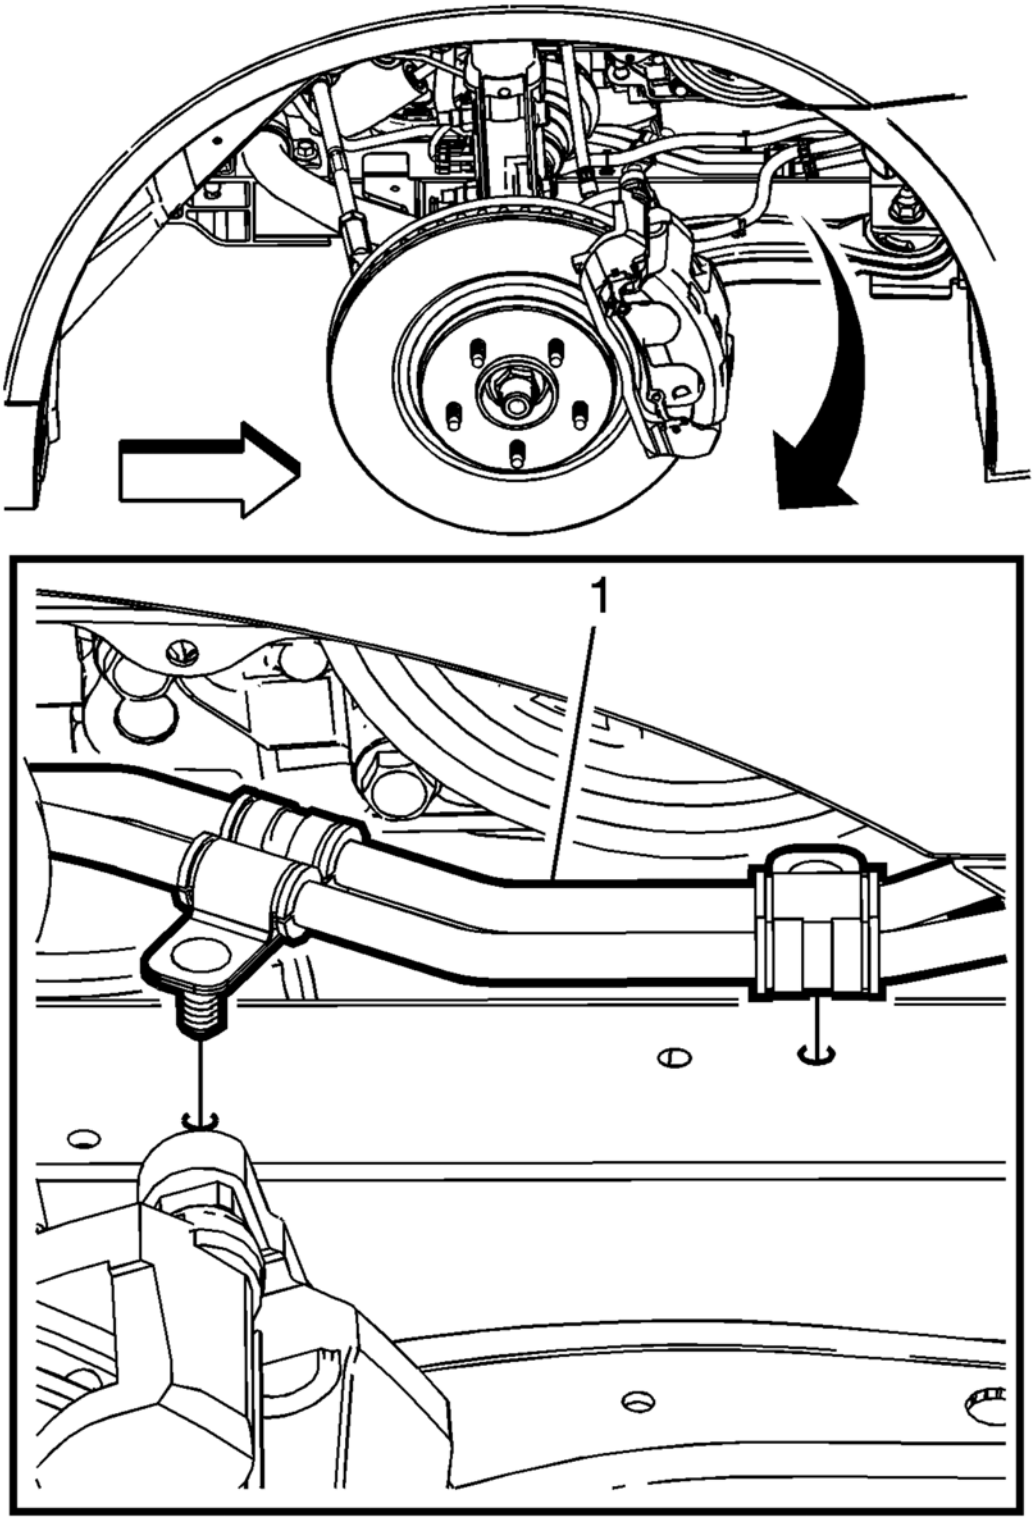

Fig. 27: Power Steering Fluid Cooling Pipe
Courtesy of GENERAL MOTORS COMPANY

6. On the right side of the frame, connect the 2 retainers and the power steering fluid cooling pipe (1) to the frame.
7. On the right side of the frame, connect the wire harness retainers.

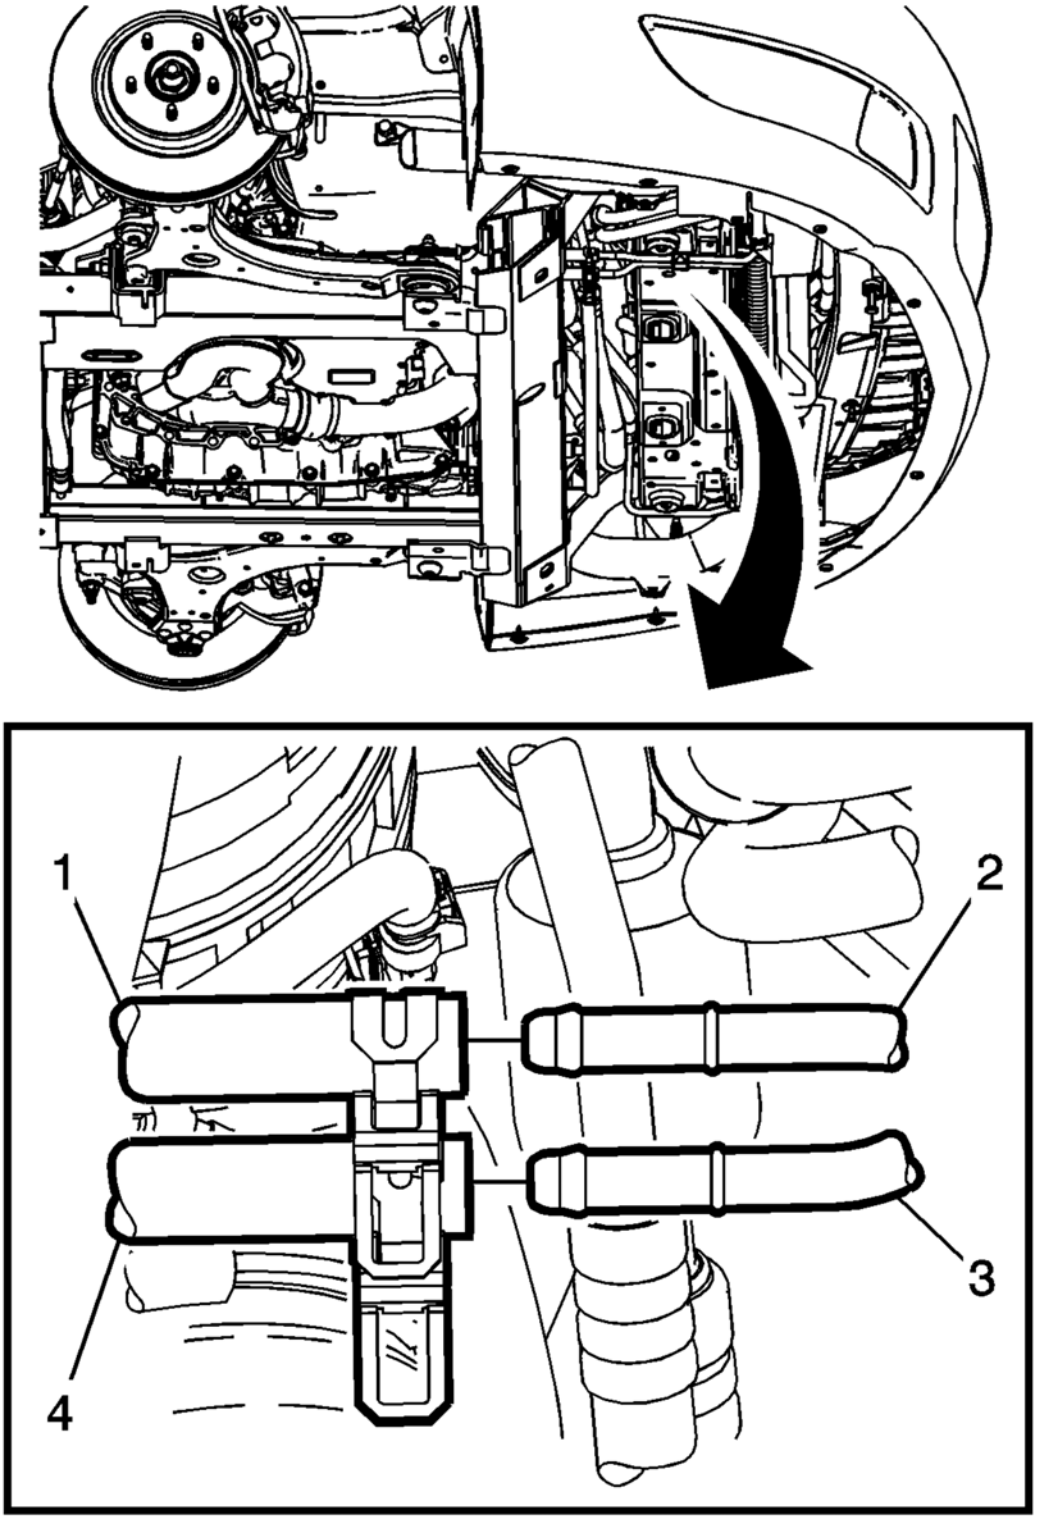

Fig. 28: Power Steering Fluid Cooler And Pipe
Courtesy of GENERAL MOTORS COMPANY

8. Connect the power steering fluid cooling pipe (1, 4) to the power steering fluid cooler (2, 3). Secure the pipe with the 2 hose clamps.
9. Install the right side engine splash shield. Refer to **Engine Splash Shield Replacement (Right)** .

10. Install the radiator air lower baffle and deflector. Refer to **Radiator Air Lower Baffle and Deflector Replacement** .
11. Lower the vehicle.
12. Fill and bleed the power steering system. Refer to **Power Steering System Bleeding**.
13. Clean any excess power steering fluid from the vehicle.
14. Remove the drain pans.

POWER STEERING FLUID COOLER REPLACEMENT

Removal Procedure

1. Place drain pans under the vehicle.
2. Remove as much power steering fluid from the reservoir as possible.
3. Raise and support the vehicle. Refer to **Lifting and Jacking the Vehicle** .
4. Remove the radiator air lower baffle and deflector. Refer to **Radiator Air Lower Baffle and Deflector Replacement** .

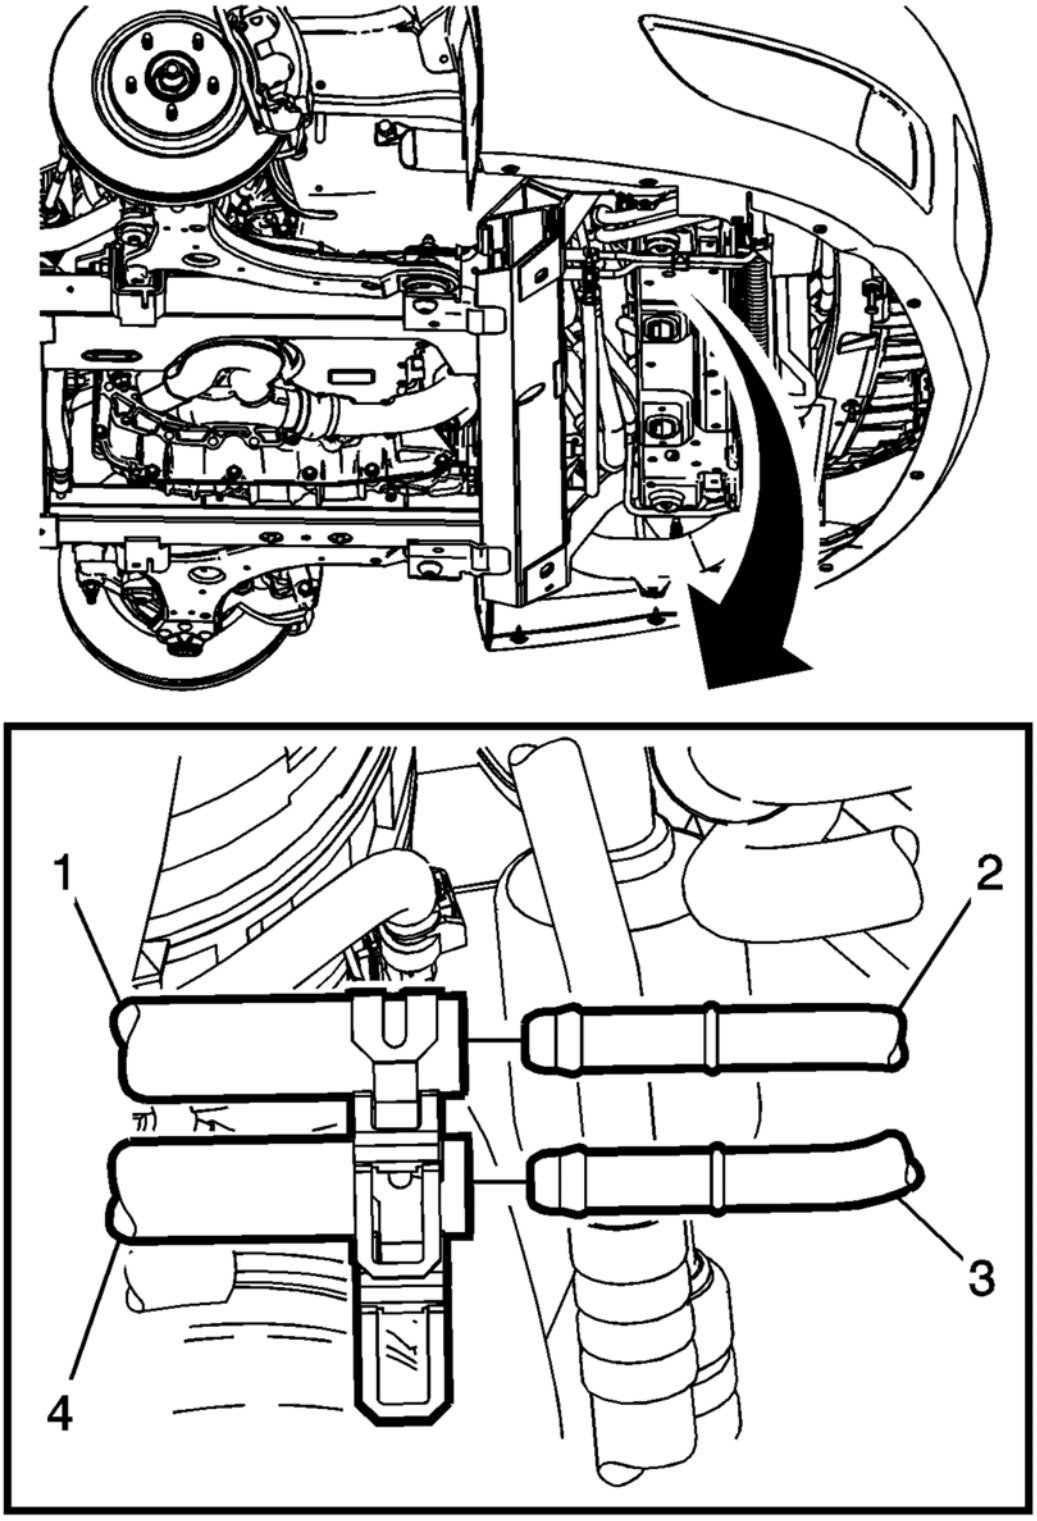

Fig. 29: Power Steering Fluid Cooler And Pipe
Courtesy of GENERAL MOTORS COMPANY

5. Loosen the 2 hose clamps and disconnect the power steering fluid cooling pipe (1, 4) from the power steering fluid cooler (2, 3).

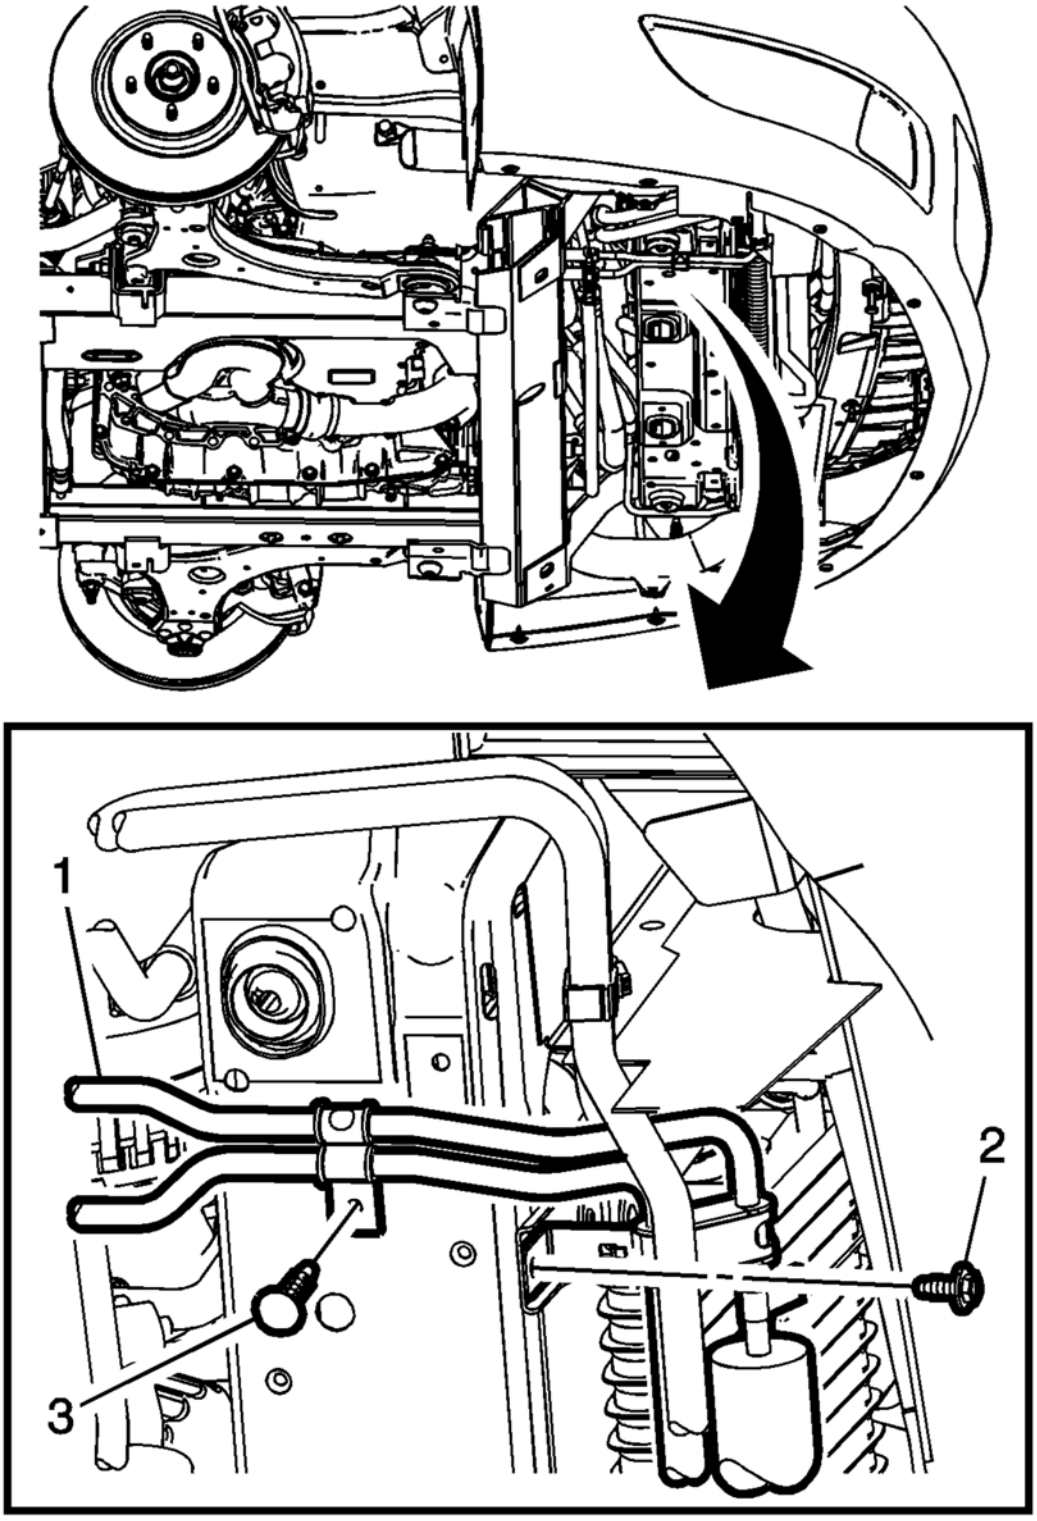

Fig. 30: Power Steering Fluid Cooler, Retainer And Bolt
Courtesy of GENERAL MOTORS COMPANY

6. Remove the bolt (2) from the power steering fluid cooler (1).
7. Disconnect the retainer (3) and the power steering fluid cooler from the front end lower tie bar.

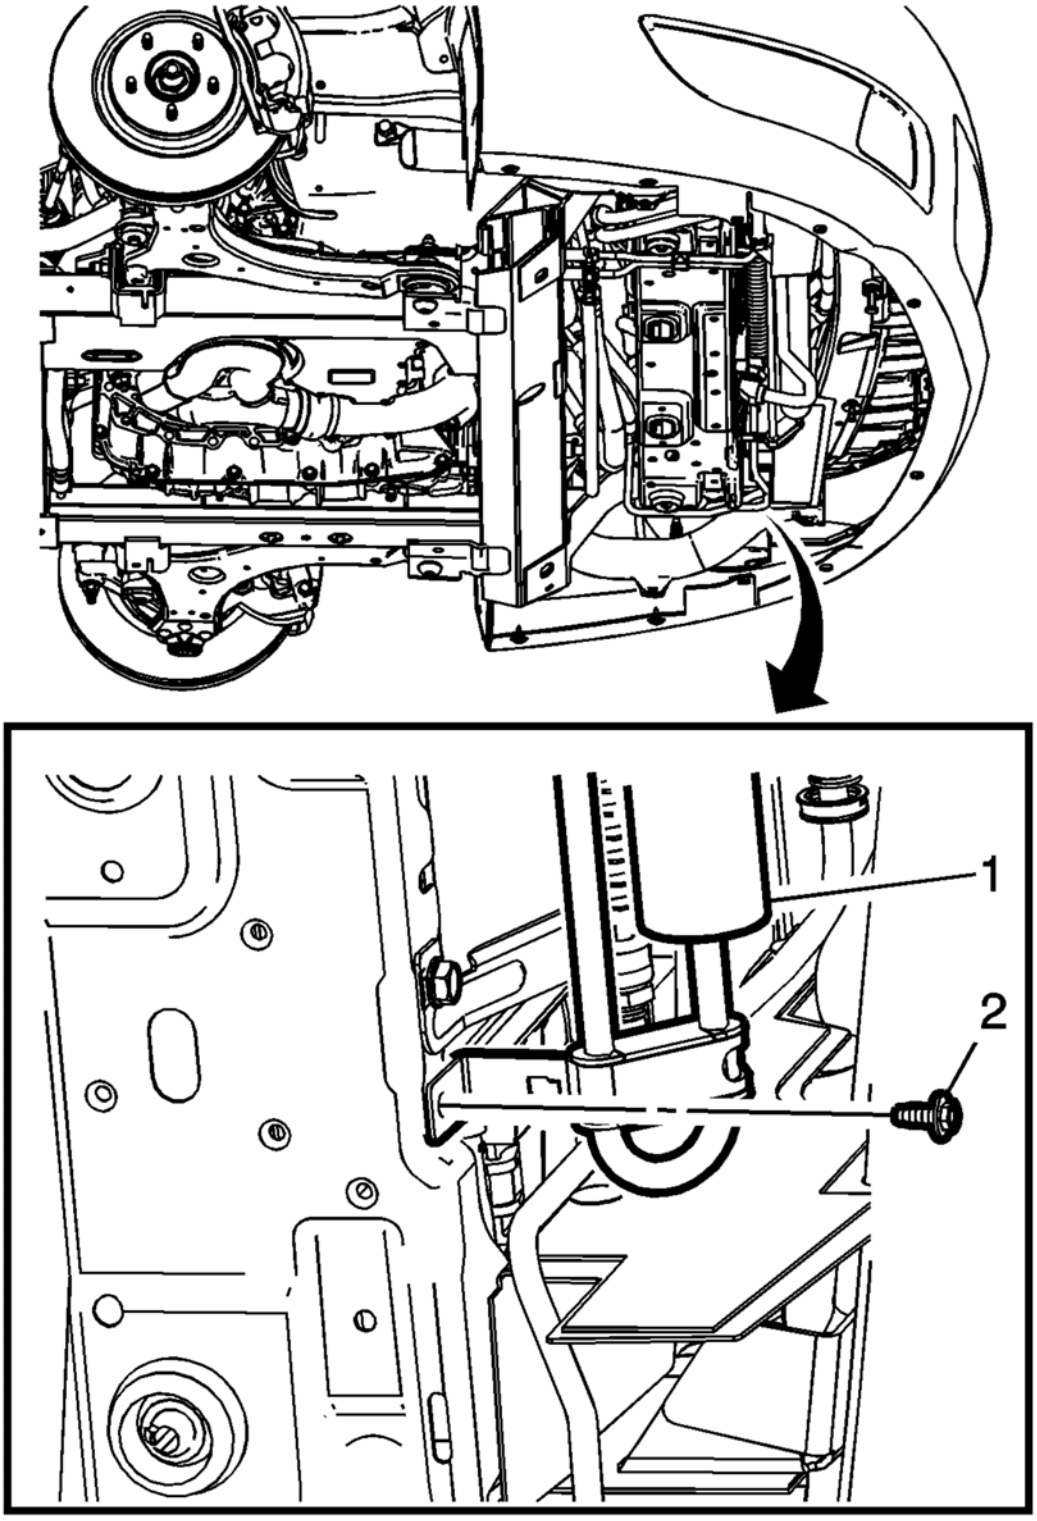

Fig. 31: Power Steering Fluid Cooler And Bolt
Courtesy of GENERAL MOTORS COMPANY

8. Remove the bolt (2) from the power steering fluid cooler (1).

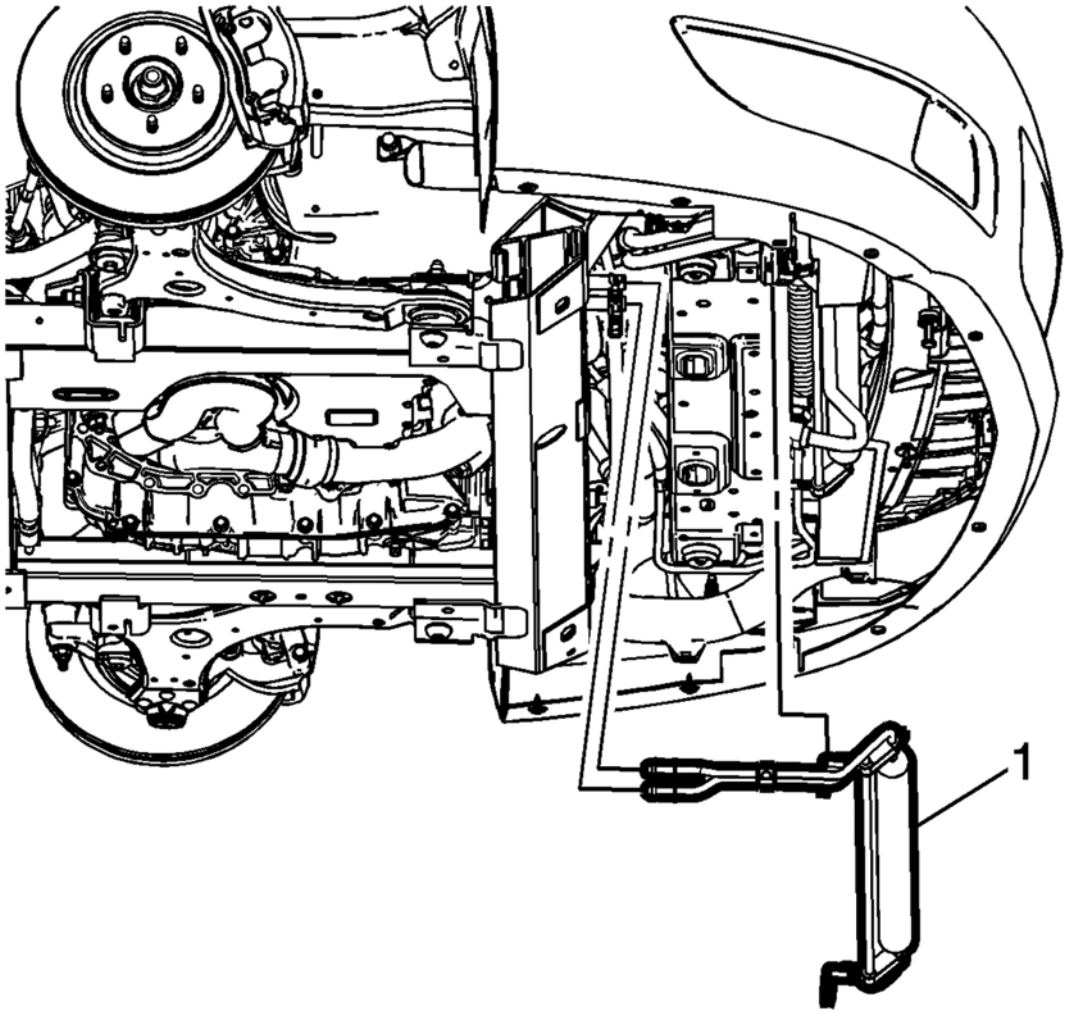

Fig. 32: Power Steering Fluid Cooler
Courtesy of GENERAL MOTORS COMPANY

9. Remove the power steering fluid cooler (1) from the vehicle.

Installation Procedure

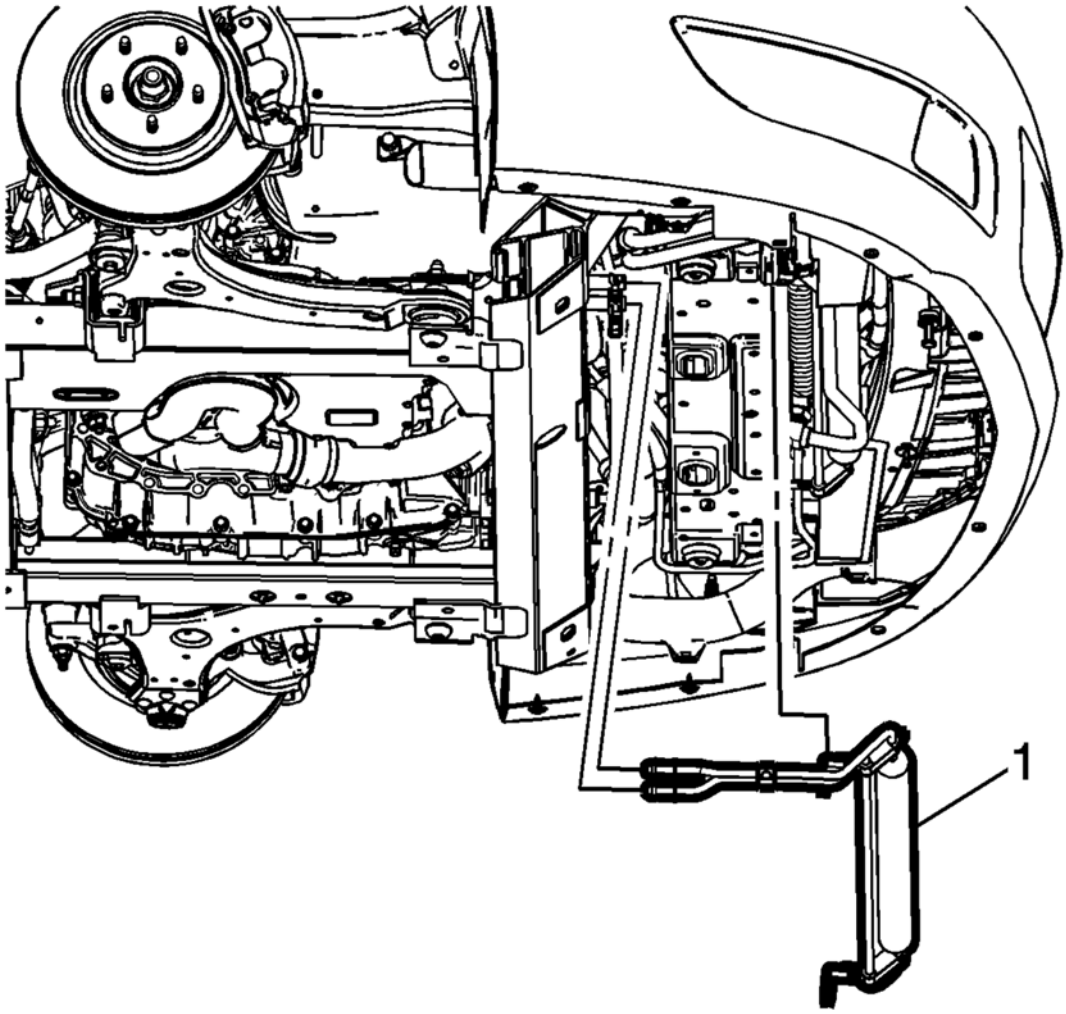

Fig. 33: Power Steering Fluid Cooler
Courtesy of GENERAL MOTORS COMPANY

CAUTION: Refer to Installing Hoses without Twists or Bends Caution .

1. Position the power steering fluid cooler (1) in the vehicle.

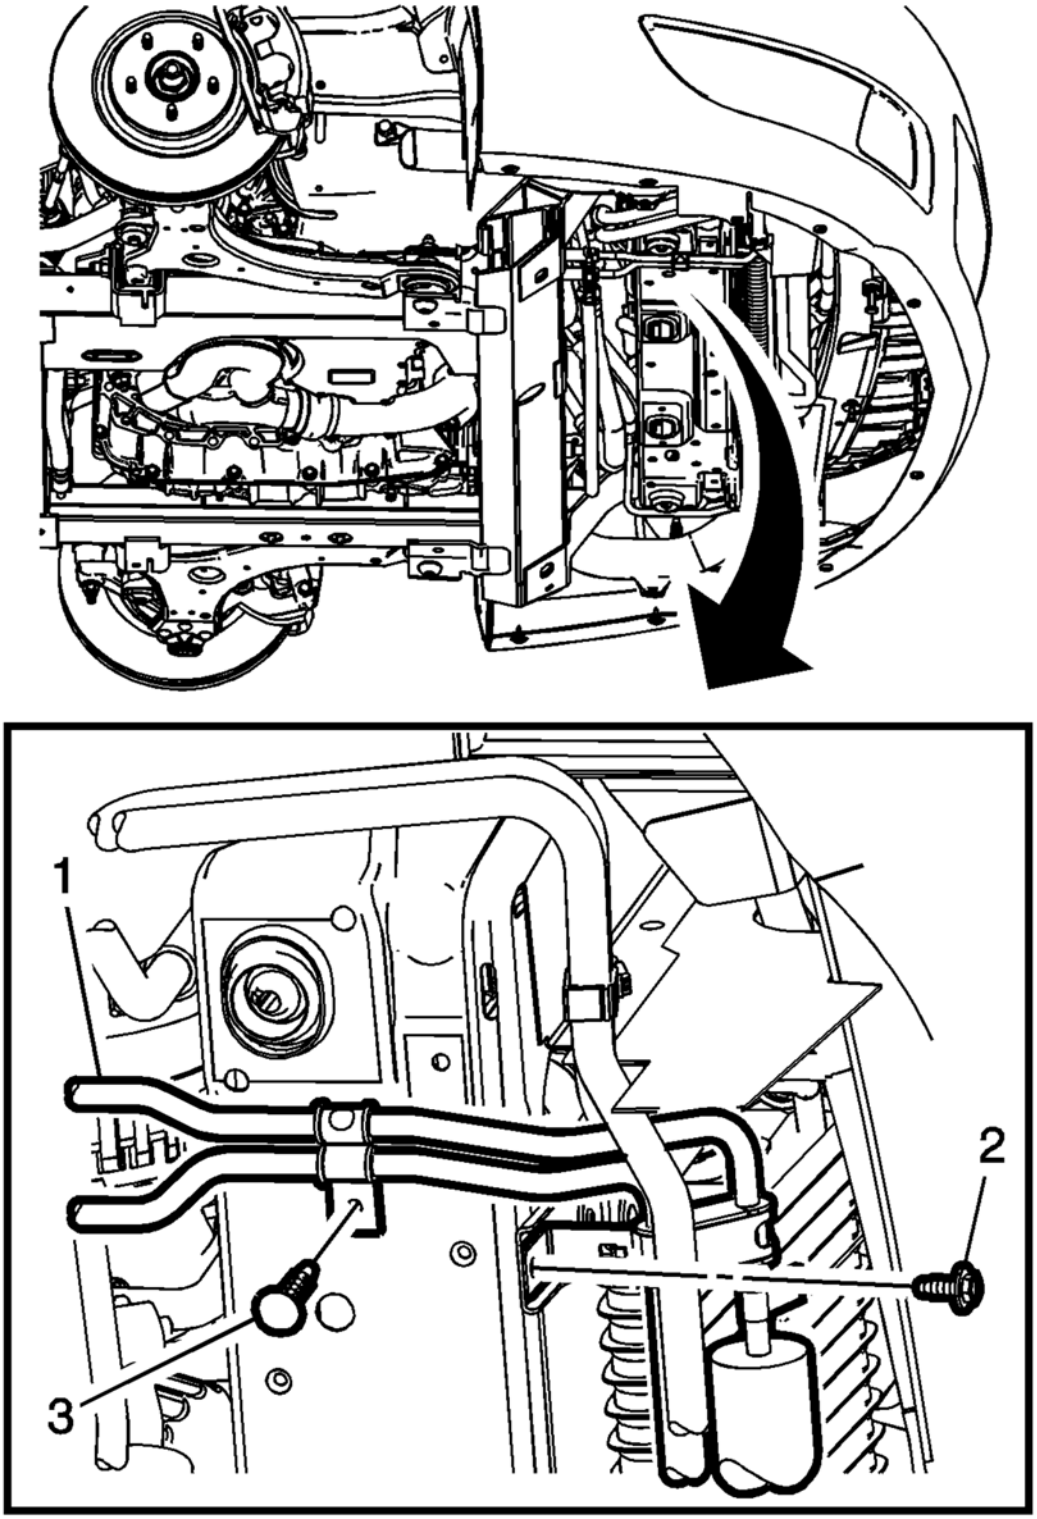

Fig. 34: Power Steering Fluid Cooler, Retainer And Bolt
Courtesy of GENERAL MOTORS COMPANY

2. Connect the retainer (3) and the power steering fluid cooler (1) to the front end lower tie bar.

CAUTION: Refer to Fastener Caution .

3. Install the bolt (2) to the power steering fluid cooler and tighten to 8 N.m (71 lb in).

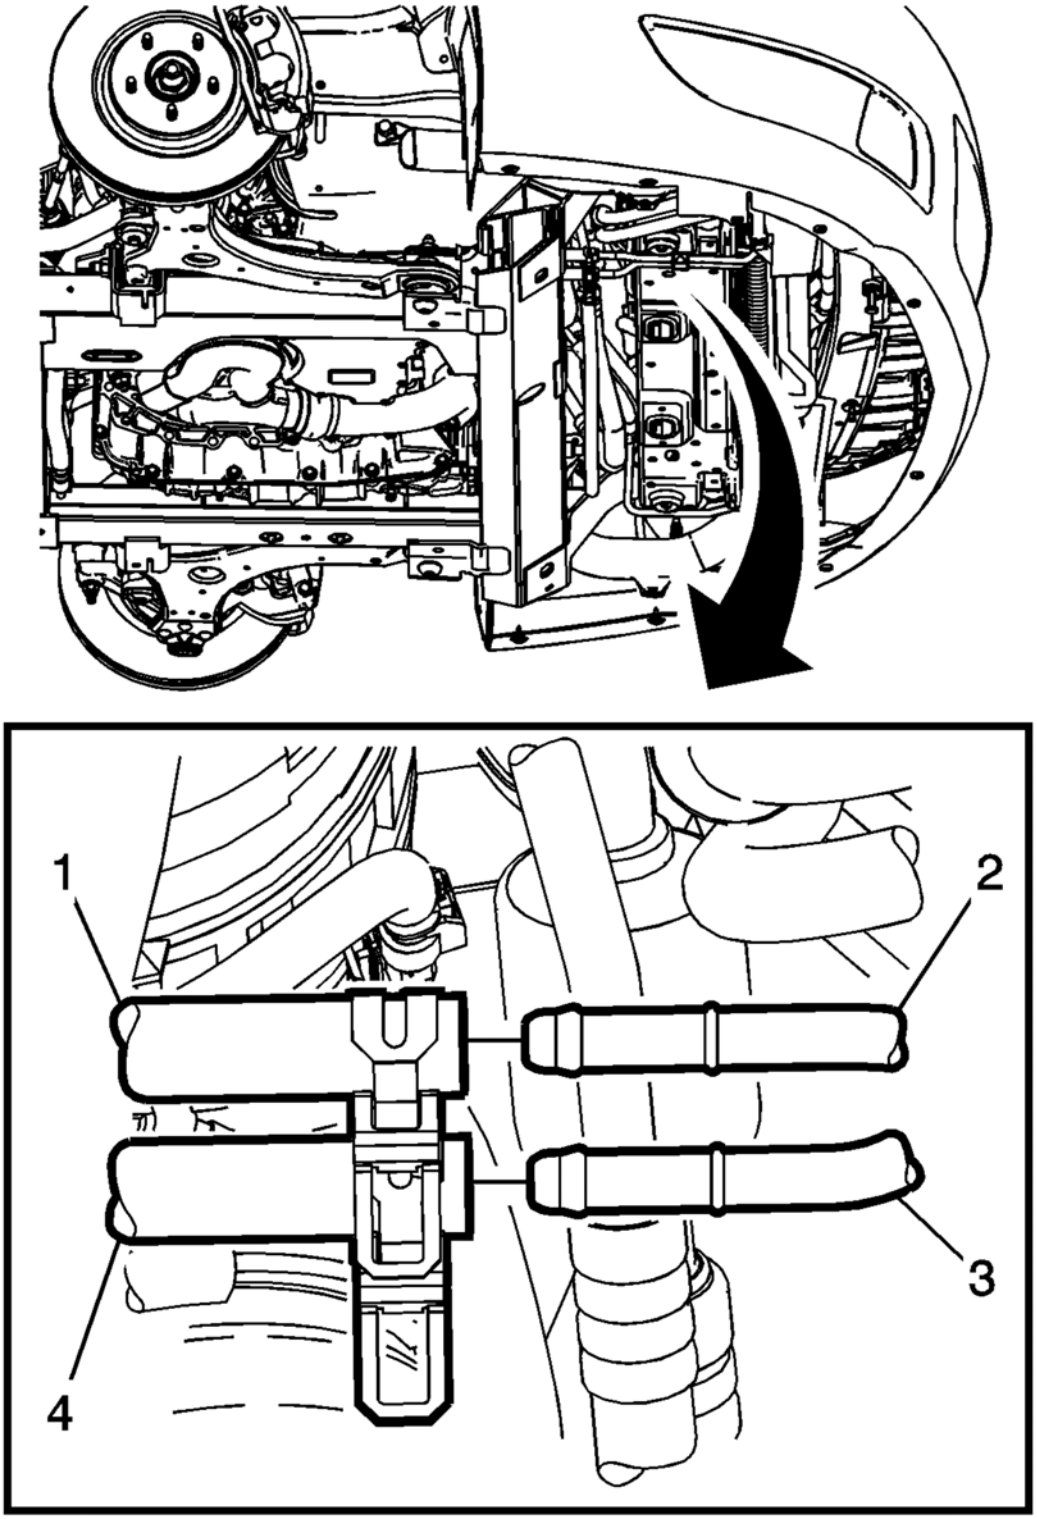

Fig. 35: Power Steering Fluid Cooler And Pipe
Courtesy of GENERAL MOTORS COMPANY

4. Connect the power steering fluid cooling pipe (1, 4) to the power steering fluid cooler (2, 3). Secure the pipe with the 2 hose clamps.

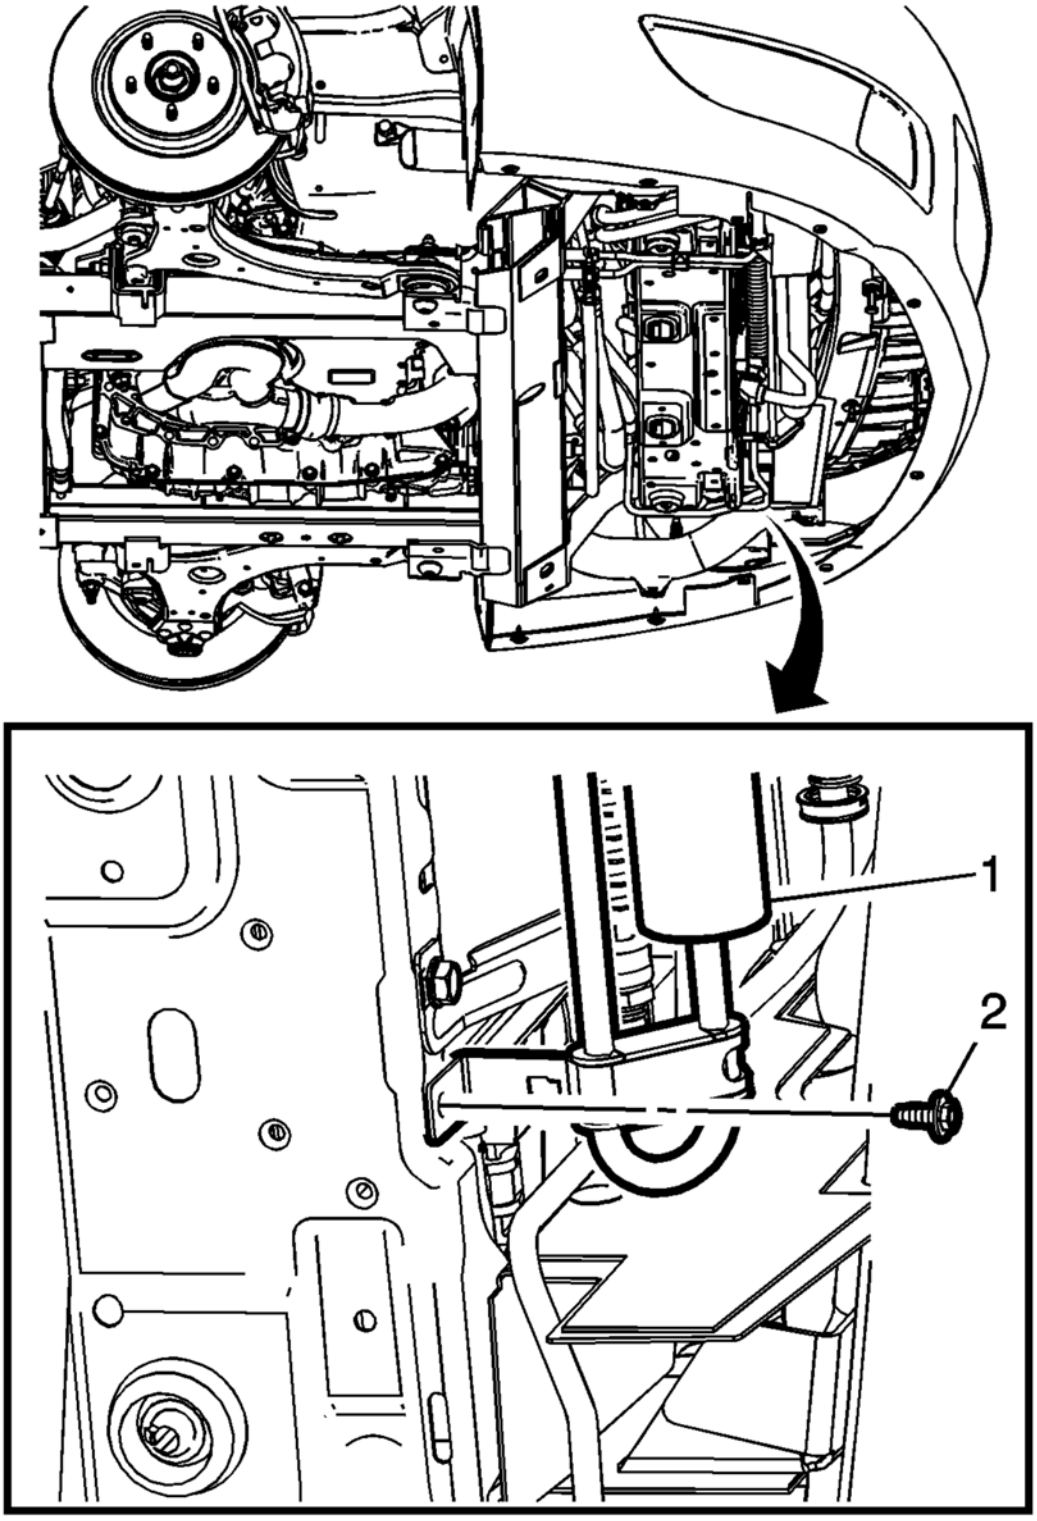

Fig. 36: Power Steering Fluid Cooler And Bolt
Courtesy of GENERAL MOTORS COMPANY

5. Install the bolt (2) to the power steering fluid cooler (1) and tighten to 8 N.m (71 lb in).
6. Install the radiator air lower baffle and deflector. Refer to **Radiator Air Lower Baffle and Deflector Replacement** .

7. Lower the vehicle.
8. Fill and bleed the power steering system. Refer to **Power Steering System Bleeding**.
9. Clean any excess power steering fluid from the vehicle.
10. Remove the drain pans.

POWER STEERING FLUID RESERVOIR HOSE REPLACEMENT

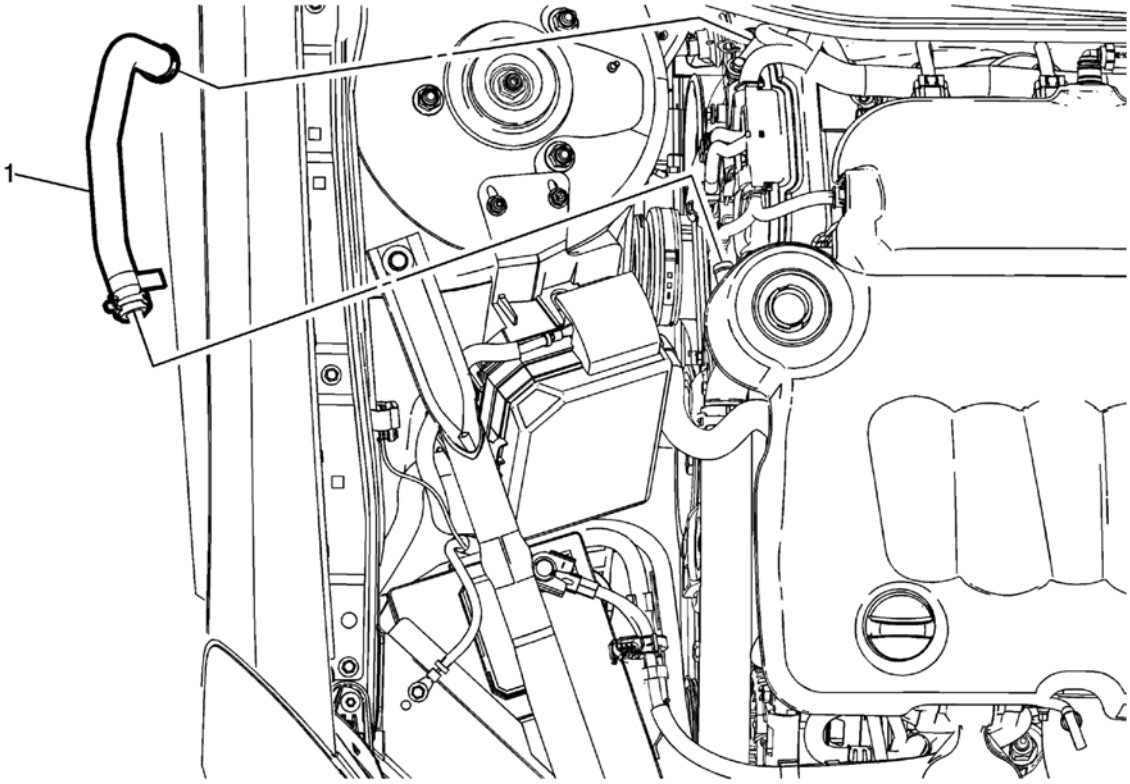

Fig. 37: Power Steering Fluid Reservoir Hose
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedures 1. Place drain pans under the vehicle. 2. Remove as much power steering fluid from the upper power steering fluid reservoir as possible.	
1	Power Steering Fluid Reservoir Hose **CAUTION:** **Refer to Installing Hoses without Twists or Bends Caution .**

Callout	Component Name
	Procedure 1. Loosen the hose clamp and disconnect the power steering fluid reservoir hose from the upper power steering fluid reservoir. 2. Loosen the hose clamp and disconnect the power steering fluid reservoir hose from the lower power steering fluid reservoir which is part of the power steering pump. 3. After the installation is complete, fill and bleed the power steering system. Refer to **Power Steering System Bleeding**. 4. Clean any excess power steering fluid from the vehicle. 5. Remove the drain pans.

POWER STEERING GEAR INLET PIPE/HOSE REPLACEMENT

Removal Procedure

1. Place drain pans under the vehicle.
2. Remove as much power steering fluid from the reservoir as possible.
3. Raise and support the vehicle. Refer to **Lifting and Jacking the Vehicle** .
4. Remove the front tire and wheel assemblies. Refer to **Tire and Wheel Removal and Installation** .

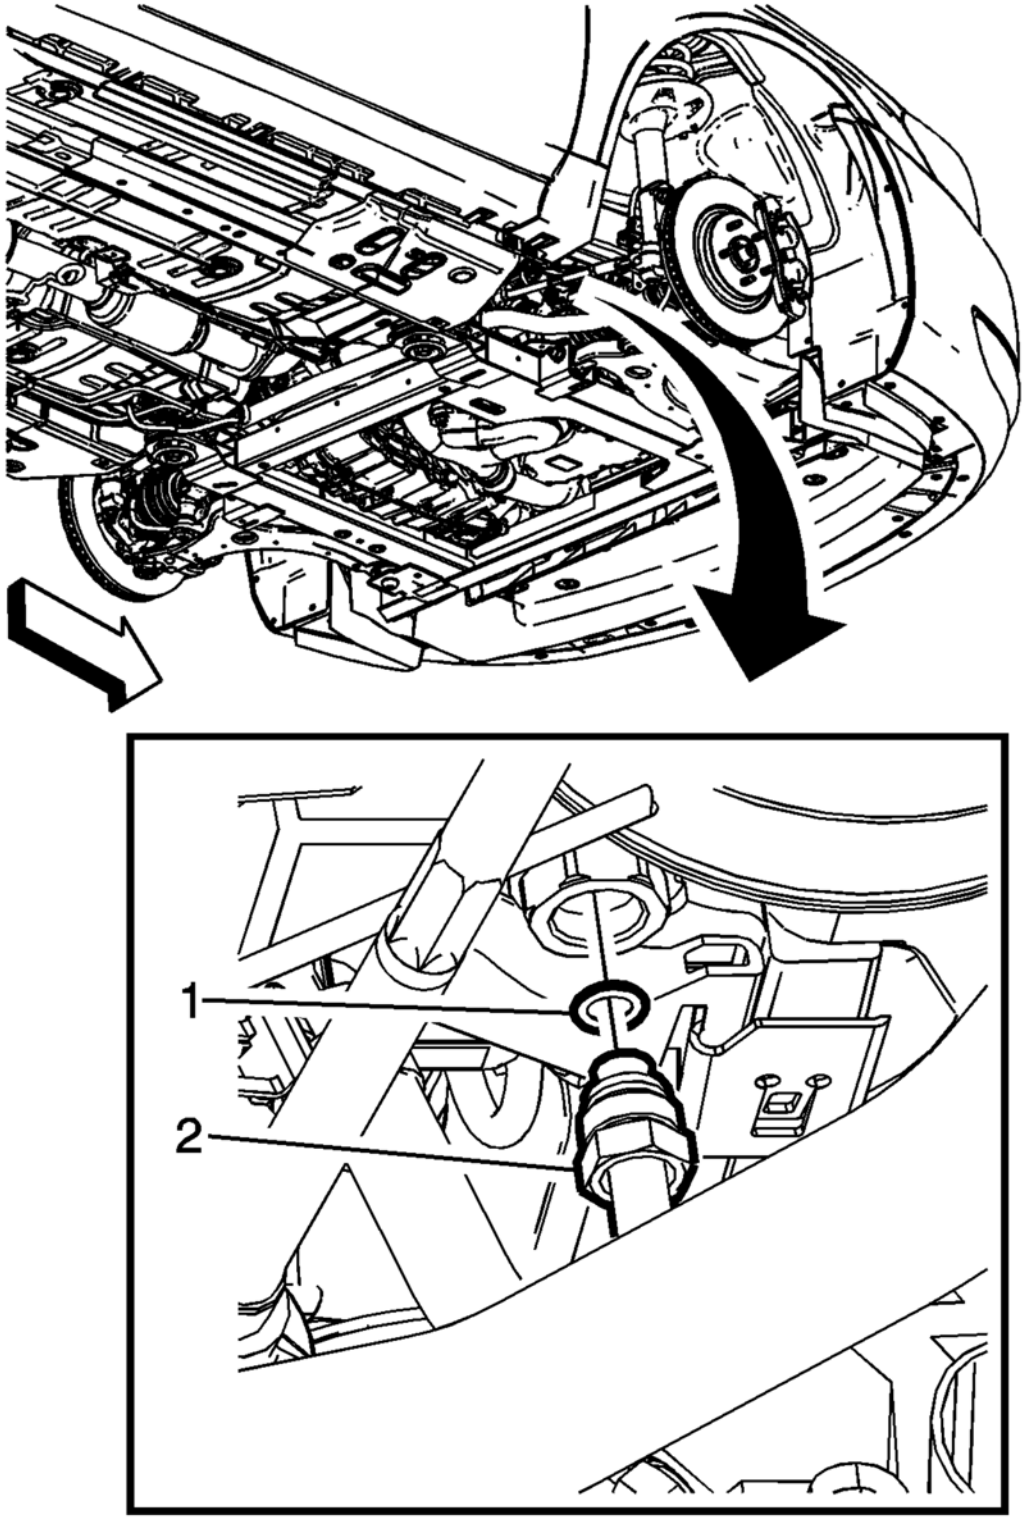

Fig. 38: Power Steering Gear Inlet Hose And O-Ring Seal
Courtesy of GENERAL MOTORS COMPANY

5. Disconnect the power steering gear inlet hose (2) from the power steering pump.
6. Remove the power steering gear inlet hose O-ring seal (1).

   Discard the seal.

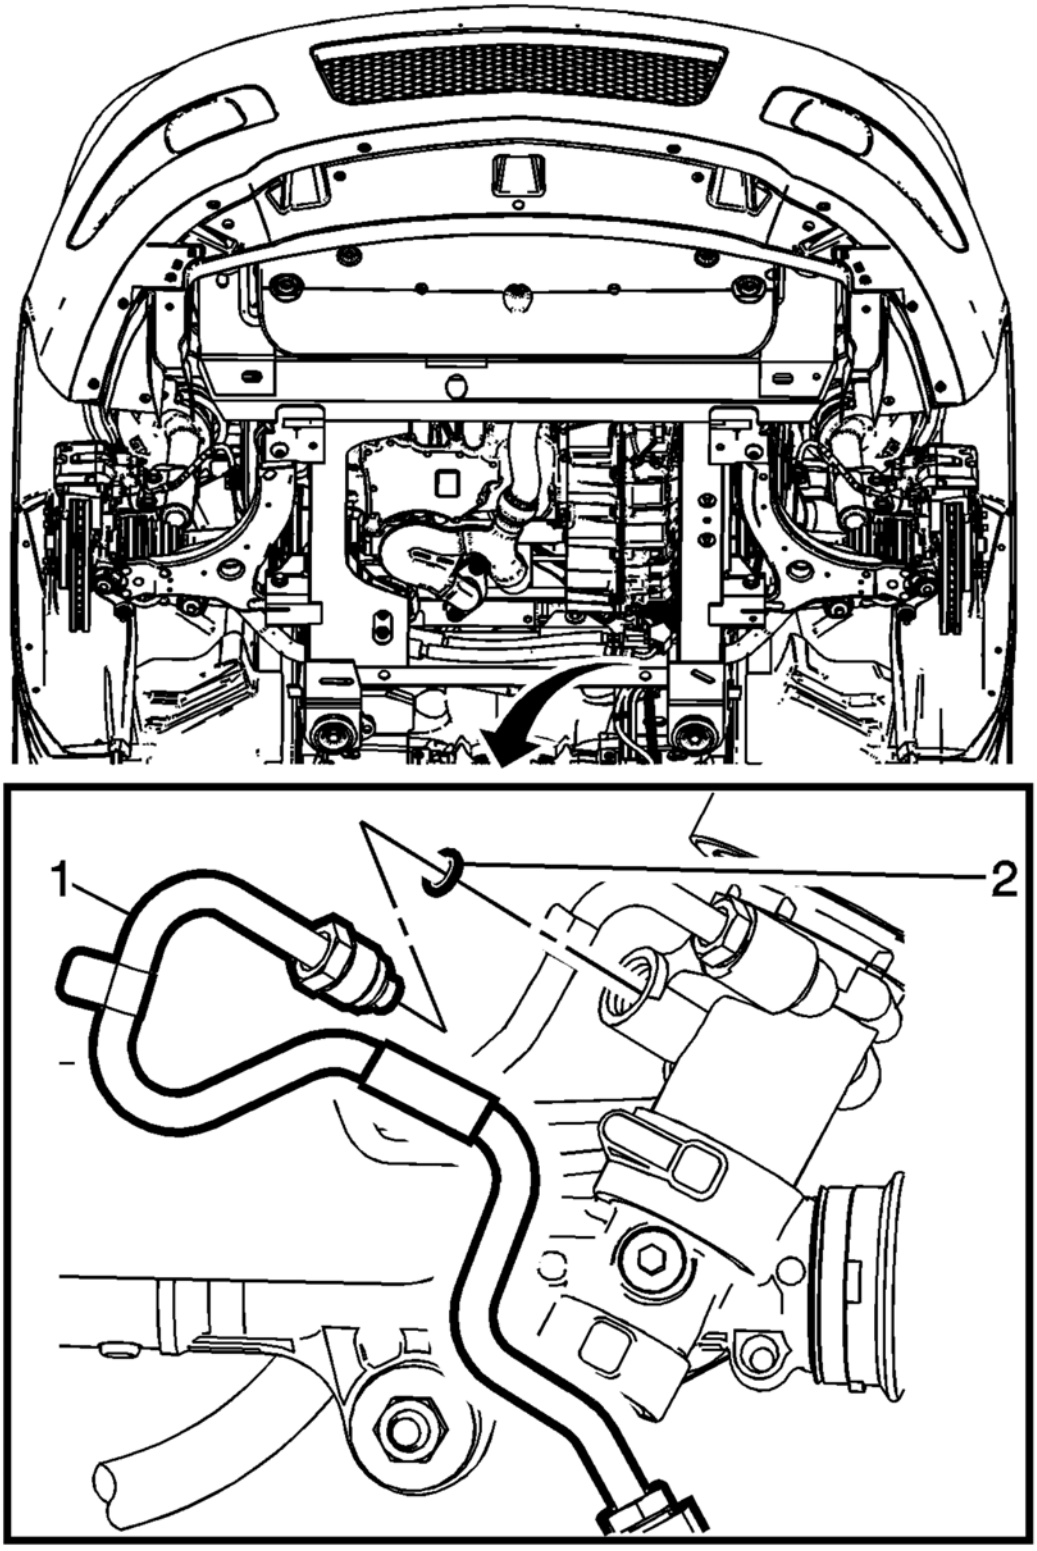

Fig. 39: Power Steering Gear Inlet Hose And O-Ring Seal
Courtesy of GENERAL MOTORS COMPANY

7. Disconnect the power steering gear inlet hose (1) from the steering gear.
8. Remove the power steering gear inlet hose O-ring seal (2).

   Discard the seal.

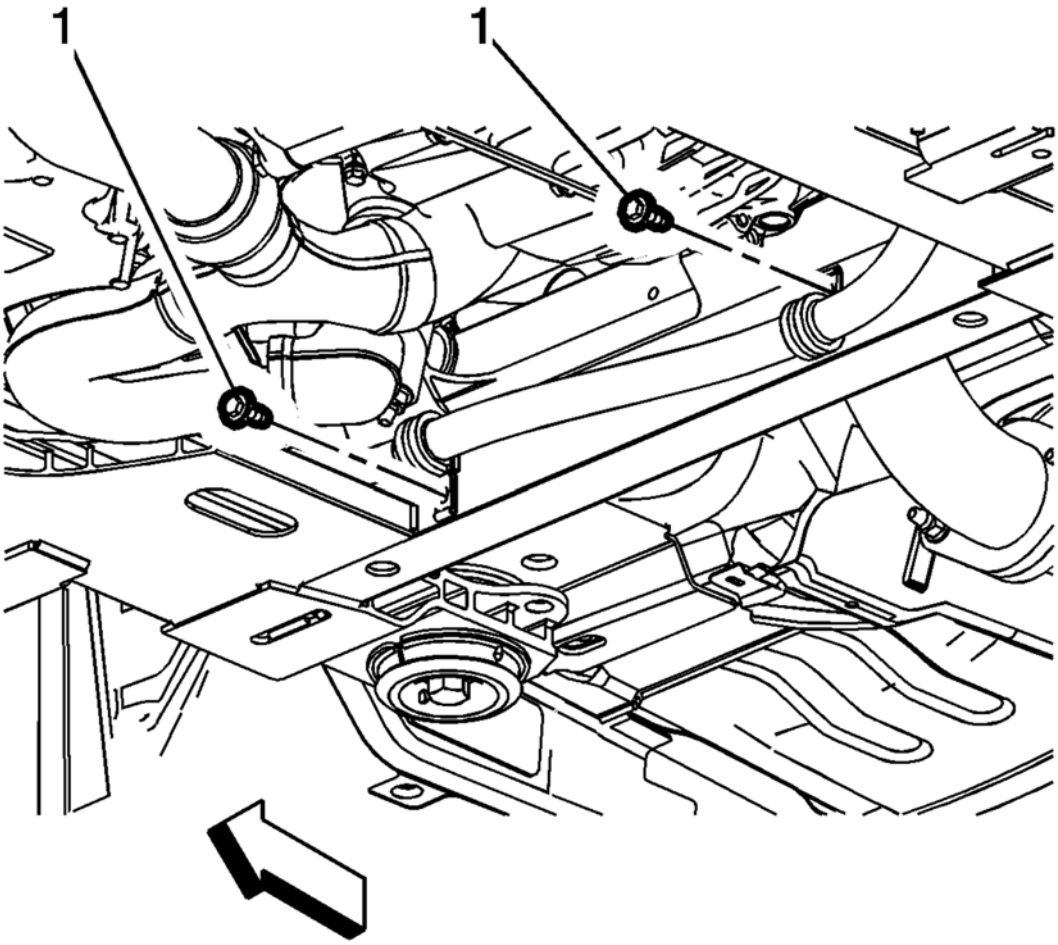

Fig. 40: Power Steering Gear Inlet Hose Bracket Bolts
Courtesy of GENERAL MOTORS COMPANY

9. Remove the power steering gear inlet hose bracket bolts (1).

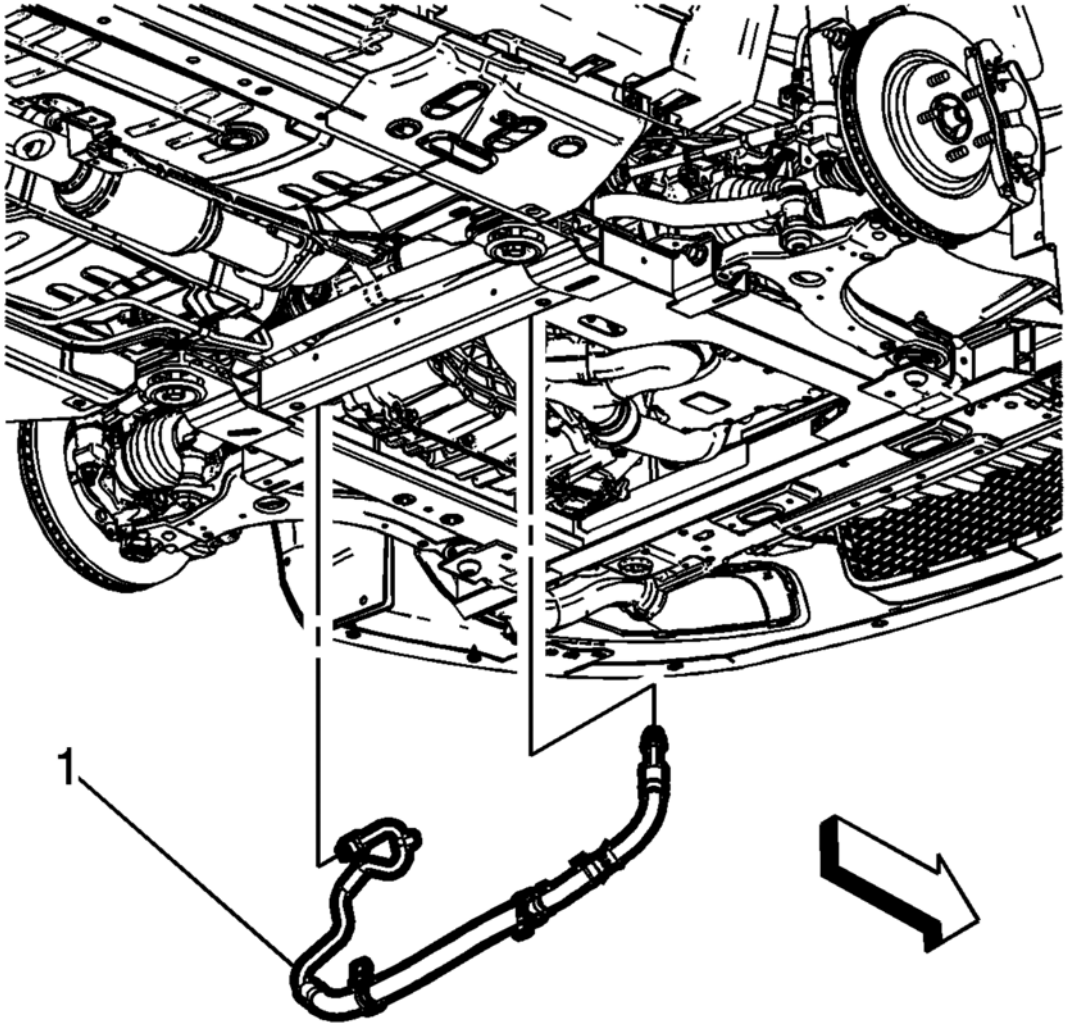

Fig. 41: Power Steering Gear Inlet Hose
Courtesy of GENERAL MOTORS COMPANY

10. Remove the power steering gear inlet hose (1) from the vehicle.

Installation Procedure

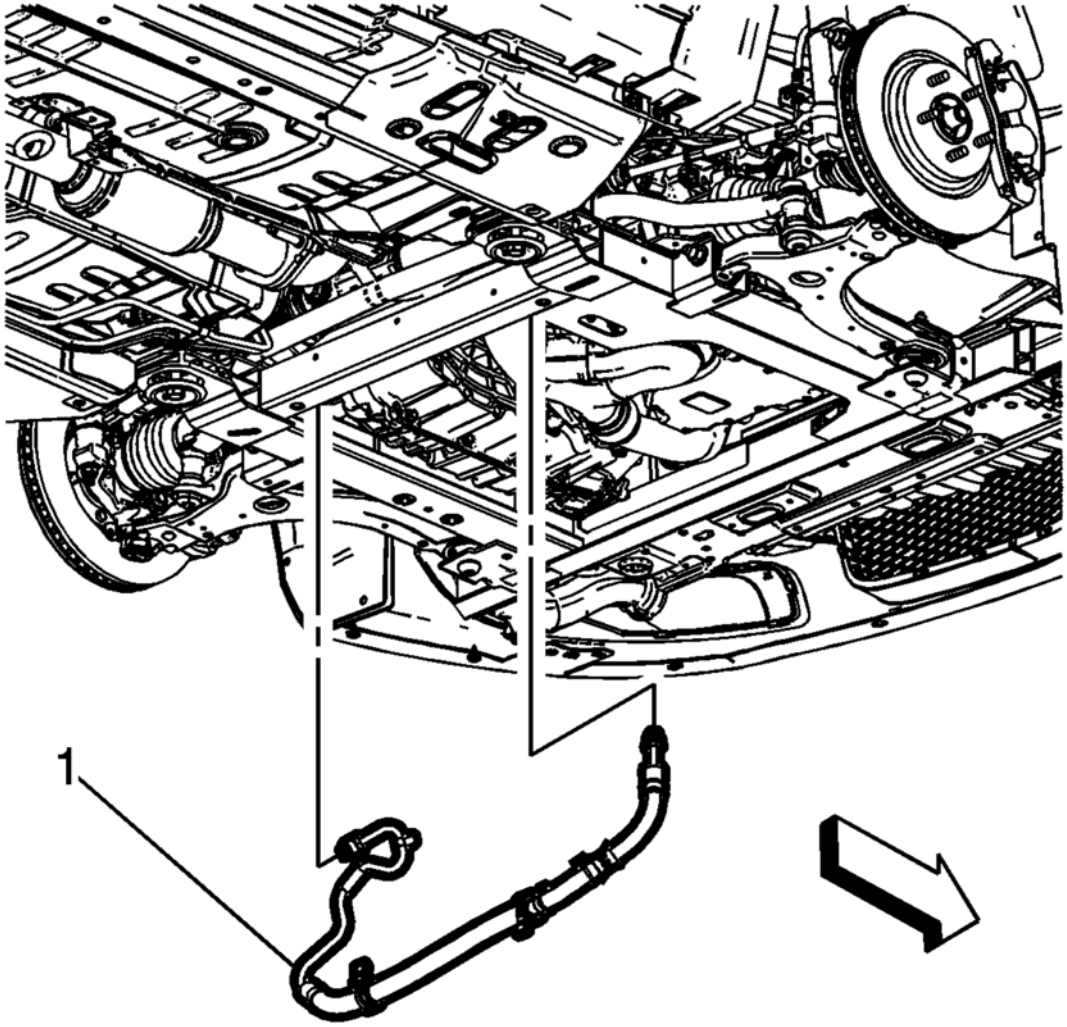

Fig. 42: Power Steering Gear Inlet Hose
Courtesy of GENERAL MOTORS COMPANY

CAUTION: Refer to Installing Hoses without Twists or Bends Caution .

1. Position the power steering gear inlet hose (1) in the vehicle.

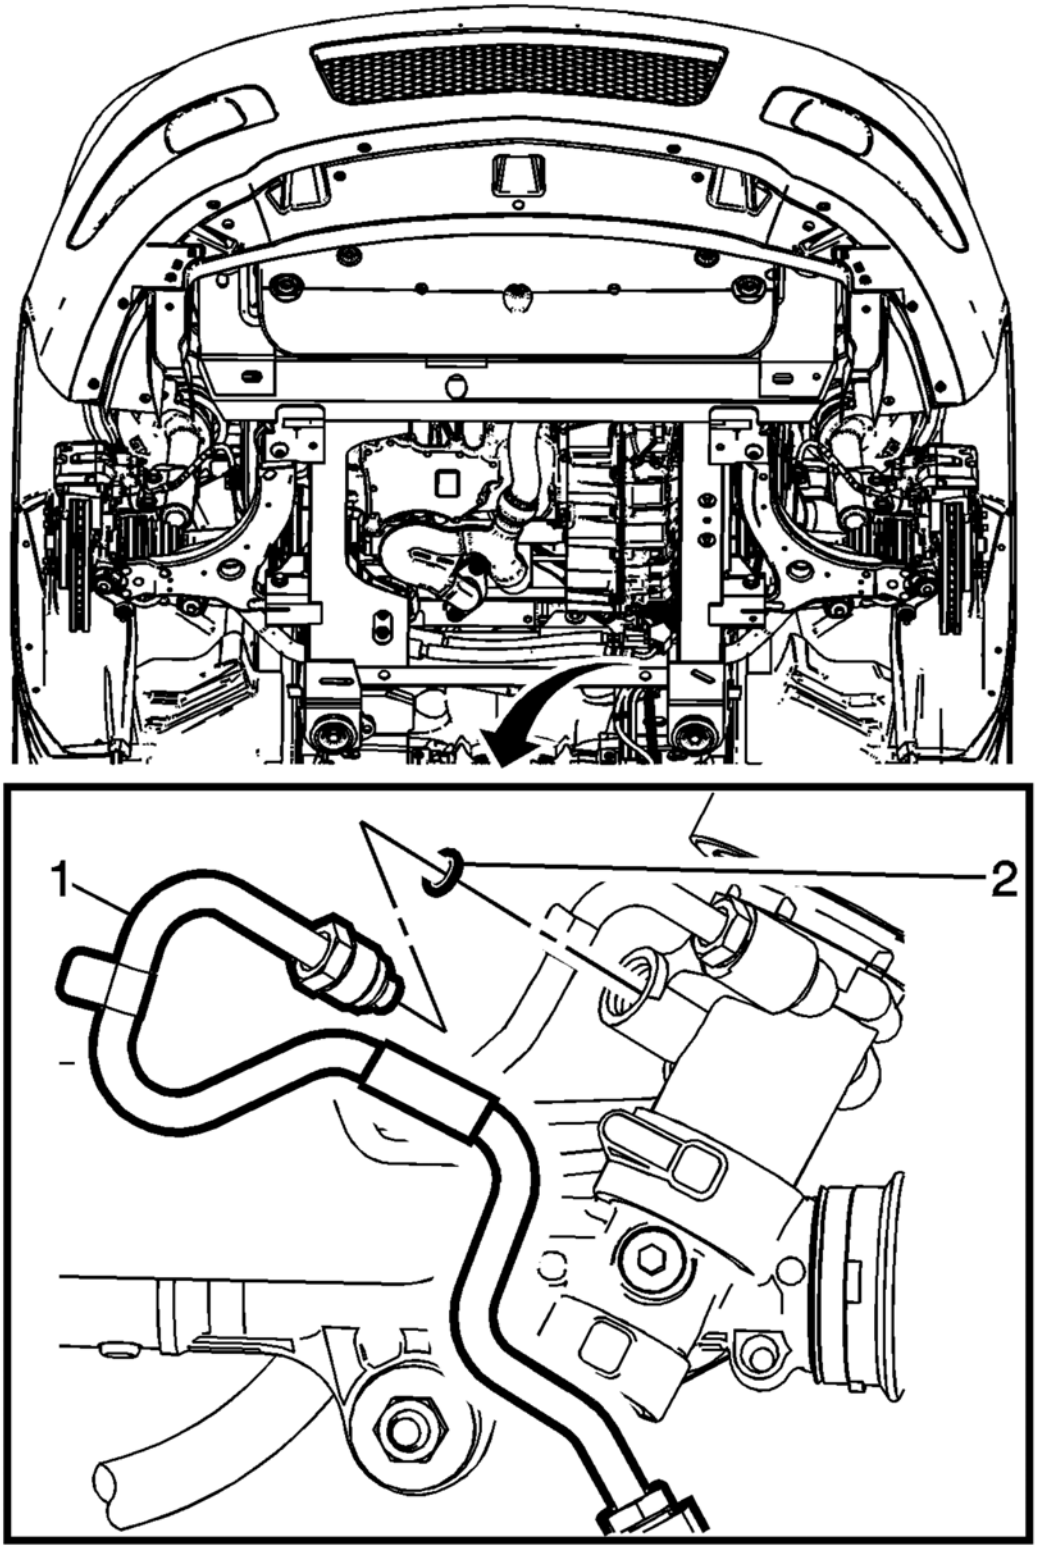

Fig. 43: Power Steering Gear Inlet Hose And O-Ring Seal
Courtesy of GENERAL MOTORS COMPANY

2. Install a NEW power steering gear inlet hose O-ring seal (2).

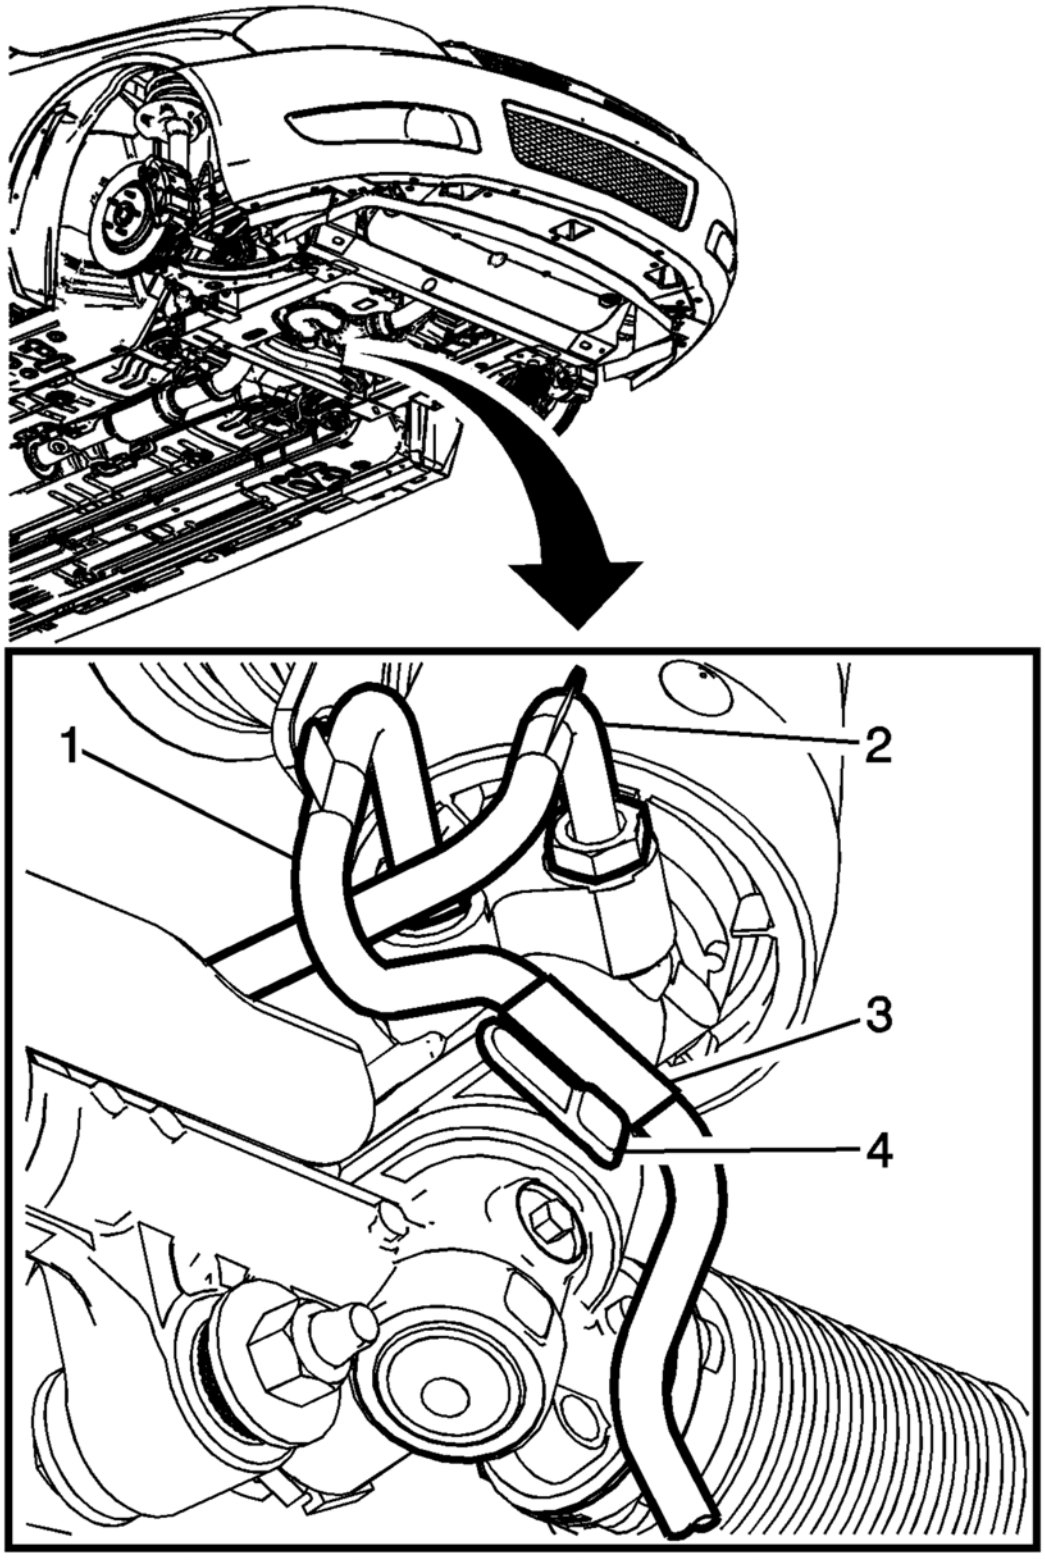

Fig. 44: Power Steering Gear Inlet Hose, Steering Gear Housing Casting And Rubber Isolation Tube

Courtesy of GENERAL MOTORS COMPANY

CAUTION: **Refer to Fastener Caution .**

NOTE: **The position of the rubber isolation tube (3) against the steering gear**

housing casting (4) is critical to the performance of the power steering gear inlet hose (1).

3. Connect the power steering gear inlet hose to the steering gear. Position the rubber isolation tube against the steering gear housing casting. Tighten the fitting to 34 N.m (25 lb ft).

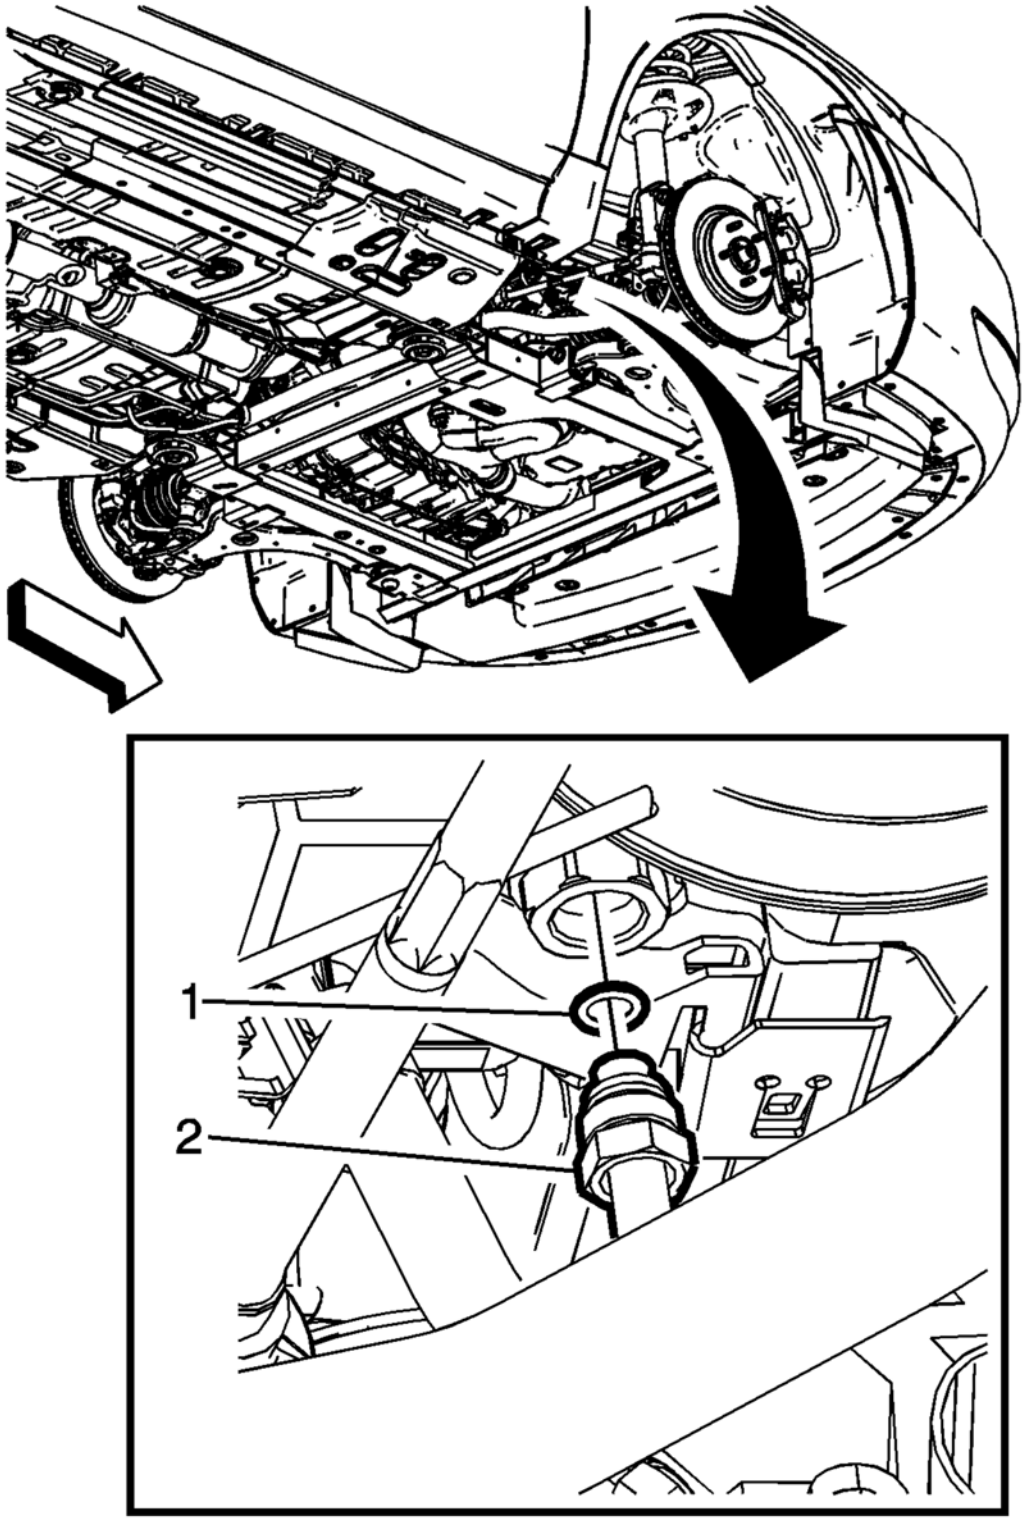

Fig. 45: Power Steering Gear Inlet Hose And O-Ring Seal

Courtesy of GENERAL MOTORS COMPANY

4. Install a NEW power steering gear inlet hose O-ring seal (1).
5. Connect the power steering gear inlet hose (2) to the power steering pump and tighten the fitting to 34 N.m (25 lb ft).

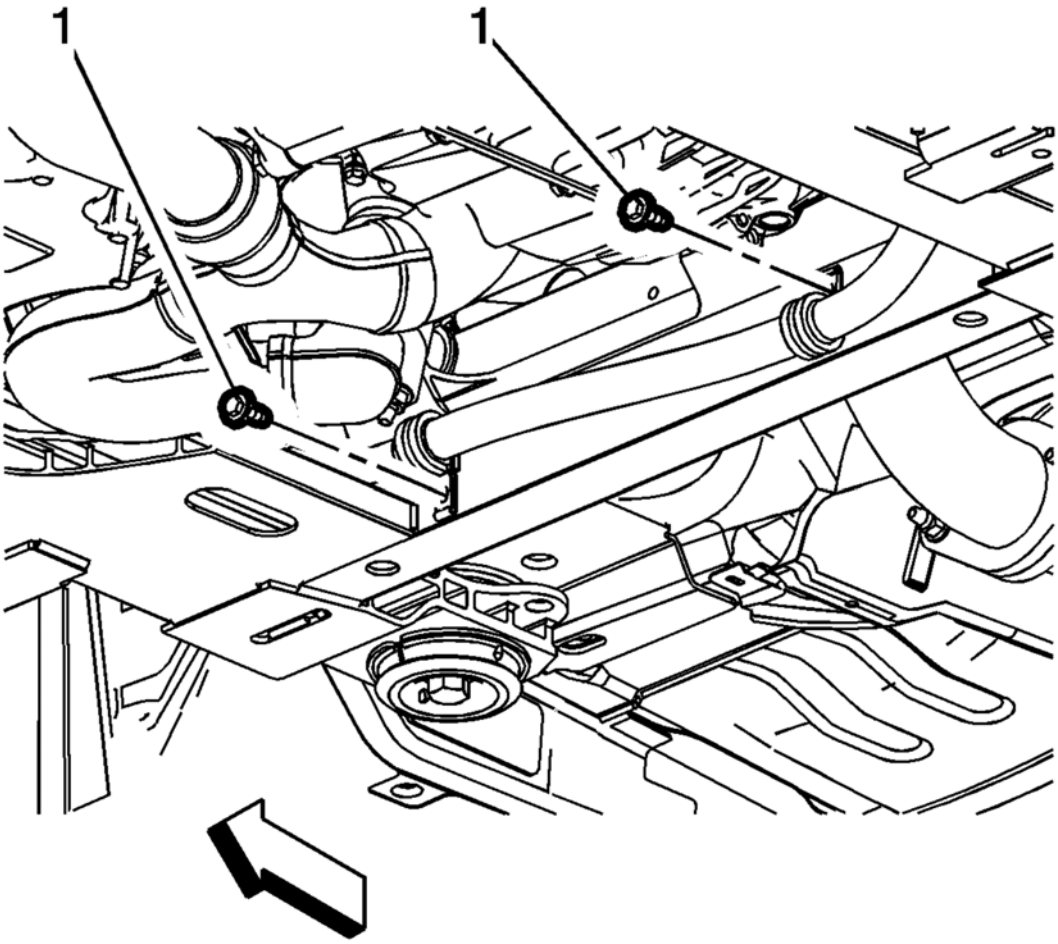

Fig. 46: Power Steering Gear Inlet Hose Bracket Bolts
Courtesy of GENERAL MOTORS COMPANY

6. Install the power steering gear inlet hose bracket bolts (1) and tighten to 7 N.m (62 lb in).
7. Install the front tire and wheel assemblies. Refer to **Tire and Wheel Removal and Installation** .
8. Lower the vehicle.
9. Fill and bleed the power steering system. Refer to **Power Steering System Bleeding**.
10. Clean any excess power steering fluid from the vehicle.
11. Remove the drain pans.

STEERING GEAR PIPE AND SEAL REPLACEMENT

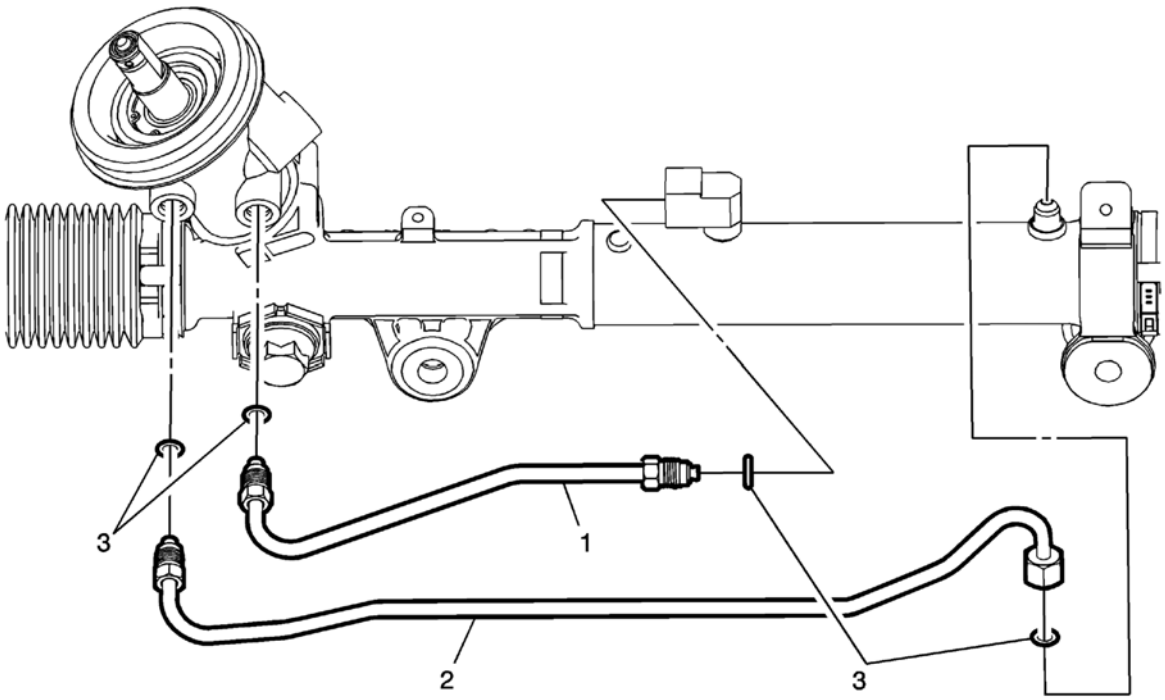

Fig. 47: Steering Gear Pipe And Seal
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedures 1. Raise and support the vehicle. Refer to **Lifting and Jacking the Vehicle** . 2. Remove the steering gear. Refer to **Steering Gear Replacement**.	
1	Steering Gear Pipe **CAUTION:** **Refer to Fastener Caution .** **Tighten** 34 N.m (25 lb ft)
2	Steering Gear Pipe **Tighten** 34 N.m (25 lb ft)
3	Steering Gear Pipe Seal (Qty: 4) **Procedure**

Callout	Component Name
	1. Remove the steering gear pipe seals. Discard the seals. 2. Install NEW steering gear pipe seals.

STEERING GEAR HEAT SHIELD REPLACEMENT

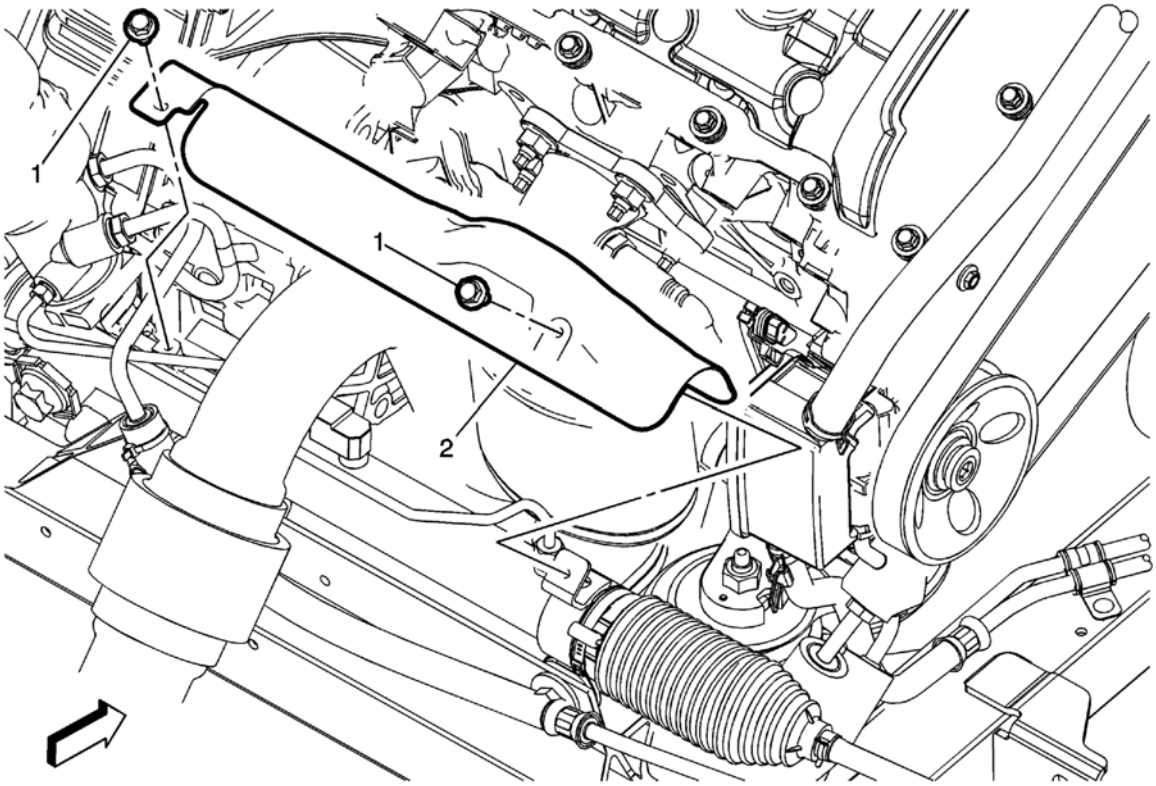

Fig. 48: Steering Gear Heat Shield
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
CAUTION: **Do not lower the rear of the frame too far as damage to the engine components nearest to the cowl may result.** **Preliminary Procedures**	

Callout	Component Name
1. Raise and support the vehicle. Refer to **Lifting and Jacking the Vehicle** . 2. Lower the rear of the frame in order to access the steering gear heat shield bolts. Refer to **Frame Replacement** .	
1	Steering Gear Heat Shield Bolt (Qty: 2) **CAUTION:** **Refer to Fastener Caution .** **Tighten** 9 N.m (80 lb in)
2	Steering Gear Heat Shield

STEERING GEAR REPLACEMENT

Special Tools

J-42640 Steering Column Anti-rotation Pin

For equivalent regional tools, refer to **Special Tools**.

Removal Procedure

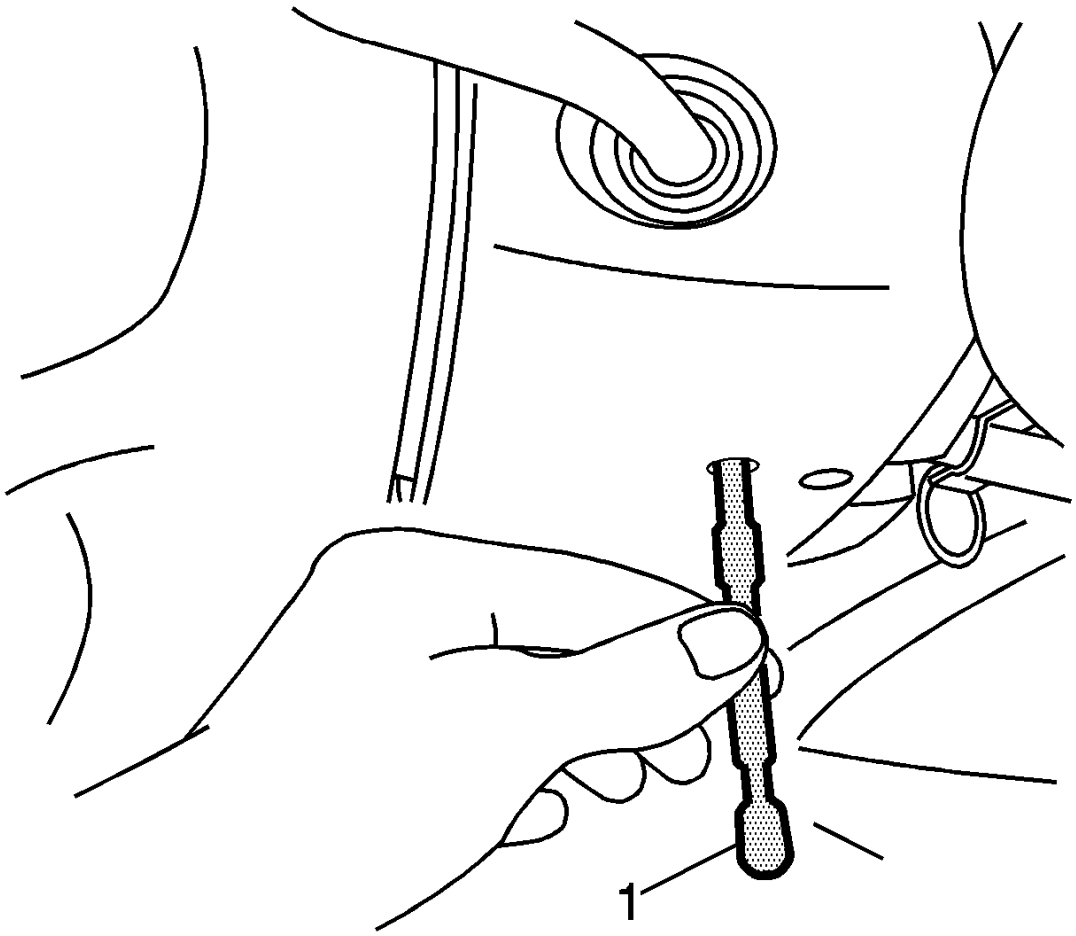

Fig. 49: Locking/Unlocking Steering Column
Courtesy of GENERAL MOTORS COMPANY

CAUTION: With wheels of the vehicle facing straight ahead, secure the steering wheel utilizing steering column anti-rotation pin, steering column lock, or a strap to prevent rotation. Locking of the steering column will prevent damage and a possible malfunction of the SIR system. The steering wheel must be secured in position before disconnecting the following components:

- **The steering column**
- **The intermediate shaft(s)**
- **The steering gear**

After disconnecting these components, do not rotate the steering wheel or move the front tires and wheels. Failure to follow this procedure may cause the SIR coil assembly to become un-centered and cause possible damage to the SIR coil. If you think the SIR coil has become un-centered, refer to your specific SIR coil's centering procedure to re-center SIR Coil.

1. Insert the **J-42640** pin into the steering column access hole in order to lock the steering column.

2. Place drain pans under the vehicle.
3. Remove as much power steering fluid from the reservoir as possible.
4. Raise and support the vehicle. Refer to **Lifting and Jacking the Vehicle** .
5. Remove the front tire and wheel assemblies. Refer to **Tire and Wheel Removal and Installation** .
6. Disconnect the intermediate steering shaft from the steering gear pinion shaft. Refer to **Intermediate Steering Shaft Replacement** .
7. Disconnect both of the outer tie rods from the steering knuckles. Refer to **Steering Linkage Outer Tie Rod Replacement**.
8. Remove the rear engine mount. Refer to **Engine Rear Mount Replacement** .

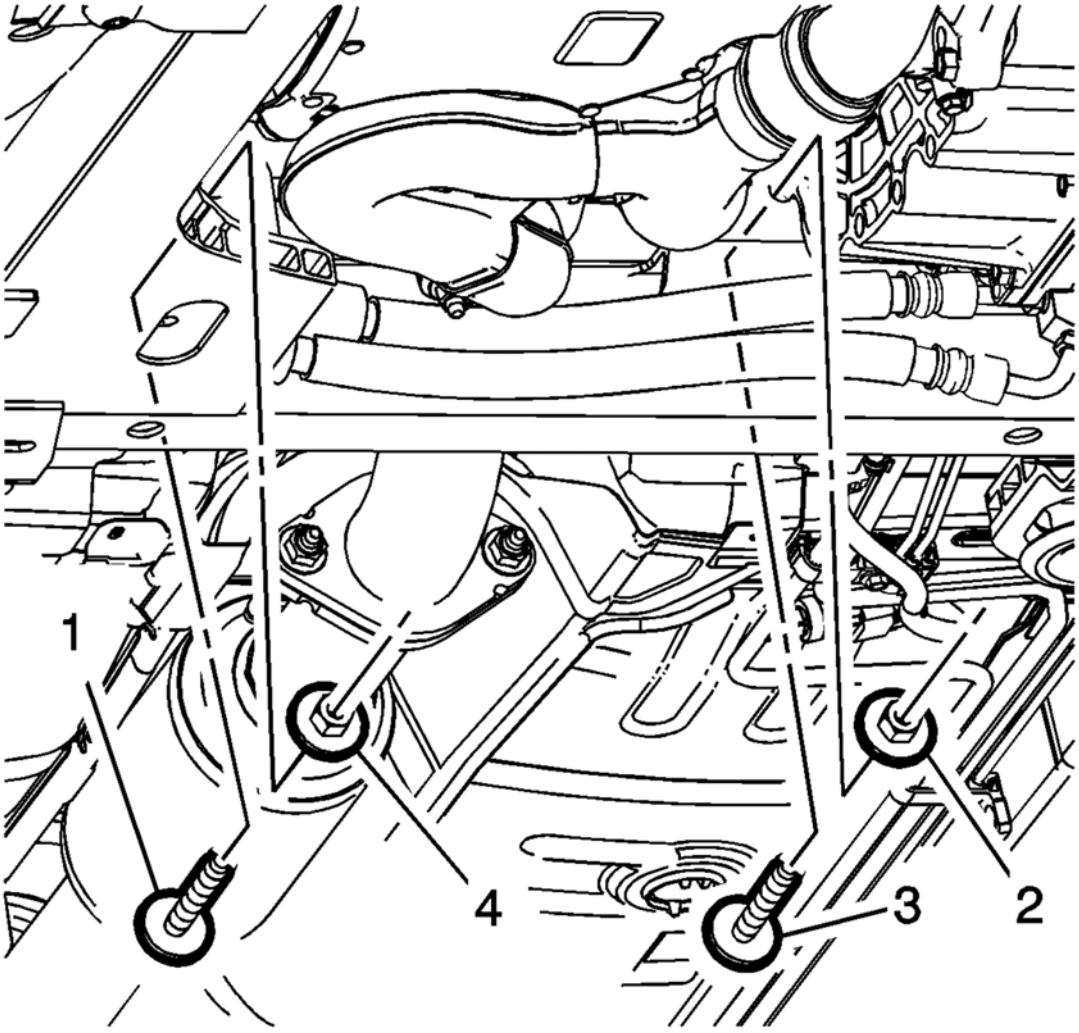

Fig. 50: Steering Gear Bolts And Nuts
Courtesy of GENERAL MOTORS COMPANY

9. Remove the 2 steering gear bolts (1, 3) and the 2 nuts (2, 4).

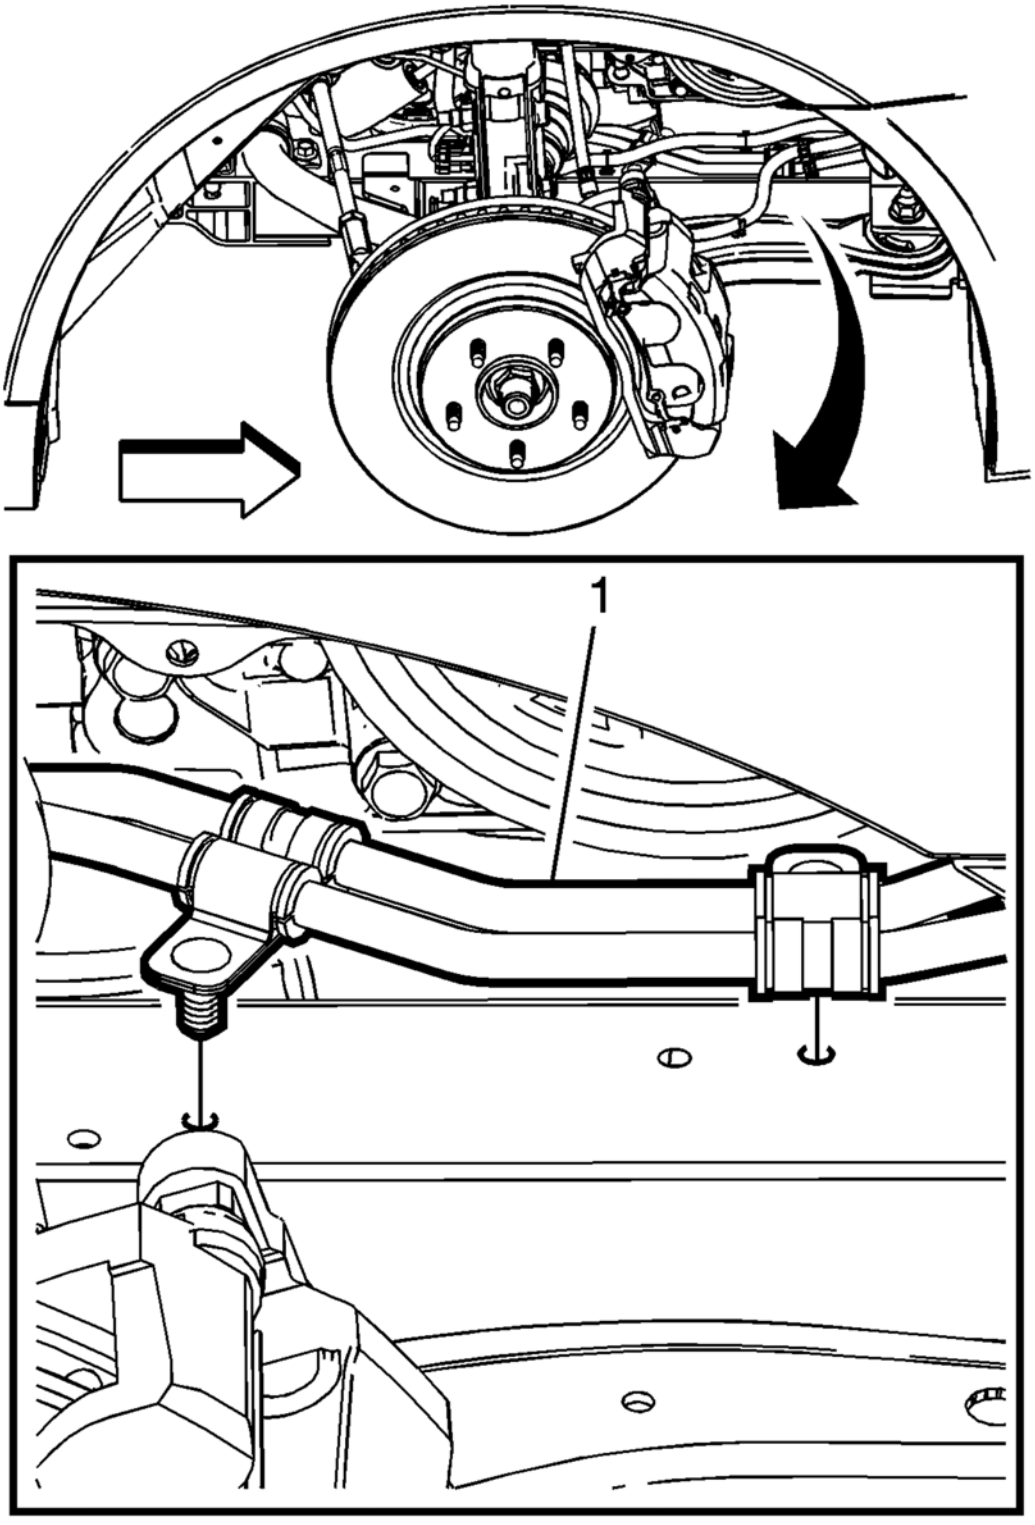

Fig. 51: Power Steering Fluid Cooling Pipe
Courtesy of GENERAL MOTORS COMPANY

10. On the right side of the frame, disconnect the 2 retainers and the power steering fluid cooling pipe (1) from the frame.

CAUTION: Do not lower the rear of the frame too far as damage to the engine

components nearest to the cowl may result.

11. Lower the rear of the frame in order to access the steering gear. Refer to **Frame Replacement** .
12. Disconnect the power steering gear inlet hose from the steering gear. Refer to **Power Steering Gear Inlet Pipe/Hose Replacement**.
13. Remove the steering gear inlet hose O-ring seal.

    Discard the seal.

14. Disconnect the power steering fluid cooling pipe from the steering gear. Refer to **Power Steering Fluid Cooling Pipe Replacement**.
15. Remove the power steering fluid cooling pipe O-ring seal.

    Discard the seal.

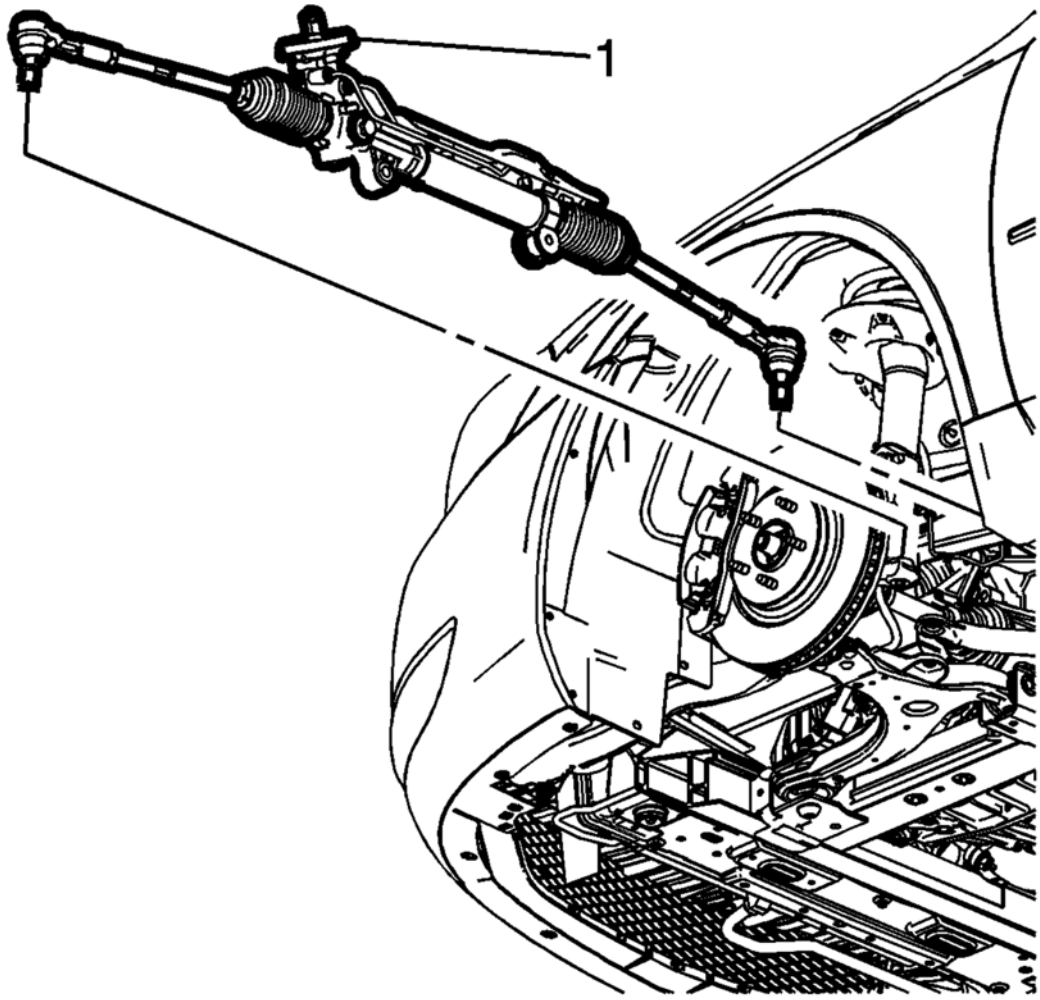

Fig. 52: Steering Gear
Courtesy of GENERAL MOTORS COMPANY

16. Remove the steering gear (1) through the left wheel opening.
17. Transfer components as necessary.

Installation Procedure

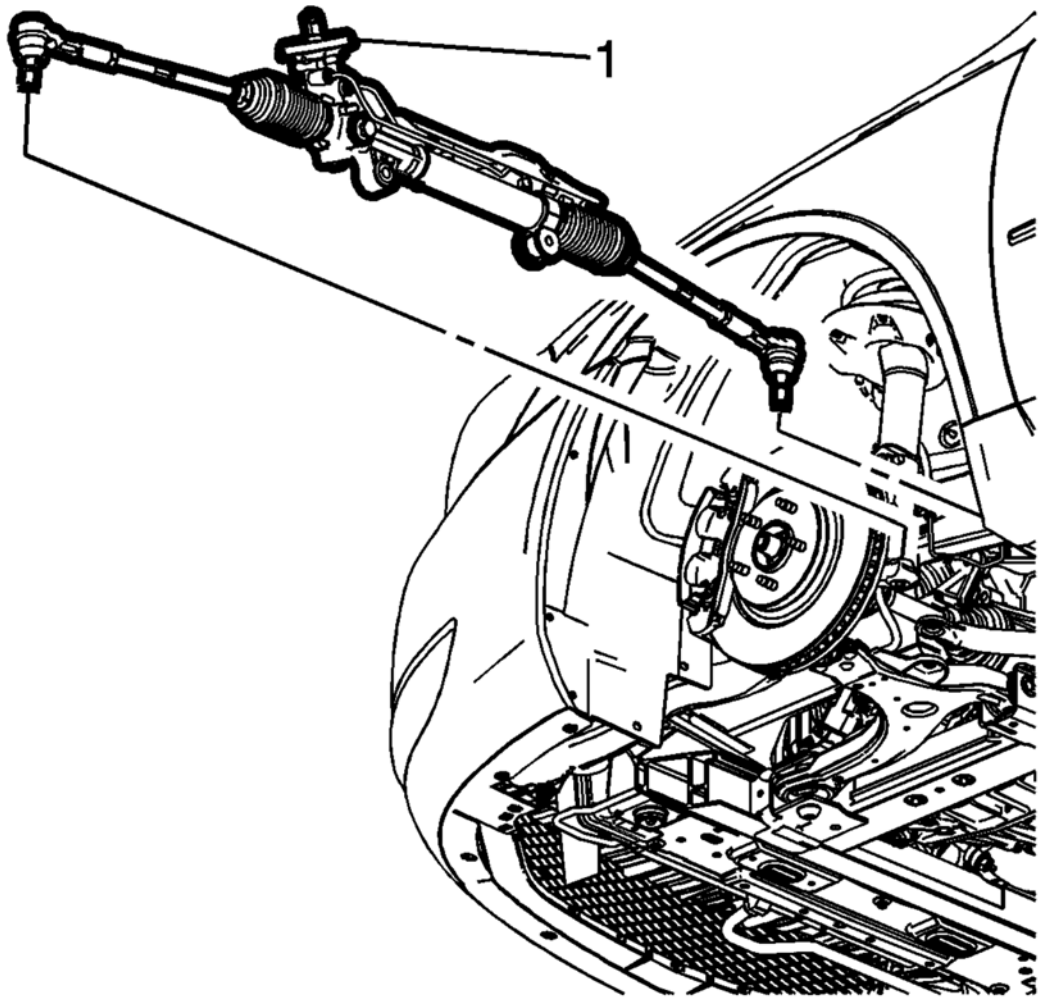

Fig. 53: Steering Gear
Courtesy of GENERAL MOTORS COMPANY

1. Position the steering gear (1) in the vehicle through the left wheel opening.
2. Install a NEW power steering fluid cooling pipe O-ring seal.

CAUTION: Refer to Installing Hoses without Twists or Bends Caution .

3. Connect the power steering fluid cooling pipe to the steering gear. Refer to **Power Steering Fluid Cooling Pipe Replacement**.
4. Install a NEW power steering gear inlet hose O-ring seal.
5. Connect the power steering gear inlet hose to the steering gear. Refer to **Power Steering Gear Inlet Pipe/Hose Replacement**.
6. Install the frame. Refer to **Frame Replacement** .

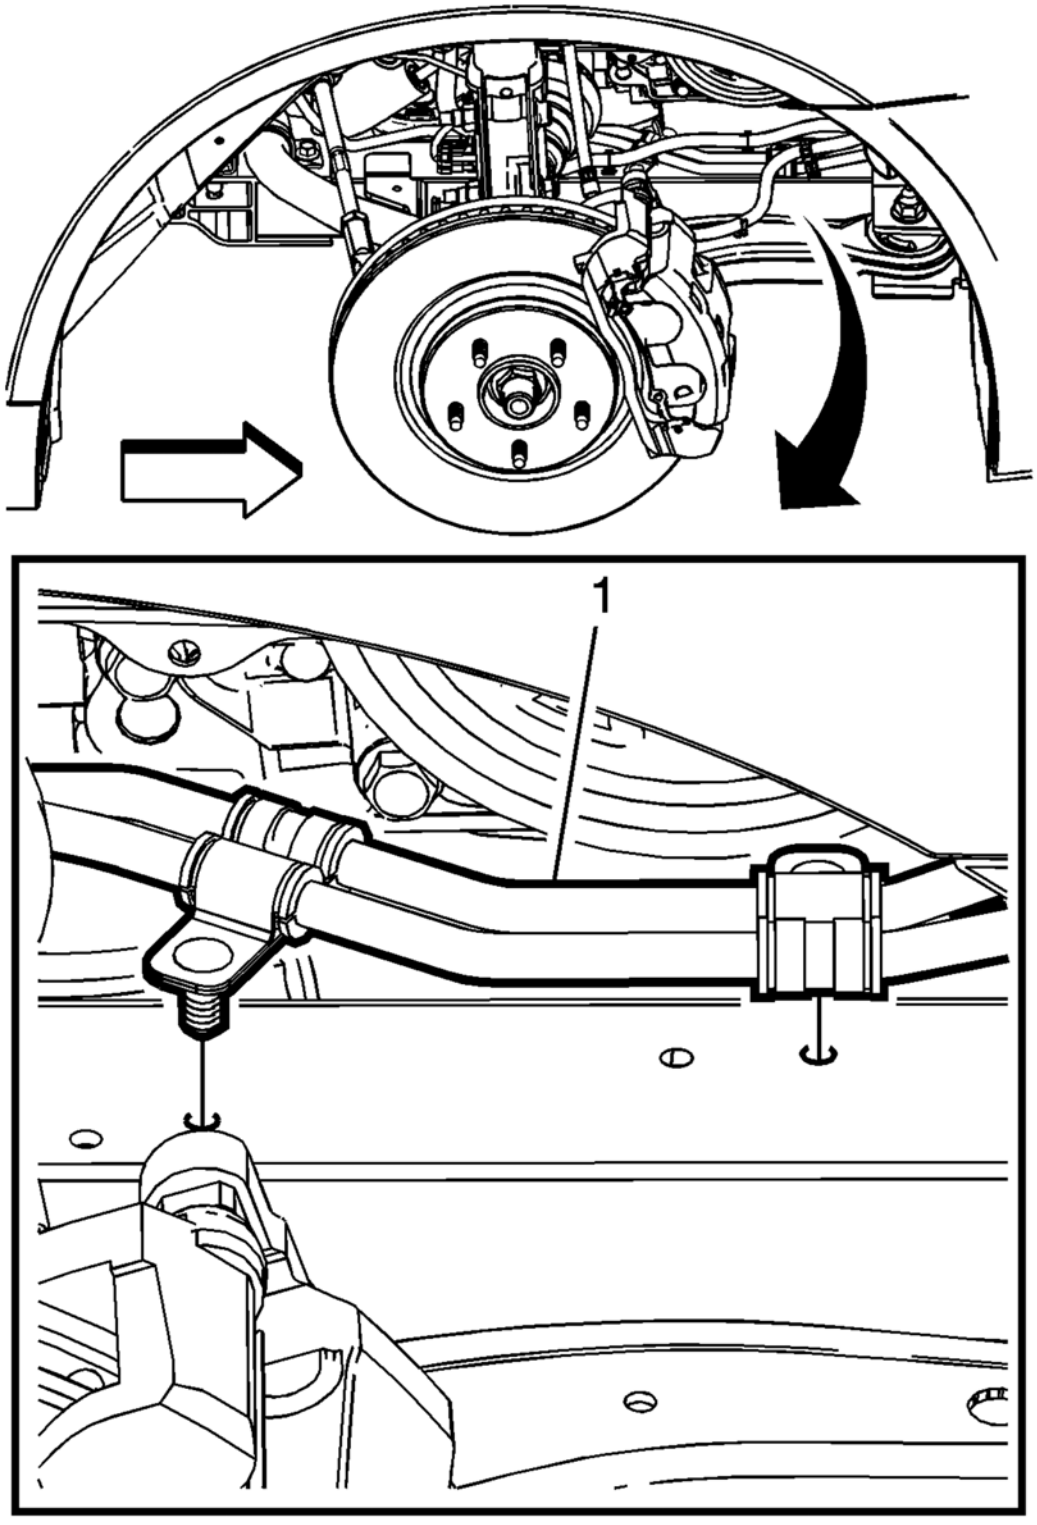

Fig. 54: Power Steering Fluid Cooling Pipe
Courtesy of GENERAL MOTORS COMPANY

7. On the right side of the frame, connect the 2 retainers and the power steering fluid cooling pipe (1) to the frame.

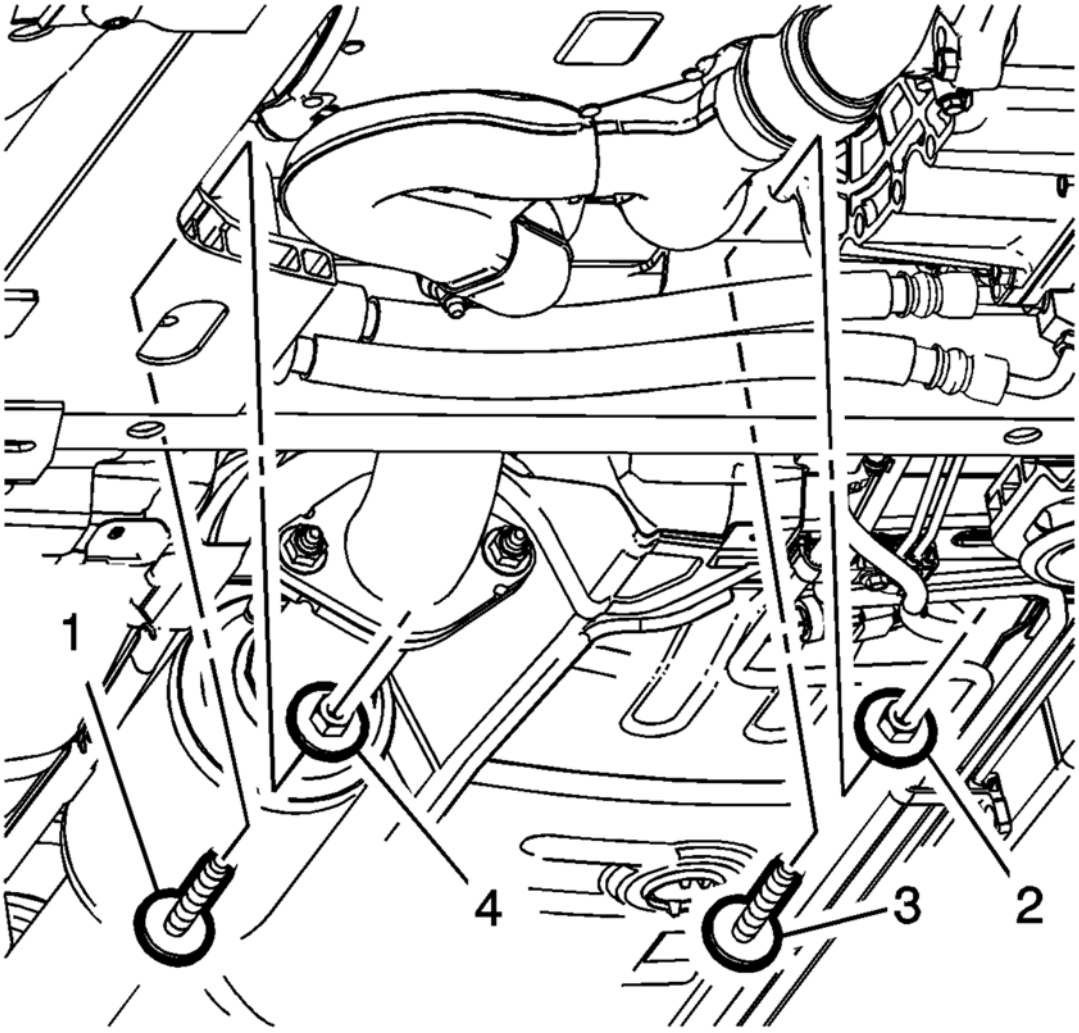

Fig. 55: Steering Gear Bolts And Nuts
Courtesy of GENERAL MOTORS COMPANY

CAUTION: Refer to Fastener Caution .

8. Install the 2 steering gear bolts (1, 3) and the 2 nuts (2, 4). Hold the nuts and tighten the steering gear bolts to 90 N.m (66 lb ft).
9. Install the rear engine mount. Refer to **Engine Rear Mount Replacement** .
10. Connect both of the outer tie rods to the steering knuckles. Refer to **Steering Linkage Outer Tie Rod Replacement**.
11. Connect the intermediate steering shaft to the steering gear pinion shaft. Refer to **Intermediate Steering Shaft Replacement** .
12. Install the front tire and wheel assemblies. Refer to **Tire and Wheel Removal and Installation** .
13. Lower the vehicle.

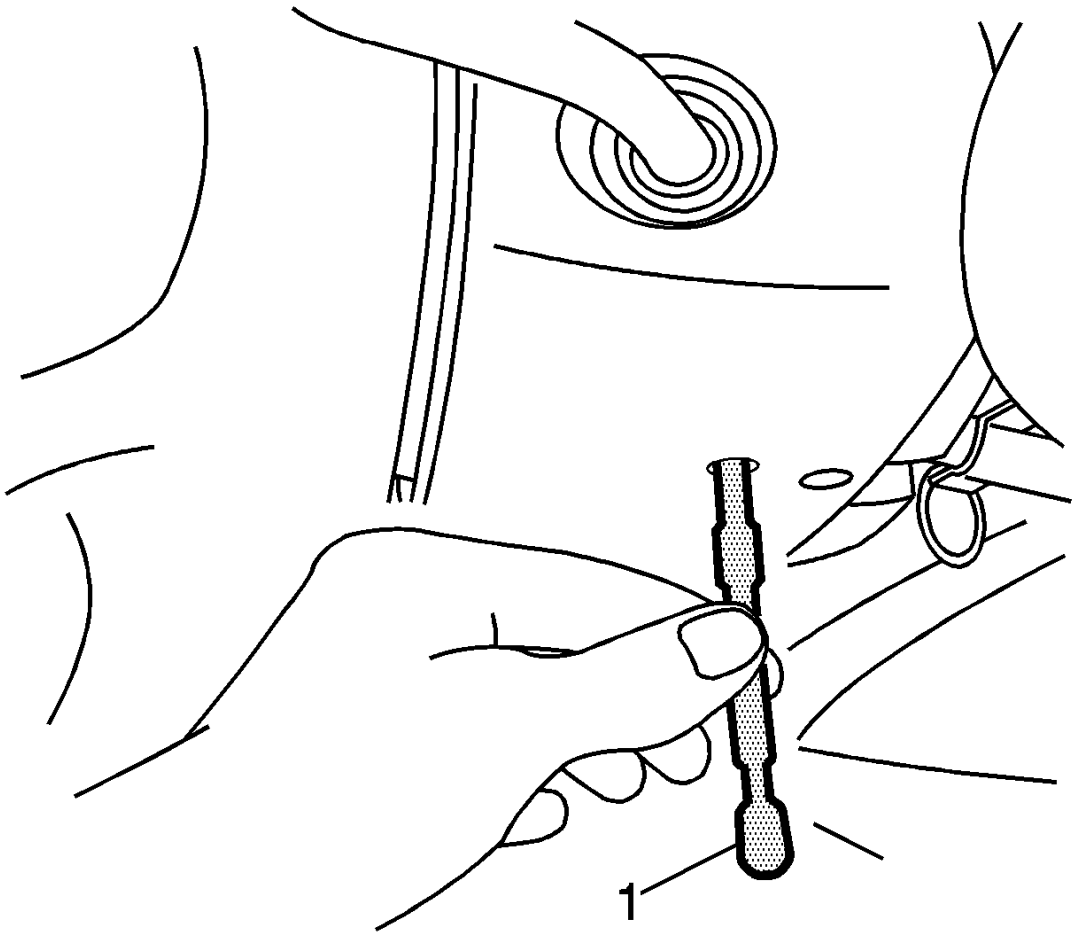

Fig. 56: Locking/Unlocking Steering Column
Courtesy of GENERAL MOTORS COMPANY

14. Remove the **J-42640** pin from the steering column.
15. Fill and bleed the power steering system. Refer to **Power Steering System Bleeding**.
16. Clean any excess power steering fluid from the vehicle.
17. Remove the drain pans.
18. Measure and adjust the front toe. Refer to **Wheel Alignment - Steering Wheel Angle and/or Front Toe Adjustment** .

STEERING LINKAGE INNER TIE ROD REPLACEMENT

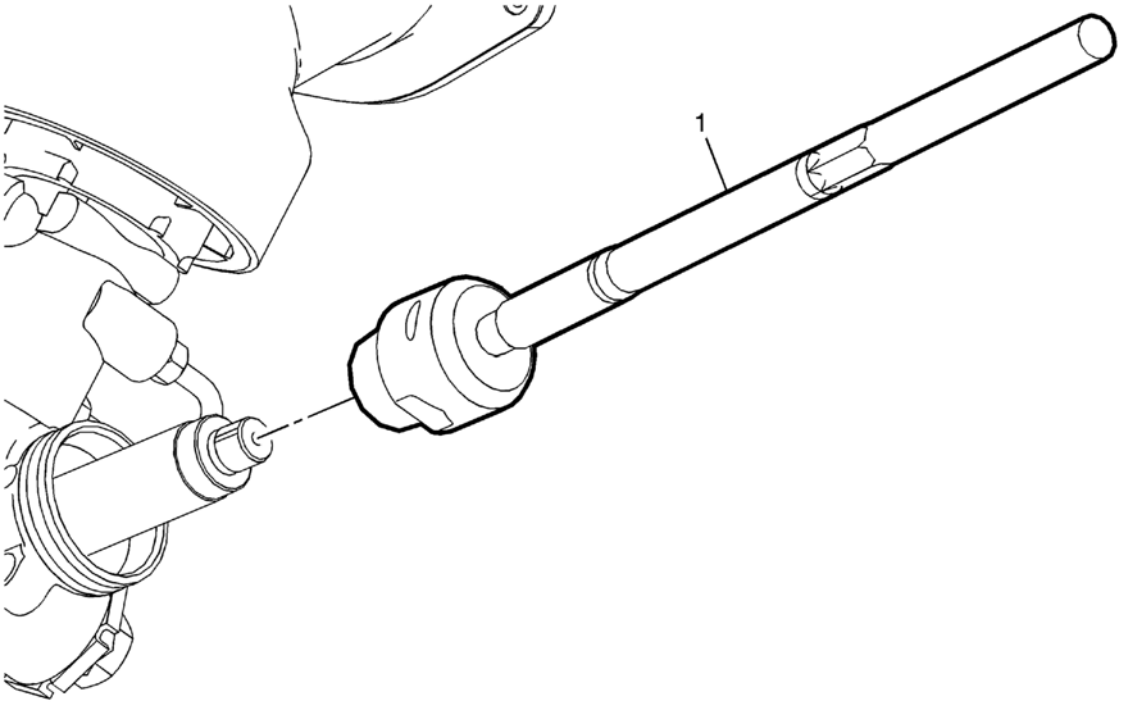

Fig. 57: Steering Linkage Inner Tie Rod
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedures 1. Raise and support the vehicle. Refer to **Lifting and Jacking the Vehicle** . 2. Remove the steering gear boot. Refer to **Steering Gear Boot Replacement**.	
1	Steering Linkage Inner Tie Rod **CAUTION:** **Do not change the steering gear preload adjustment before moving the inner tie rod from the steering gear. Changing the steering gear preload**

Callout	Component Name
	adjustment before moving the inner tie rod could result in damage to the pinion and the steering gear. **CAUTION:** **Refer to Fastener Caution .** **Procedure** 1. Place a wrench on the flats of the steering linkage inner tie rod housing. 2. Rotate the steering linkage inner tie rod housing counterclockwise in order to remove the steering linkage inner tie rod from the rack. 3. Rotate the steering linkage inner tie rod housing clockwise in order to install the steering linkage inner tie rod to the rack. **Tighten** 100 N.m (74 lb ft)

DESCRIPTION AND OPERATION

POWER STEERING SYSTEM DESCRIPTION AND OPERATION

The hydraulic power steering pump is a constant displacement vane-type pump that provides hydraulic pressure and flow for the power steering gear. The hydraulic power steering pump is either belt-driven or direct cam-driven.

The power steering fluid reservoir holds the power steering fluid. The power steering fluid reservoir may be integral with the power steering pump or remotely located. The vehicle may have a combination of a power steering fluid reservoir integral with the power steering pump and a remotely located power steering fluid reservoir. The following locations are typical locations for the remote reservoir:

- Mounted to the front of the dash panel
- Mounted to the inner fender
- Mounted to a bracket on the engine

The 2 basic types of power steering gears are listed below:

- A recirculating ball system
- A rack and pinion system

In the recirculating ball system, a worm gear converts steering wheel movement to movement of a sector shaft. A pitman arm attached to the bottom of the sector shaft actually moves one tie rod. An intermediate rod moves the other tie rod.

In the rack and pinion system, the rack and the pinion are the 2 components that convert steering wheel rotation to lateral movement. The steering shaft is attached to the pinion in the steering gear. The pinion rotates with the steering wheel. Gear teeth on the pinion mesh with the gear teeth on the rack. The rotating pinion moves the rack from side to side. The lateral action of the rack pushes and pulls the tie rods in order to change the direction of the vehicle's front wheels.

The power steering pressure hose connects the power steering pump union fitting to the power steering gear and allows pressurized power steering fluid to flow from the pump to the gear.

The power steering return hose returns fluid from the power steering gear back to the power steering fluid reservoir. The power steering return hose may contain an integral fin-type or line-type power steering fluid cooler.

In a typical power steering system, a pump generates hydraulic pressure, causing fluid to flow, via the pressure hose, to the steering gear valve assembly. The steering gear valve assembly regulates the incoming fluid to the right and left chambers in order to assist in right and left turns.

Turning the steering wheel activates the valve assembly, which applies greater fluid pressure and flow to 1 side of the steering gear piston, and lower pressure and flow to the other side of the piston. The pressure assists the movement of the gear piston. Tie rods transfer this force to the front wheels, which turn the vehicle right or left.

DIAGNOSTIC INFORMATION AND PROCEDURES

SYMPTOMS - STEERING WHEEL AND COLUMN

Review the system description and operation in order to familiarize yourself with the system functions. Refer to **Steering Wheel and Column Description and Operation**.

Visual/Physical Inspection

- Inspect for aftermarket devices which could affect the operation of the steering wheel and column.
- Inspect the easily accessible or visible system components for obvious damage or conditions which could cause the symptom.

Symptoms List

Refer to a symptom diagnostic procedure from the following list in order to diagnose the symptom:

- **Noise in Steering Column**
- **Looseness in Steering Column**
- **Steering Column Tilt Function Inoperative**
- **Ignition Can/Cannot Be Turned Off with Transmission in Any Gear**

STEERING COLUMN TILT FUNCTION INOPERATIVE

Step	Action	Yes	No
1	Did you review the Steering Wheel and Column Description and Operation and perform the necessary inspections?	Go to **Step 2**	Go to **Symptoms - Steering Wheel and Column**
2	Verify that the steering column tilt function is inoperative. Does the steering column tilt function operate normally?	System OK	Go to **Step 3**

Step	Action	Yes	No
3	If equipped, verify that the following components are not seized or corroded: • Tilt pivot pins • Tilt head lock shoes Are the components seized or corroded?	Go to **Step 7**	Go to **Step 4**
4	Inspect the tilt pivot pins for binding. Are the tilt pivot pins binding?	Go to **Step 8**	Go to **Step 5**
5	Inspect for a weak or broken steering column tilt spring. Is the steering column tilt spring weak or broken?	Go to **Step 9**	Go to **Step 6**
6	Inspect the steering column wiring harness routing for tightness. Was the steering column wiring harness routed correctly?	Go to **Step 11**	Go to **Step 10**
7	Replace the steering column. Refer to **Steering Column Replacement**. Did you complete the repair?	Go to **Step 11**	-
8	If serviceable, replace the pivot pins. If not serviceable replace the steering column. Refer to **Steering Column Replacement**. Did you complete the repair?	Go to **Step 11**	-
9	If serviceable, replace the tilt spring. Did you complete the repair?	Go to **Step 11**	-
10	Route the steering column wiring harness to the correct location. Did you correctly route the wiring harness?	Go to **Step 11**	-
11	Operate the steering column tilt function in order to verify the repair. Did you correct the condition?	System OK	Go to **Step 3**

NOISE IN STEERING COLUMN

Step	Action	Yes	No
1	Did you review the Steering Wheel and Column Description and Operation and perform the necessary inspections?	Go to **Step 2**	Go to **Symptoms - Steering Wheel and Column**
2	Verify that noise is present in the steering column during operation. Is noise present in the steering column during operation?	Go to **Step 3**	System OK

Step	Action	Yes	No
3	Inspect the steering column mounting features for the following conditions: • The steering column mounting fasteners are loose. • The steering column mounting features are sheared. Are the steering column mounting features loose or sheared?	Go to **Step 10**	Go to **Step 4**
4	Inspect the SIR/SRS coil for noise. Is the SIR/SRS coil noisy?	Go to **Step 11**	Go to **Step 5**
5	If equipped, inspect the lock plate retaining ring for correct installation. Is the lock plate retaining ring installed incorrectly?	Go to **Step 12**	Go to **Step 6**
6	Inspect the steering column upper and lower bearings for the following conditions: • Damage • Lubrication • Wear • Proper seating Are the bearings in need of repair or replacement?	Go to **Step 13**	Go to **Step 7**
7	Does the steering column tilt joint need to be lubricated?	Go to **Step 14**	Go to **Step 8**
8	**NOTE:** **Inspect the intermediate steering shaft for noise while driving the vehicle, turning the steering wheel, and applying the brakes.** Inspect the intermediate steering shaft for noise.Is the intermediate steering shaft noisy?	Go to **Step 15**	Go to **Step 9**

Step	Action	Yes	No
9	**NOTE:** **For vehicles equipped with a telescoping steering column, perform this step. If not equipped, go to next step.** Inspect the steering column for noise while telescoping the column.Is the steering column noisy while telescoping?	Go to **Step 16**	Go to **Step 17**
10	**NOTE:** **If the steering column mounting features are damaged or sheared, replace the steering column. Refer to Steering Column Replacement.** Tighten the steering column mounting fasteners to specification. Refer to **Fastener Specifications**.Did you complete the repair?	Go to **Step 17**	-
11	Replace the SIR/SRS coil. Refer to **Steering Wheel Airbag Coil Replacement** . Did you complete the repair?	Go to **Step 17**	-
12	Install the lock plate retaining ring correctly. Did you complete the repair?	Go to **Step 17**	-
13	**NOTE:** **If the steering column upper and/or lower bearings are**	Go to **Step 17**	-

Step	Action	Yes	No
	not serviceable, replace the steering column. Refer to Steering Column Replacement. Replace the steering column upper and/or lower bearings, if serviceable.Did you complete the replacement?		
14	Lubricate the steering column tilt joint. Did you complete the repair?	Go to **Step 17**	-
15	Replace the appropriate intermediate steering shaft component. Did you complete the repair?	Go to **Step 17**	-
16	Redistribute or add lubricant to the steering column lower jacket with the column telescoped to its end of outward travel. Did you complete the repair?	Go to **Step 17**	-
17	Operate the system in order to verify the repair. Did you correct the condition?	System OK	Go to **Step 3**

LOOSENESS IN STEERING COLUMN

Step	Action	Yes	No
1	Did you review the Steering Wheel and Column Description and Operation and perform the necessary inspections?	Go to **Step 2**	Go to **Symptoms - Steering Wheel and Column**
2	Verify that the steering column is loose. Is the steering column loose?	Go to **Step 3**	System OK
3	Inspect the steering column mounting features for the following conditions. • The steering column mounting fasteners are loose. • The steering column mounting features are sheared. Are the steering column mounting features loose or sheared?	Go to **Step 5**	Go to **Step 4**
4	Inspect the upper and/or lower bearings for looseness. Are any of the bearings worn or loose?	Go to **Step 6**	Go to **Step 7**

Step	Action	Yes	No
5	**NOTE:** **If the steering column mounting features are damaged or sheared, replace the steering column. Refer to Steering Column Replacement.** Tighten the steering column mounting fasteners to specification. Refer to **Fastener Specifications**.Did you complete the repair?	Go to **Step 7**	-
6	**NOTE:** **If the steering column upper and/or lower bearings are not serviceable, replace the steering column. Refer to Steering Column Replacement.** Replace the upper and/or lower bearings, if serviceable.Did you complete the repair?	Go to **Step 7**	-
7	Operate the steering column in order to verify the repair. Did you correct the condition?	System OK	Go to **Step 3**

REPAIR INSTRUCTIONS

INTERMEDIATE STEERING SHAFT SEAL REPLACEMENT

Special Tools

J-42640 Steering Column Anti-rotation Pin

Removal Procedure

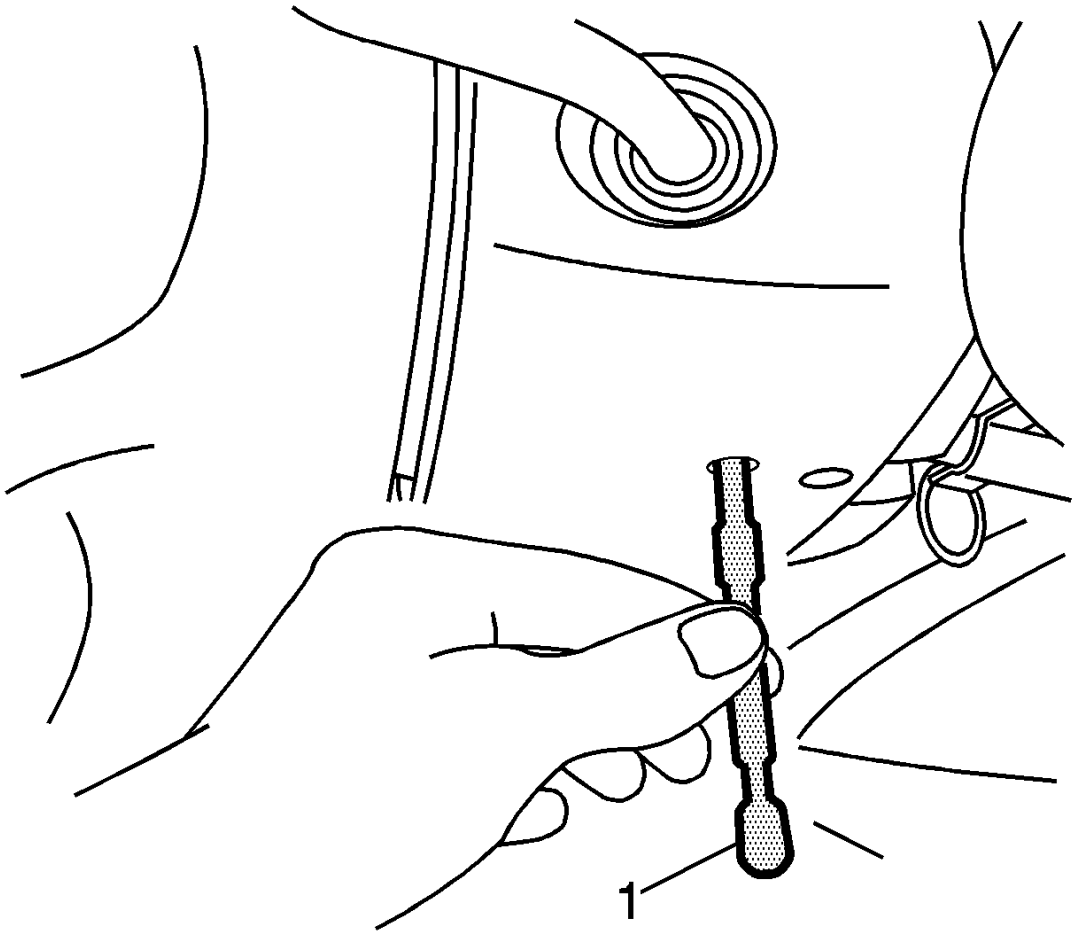

Fig. 3: Locking/Unlocking Steering Column
Courtesy of GENERAL MOTORS COMPANY

CAUTION: **With wheels of the vehicle facing straight ahead, secure the steering wheel utilizing steering column anti-rotation pin, steering column lock, or a strap to prevent rotation. Locking of the steering column will prevent damage and a possible malfunction of the SIR system. The steering wheel must be secured in position before disconnecting the following components:**

- **The steering column**
- **The intermediate shaft(s)**
- **The steering gear**

After disconnecting these components, do not rotate the steering wheel or move the front tires and wheels. Failure to follow this procedure may cause the SIR coil assembly to become un-centered and cause possible

damage to the SIR coil. If you think the SIR coil has become un-centered, refer to your specific SIR coil's centering procedure to re-center SIR Coil.

1. Insert the **J-42640** pin into the steering column access hole in order to lock the steering column.
2. Separate the intermediate steering shaft seal from the steering column.
3. Disconnect the intermediate steering shaft from the steering column. Refer to **Intermediate Steering Shaft Replacement**.
4. Push the intermediate steering shaft down in order to collapse the intermediate steering shaft.

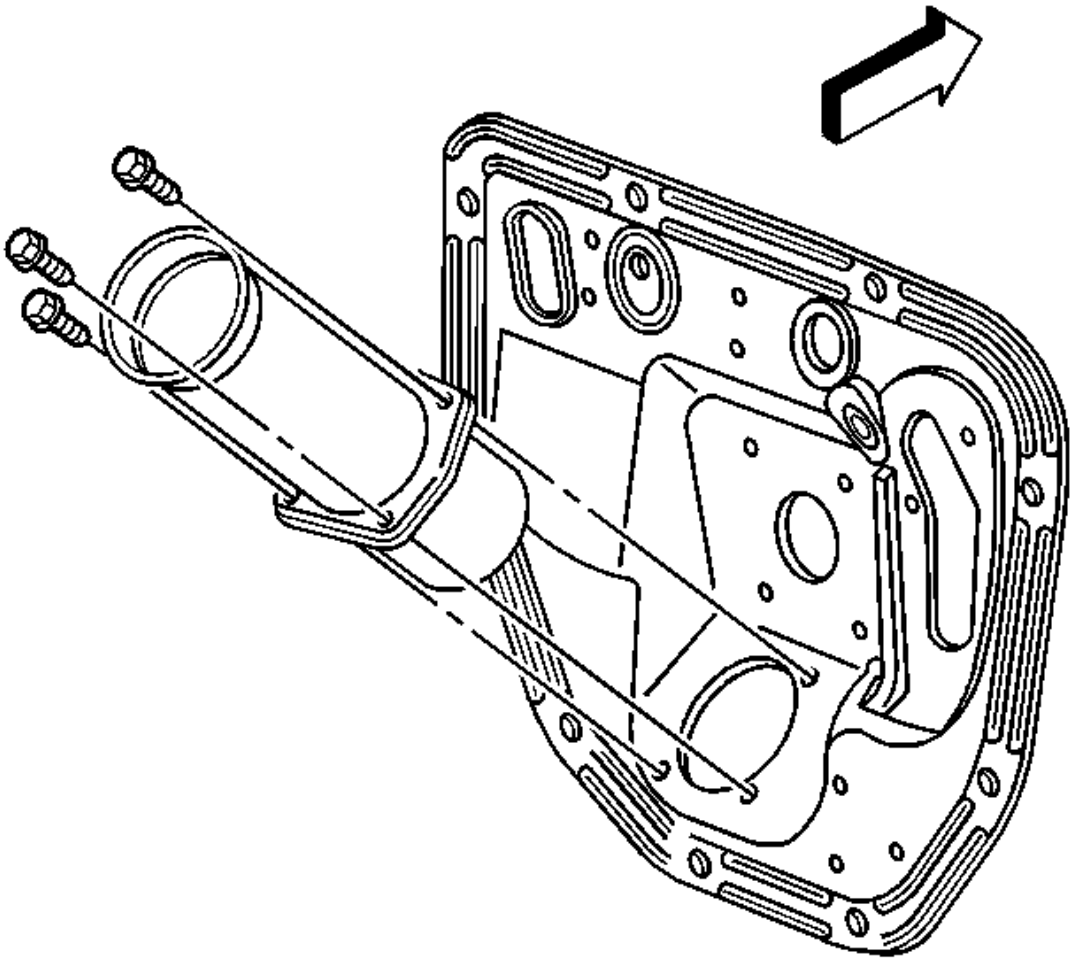

Fig. 4: Locating Intermediate Shaft Seal Bolts
Courtesy of GENERAL MOTORS COMPANY

5. Remove the intermediate steering shaft seal bolts.
6. Separate the intermediate steering shaft seal from the steering gear.
7. Remove the intermediate steering shaft seal from the vehicle.

Installation Procedure

1. Position the intermediate steering shaft seal in the vehicle.
2. Position the intermediate steering shaft lower seal on the intermediate shaft and on the steering gear.
3. Position the intermediate steering shaft upper seal over the lower seal and on the dash panel.
4. Connect the intermediate steering shaft to the steering column. Refer to **Intermediate Steering Shaft Replacement**.
5. Install the intermediate steering shaft seal to the steering column.

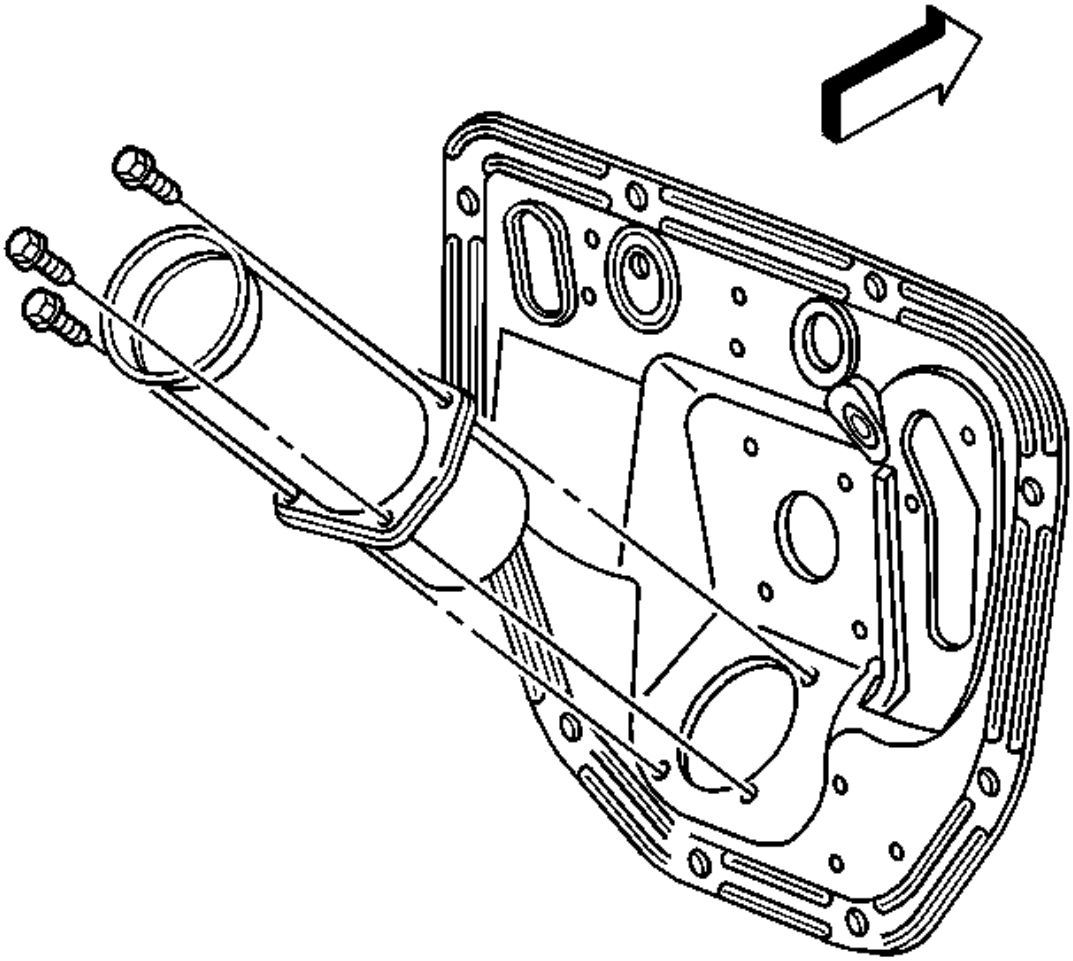

Fig. 5: Locating Intermediate Shaft Seal Bolts
Courtesy of GENERAL MOTORS COMPANY

CAUTION: Refer to Fastener Caution .

6. Install the intermediate steering shaft seal bolts and tighten to 3 N.m (27 lb in).
7. Remove the **J-42640** pin.

INTERMEDIATE STEERING SHAFT REPLACEMENT

Special Tools

J 42640 Steering Column Anti-rotation Pin

For equivalent regional tools, refer to **Special Tools**.

Removal Procedure

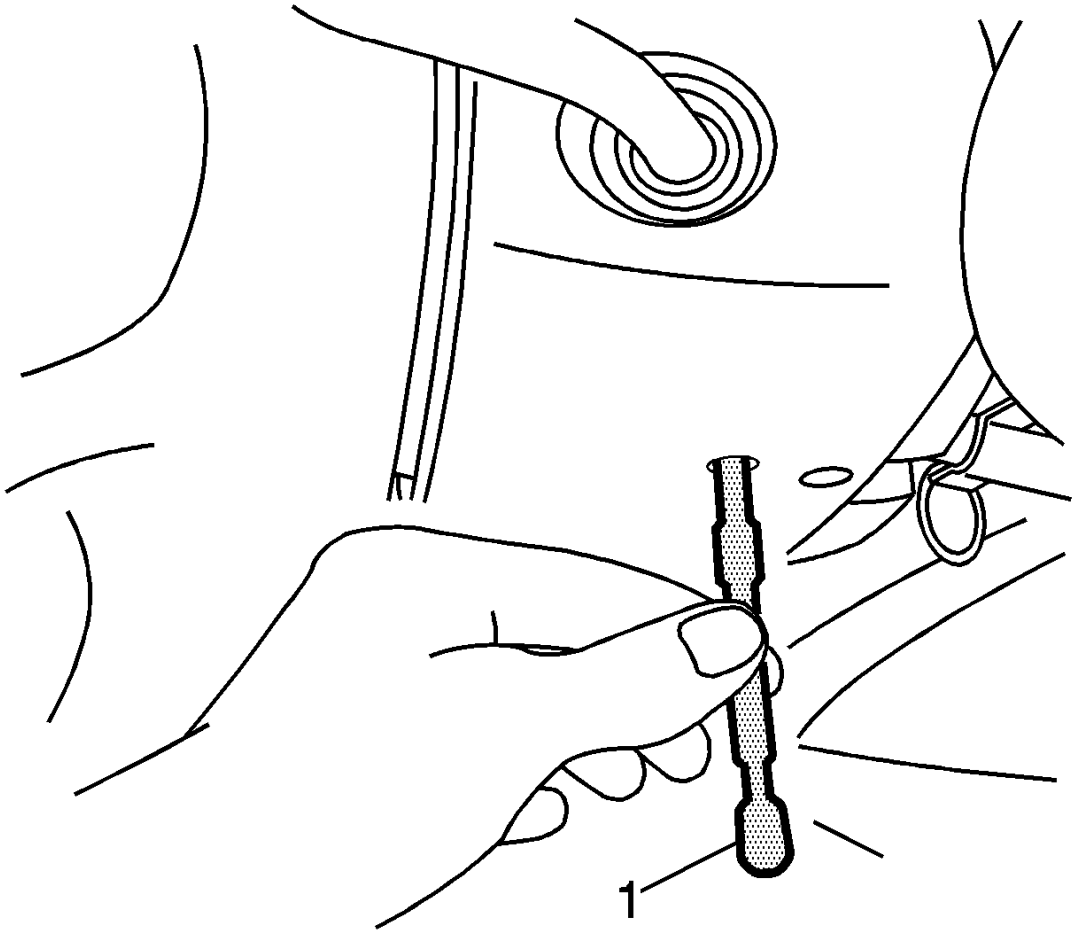

Fig. 6: Locking/Unlocking Steering Column
Courtesy of GENERAL MOTORS COMPANY

CAUTION: **With wheels of the vehicle facing straight ahead, secure the steering wheel utilizing steering column anti-rotation pin, steering column lock, or a strap to prevent rotation. Locking of the steering column will prevent damage and a possible malfunction of the SIR system. The steering wheel must be secured in position before disconnecting the following components:**

- **The steering column**
- **The intermediate shaft(s)**
- **The steering gear**

After disconnecting these components, do not rotate the steering wheel or move the front tires and wheels. Failure to follow this procedure may

cause the SIR coil assembly to become un-centered and cause possible damage to the SIR coil. If you think the SIR coil has became un-centered, refer to your specific SIR coil's centering procedure to re-center SIR Coil.

1. Insert the **J-42640** pin into the steering column access hole in order to lock the steering column.
2. Remove the front left tire and wheel assembly. Refer to **Tire and Wheel Removal and Installation** .

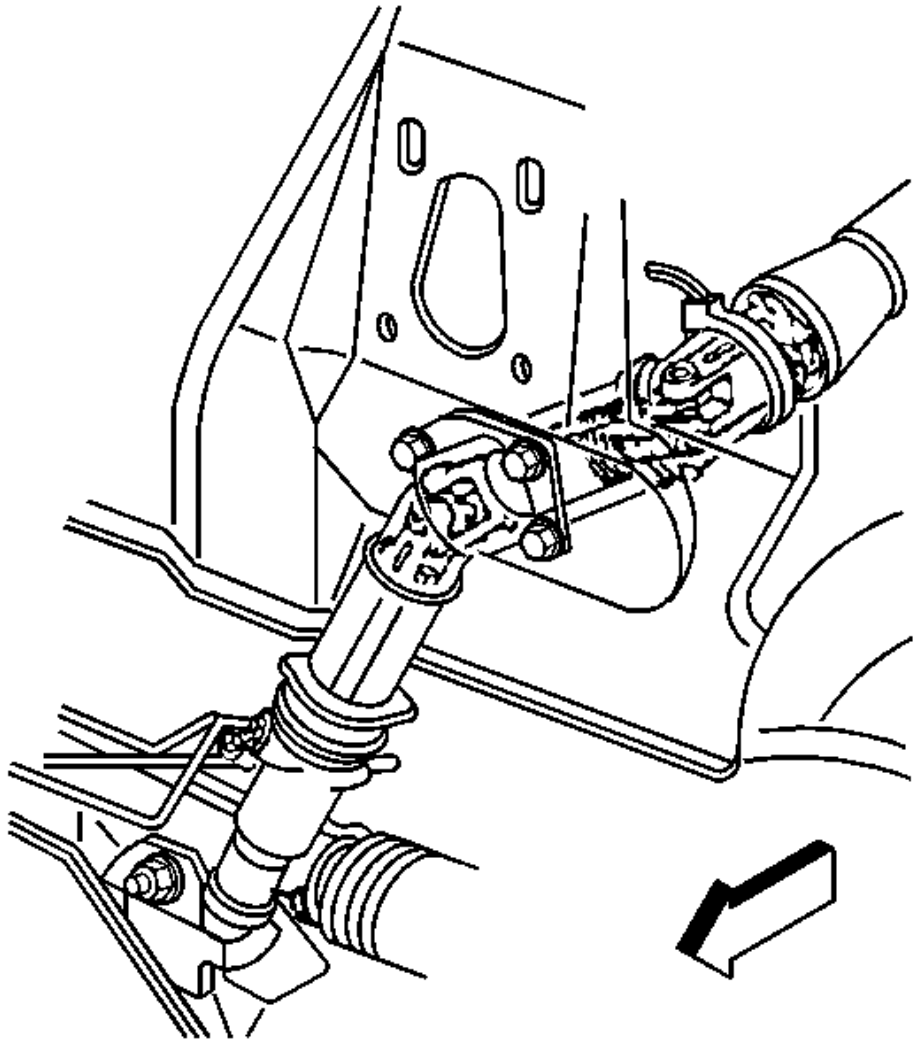

Fig. 7: Providing Access To Intermediate Steering Shaft Lower Pinch Bolt
Courtesy of GENERAL MOTORS COMPANY

3. Move the intermediate steering shaft seal at the steering gear in order to provide access to the intermediate steering shaft lower bolt.
4. Use paint in order to place match marks on the intermediate shaft and on the steering gear.

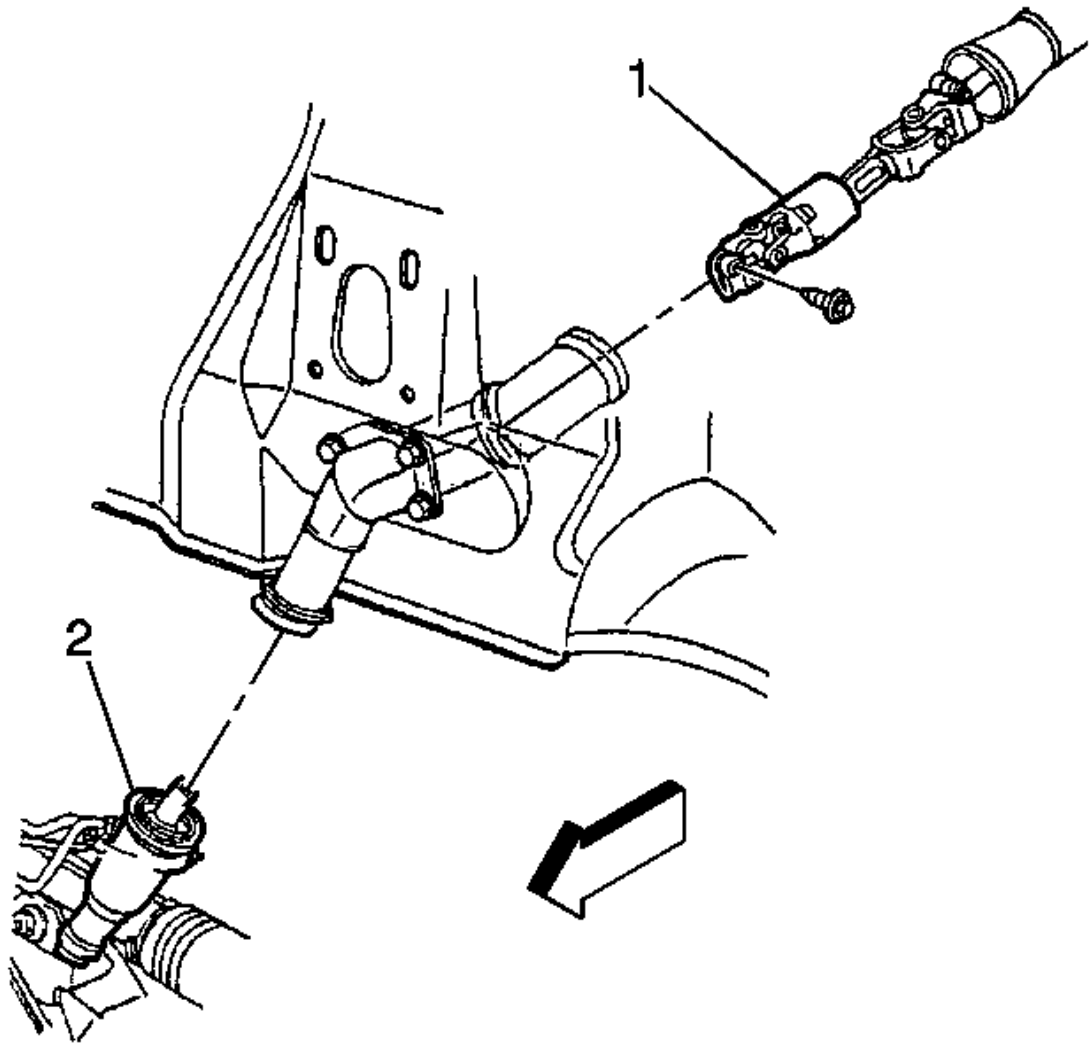

Fig. 8: View Of Intermediate Steering Shaft To Power Steering Gear Stub Shaft
Courtesy of GENERAL MOTORS COMPANY

5. Remove the intermediate steering shaft lower pinch bolt from the steering gear (2).
6. Separate the intermediate steering shaft (1) from the steering gear (2).
7. Remove the left instrument panel insulator panel. Refer to **Instrument Panel Insulator Panel Replacement - Left Side** .

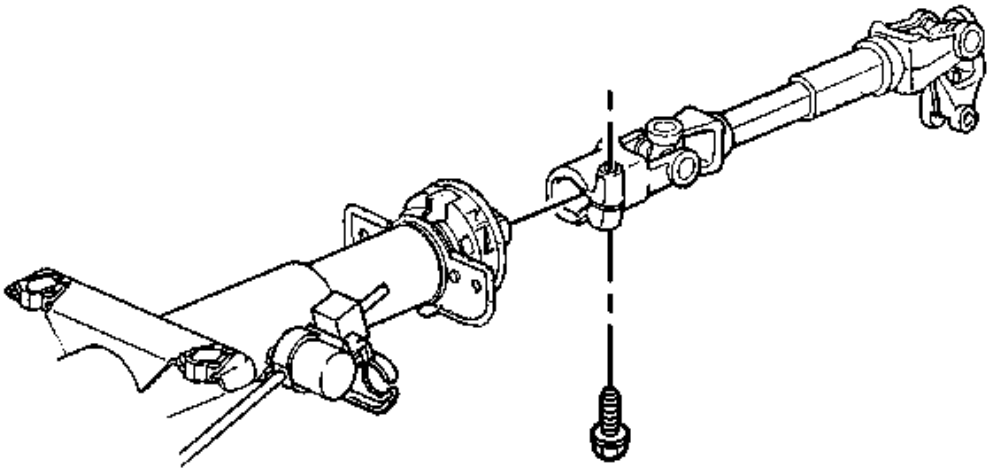

Fig. 9: View Of Upper Pinch Bolt Of Intermediate Steering Shaft
Courtesy of GENERAL MOTORS COMPANY

8. Reposition the intermediate steering shaft seal in order to gain access to the intermediate steering shaft bolt at the steering column.
9. Use paint in order to place match marks on the intermediate shaft and on the steering column.
10. Remove the intermediate steering shaft bolt and nut at the steering column.
11. Disconnect the intermediate steering shaft from the steering column.
12. Remove the intermediate steering shaft from the vehicle.

Installation Procedure

1. If you are installing a NEW intermediate shaft, copy the match marks from the old intermediate shaft to the new intermediate shaft.

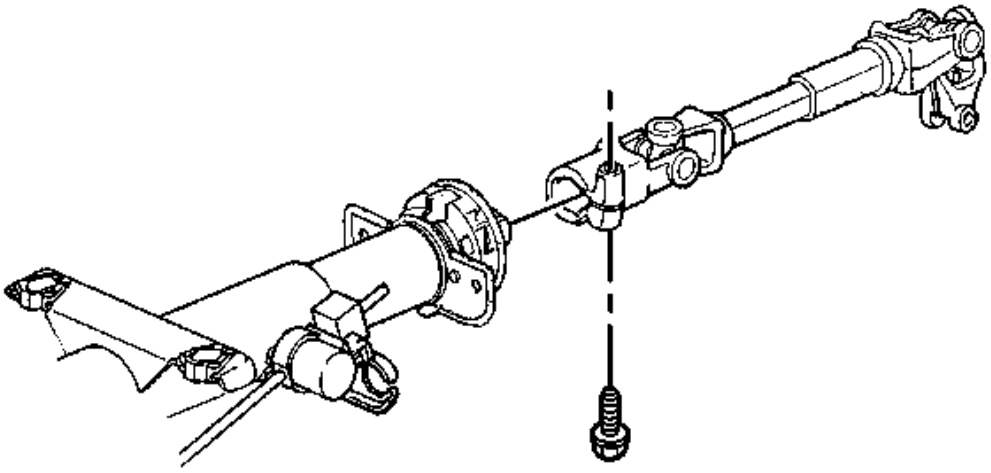

Fig. 10: View Of Upper Pinch Bolt Of Intermediate Steering Shaft
Courtesy of GENERAL MOTORS COMPANY

2. Position the intermediate steering shaft in the vehicle.
3. Align the match marks and connect the intermediate shaft to the steering column.

CAUTION: Refer to Fastener Caution .

4. Install the intermediate steering shaft bolt at the steering column and tighten to 62 N.m (46 lb ft).
5. Position the intermediate steering shaft seal onto the steering column.
6. Install the left instrument panel insulator panel. Refer to **Instrument Panel Insulator Panel Replacement - Left Side** .

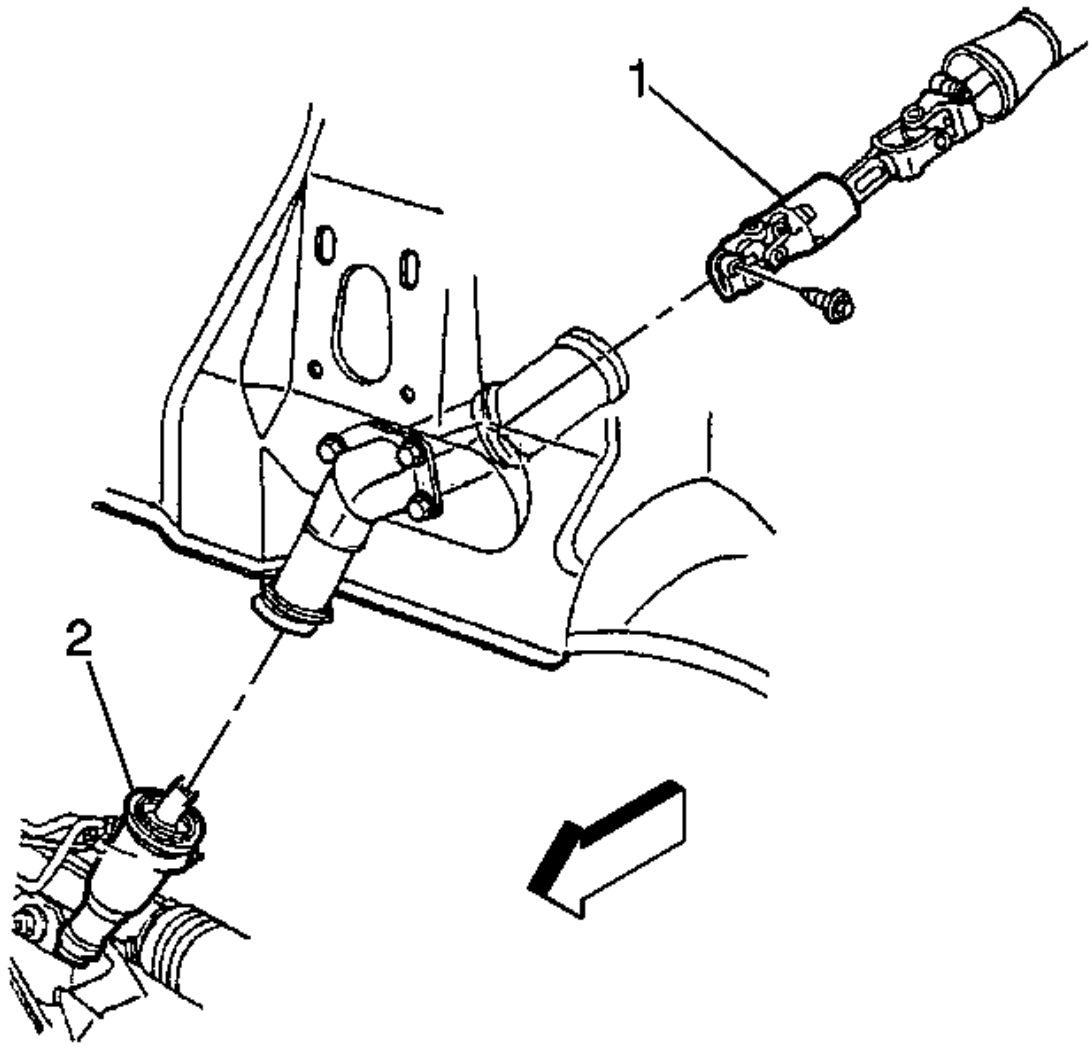

Fig. 11: View Of Intermediate Steering Shaft To Power Steering Gear Stub Shaft
Courtesy of GENERAL MOTORS COMPANY

7. Align the match marks and connect the intermediate steering shaft (1) to the power steering gear stub shaft (2).
8. Install the intermediate steering shaft lower bolt at the steering gear and tighten to 48 N.m (35 lb ft).

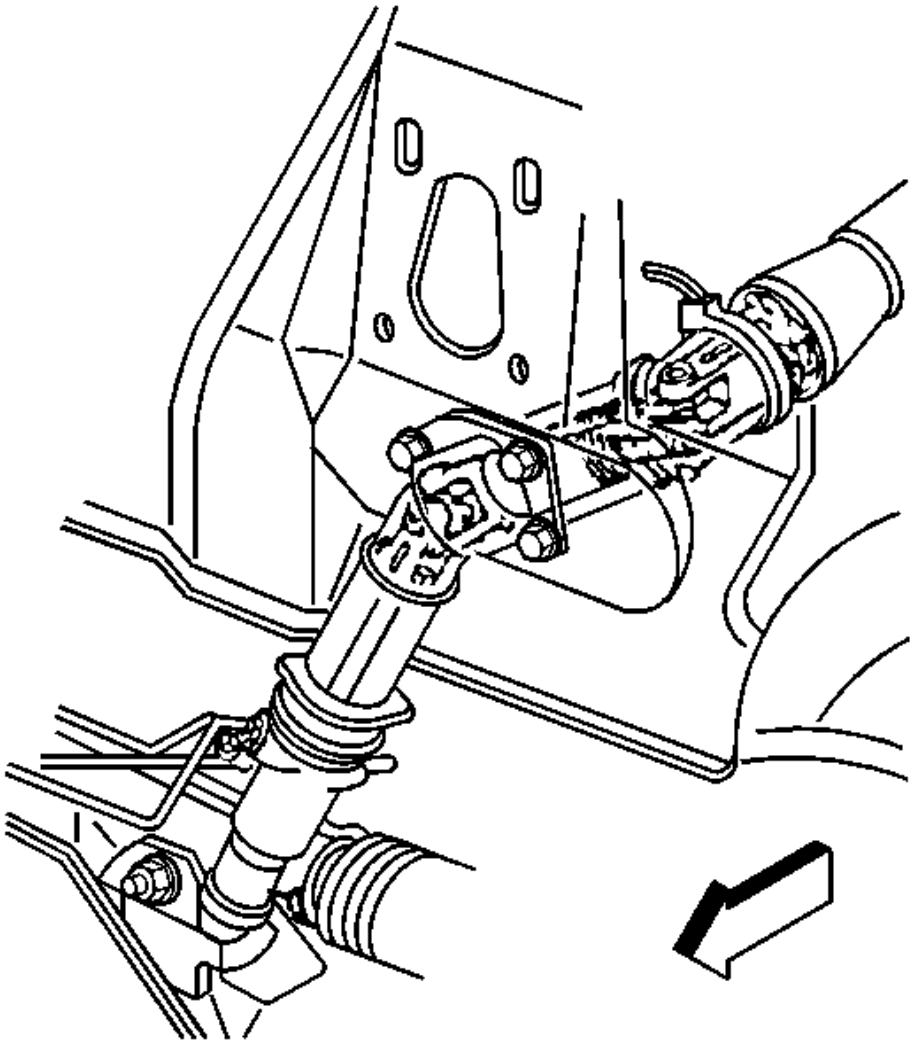

Fig. 12: Providing Access To Intermediate Steering Shaft Lower Pinch Bolt
Courtesy of GENERAL MOTORS COMPANY

9. Position the intermediate steering shaft seal onto the steering gear.
10. Install the tire and wheel assembly. Refer to **Tire and Wheel Removal and Installation** .
11. Remove the **J 42640** pin.

STEERING COLUMN ACCIDENT DAMAGE INSPECTION

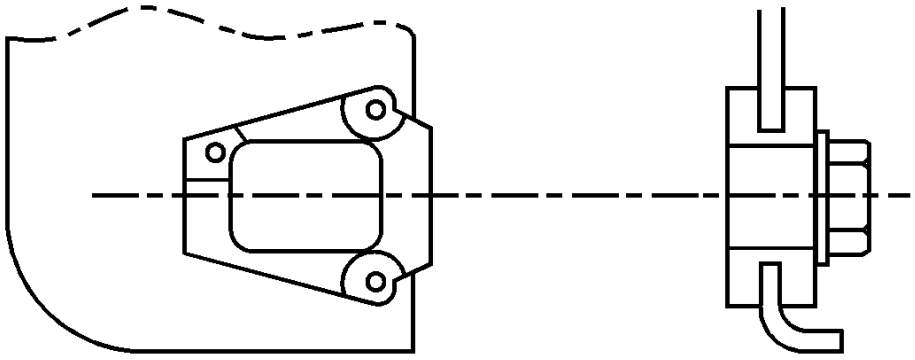

Fig. 13: Inspecting Capsules On Steering Column Bracket Assembly
Courtesy of GENERAL MOTORS COMPANY

CAUTION: Vehicles involved in accidents that result in any of the following kinds of damage or situations, may also have a damaged or misaligned steering column:

- **Frame damage**
- **Major body damage**
- **Sheet metal damage**
- **If the steering column has been impacted**
- **If the supplemental inflatable restraints system was deployed**

- Inspect the capsules on the steering column bracket assembly. All capsules must be securely seated in the bracket slots and inspected for any loose conditions when pushed or pulled by hand.
- Observe how the bracket is attached to the jacket assembly.
  - If the capsules are not securely seated and the bracket is bolted to the jacket assembly, replace only the bracket.

- If the capsules are not securely seated and the bracket is welded to the jacket assembly, replace only the jacket assembly.

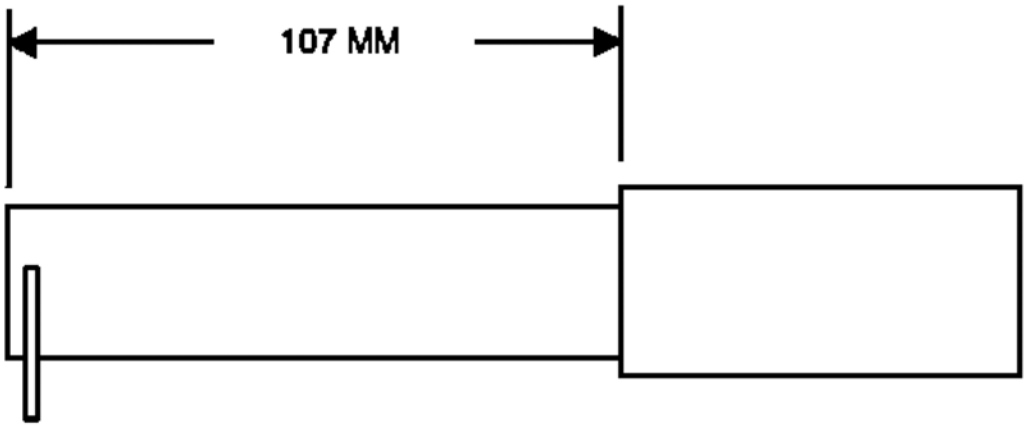

Fig. 14: Measuring Distance From Lower Edge Of Upper Jacket To A Defined Point On Lower Jacket
Courtesy of GENERAL MOTORS COMPANY

- Inspect for jacket assembly collapse by measuring the distance from the lower edge of the upper jacket to a defined point on the lower jacket. Replace the jacket assembly if the measured dimensions are not within specifications.

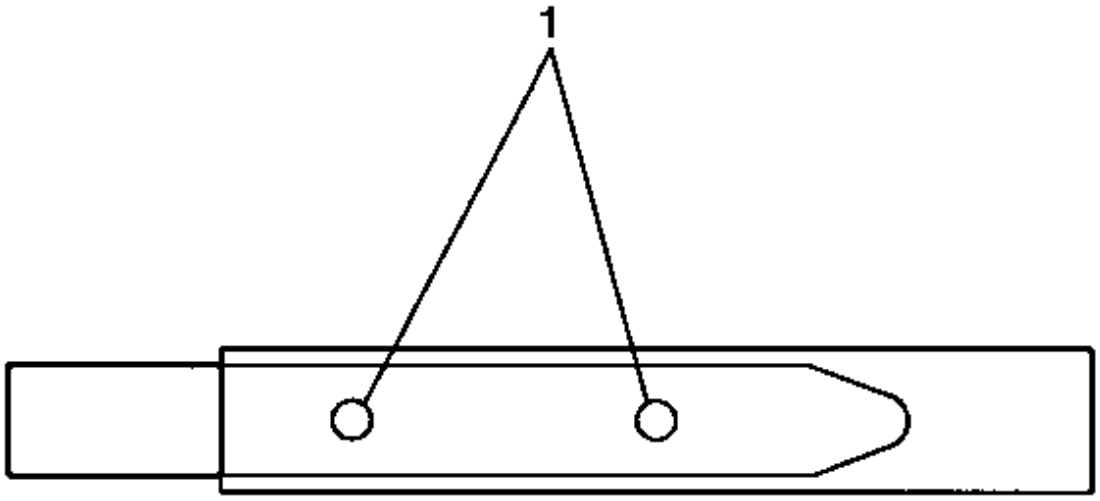

Fig. 15: Inspecting Steering Shaft For Sheared Injected Plastic
Courtesy of GENERAL MOTORS COMPANY

- Visually inspect the steering shaft for sheared injected plastic (1). If the steering shaft shows sheared plastic (1), replace the steering shaft.
- Any frame damage that could cause a bent steering shaft must have the steering shaft runout checked. Using a dial indicator at the lower end of the steering shaft, rotate the steering wheel. The runout must not exceed 1.60 mm (0.06 in).

STEERING COLUMN TRIM COVER REPLACEMENT

Removal Procedure

1. Remove the steering wheel. Refer to **Steering Wheel Replacement**.
2. Remove the steering column opening filler. Refer to **Steering Column Opening Filler Replacement** .

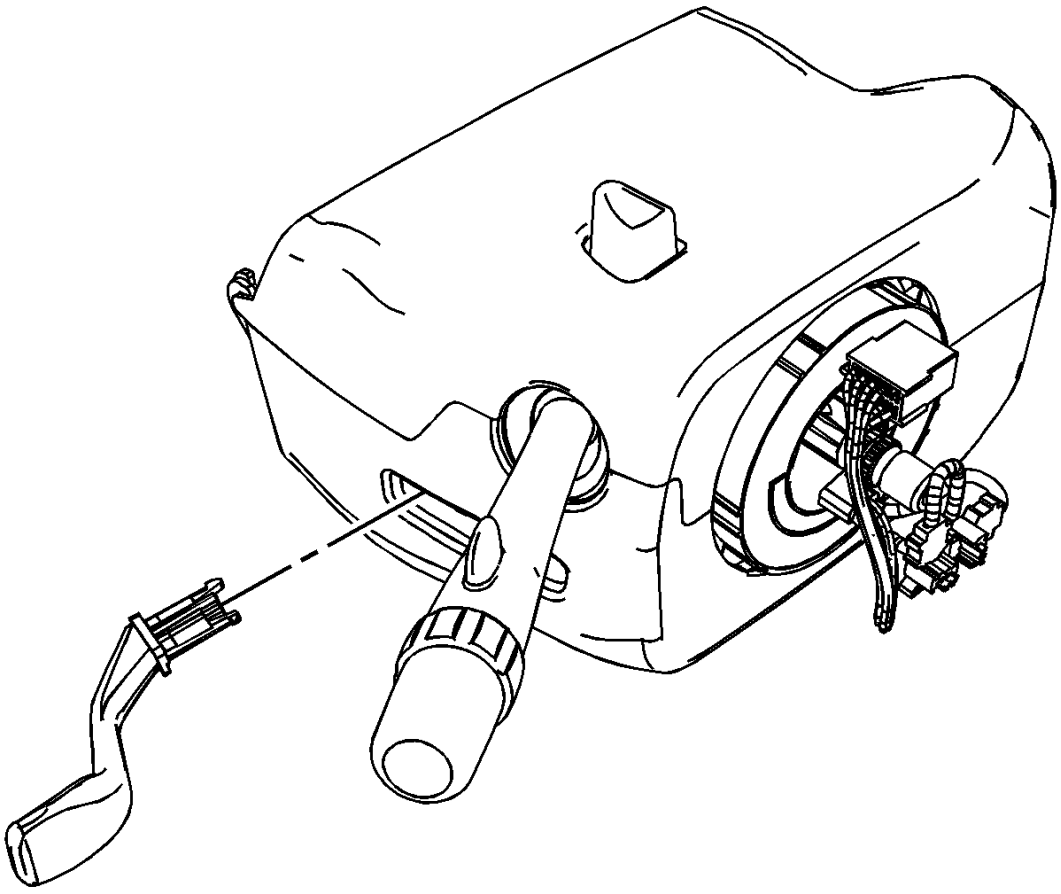

Fig. 16: View Of Tilt Lever
Courtesy of GENERAL MOTORS COMPANY

3. Remove the tilt lever.

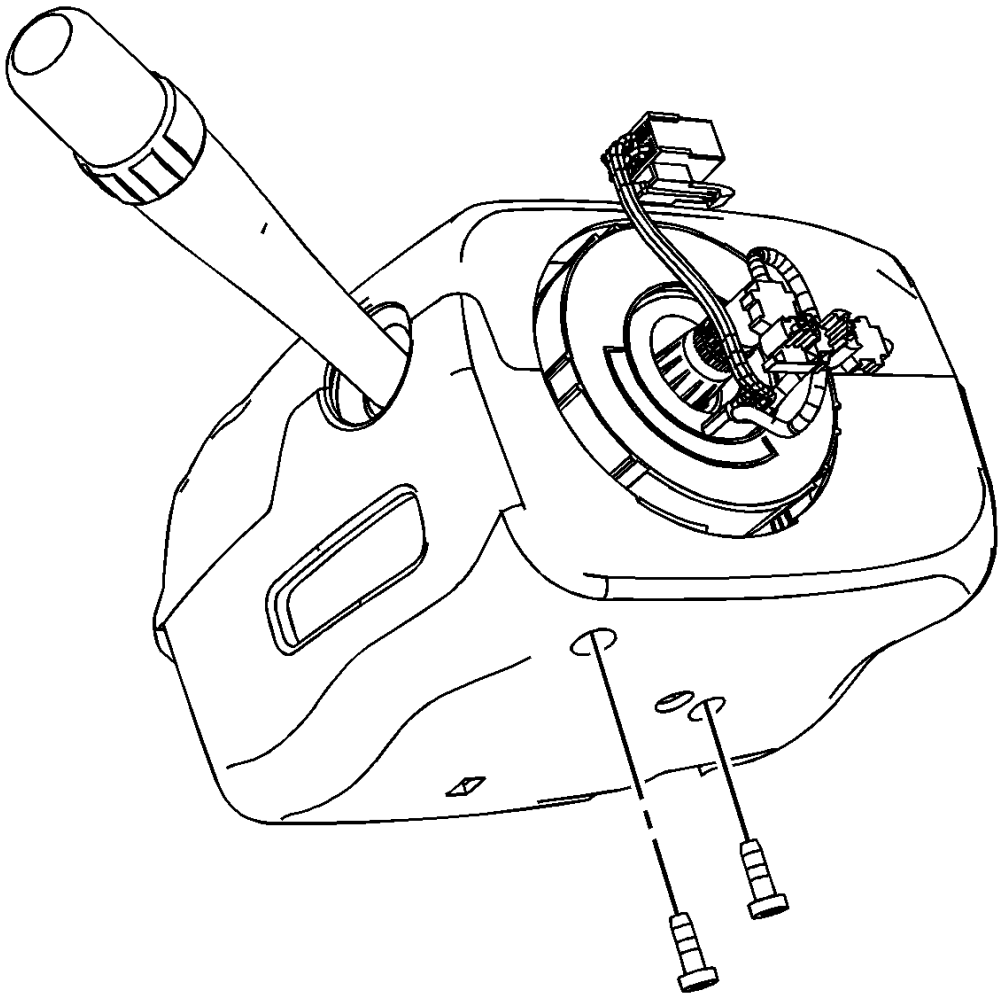

Fig. 17: View Of Lower Steering Column Trim Cover & Retaining Screws
Courtesy of GENERAL MOTORS COMPANY

4. Remove the steering column trim cover bolts.

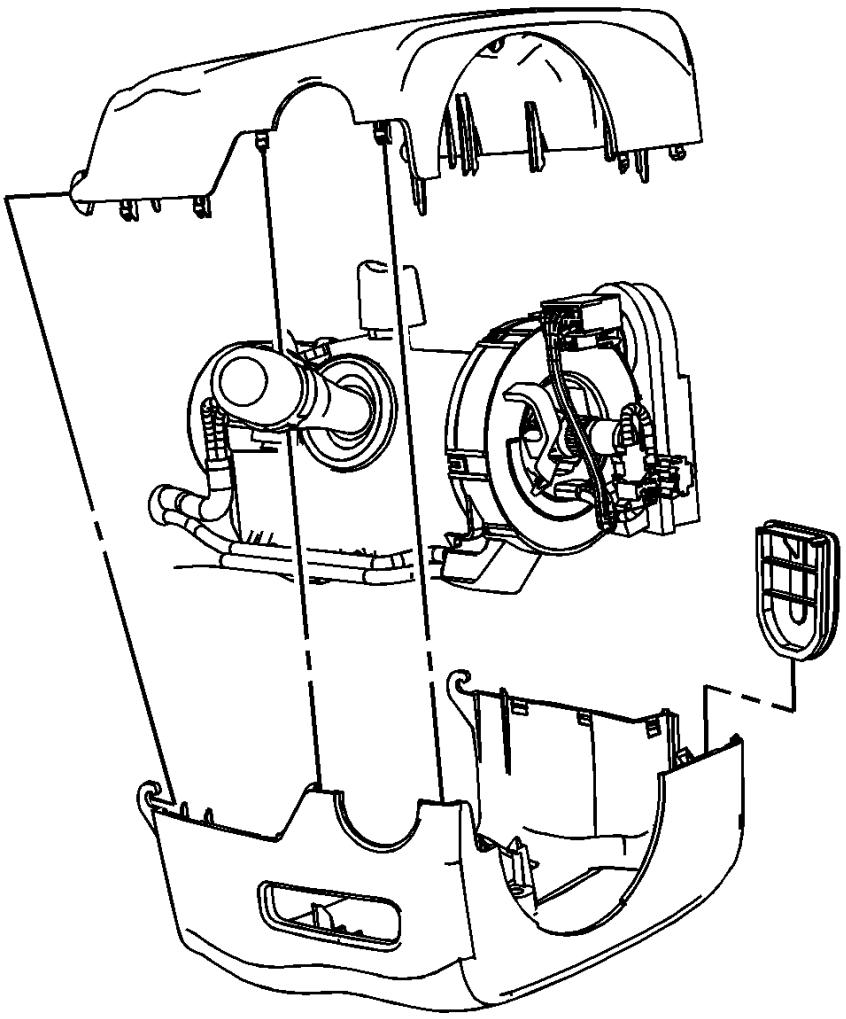

Fig. 18: View Of Upper & Lower Steering Column Cover & Steering Column
Courtesy of GENERAL MOTORS COMPANY

5. Separate the upper steering column trim cover from the lower steering column trim cover and remove them from the vehicle.

Installation Procedure

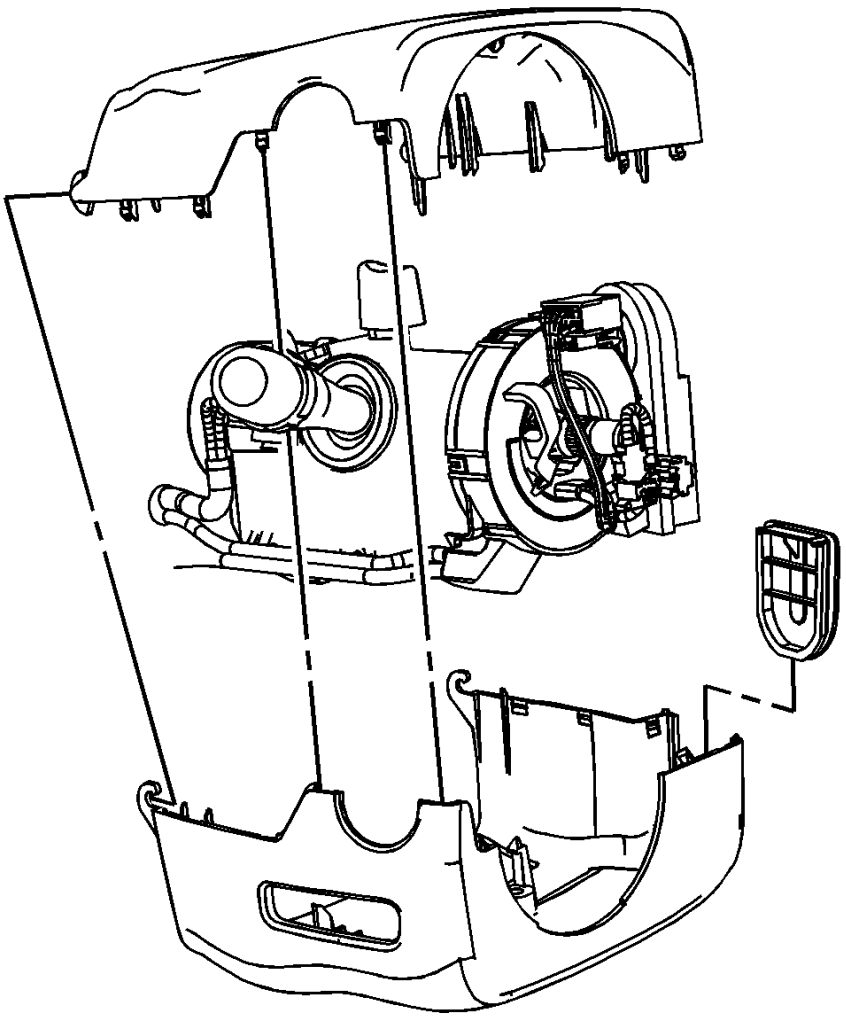

Fig. 19: View Of Upper & Lower Steering Column Cover & Steering Column
Courtesy of GENERAL MOTORS COMPANY

1. Position the upper steering column trim cover and the lower steering column trim cover together on the steering column.

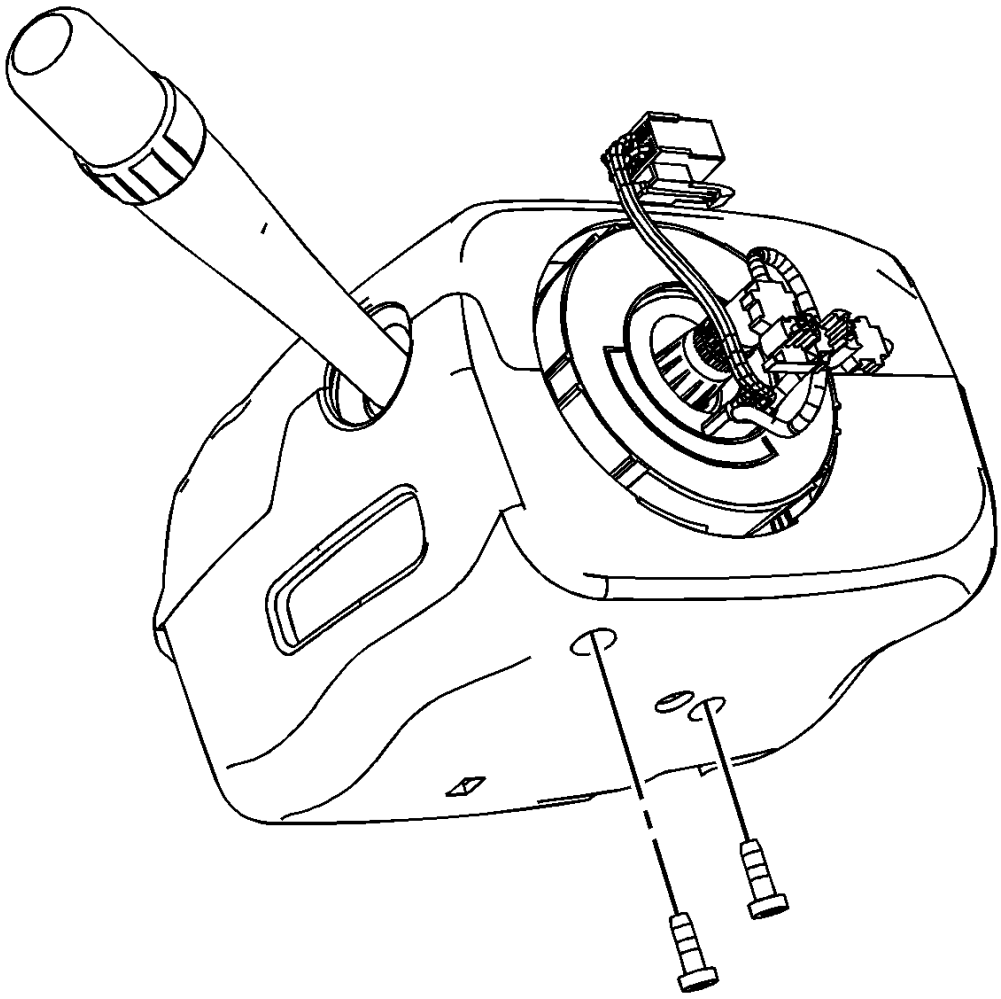

Fig. 20: View Of Lower Steering Column Trim Cover & Retaining Screws
Courtesy of GENERAL MOTORS COMPANY

CAUTION: Refer to Fastener Caution .

2. Install the steering column trim cover bolts and tighten to 3 N.m (27 lb in).

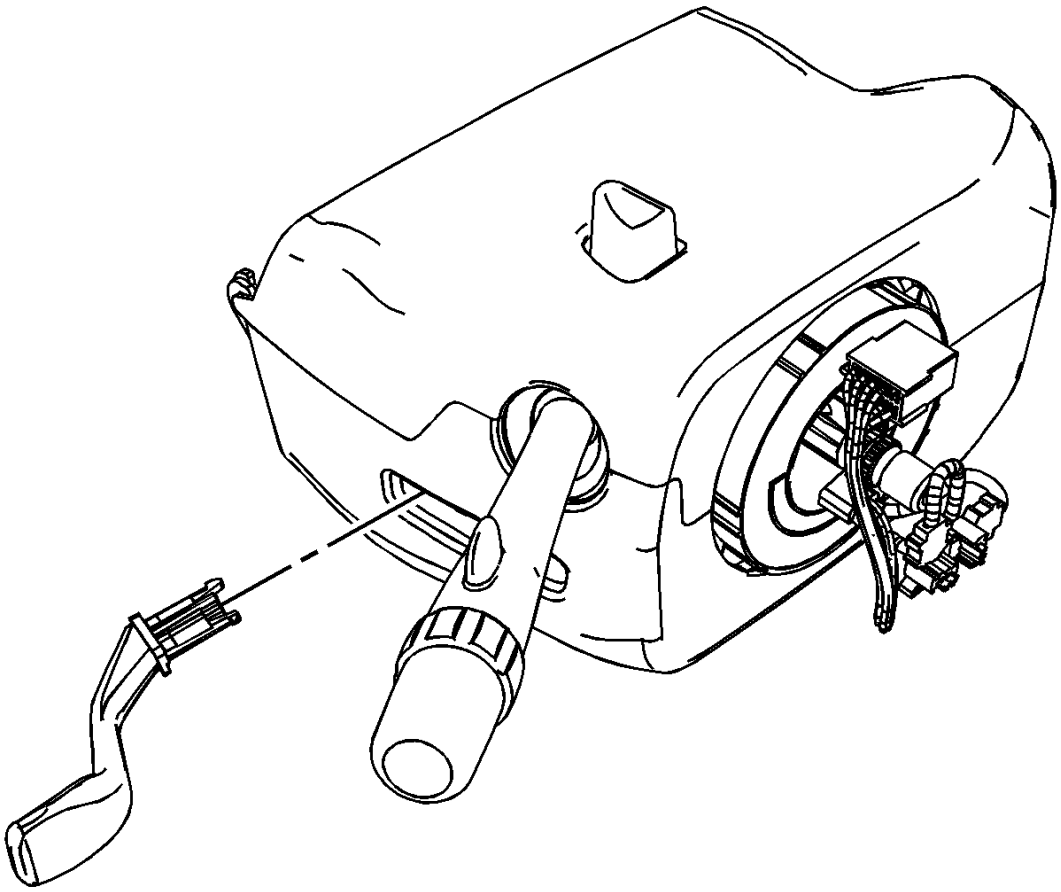

Fig. 21: View Of Tilt Lever
Courtesy of GENERAL MOTORS COMPANY

3. Install the tilt lever.
4. Install the steering column opening filler. Refer to **Steering Column Opening Filler Replacement** .
5. Install the steering wheel. Refer to **Steering Wheel Replacement**.

TURN SIGNAL CANCEL CAM AND STEERING SHAFT UPPER BEARING SPRING REPLACEMENT

Special Tools

- **J 23653-SIR** Steering Column Lock Plate Compressor
- **J 42137** Steering Column Lock Plate Compressor Adapter

For equivalent regional tools, refer to **Special Tools**.

Removal Procedure

1. Remove the inflatable restraint steering wheel module coil. Refer to **Steering Wheel Airbag Coil**

Replacement .

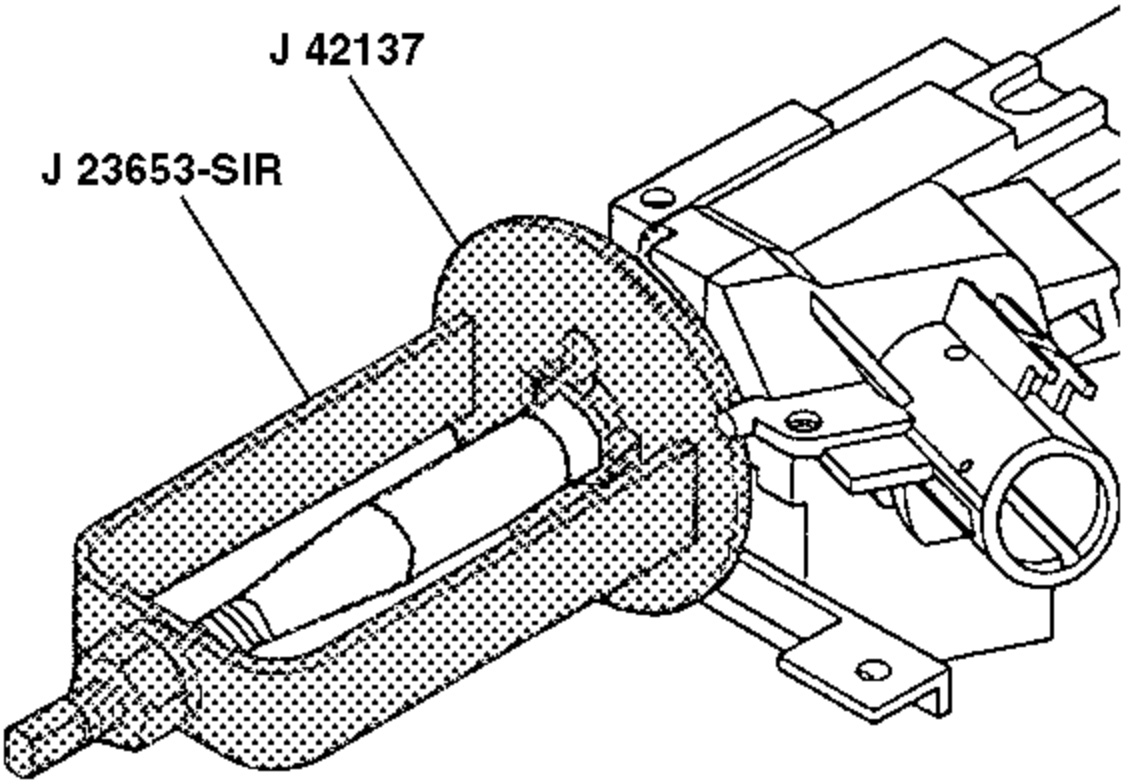

Fig. 22: Compressing Cam Orientation Plate
Courtesy of GENERAL MOTORS COMPANY

2. Remove the steering shaft lock plate retaining ring using the **J 23653-SIR** compressor and the **J 42137** adapter and dispose of it.

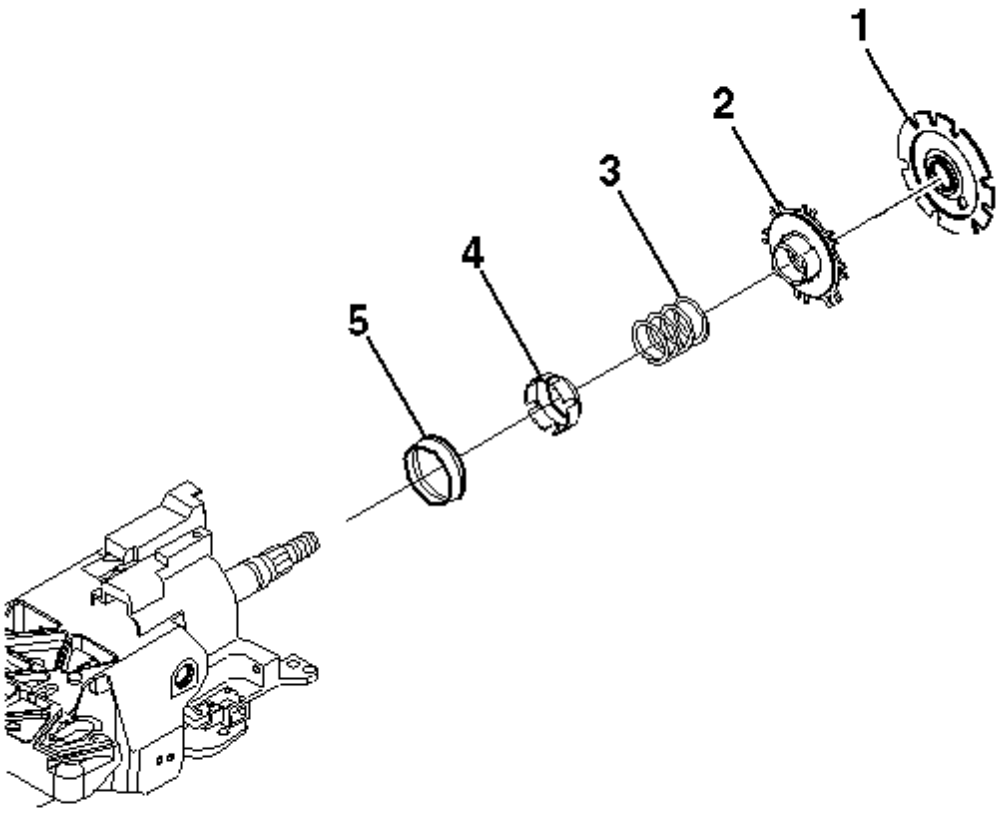

Fig. 23: View of Shaft Lock Shield Assembly, Turn Signal Cancel Cam Assembly, Upper Bearing Spring, Bearing Inner Race Seat and Inner Race
Courtesy of GENERAL MOTORS COMPANY

3. Remove the turn signal cancel cam plate (1).
4. Remove the turn signal cancel cam (2).
5. Remove the steering shaft upper bearing spring (3).
6. Remove the steering shaft upper bearing race seat (4).
7. Remove the steering shaft upper bearing (5).

Installation Procedure

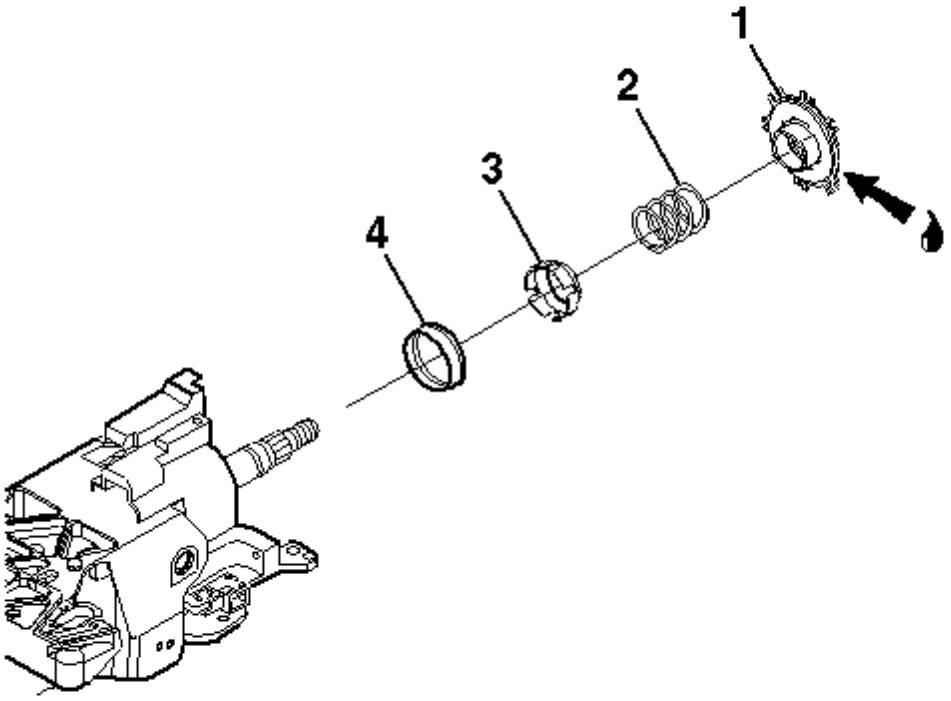

Fig. 24: View of Inner Race, Upper Bearing Inner Race Seat, Upper Bearing Spring, and Turn Signal Cancel Cam Assembly
Courtesy of GENERAL MOTORS COMPANY

1. Install the steering shaft upper bearing (4).
2. Install the steering shaft upper bearing race seat (3).
3. Install the steering shaft upper bearing spring (2).
4. Apply lubricant to the turn signal cancel cam (1). Refer to **Adhesives, Fluids, Lubricants, and Sealers** for the recommended lubricant.
5. Install the turn signal cancel cam (1).

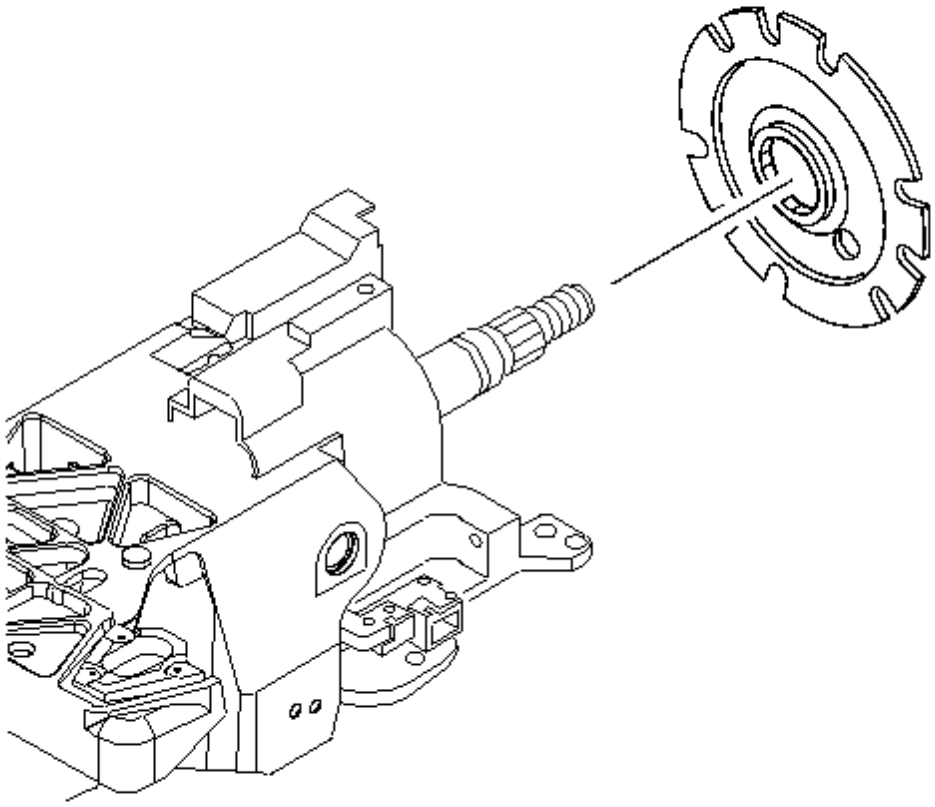

Fig. 25: View of Shaft Lock Shield Assembly
Courtesy of GENERAL MOTORS COMPANY

6. Install the turn signal cancel cam plate.

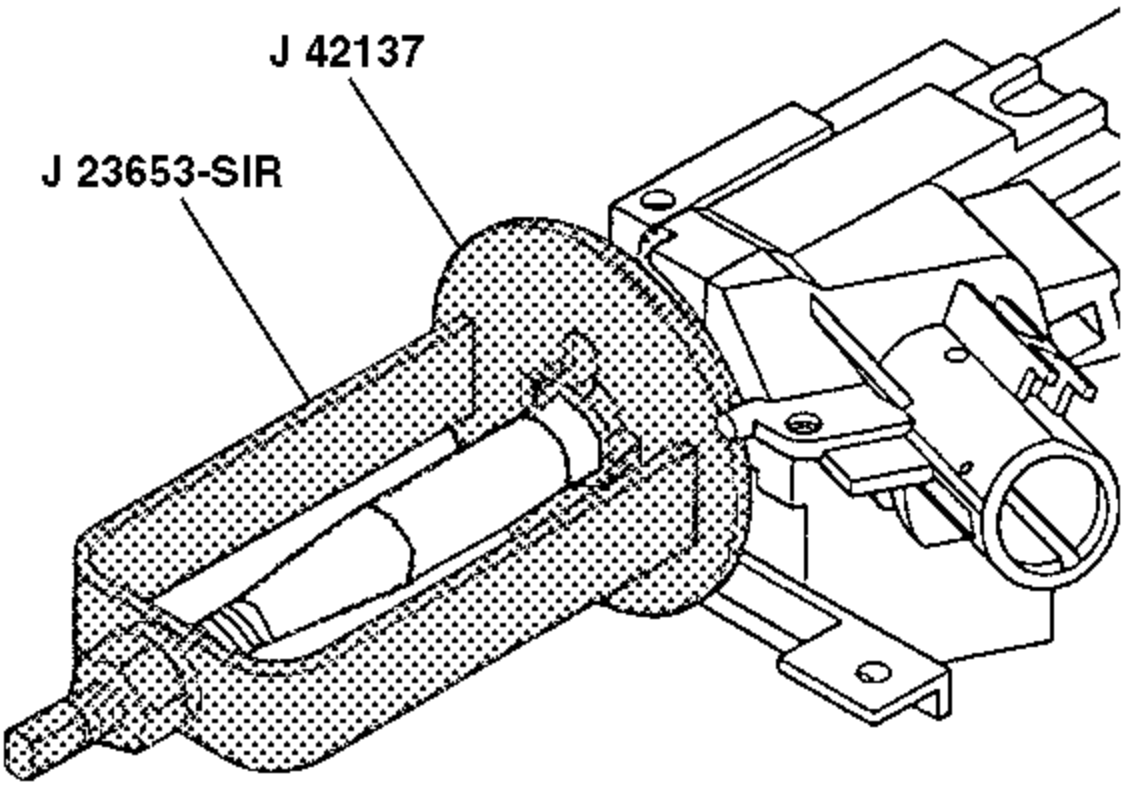

Fig. 26: Compressing Cam Orientation Plate
Courtesy of GENERAL MOTORS COMPANY

7. Install the new steering shaft lock plate retaining ring using the **J 23653-SIR** compressor and the **J 42137** adapter.

TURN SIGNAL MULTIFUNCTION SWITCH REPLACEMENT

Removal Procedure

1. Remove the steering column trim covers. Refer to **Steering Column Trim Cover Replacement**.

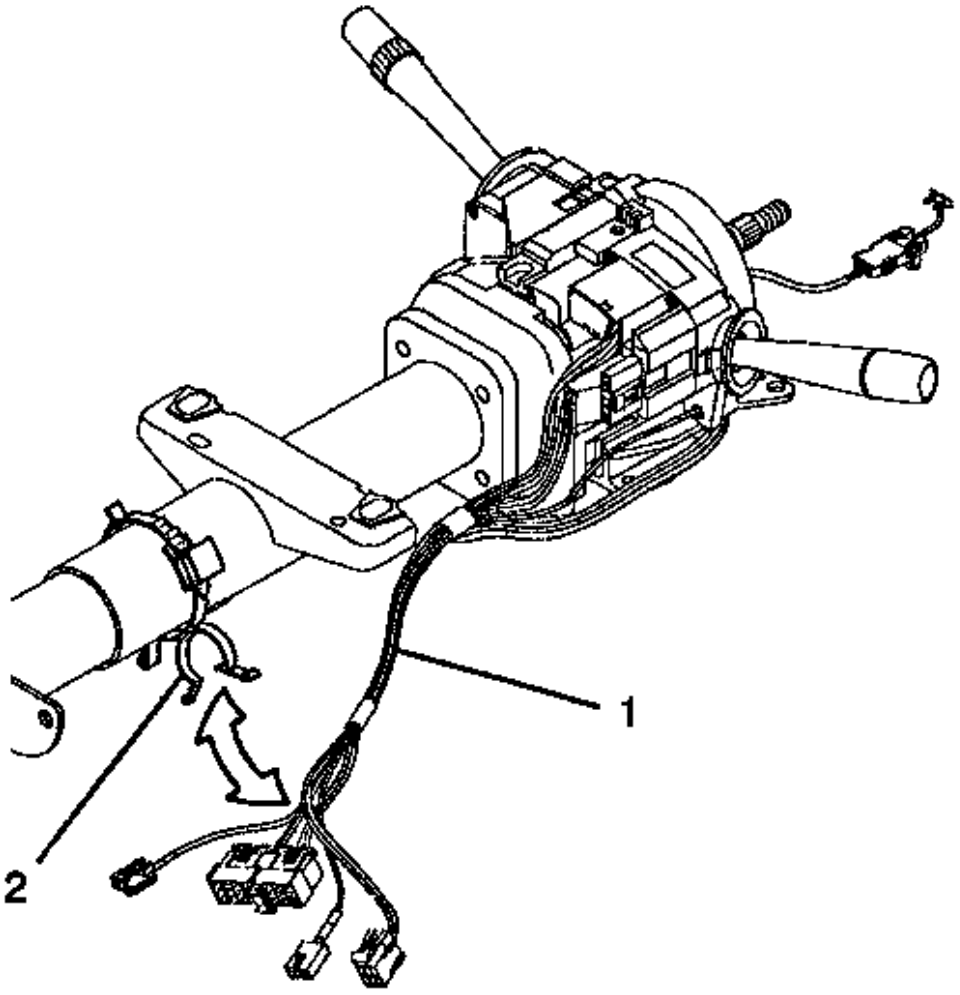

Fig. 27: View Of Steering Column Wire Harness Assembly & Wire Harness Strap
Courtesy of GENERAL MOTORS COMPANY

NOTE: **The abrasion sleeve located on the steering column wire harness assembly must be reinstalled. Make note of what connector is coming out of the abrasion sleeve for installation purposes.**

2. Remove the wire harness assembly (1) from the wire harness strap (2).
3. Disconnect the turn signal multifunction switch connector from the inflatable restraint steering wheel module coil connector.

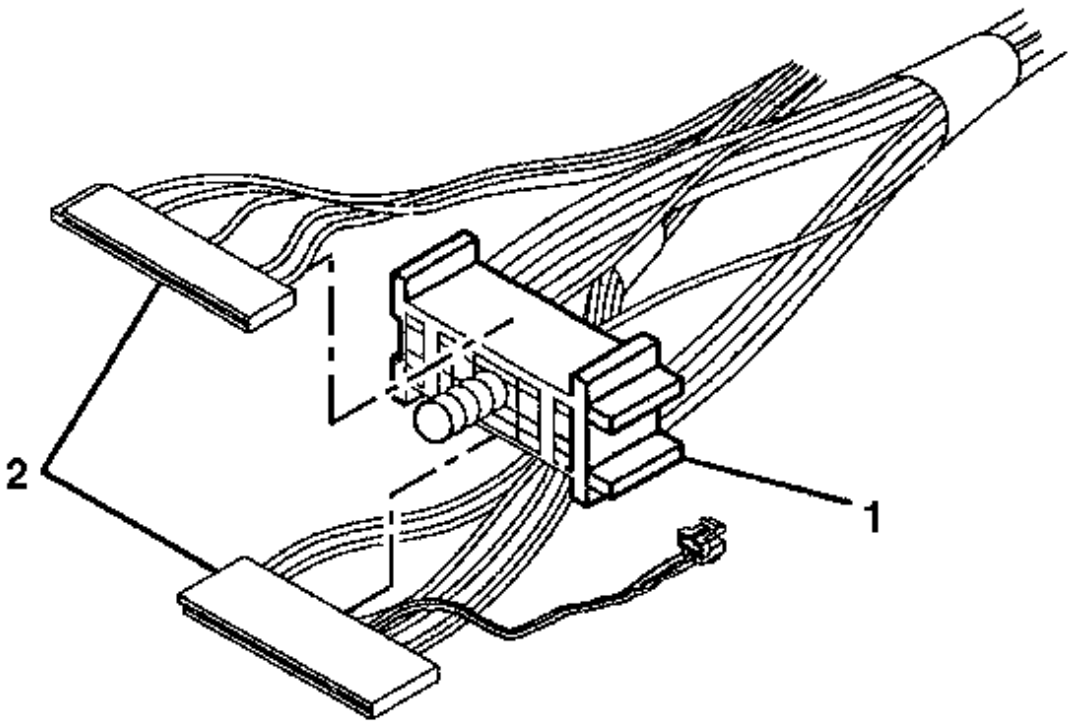

Fig. 28: Turn Signal & Multifunction Switch Assembly Connectors
Courtesy of GENERAL MOTORS COMPANY

4. Slide the 2 connectors (2) of the turn signal multifunction switch assembly out of the bulkhead connector (1).

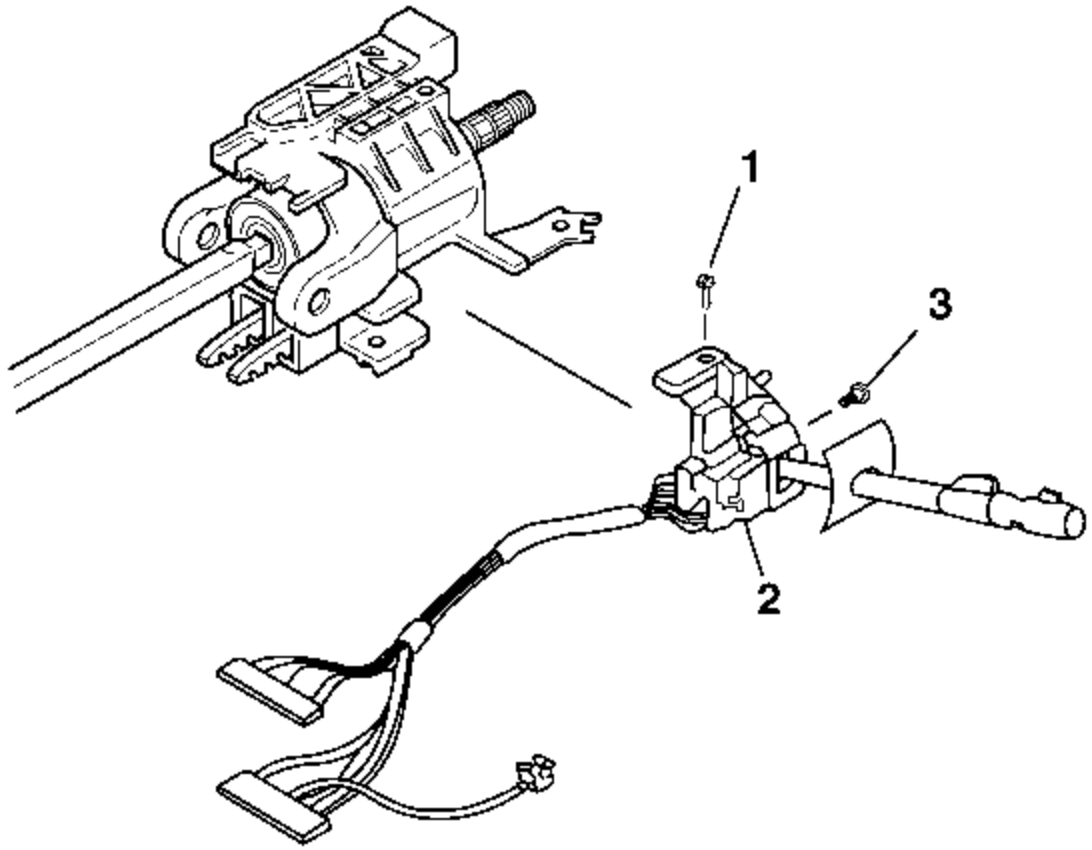

Fig. 29: View Of Turn Signal & Multifunction Switch Assembly
Courtesy of GENERAL MOTORS COMPANY

5. Remove the turn signal multifunction switch bolts (1) and (3) from the turn signal multifunction switch (2).
6. Remove the turn signal multifunction switch (2) from the steering column tilt head assembly.

Installation Procedure

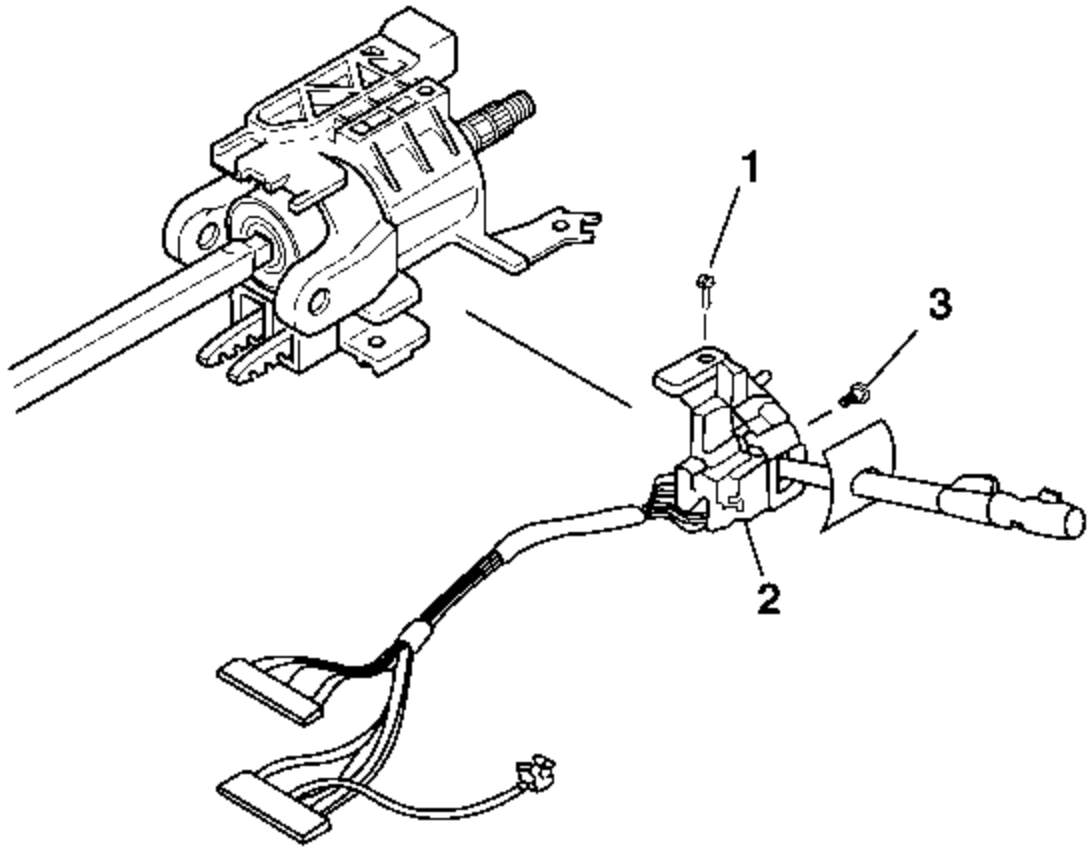

Fig. 30: View Of Turn Signal & Multifunction Switch Assembly
Courtesy of GENERAL MOTORS COMPANY

1. Position the turn signal multifunction switch (2) onto the steering column tilt head assembly.

CAUTION: **Refer to Fastener Caution .**

NOTE: **Be sure that the electrical contact of the turn signal and multifunction switch assembly (2) rests on the turn signal cancel cam assembly.**

2. Install the turn signal multifunction switch bolts (1) and (3) into the turn signal multifunction (2) and tighten to 1 N.m (11 lb in).

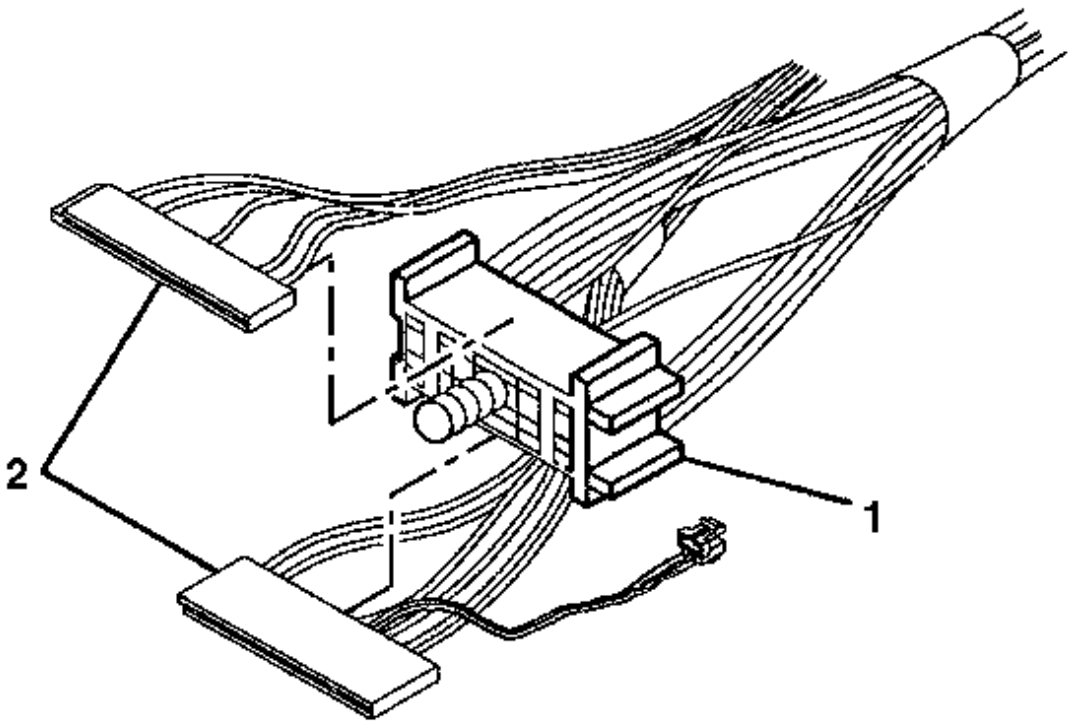

Fig. 31: Turn Signal & Multifunction Switch Assembly Connectors
Courtesy of GENERAL MOTORS COMPANY

3. Slide the 2 connectors (2) of the turn signal multifunction switch assembly into the bulkhead connector (1).

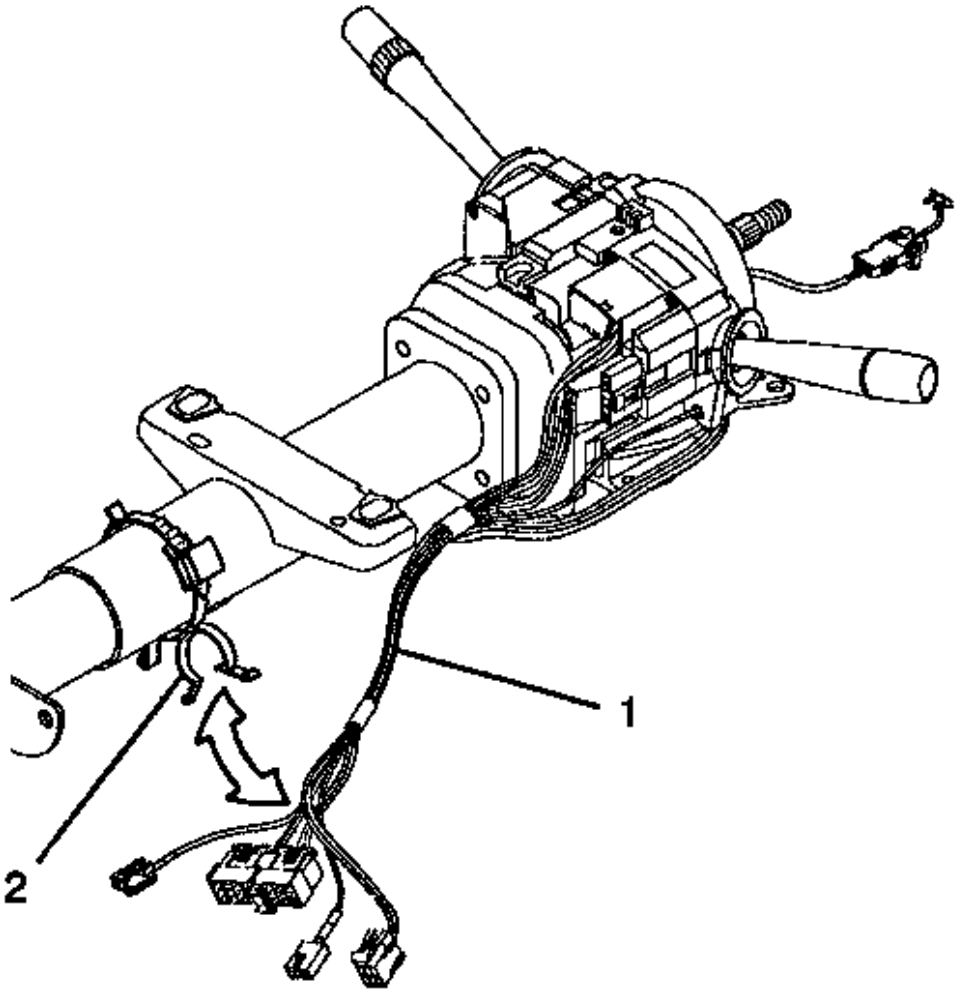

Fig. 32: View Of Steering Column Wire Harness Assembly & Wire Harness Strap
Courtesy of GENERAL MOTORS COMPANY

4. Connect the turn signal multifunction switch connector to the inflatable restraint steering wheel module coil connector.

NOTE: **The abrasion sleeve must be installed back onto the steering column wire harness assembly. The ignition lock cylinder case wires and connector must be hanging out of the middle of the abrasion sleeve.**

5. Install the wire harness assembly (1) to the wire harness strap (2).
6. Install the steering column trim covers. Refer to **Steering Column Trim Cover Replacement**.

TURN SIGNAL SWITCH HOUSING REPLACEMENT

Removal Procedure

1. Remove the turn signal cancel cam and steering shaft upper bearing spring. Refer to **Turn Signal Cancel Cam and Steering Shaft Upper Bearing Spring Replacement**.
2. Remove the turn signal multifunction switch. Refer to **Turn Signal Multifunction Switch Replacement**.

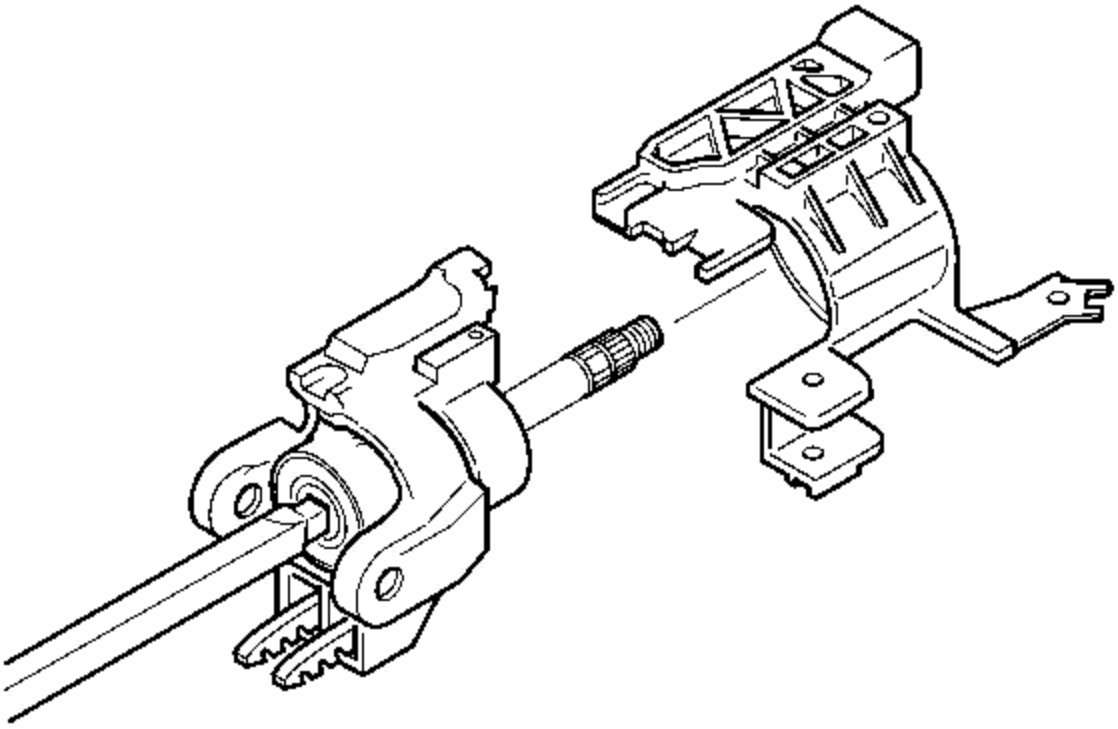

Fig. 33: View Of Turn Signal Switch Housing & Steering Column Shaft Assembly
Courtesy of GENERAL MOTORS COMPANY

3. Slide the turn signal switch housing off of the steering column.

Installation Procedure

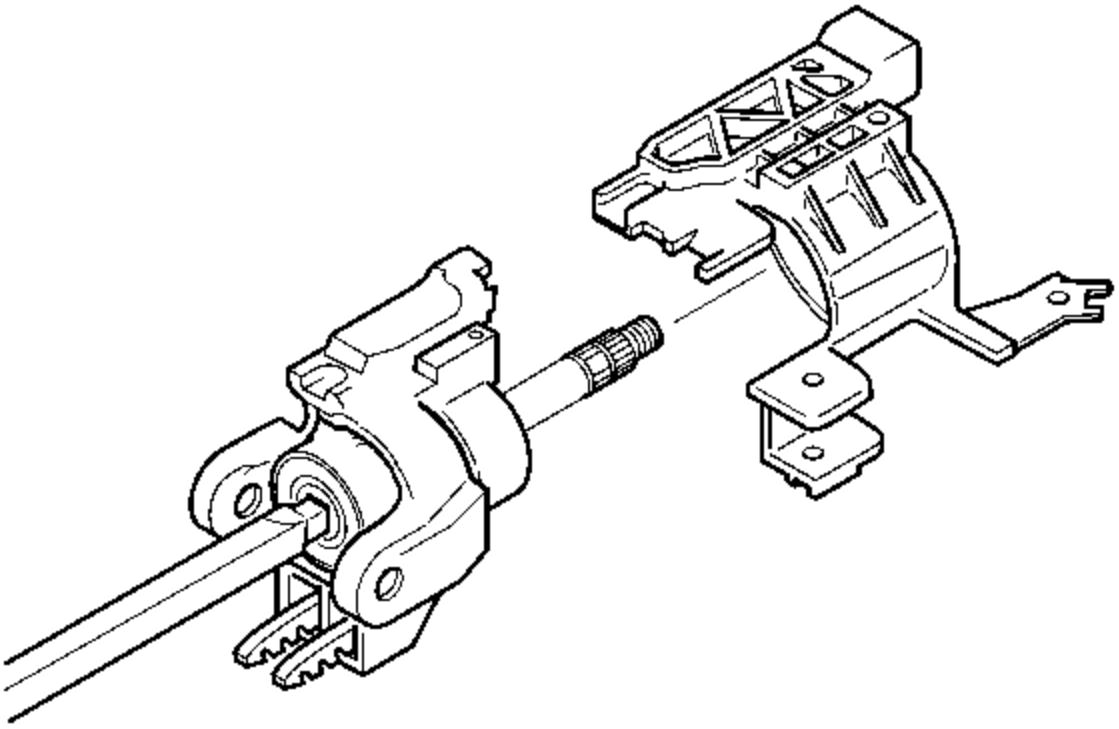

Fig. 34: View Of Turn Signal Switch Housing & Steering Column Shaft Assembly
Courtesy of GENERAL MOTORS COMPANY

NOTE: **The turn signal switch housing must be pressed firmly against the steering column to seat it properly.**

1. Slide the turn signal switch housing onto the steering column.
2. Install the turn signal multifunction switch. Refer to **Turn Signal Multifunction Switch Replacement**.
3. Install the turn signal cancel cam and steering shaft upper bearing spring. Refer to **Turn Signal Cancel Cam and Steering Shaft Upper Bearing Spring Replacement**.

SHIFT LEVER REPLACEMENT

Removal Procedure

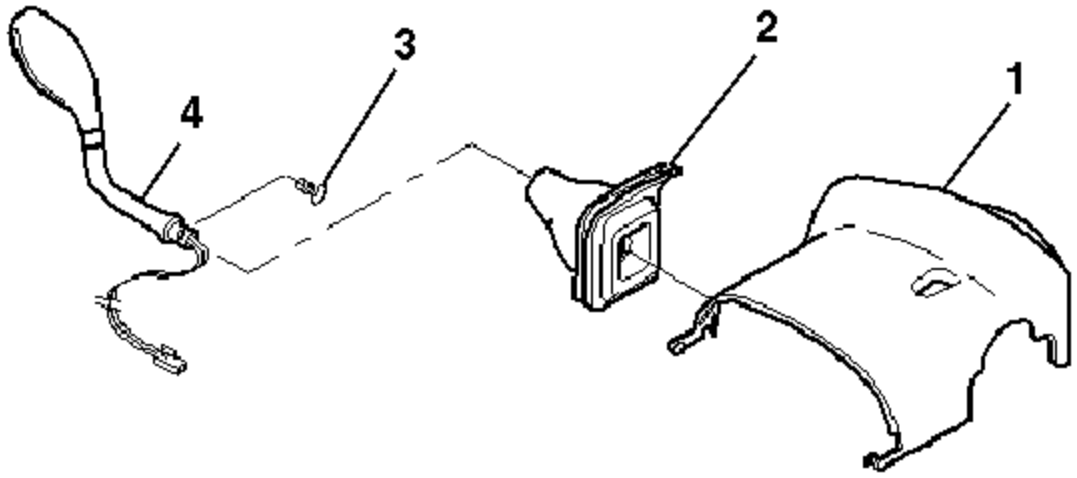

Fig. 35: View Of Shift Lever, Seal (Boot), Screw & Upper Trim Cover
Courtesy of GENERAL MOTORS COMPANY

1. Remove the steering column trim covers. Refer to **Steering Column Trim Cover Replacement**.
2. Disconnect the shift lever electrical connector at the base of the steering column.
3. Remove the shift lever screw (3) from the shift lever (4).
4. Disengage the shift lever (4) from the linear shift assembly.
5. Transfer the shift lever seal (2) if needed.

Installation Procedure

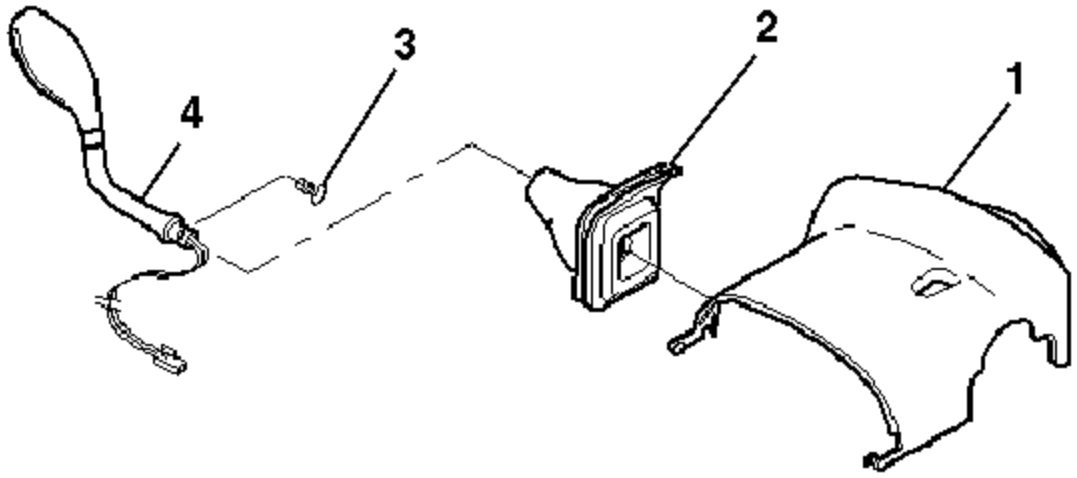

Fig. 36: View Of Shift Lever, Seal (Boot), Screw & Upper Trim Cover
Courtesy of GENERAL MOTORS COMPANY

1. Engage the shift lever (4) to the linear shift assembly.

CAUTION: Refer to Fastener Caution .

2. Install the shift lever screw (3) to the shift lever (4) and tighten it to 20 N.m (15 lb ft).
3. Connect the shift lever electrical connector at the base of the steering column.
4. Install the steering column trim covers. Refer to **Steering Column Trim Cover Replacement**.

LINEAR SHIFT ASSEMBLY REPLACEMENT

Removal Procedure

1. Remove the steering column trim covers. Refer to **Steering Column Trim Cover Replacement**.
2. Remove the shift lever. Refer to **Shift Lever Replacement**.

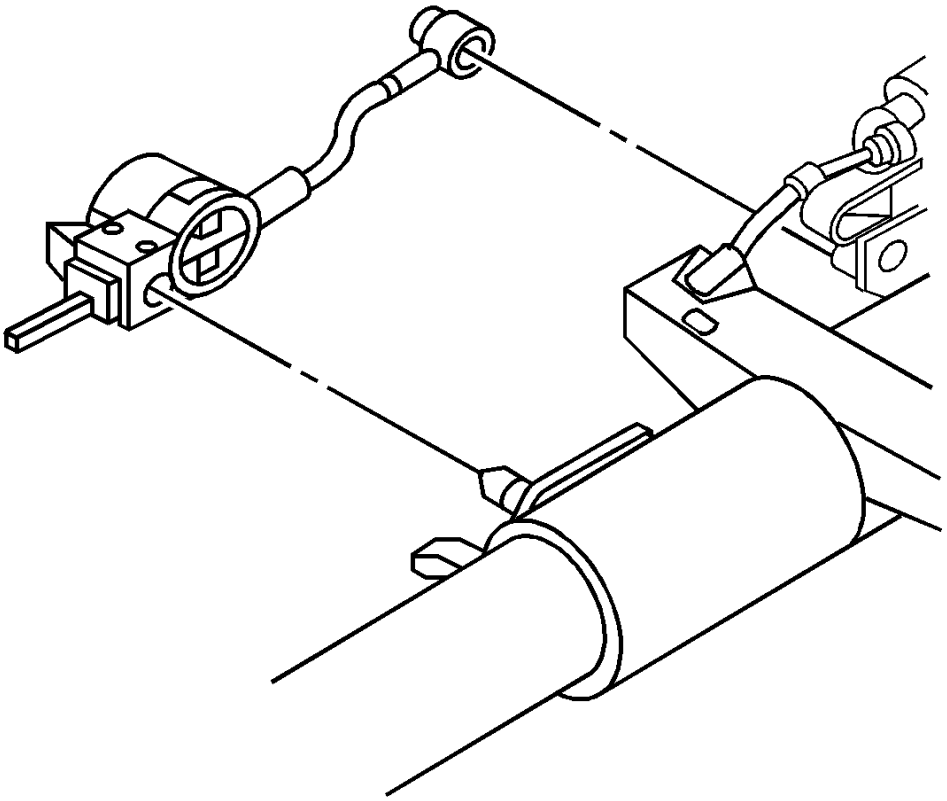

Fig. 37: View Of Automatic Transmission Shift Lock Control Actuator
Courtesy of GENERAL MOTORS COMPANY

3. With a screwdriver, carefully pry the automatic transmission shift lock control away from the steering column jacket.
4. Place the ignition lock cylinder in the OFF-LOCK position.

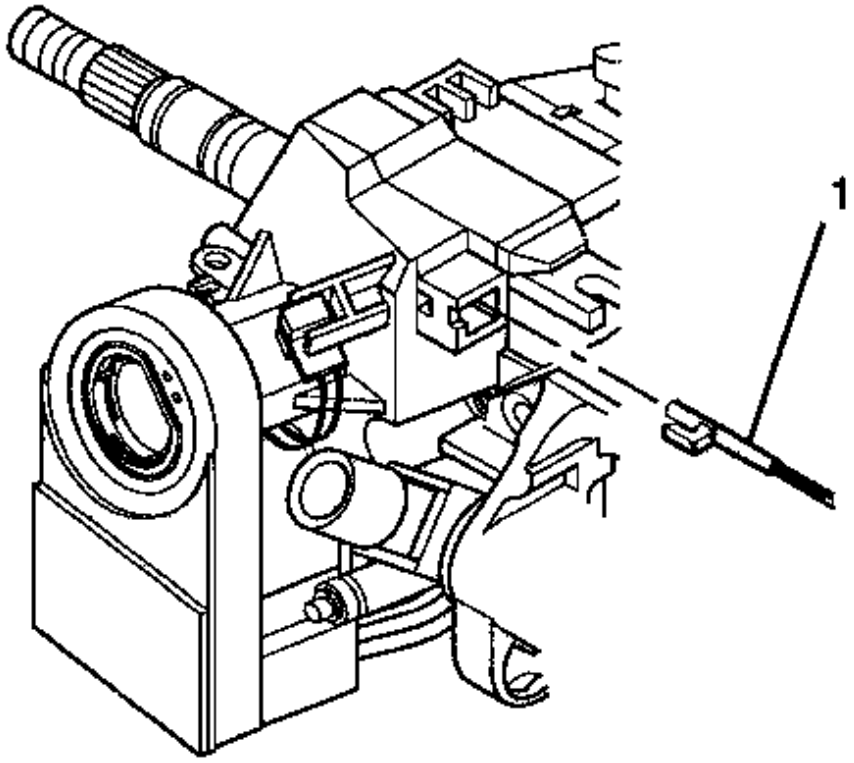

Fig. 38: Identifying Park Lock Cable At Ignition Lock Cylinder
Courtesy of GENERAL MOTORS COMPANY

NOTE: **Do NOT remove the tape on the park lock cable. If the tape is removed from the park lock cable, you MUST order a new linear shift assembly.**

5. Insert a small screwdriver into the slot on the ignition lock cylinder case and push against the locking tab to remove the park lock cable (1).

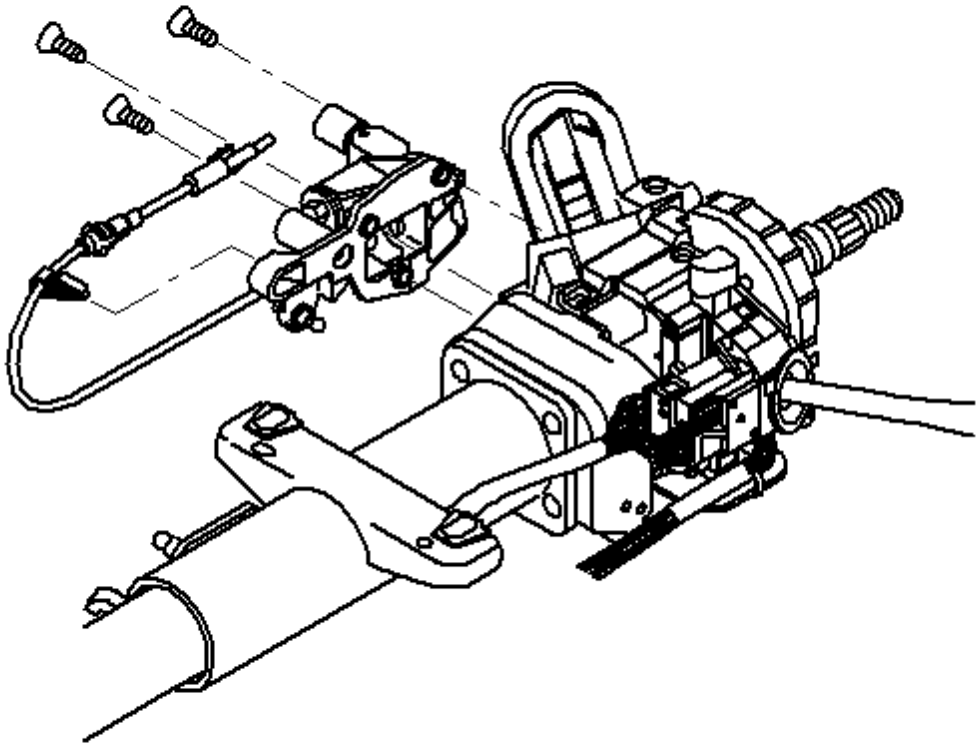

Fig. 39: Flat-Head 6-Lobed Socket Tap Screws & Linear Shift Assembly
Courtesy of GENERAL MOTORS COMPANY

NOTE: **It may be necessary to move the linear shift assembly out of park to access the lower linear shift assembly bolt.**

6. Remove the linear shift assembly bolts.
7. Remove the linear shift assembly.

Installation Procedure

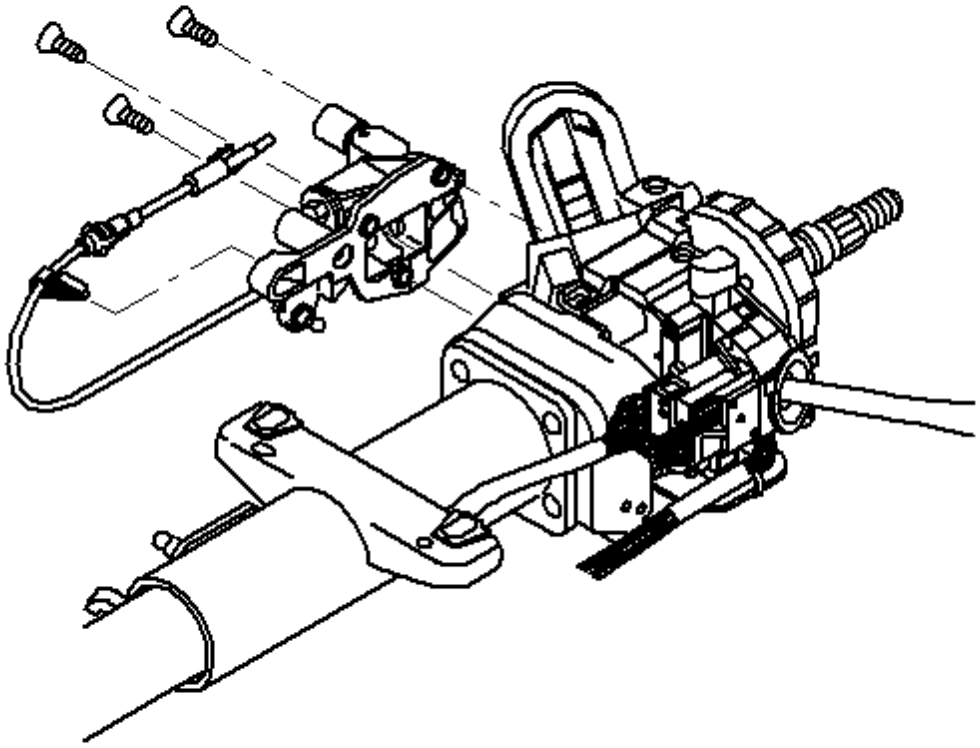

Fig. 40: Flat-Head 6-Lobed Socket Tap Screws & Linear Shift Assembly
Courtesy of GENERAL MOTORS COMPANY

1. Position the linear shift assembly to the steering column.

CAUTION: **Refer to Fastener Caution .**

NOTE: **Start all linear shift assembly bolts by hand before finalizing any torques.**

2. Install the linear shift assembly bolts and tighten to 10 N.m (89 lb in).

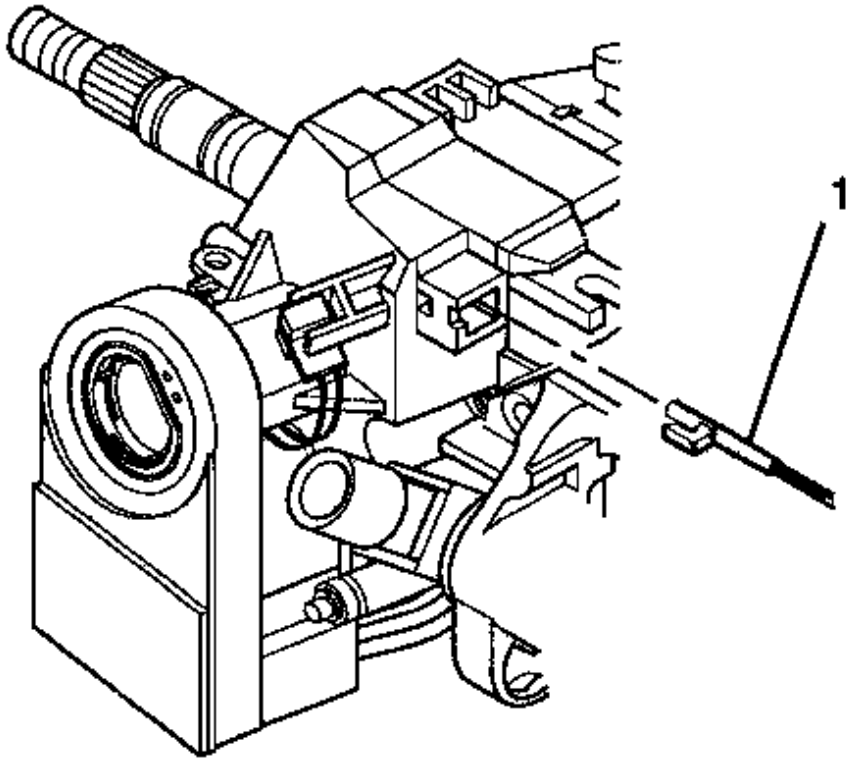

Fig. 41: Identifying Park Lock Cable At Ignition Lock Cylinder
Courtesy of GENERAL MOTORS COMPANY

3. Connect the park lock cable (1) to the ignition lock cylinder case.
    - The ignition lock cylinder should be in the OFF-LOCK position.
    - The locking tab at the end of the park lock cable (1) must be installed into the ignition lock cylinder case completely.

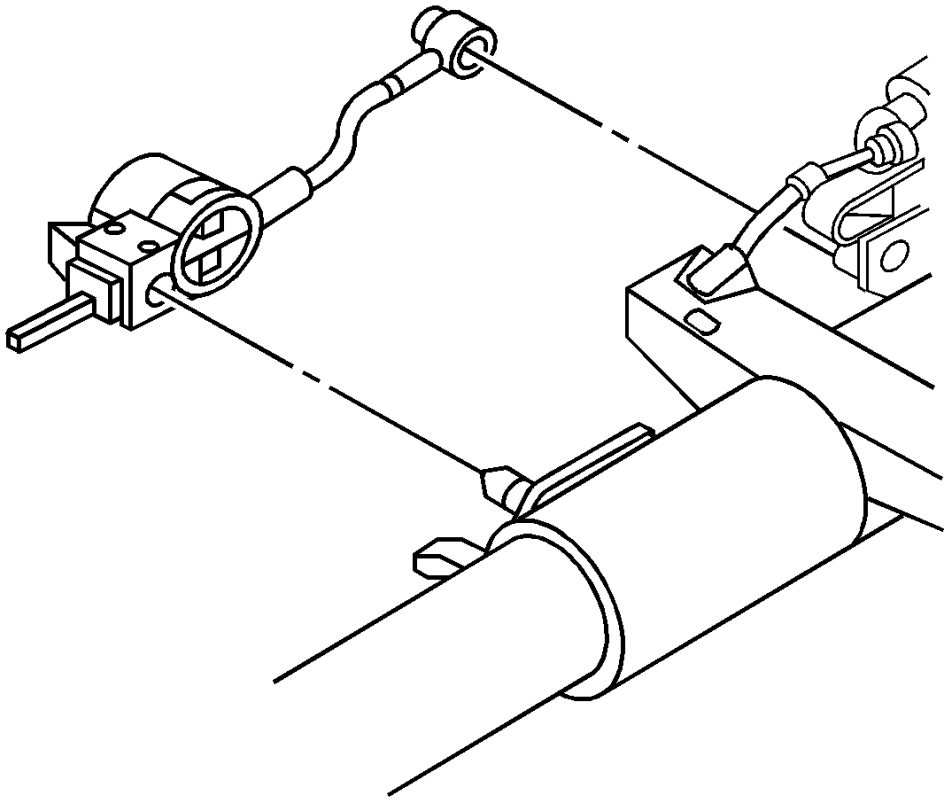

Fig. 42: View Of Automatic Transmission Shift Lock Control Actuator
Courtesy of GENERAL MOTORS COMPANY

4. Install the automatic transmission shift lock control.
5. Install the shift lever and put the column in the NEUTRAL position. Refer to **Shift Lever Replacement**.

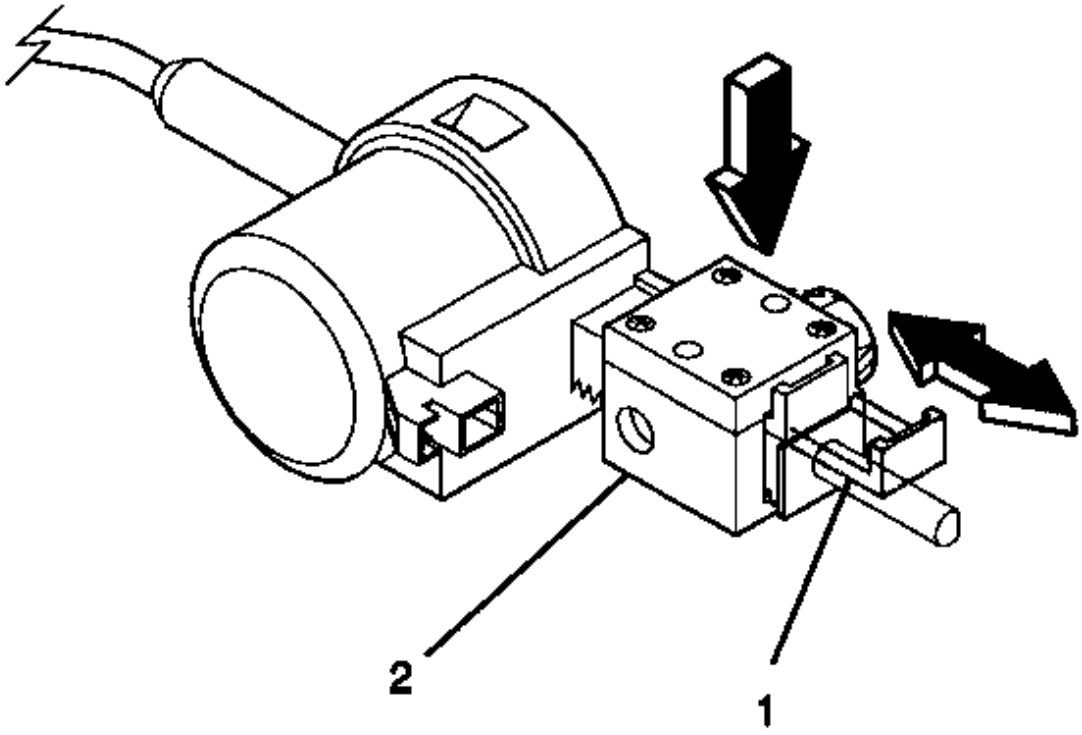

Fig. 43: Adjusting Automatic Transmission Shift Lock Control Actuator
Courtesy of GENERAL MOTORS COMPANY

6. Adjust the automatic transmission shift lock control.
    1. Pull the tab (1) out on the block side (2) of the automatic transmission shift lock control.
    2. Press on the adjuster block (2) to compress the internal adjuster spring to disengage the adjuster teeth. Slide the adjuster block as far away from the solenoid as possible.
    3. Lock in place by pushing the tab (1) back in.
7. Inspect the automatic transmission shift lock control.
    1. The automatic transmission shift lock control must lock the shift lever when it is put into the PARK position.
    2. When the column is installed in the vehicle you will not be able to move the shift lever out of the PARK position without pressing on the brake pedal. The solenoid will be energized.
    3. Readjust if needed.
8. Install the steering column trim covers. Refer to **Steering Column Trim Cover Replacement**.

STEERING COLUMN TILT WHEEL RELEASE LEVER REPLACEMENT

Removal Procedure

1. Disable the supplemental inflatable restraint (SIR) system. Refer to **SIR Disabling and Enabling** .

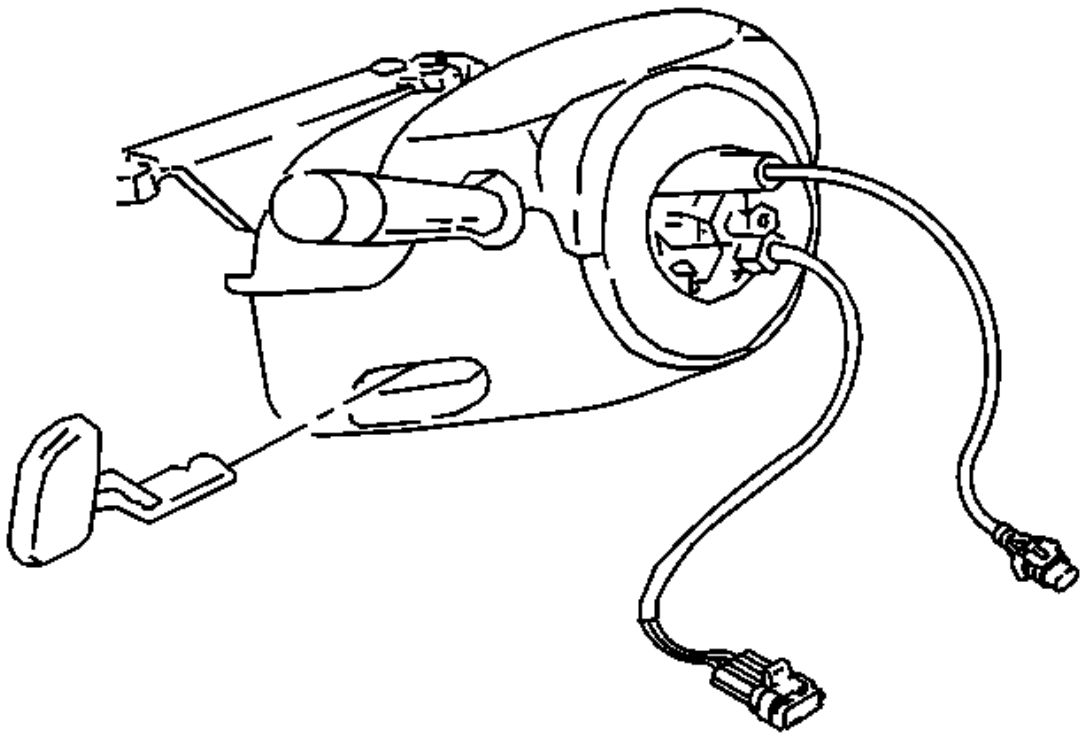

Fig. 44: Identifying Tilt Lever
Courtesy of GENERAL MOTORS COMPANY

2. Pull the tilt lever out from the steering column.

Installation Procedure

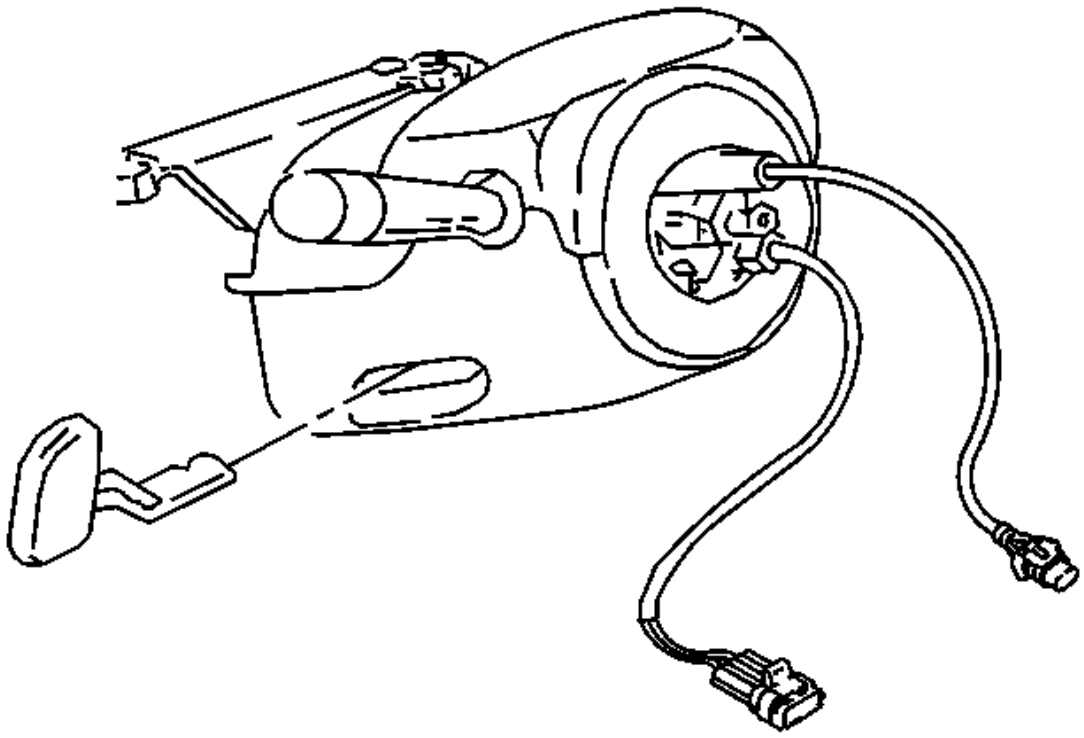

Fig. 45: Identifying Tilt Lever
Courtesy of GENERAL MOTORS COMPANY

1. Push the tilt lever into the steering column.
2. Enable the SIR system. Refer to **SIR Disabling and Enabling** .

STEERING WHEEL REPLACEMENT

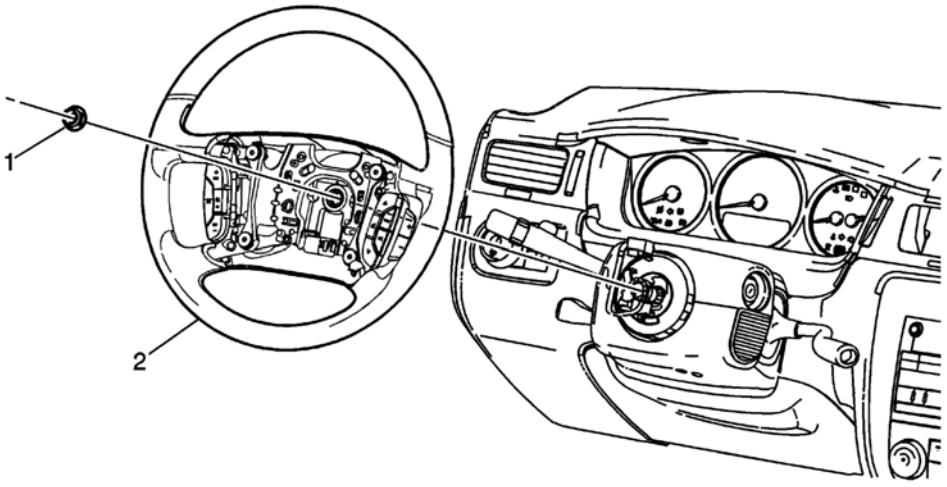

Fig. 46: Steering Wheel
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure Remove the inflatable restraint steering wheel module. Refer to **Airbag Steering Wheel Module Replacement** .	
1	Steering Wheel Nut **CAUTION:** **Refer to Fastener Caution .** **Tighten** 41 N.m (30 lb ft)
2	Steering Wheel **Procedure** 1. Disconnect any electrical connectors as needed. 2. Use the **J 1859-A** puller and the **J 42578** legs to remove the steering wheel. **Special Tools** • **J 1859-A** Steering Wheel Puller • **J 42578** Steering Wheel Puller Legs For regional tools, refer to **Special Tools**.

STEERING WHEEL THEFT DETERRENT LOCK REPLACEMENT

Removal Procedure

1. Remove the ignition lock cylinder. Refer to **Ignition Lock Cylinder Replacement** .

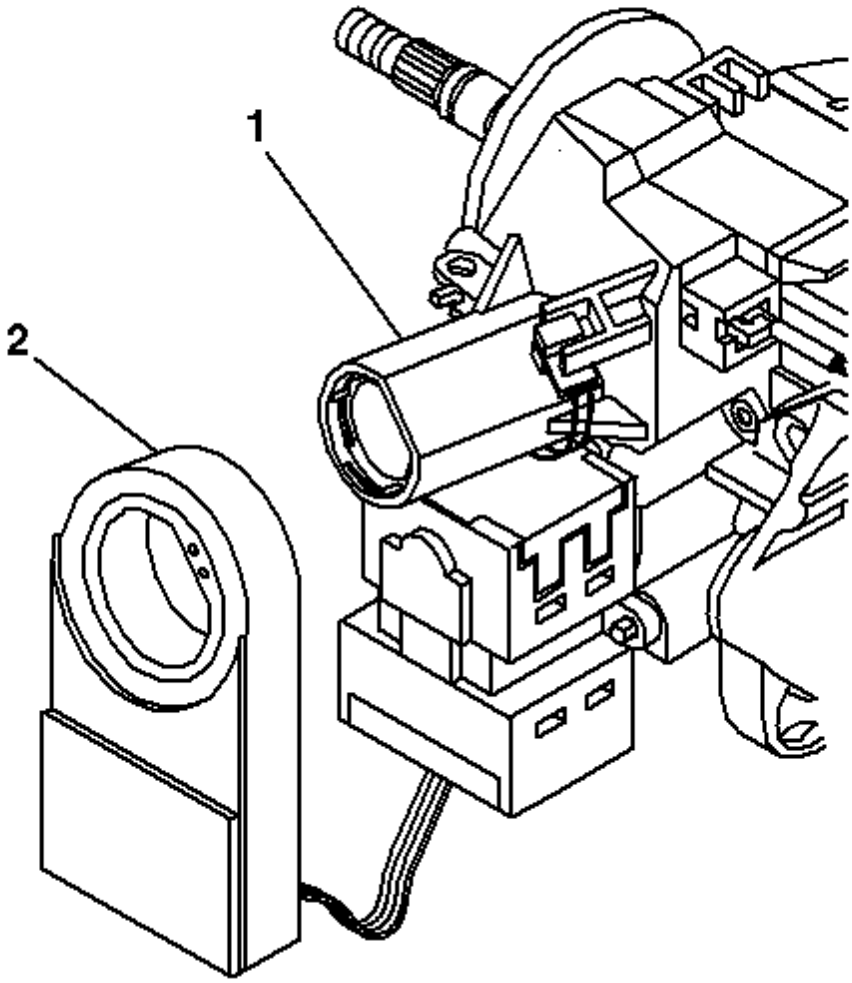

Fig. 47: Locating Theft Deterrent Module & Ignition Lock Cylinder Case Assembly
Courtesy of GENERAL MOTORS COMPANY

2. Disconnect the electrical connector from the steering wheel theft deterrent lock.
3. If necessary, disconnect the electrical connector from the ignition lock cylinder case (1).
4. Remove the steering wheel theft deterrent lock (2) from ignition lock cylinder case (1).

Installation Procedure

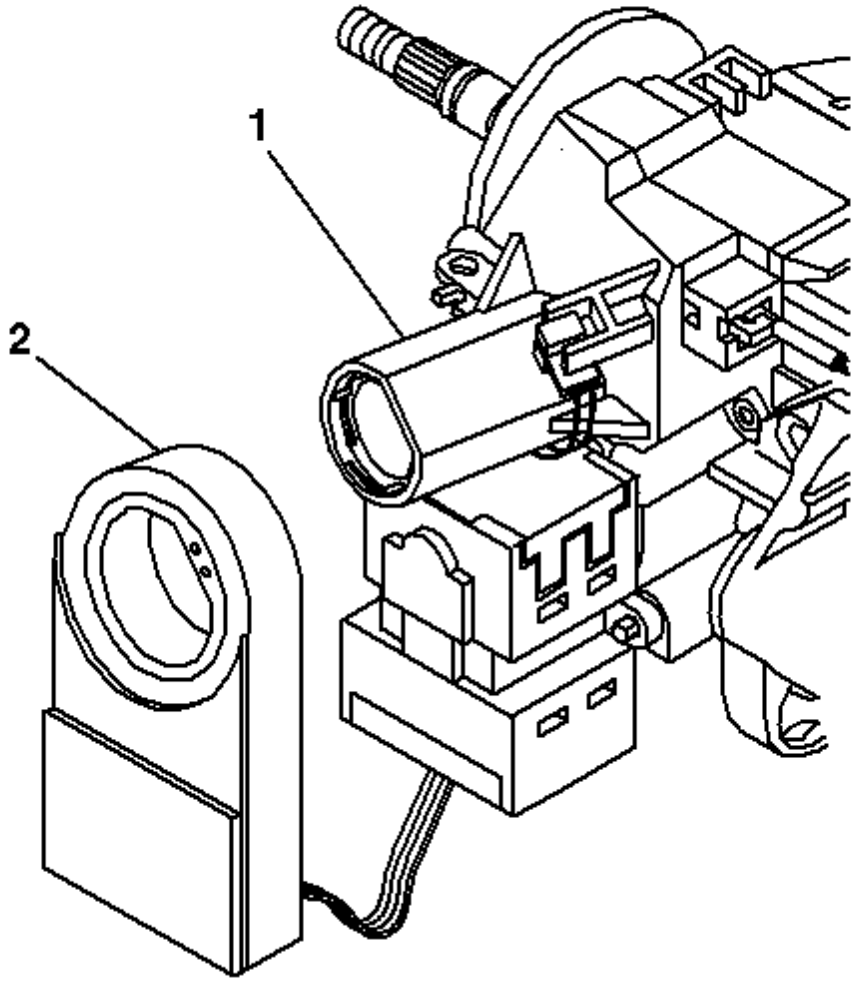

Fig. 48: Locating Theft Deterrent Module & Ignition Lock Cylinder Case Assembly
Courtesy of GENERAL MOTORS COMPANY

1. Install the steering wheel theft deterrent lock (2) to ignition lock cylinder case (1).
2. Connect the electrical connector to the steering wheel theft deterrent lock.
3. If necessary, connect the electrical connector to the ignition lock cylinder case (1).
4. Install the ignition lock cylinder. Refer to **Ignition Lock Cylinder Replacement** .

STEERING COLUMN TILT SPRING REPLACEMENT

Removal Procedure

1. Remove the steering column trim covers. Refer to **Steering Column Trim Cover Replacement**.

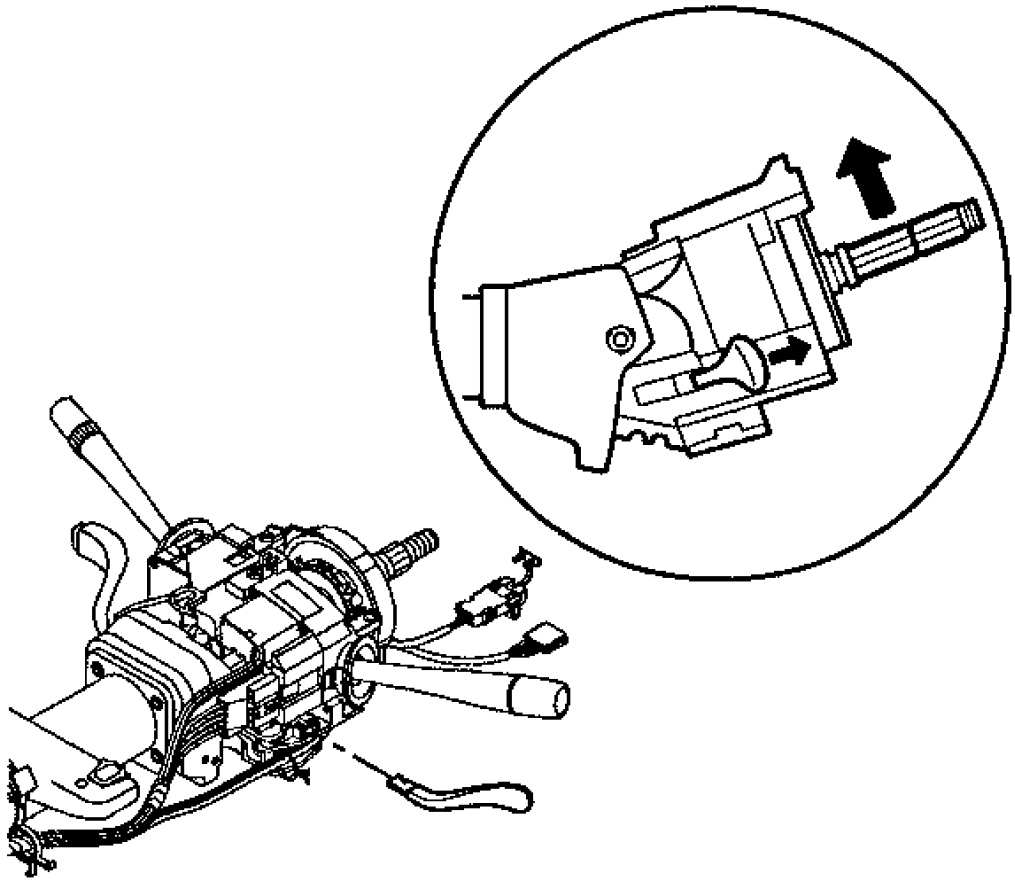

Fig. 49: Tilting Column To Up Position
Courtesy of GENERAL MOTORS COMPANY

2. Install the tilt lever onto the steering column tilt head assembly.
3. Use the tilt lever to tilt the column to the UP position.

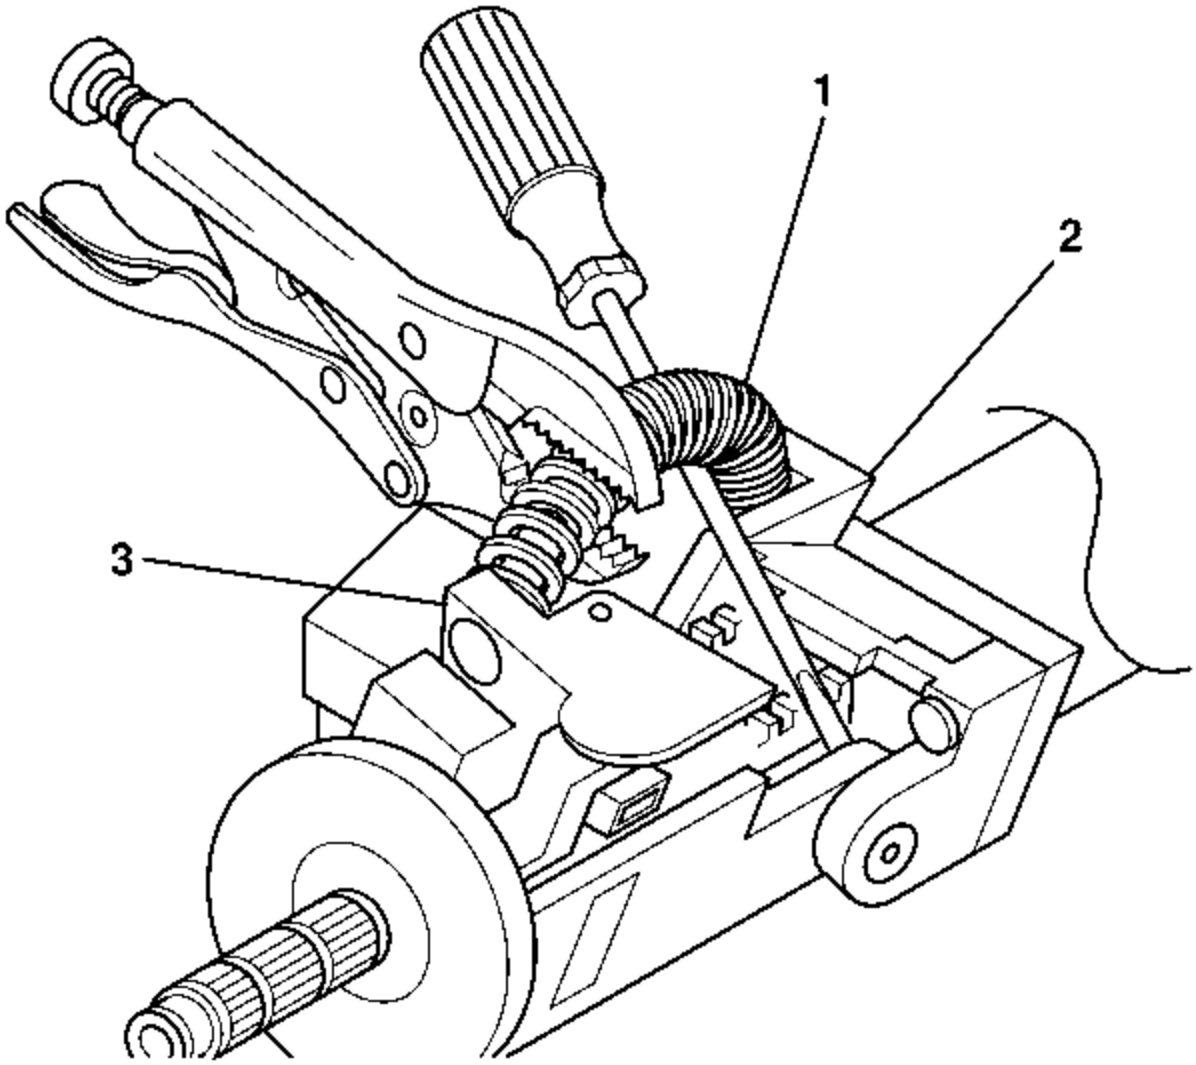

Fig. 50: View Of Tilt Spring And Steering Column Support Assembly
Courtesy of GENERAL MOTORS COMPANY

WARNING: The tilt spring and the spring guide are under pressure. The tilt spring and the spring guide may become a projectile. Secure the spring with locking pliers during removal. Secure the spring with locking pliers during installation. Bodily injury may result during removal and installation of the tilt spring and the spring guide. Always use caution during removal and installation of the tilt spring and the spring guide.

4. Remove the steering column tilt spring (1) from the steering column support assembly (2) and from the steering column tilt head assembly (3) by using the following procedure:
    1. Pry up the steering column tilt spring (1) until a bulge occurs and most of the tension is removed.
    2. Secure the steering column tilt spring (1) with locking pliers.
    3. Continue prying up the steering column tilt spring (1) until it disengages from the post on the steering column support assembly (2) and from the steering column tilt head assembly (3).

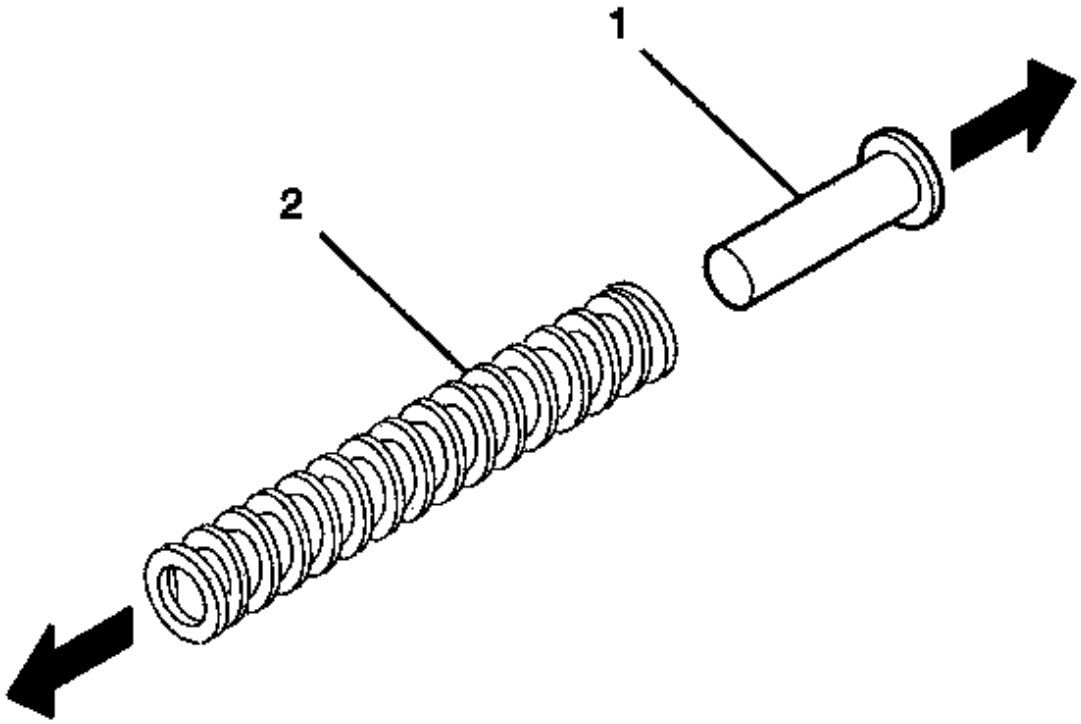

Fig. 51: Identifying Spring Guide Components
Courtesy of GENERAL MOTORS COMPANY

5. Remove the steering column tilt spring guide (1) from the steering column tilt spring (2).

Installation Procedure

1. Tilt the steering column to the UP position.

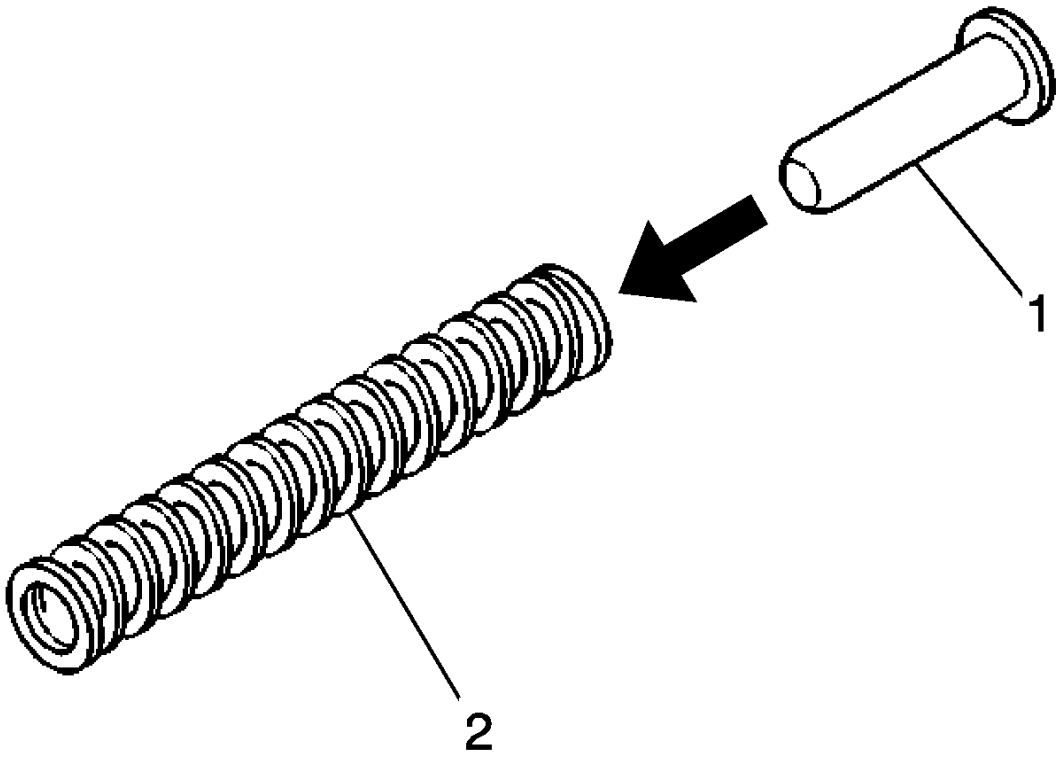

Fig. 52: Spring Guide & Tilt Spring
Courtesy of GENERAL MOTORS COMPANY

2. Install the steering column spring guide (1) into the steering column tilt spring (2).

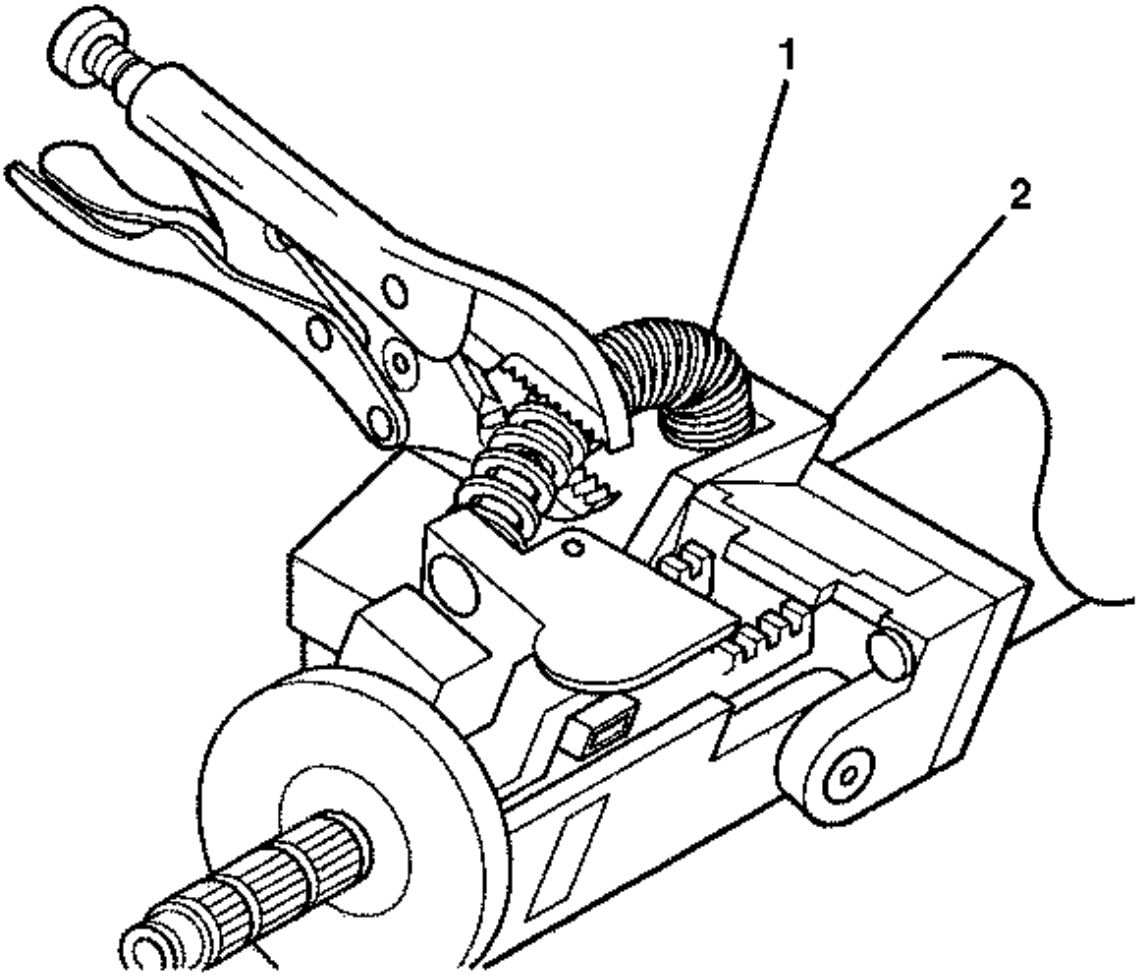

Fig. 53: Identifying Tilt Spring And Steering Column Support Assembly
Courtesy of GENERAL MOTORS COMPANY

3. Install the steering column tilt spring (1) onto the steering column support assembly (2) and onto the steering column tilt head assembly by using the following procedure:
    1. Install the steering column tilt spring (1) onto the steering column tilt head assembly.
    2. Install the steering column tilt spring (1) onto the post on the steering column support assembly (2).
4. Install the steering column trim covers. Refer to **Steering Column Trim Cover Replacement**.

STEERING COLUMN TILT HEAD REPLACEMENT

Special Tools

J 21854-01 Pivot Pin Remover

For equivalent regional tools, refer to **Special Tools**.

Removal Procedure

1. Remove the turn signal cancel cam and steering shaft upper bearing spring. Refer to **Turn Signal Cancel Cam and Steering Shaft Upper Bearing Spring Replacement**.

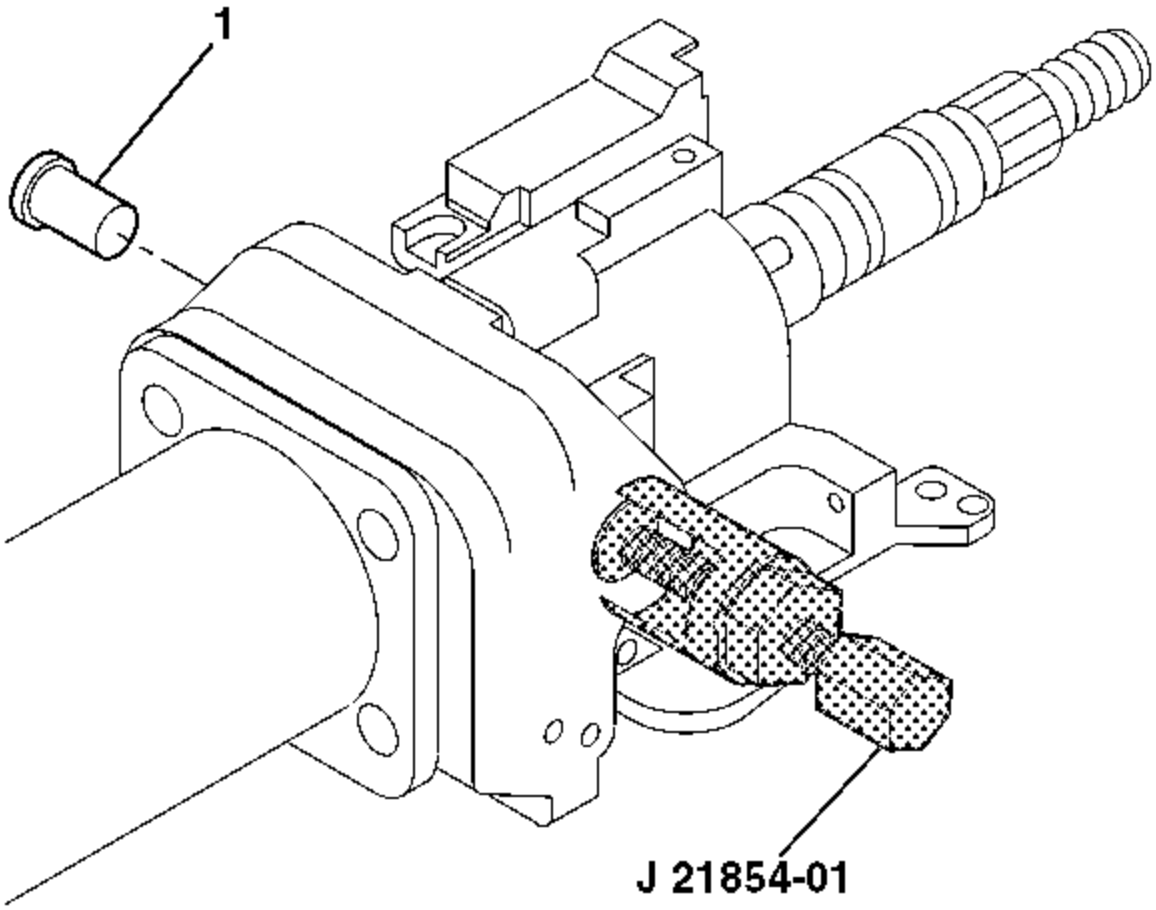

Fig. 54: Pivot Pins And Special Tool
Courtesy of GENERAL MOTORS COMPANY

2. Use the **J 21854-01** remover to remove the pivot pins (1).

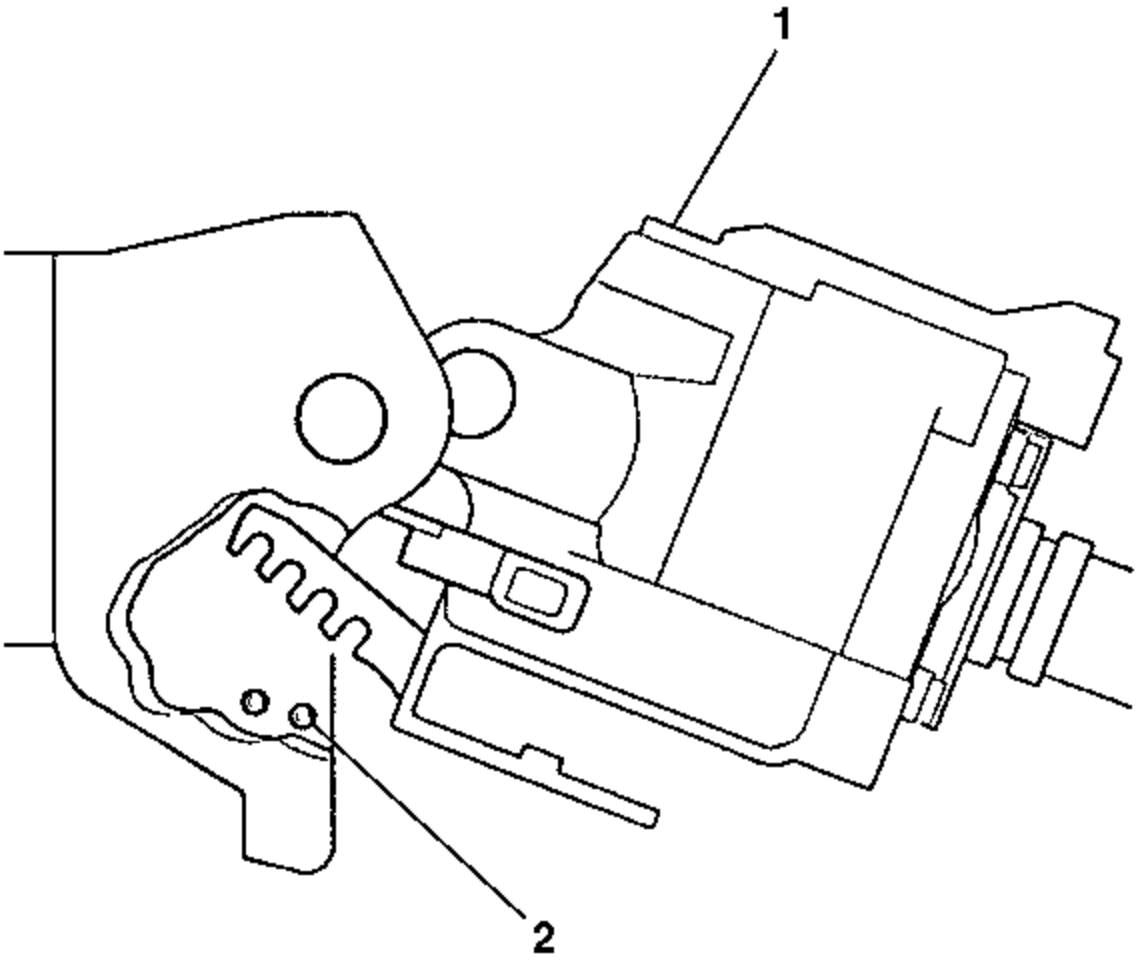

Fig. 55: Disengaging Steering Wheel Lock Shoes From Dowel Pins
Courtesy of GENERAL MOTORS COMPANY

3. Pull the tilt arm in order to disengage the steering wheel lock shoes from the dowel pins (2) in the steering column support assembly.

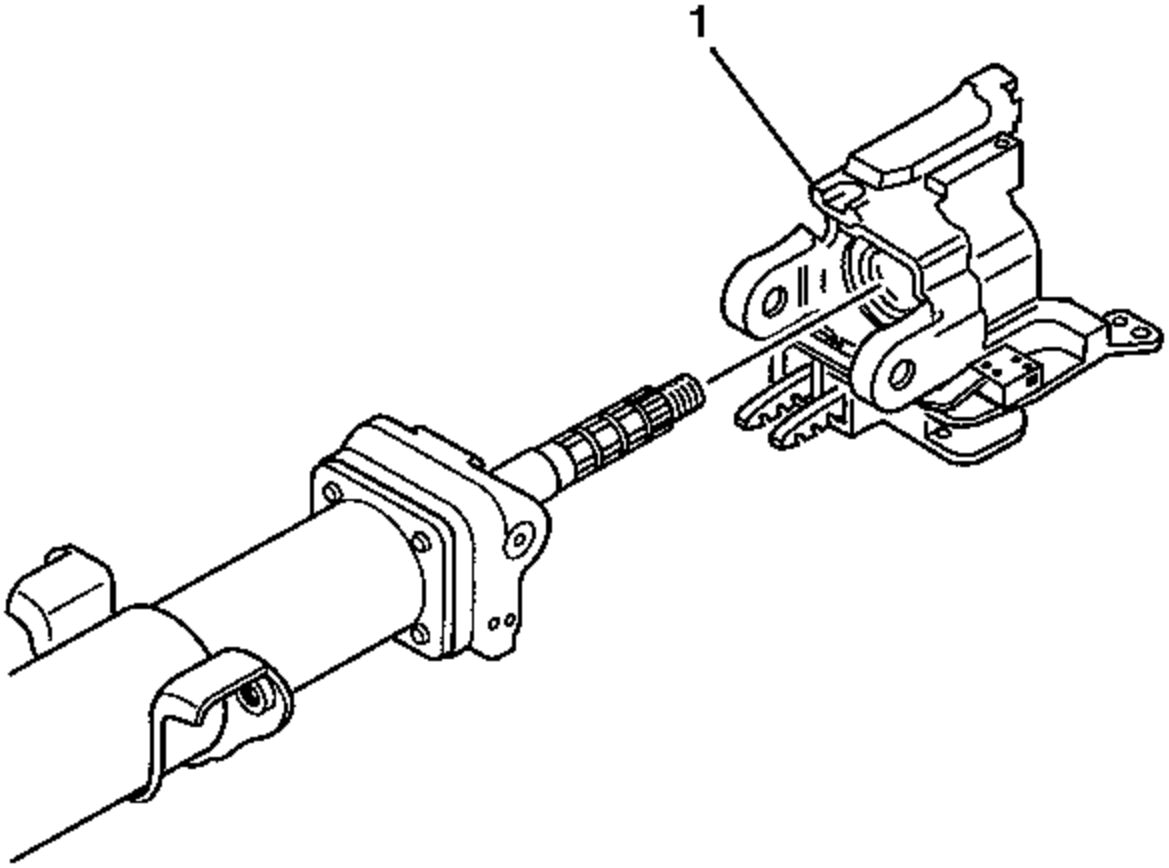

Fig. 56: View Of Steering Column Housing And Bearing Assembly
Courtesy of GENERAL MOTORS COMPANY

4. Remove the steering column tilt head (1).

Installation Procedure

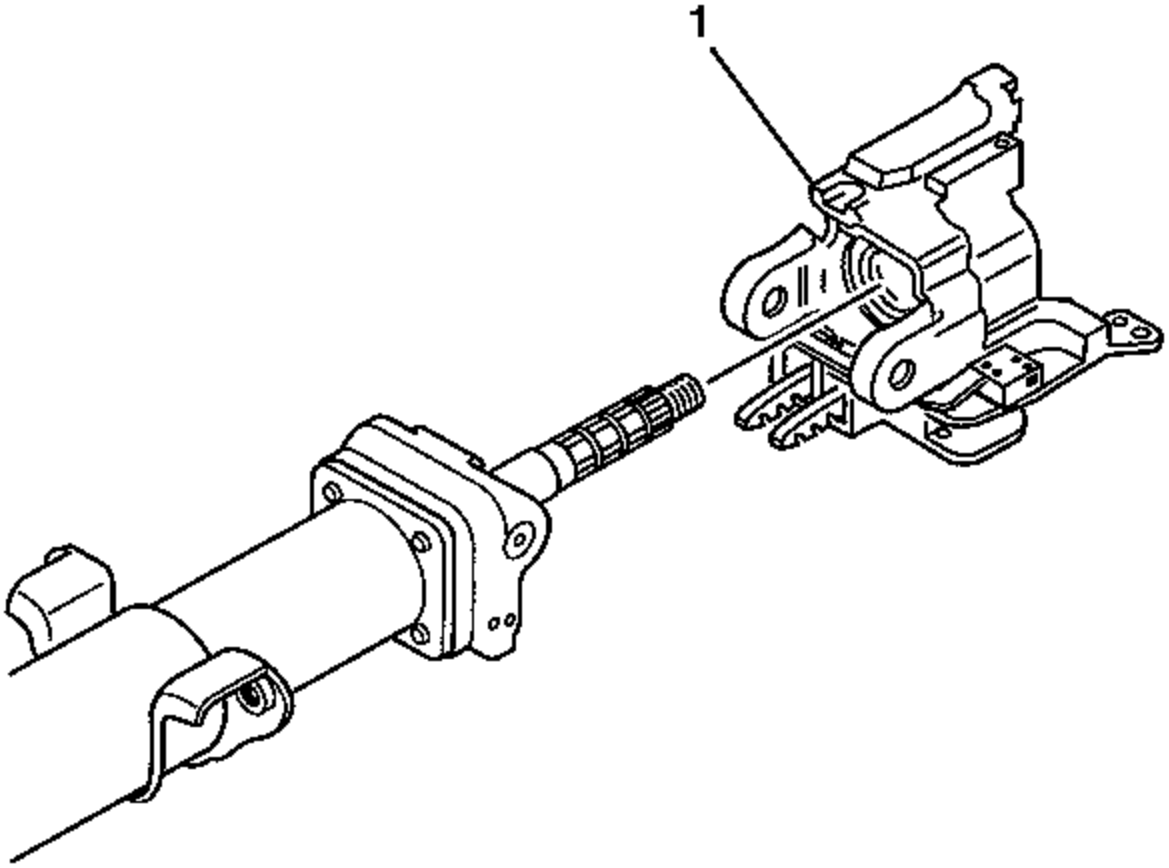

Fig. 57: View Of Steering Column Housing And Bearing Assembly
Courtesy of GENERAL MOTORS COMPANY

1. Position the steering column tilt head (1) on to the steering column.

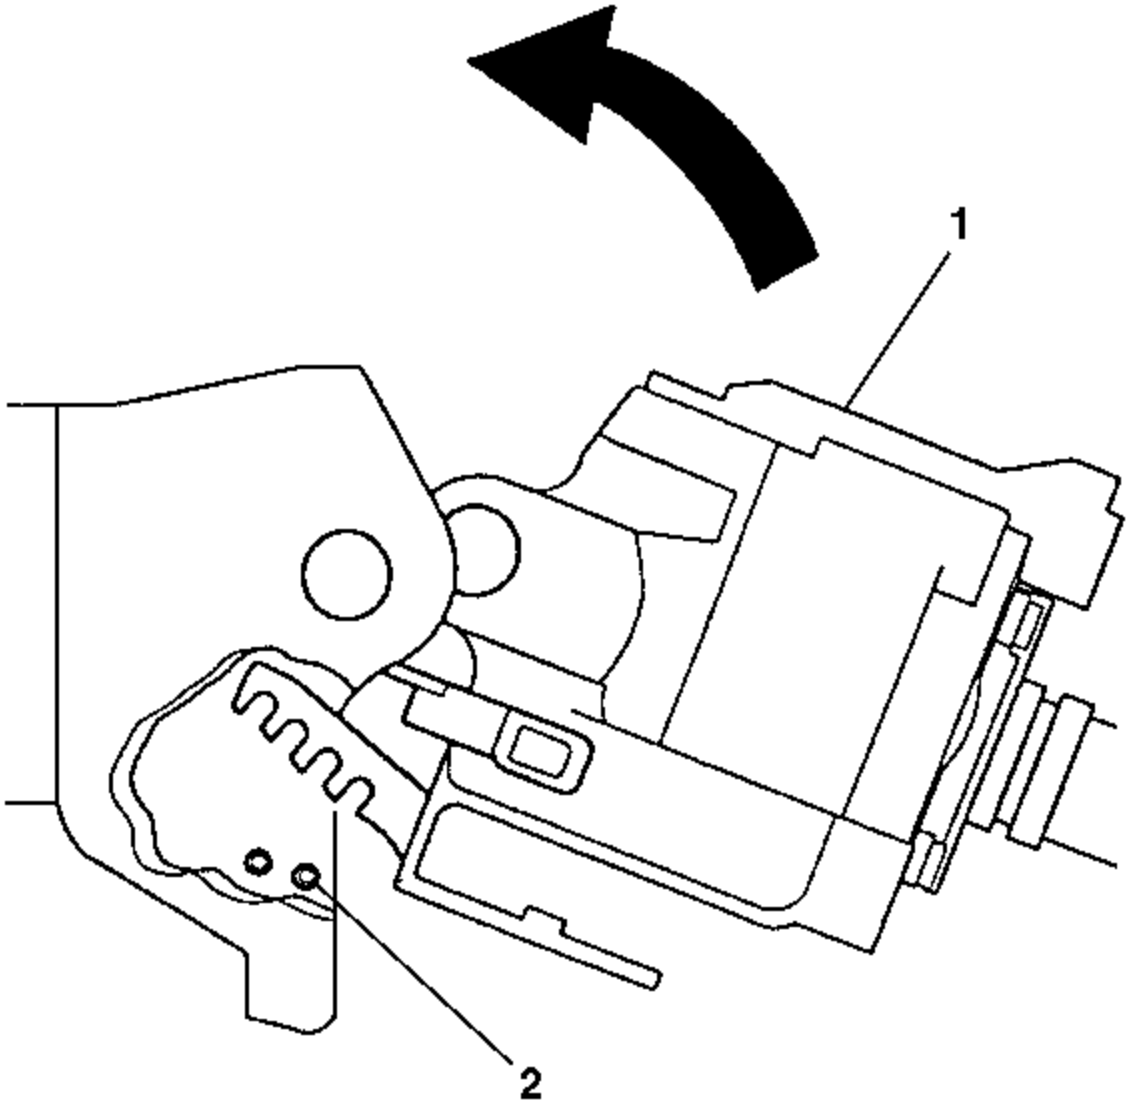

Fig. 58: Locking Shoes To Dowel Pins
Courtesy of GENERAL MOTORS COMPANY

2. Using the tilt lever position, lock the shoes to the dowel pins (2).
3. Rotate the steering column tilt head (1) in order to align the holes for the pivot pins.

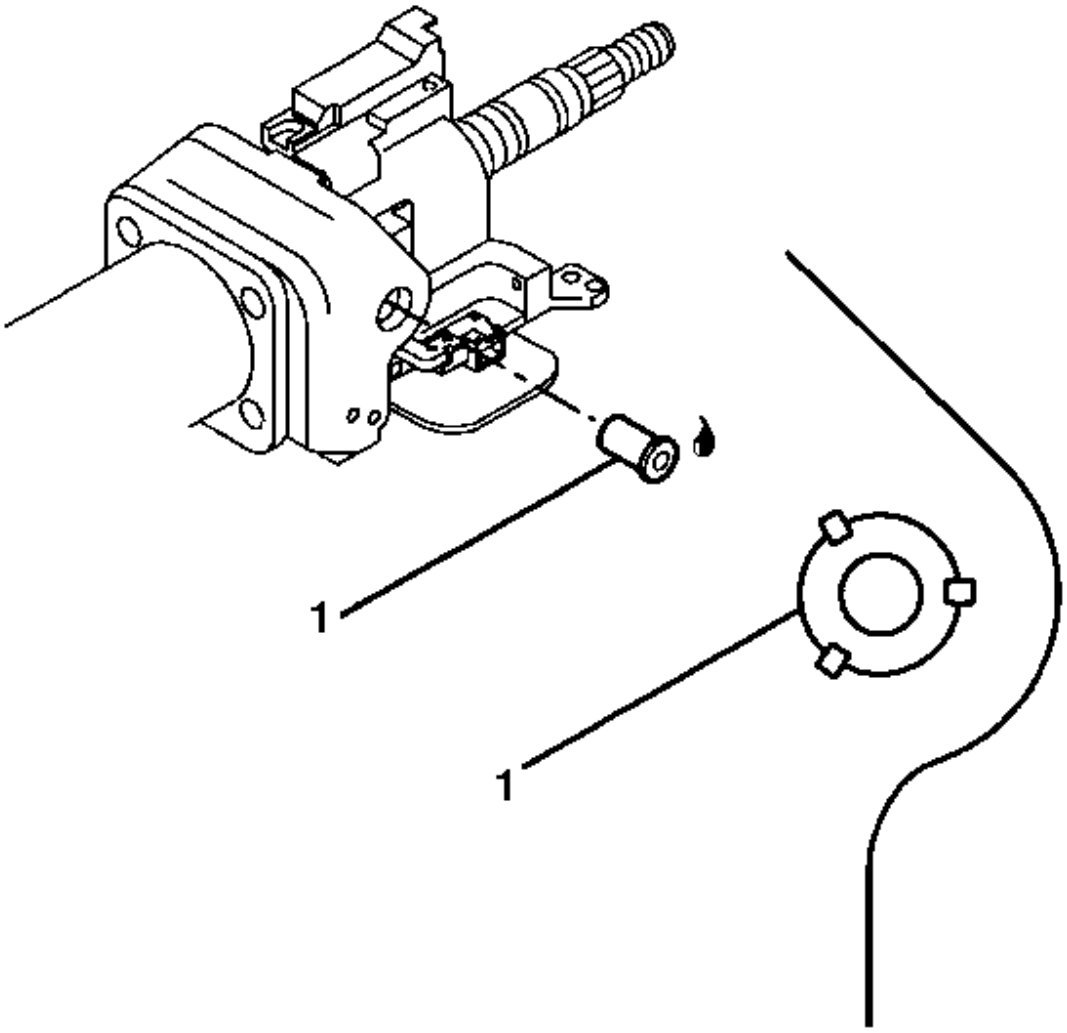

Fig. 59: View Of Pivot Pins At Steering Column Assembly
Courtesy of GENERAL MOTORS COMPANY

4. Install the 2 pivot pins by performing the following steps:
    1. Lubricate the pivot pins (1). Refer to **Adhesives, Fluids, Lubricants, and Sealers** for the recommended lubricant.
    2. Press the pivot pins (1) until the pins are firmly seated.
    3. Stake the pivot pins at three new locations (1).
5. Install the turn signal cancel cam and steering shaft upper bearing spring. Refer to **Turn Signal Cancel Cam and Steering Shaft Upper Bearing Spring Replacement**.

STEERING COLUMN REPLACEMENT

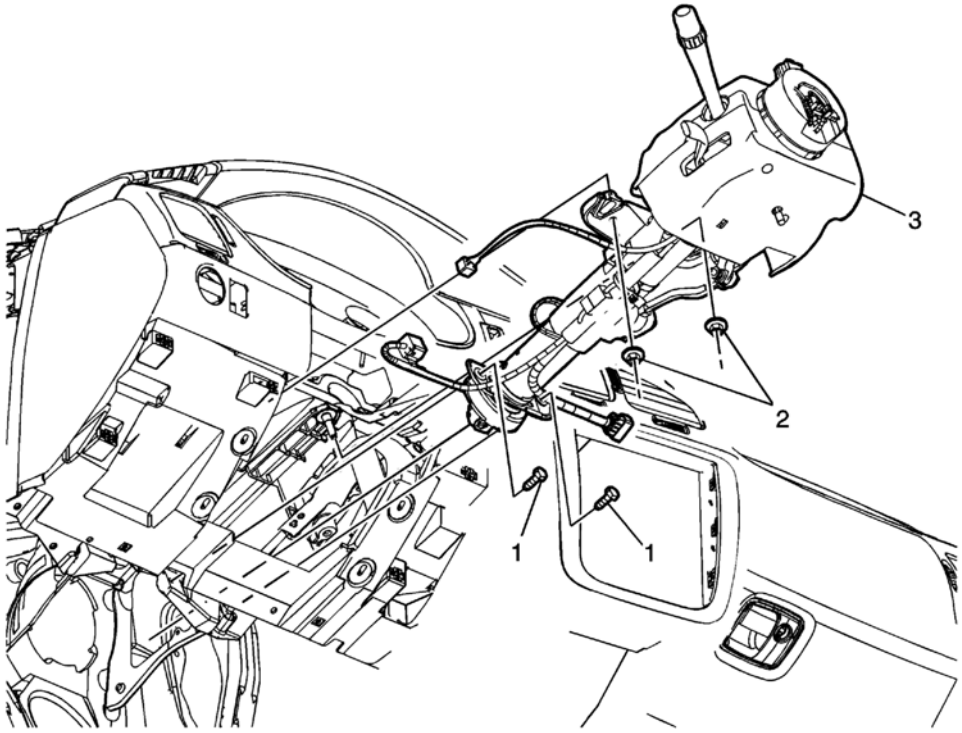

Fig. 60: Steering Column
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
WARNING: **Refer to SIR Warning .** **WARNING:** **Refer to Battery Disconnect Warning .** **CAUTION:** **With wheels of the vehicle facing straight ahead, secure the steering wheel utilizing steering column anti-rotation pin, steering column lock, or a strap to prevent rotation.**	

Callout	Component Name
Locking of the steering column will prevent damage and a possible malfunction of the SIR system. The steering wheel must be secured in position before disconnecting the following components: • **The steering column** • **The intermediate shaft(s)** • **The steering gear** **After disconnecting these components, do not rotate the steering wheel or move the front tires and wheels. Failure to follow this procedure may cause the SIR coil assembly to become un-centered and cause possible damage to the SIR coil. If you think the SIR coil has become un-centered, refer to your specific SIR coil's centering procedure to re-**	

Callout	Component Name
center SIR Coil. **Preliminary Procedures** 1. Insert the **J-42640** pin into the steering column access hole in order to lock the steering column. 2. Disconnect the negative battery cable. Refer to **Battery Negative Cable Disconnection and Connection** . 3. Disable the SIR system. Refer to **SIR Disabling and Enabling** . 4. Remove the steering wheel. Refer to **Steering Wheel Replacement**. 5. Remove the left closeout/insulator panel. Refer to **Instrument Panel Insulator Panel Replacement - Left Side** . 6. Remove the steering column filler panel. Refer to **Steering Column Opening Filler Replacement** . 7. Remove the knee bolster reinforcement. Refer to **Driver Knee Bolster Reinforcement Replacement** . 8. Remove the intermediate shaft from the bottom of the steering column. Refer to **Intermediate Steering Shaft Replacement**. 9. Perform passkey relearn after the ignition lock cylinder has been replaced. Refer to **Control Module References** . **Special Tools J 42640** Steering Column Anti-rotation Pin	
1	Steering Column Bolt (Qty: 2) **CAUTION:** **Refer to Fastener Caution .** **Tighten** 25 N.m (18 lb ft)
2	Steering Column Nut (Qty: 2) **Procedure** Once all steering column bolts and nuts are started, torque the steering column bolts first. **Tighten** 25 N.m (18 lb ft)
3	Steering Column **Procedure** 1. Disconnect any electrical connectors as needed. 2. Transfer any parts as needed.

STEERING SHAFT LOWER BEARING REPLACEMENT

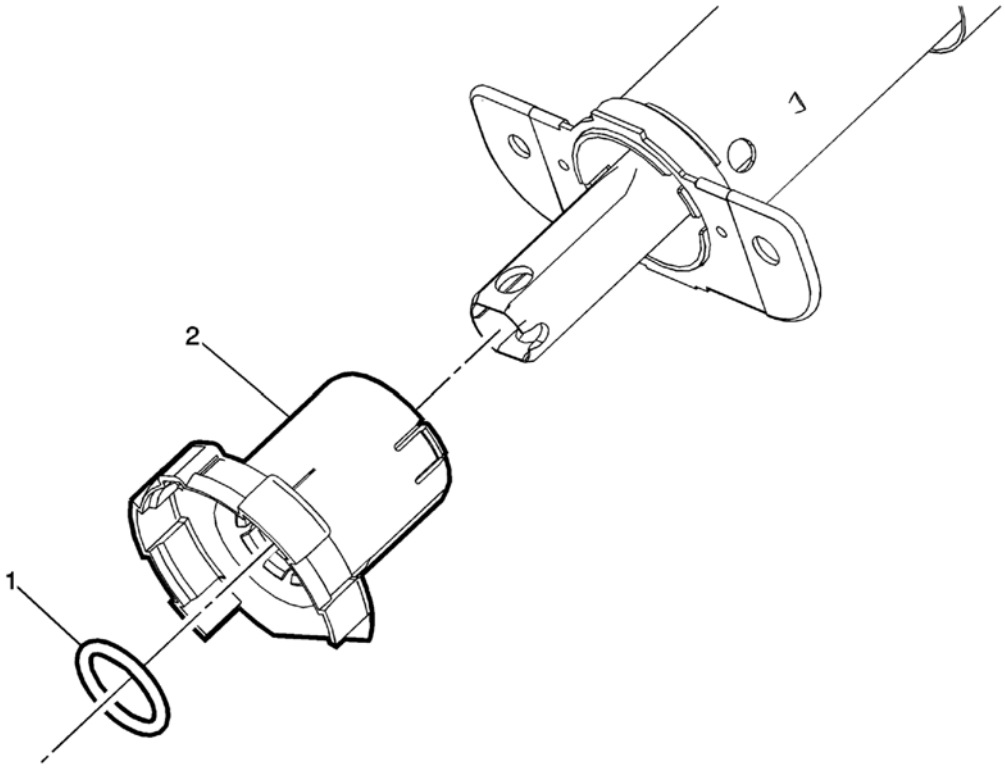

Fig. 61: Steering Shaft Lower Bearing
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure Remove the steering angle sensor. Refer to **Steering Angle Sensor Replacement** .	
1	Steering Shaft Lower Bearing Retaining Ring **CAUTION:** **Refer to Fastener Caution .** **Procedure** Remove and discard the old retaining ring. Do NOT reuse the retaining ring, replace with NEW only.
2	Steering Shaft Lower Bearing

DESCRIPTION AND OPERATION

STEERING WHEEL AND COLUMN DESCRIPTION AND OPERATION

The steering wheel and column has 4 primary functions:

- Heated Steering Wheel

- Vehicle steering
- Vehicle security
- Driver convenience
- Driver safety

Heated Steering Wheel

The heated steering wheel control module controls the heated steering wheel and the heated steering wheel ON indicator based on an input from the heated steering wheel switch. When the heated steering wheel switch is pressed, the switch signal circuit is pulled to ground. This indicates to the heating steering wheel control module that steering wheel heat is requested. When the request is seen, the heated steering wheel control module supplies ground to the indicator lamp and supplies voltage to the heating elements, which are internal to the steering wheel. The heated steering wheel temperature is monitored through an internal temperature sensor. When the steering wheel reaches operating temperature the module will cycle the voltage on and off to maintain the operating temperature.

Vehicle Steering

The steering wheel is the first link between the driver and the vehicle. The steering wheel is fastened to a steering shaft within the column. At the lower end of the column, the intermediate shaft connects the column to the steering gear.

Vehicle Security, Found on Some Vehicle Models

Theft deterrent components are mounted and designed into the steering column. The following components allow the column to be locked in order to minimize theft:

- The ignition switch-location varies
- The steering column lock-content varies
- The ignition cylinder-location varies
- The theft deterrent module-location varies

Driver Convenience

The steering wheel and column may also have driver controls attached for convenience and comfort. The following controls may be mounted on or near the steering wheel or column.

- The turn signal switch
- The hazard switch
- The headlamp dimmer switch
- The wiper/washer switch
- The horn pad/cruise control switch
- The redundant radio/entertainment system controls
- The manual/power tilt or tilt/telescoping functions
- The power pedal adjustment control switch
- The navigation/OnStarÂ® features

- The HVAC controls

Driver Safety

The steering wheel and column has safety features to protect the driver. The following components may be mounted on or near the steering column:

Energy-Absorbing Steering Column

The energy-absorbing steering column compresses in the event of a front-end collision, which reduces the chance of injury to the driver. The energy-absorbing feature, collapsible steering shaft, and break away mounting features help reduce the injury in the event of an accident. In addition to these features, the following driver safety features may be on the steering column. To inspect the steering column for damage, refer to **Steering Column Accident Damage Inspection**.

Electronic Park Lock (EPL)/Ignition Lock Cylinder Control Actuator

If the vehicle is equipped with automatic transmission and a floor mounted console gear shift, it has an ignition lock cylinder control actuator system in the steering column. The ignition lock cylinder control actuator purpose is to prevent the ignition key from being turned to the OFF position when the transmission is in any position other than PARK and the vehicle may still be moving. The column ignition lock system consists of an ignition lock cylinder control actuator, and a park position switch that is located in the automatic transmission shift lock control switch. The ignition lock cylinder control actuator contains a pin that is spring loaded to mechanically prevent the ignition key cylinder from being turned to the lock position when the vehicle transmission is not in the PARK position. If vehicle power is lost, and/or the transmission is not in the PARK position the operator will not be able to turn the ignition key to the lock position and will not be able to remove the ignition key from the column.

Linear Shift Assembly

If the vehicle is equipped with a column mounted gear shift, it has a linear shift assembly on the steering column. The linear shift assembly has a cable that runs from the linear shift assembly to the ignition lock cylinder case. The purpose of this cable is to prevent the ignition key from being turned to the OFF position when the transmission is in gear and the vehicle may still be moving. The linear shift assembly cable contains a pin that is spring loaded to mechanically prevent the ignition key cylinder from being turned to the lock position when the vehicle transmission is not in the PARK position. If vehicle power is lost, and/or the transmission is not in the PARK position the operator will not be able to turn the ignition key to the lock position and will not be able to remove the ignition key from the column.

SIR Coil and Module

For additional information on the operation of the SIR coil and module, refer to **Supplemental Inflatable Restraint System Description and Operation** .

Automatic Transmission Shift Lock Actuator

The automatic transmission shift lock control system is a safety device that prevents an inadvertent shift out of PARK when the engine is running. The driver must press the brake pedal before moving the shift lever out of the PARK position. The system consists of the following components: the automatic transmission shift lock control solenoid, the automatic transmission shift lock control switch, the body

control module (BCM), the powertrain control module (PCM)/engine control module (ECM). With the ignition in the ON position, voltage is supplied to automatic transmission shift lock control switch. Voltage flows through the normally closed contacts of the automatic transmission shift lock control switch to the automatic transmission shift lock control solenoid. When the BCM receives a class 2 message from the PCM/ECM indicating the transmission is in the park position the BCM then grounds the automatic transmission shift lock solenoid control circuit . This energizes the automatic transmission shift lock control solenoid causing the transmission shift lever to be physically locked in the PARK position. When the brake pedal is pressed the contacts in the automatic transmission shift lock control switch open, de-energizing the automatic transmission shift lock control solenoid. This allows the shift lever to be move out of the PARK position.

Steering Wheel Angle Sensor or Steering Wheel Position Sensor

The steering wheel position sensor is located somewhere along the steering shaft assembly. The sensor measures the position of the steering wheel and the speed at which it is rotated. A signal representing this measurement is provided to the vehicle stability enhancement system (VSES) module. The VSES module uses this signal, along with several others representing different vehicle conditions, to monitor the driving behavior of the vehicle and ensure that it stays in control. If the VSES module determines that the vehicle is out of control it provides signals to the powertrain control module (PCM) and the ABS module. These output signals are used to modulate the transmission torque and brake pressure of each of the vehicles wheels in order to regain control of the vehicle.

[1] Tighten the nut to 20 N.m(15 lb ft) plus 2 nut flats (120Â°) to align the cotter pin hole with the front lower control arm ball stud. Turn the nut clockwise. DO NOT loosen the nut in order to align the cotter pin hole. Minimum torque is 55 N.m (41 lb ft).		

REPAIR INSTRUCTIONS

STABILIZER SHAFT REPLACEMENT

Removal Procedure

WARNING: Failure to disconnect intermediate shaft from rack and pinion stub shaft can result in damage to steering gear and/or intermediate shaft. This damage can cause loss of steering control which could result in personal injury.

1. Raise and suitably support the vehicle. Refer to **Lifting and Jacking the Vehicle** .
2. Remove the left tire and wheel assembly. Refer to **Tire and Wheel Removal and Installation** .
3. Remove the pinch bolt from the lower intermediate steering shaft. Refer to **Intermediate Steering Shaft Replacement** .
4. Loosen all insulator clamp attaching bolts.
5. Place a jackstand under the center of the rear frame crossmember.
6. Remove the rear frame-to-body bolts.
7. Lower the rear of the frame just enough to gain access to the stabilizer shaft.

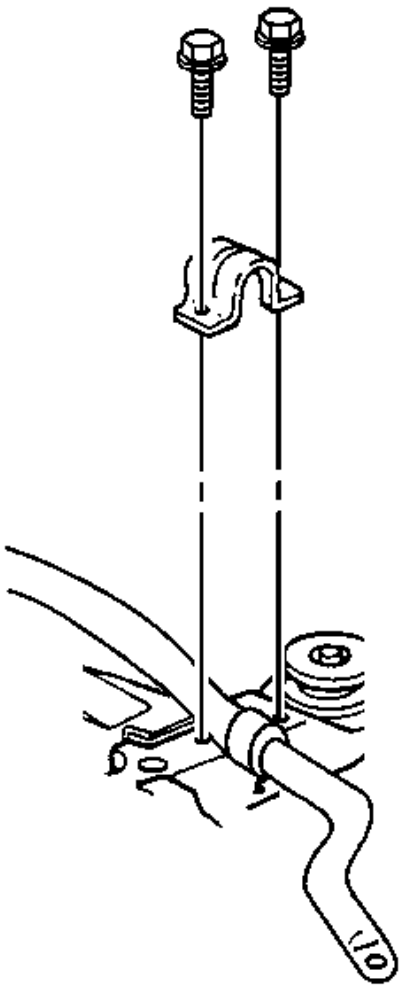

Fig. 1: View Of Insulator Brackets
Courtesy of GENERAL MOTORS COMPANY

8. Remove the insulator clamp bolts and the clamps from the frame.

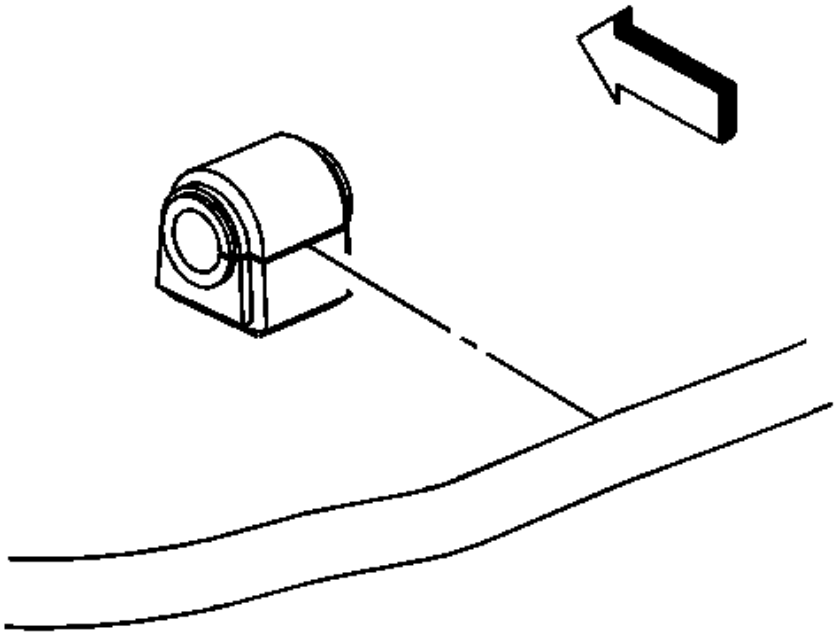

Fig. 2: View Of Insulator For Stabilizer Bar
Courtesy of GENERAL MOTORS COMPANY

9. Remove the insulators from the stabilizer bar.

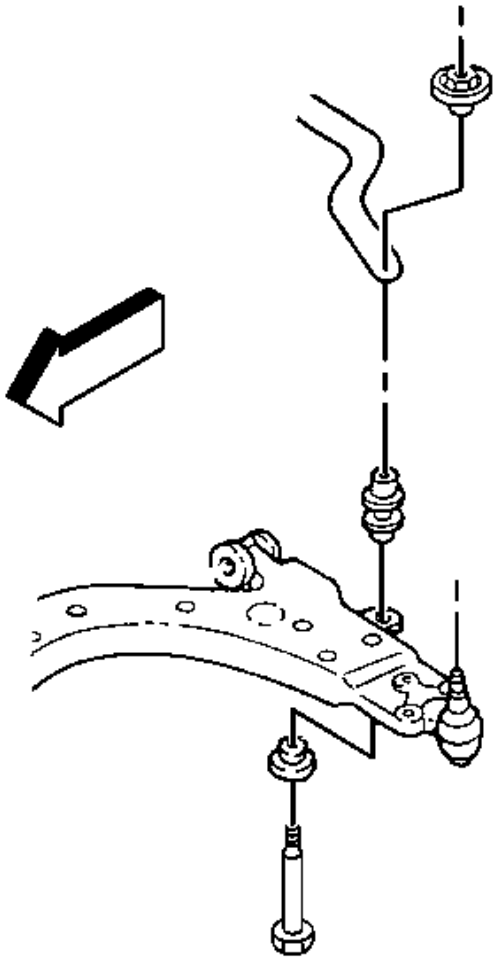

Fig. 3: View Of Stabilizer Shaft Link
Courtesy of GENERAL MOTORS COMPANY

10. Remove the stabilizer bar links from the control arms. Refer to **Stabilizer Shaft Link Replacement**.
11. Pull the stabilizer shaft rearward.
12. Swing the stabilizer shaft down to remove the stabilizer shaft from the left side of the vehicle.

Installation Procedure

WARNING: When installing the intermediate shaft make sure that the shaft is seated prior to pinch bolt installation. If the pinch bolt is inserted into the coupling before shaft installation, the two mating shafts may disengage. Disengagement of the two mating shafts will cause loss of steering control which could result in personal injury.

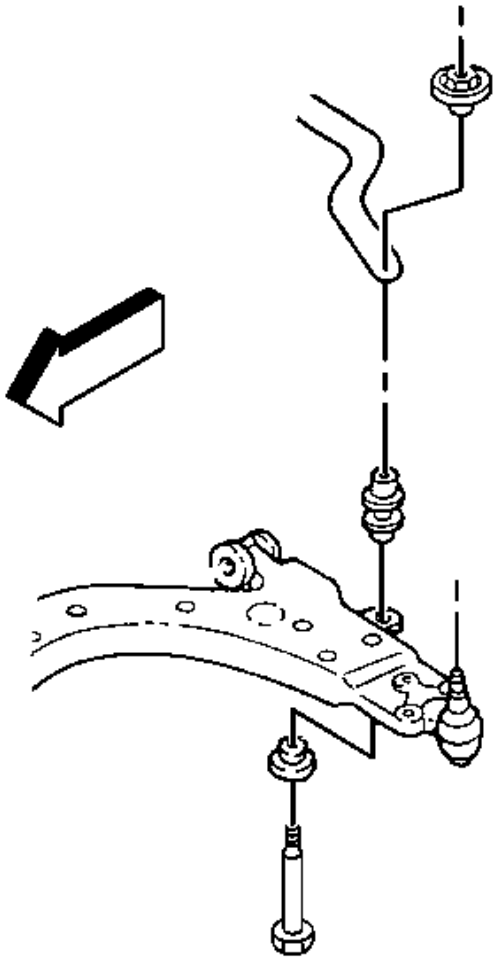

Fig. 4: View Of Stabilizer Shaft Link
Courtesy of GENERAL MOTORS COMPANY

1. Insert the stabilizer shaft to the left side of the vehicle.

NOTE: **DO NOT tighten the stabilizer link nut at this time. The weight of the vehicle must be supported by the control arms such that you can obtain the vehicle design trim heights before tightening the link nut.**

2. Loosely install the stabilizer shaft link at the control arm.

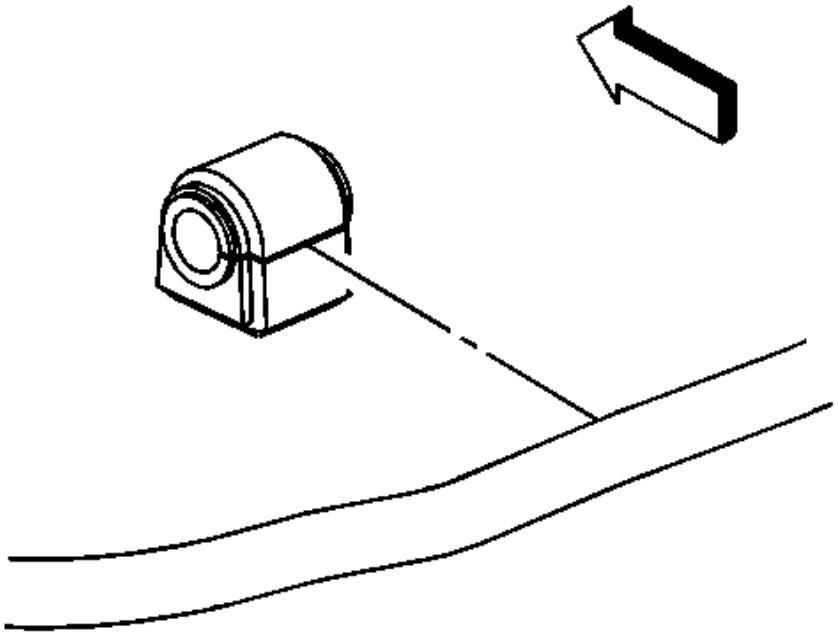

Fig. 5: View Of Insulator For Stabilizer Bar
Courtesy of GENERAL MOTORS COMPANY

3. Install the insulators on to the stabilizer bar.

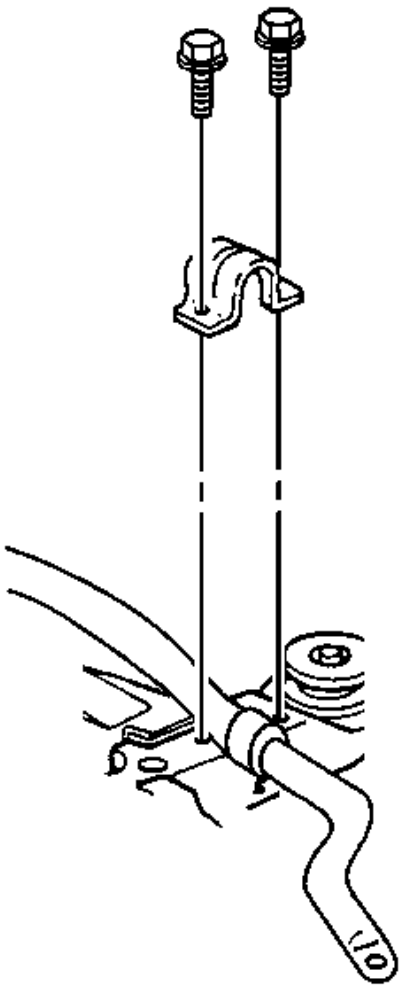

Fig. 6: View Of Insulator Brackets
Courtesy of GENERAL MOTORS COMPANY

CAUTION: Refer to Fastener Caution .

4. Connect the insulator clamps to the frame.

Tighten

Tighten the stabilizer shaft bracket bolt to 42 N.m (31 lb ft).

5. Raise the frame into position while you guide the steering shaft onto the gear.
6. Install the rear frame-to-body attaching bolts.

Tighten

Tighten the frame to body attaching bolts to 160 N.m (118 lb ft).

7. Remove the jackstand.

8. Install the pinch bolt and tighten. Refer to **Intermediate Steering Shaft Replacement** .
9. Install the left tire and wheel assembly. Refer to **Tire and Wheel Removal and Installation** .
10. Lower the vehicle.
11. Support the weight of the vehicle by the control arms.
12. Tighten the stabilizer link nut.

Tighten

Tighten the stabilizer shaft link nut to 23 N.m (17 lb ft).

STABILIZER SHAFT LINK REPLACEMENT

Removal Procedure

1. Raise the vehicle and suitably support the vehicle. Refer to **Lifting and Jacking the Vehicle** .
2. Remove the tire and wheel assembly. Refer to **Tire and Wheel Removal and Installation** .

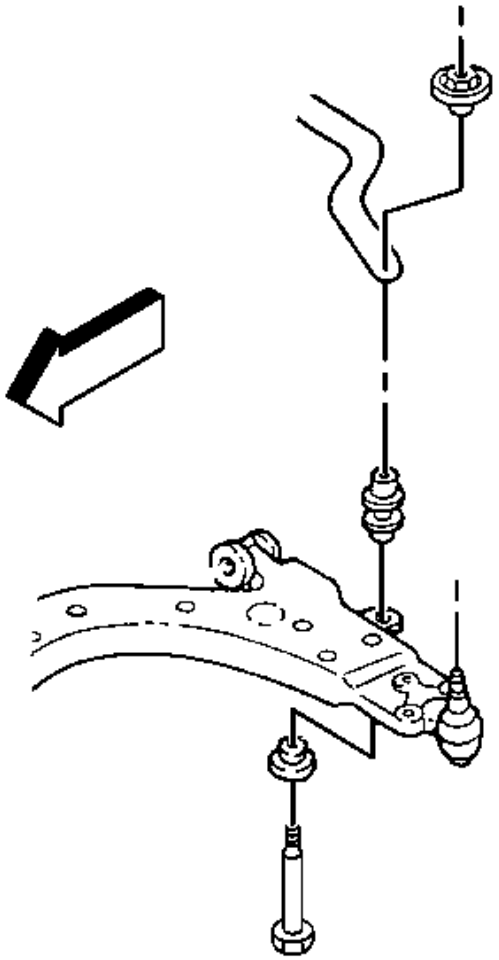

Fig. 7: View Of Stabilizer Shaft Link
Courtesy of GENERAL MOTORS COMPANY

3. Remove the stabilizer shaft link bolt and nut.
4. Remove the stabilizer shaft link from the vehicle.

Installation Procedure

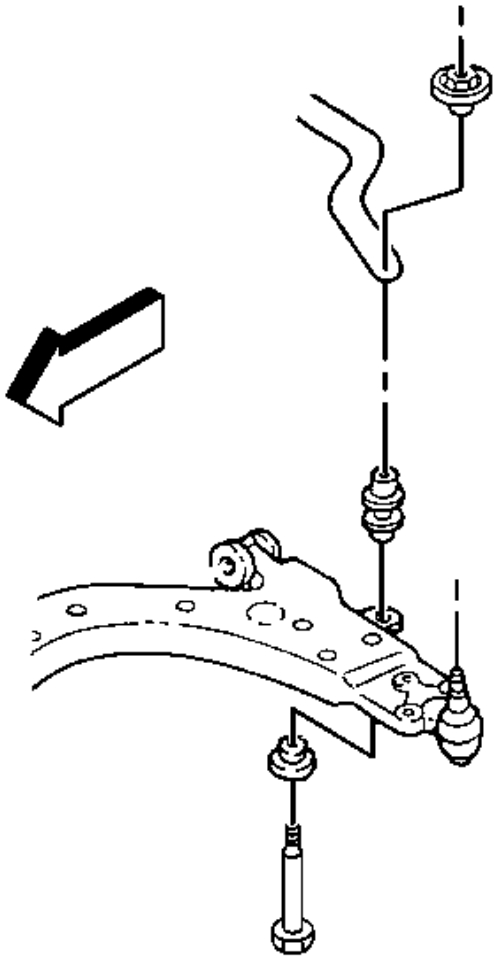

Fig. 8: View Of Stabilizer Shaft Link
Courtesy of GENERAL MOTORS COMPANY

1. Install the stabilizer link into the vehicle.

CAUTION: Refer to Fastener Caution .

2. Install the stabilizer shaft link bolt and nut.

Tighten

Tighten the stabilizer shaft link nut to 23 N.m (17 lb ft).

3. Install the tire and wheel assembly. Refer to **Tire and Wheel Removal and Installation** .
4. Lower the vehicle.

STABILIZER SHAFT INSULATOR REPLACEMENT

Removal Procedure

1. Raise and support the vehicle. Refer to **Lifting and Jacking the Vehicle** .

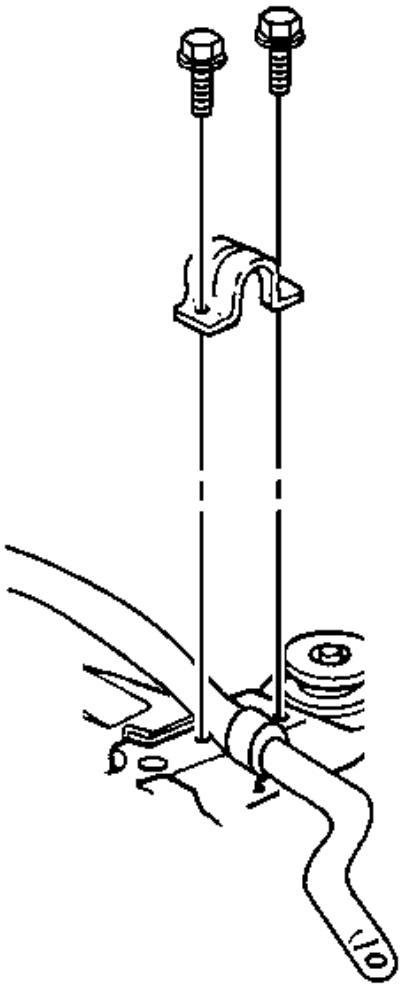

Fig. 9: View Of Insulator Brackets
Courtesy of GENERAL MOTORS COMPANY

2. Remove the left and right side stabilizer shaft insulator bracket bolts.
3. Remove the left and right side stabilizer shaft insulator brackets.

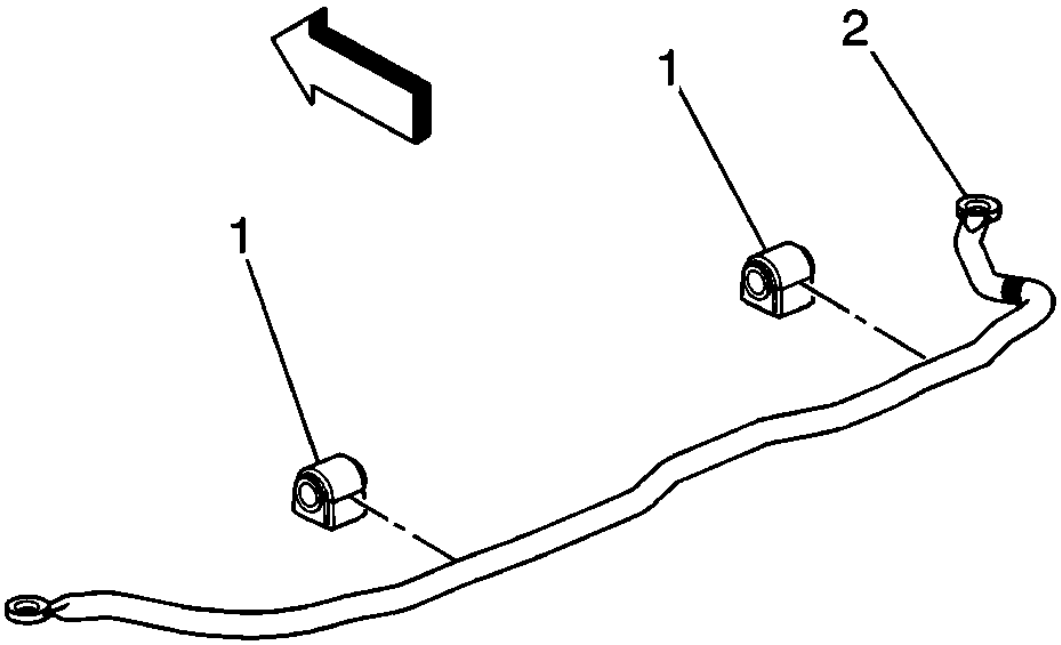

Fig. 10: Stabilizer Shaft Insulators
Courtesy of GENERAL MOTORS COMPANY

4. Remove the left and right side stabilizer shaft insulators (1) from the stabilizer shaft (2).

Installation Procedure

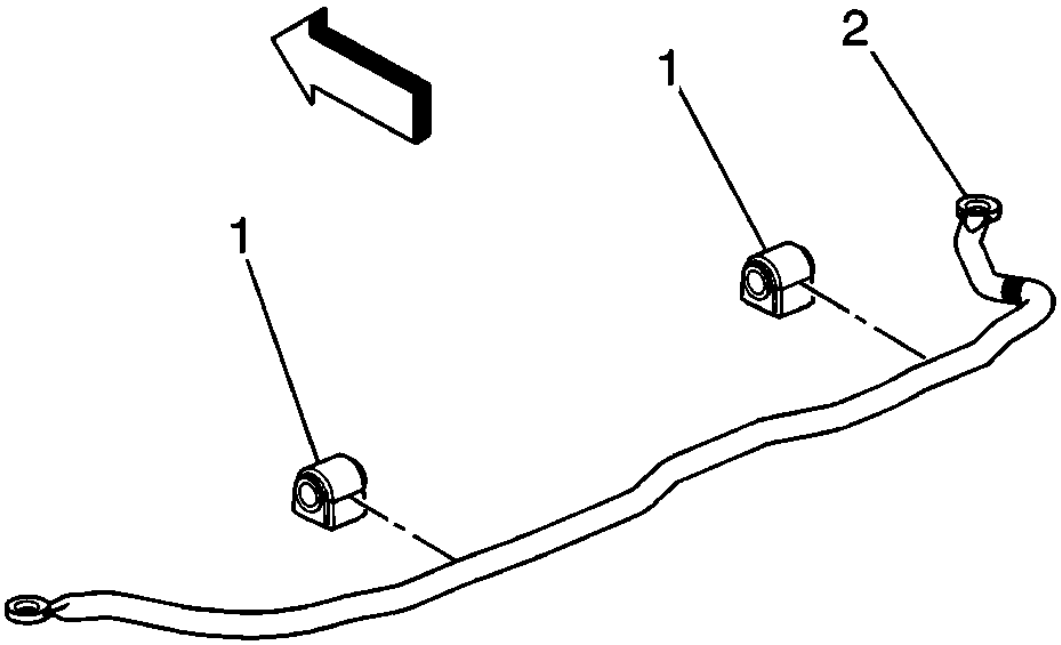

Fig. 11: Stabilizer Shaft Insulators
Courtesy of GENERAL MOTORS COMPANY

1. Install the left and right side stabilizer shaft insulators (1) to the stabilizer shaft (2).

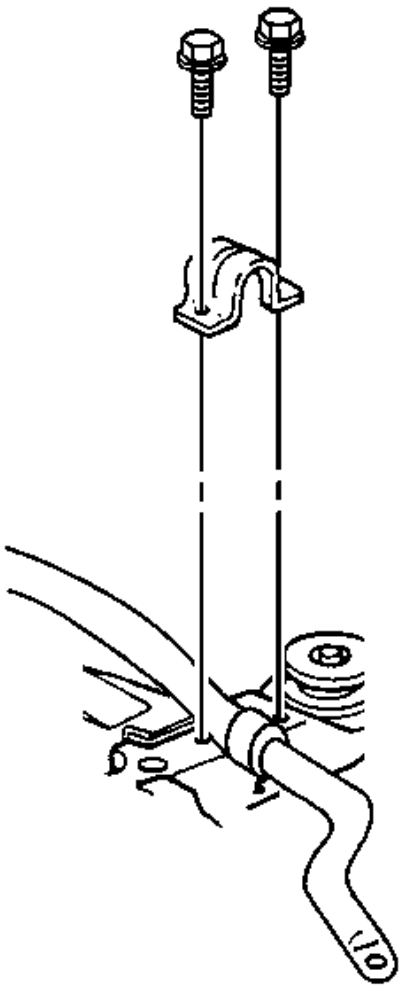

Fig. 12: View Of Insulator Brackets
Courtesy of GENERAL MOTORS COMPANY

2. Install the left and right side stabilizer shaft insulator brackets.

CAUTION: **Refer to Fastener Caution .**

3. Install the left and right side stabilizer shaft insulator bracket bolts.

Tighten

Tighten the stabilizer shaft insulator bracket bolts to 42 N.m (31 lb ft).

4. Lower the vehicle.

LOWER CONTROL ARM BALL JOINT REPLACEMENT

Removal Procedure

1. Raise and support the vehicle. Refer to **Lifting and Jacking the Vehicle** .

2. Remove the tires and wheels. Refer to **Tire and Wheel Removal and Installation** .
3. Remove the lower control arm. Refer to **Lower Control Arm Replacement**.
4. Secure the lower control arm in a suitable vise.

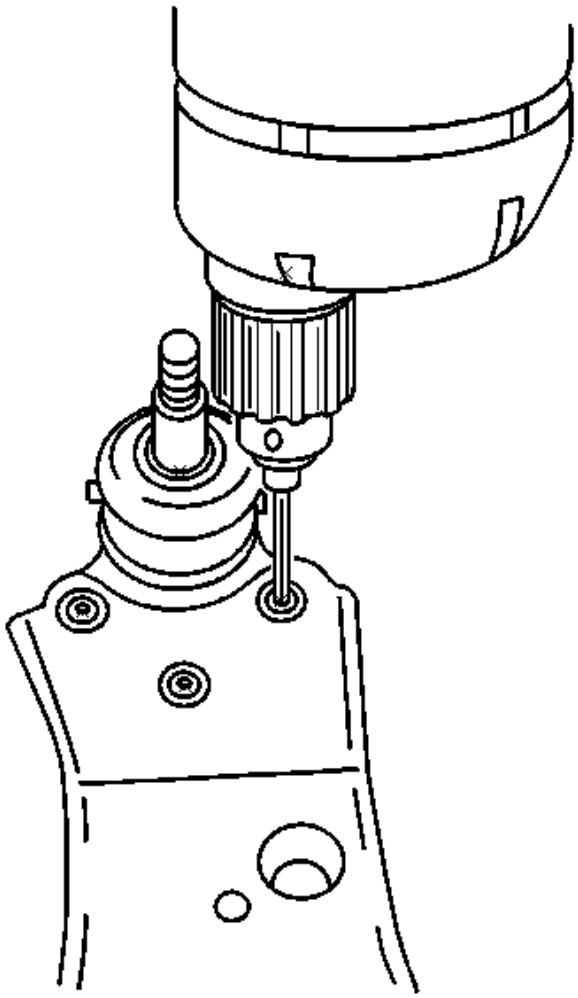

Fig. 13: Drilling Out Lower Ball Joint Rivet Heads
Courtesy of GENERAL MOTORS COMPANY

5. Using the appropriate size drill, drill out the rivet heads from the lower control arm.

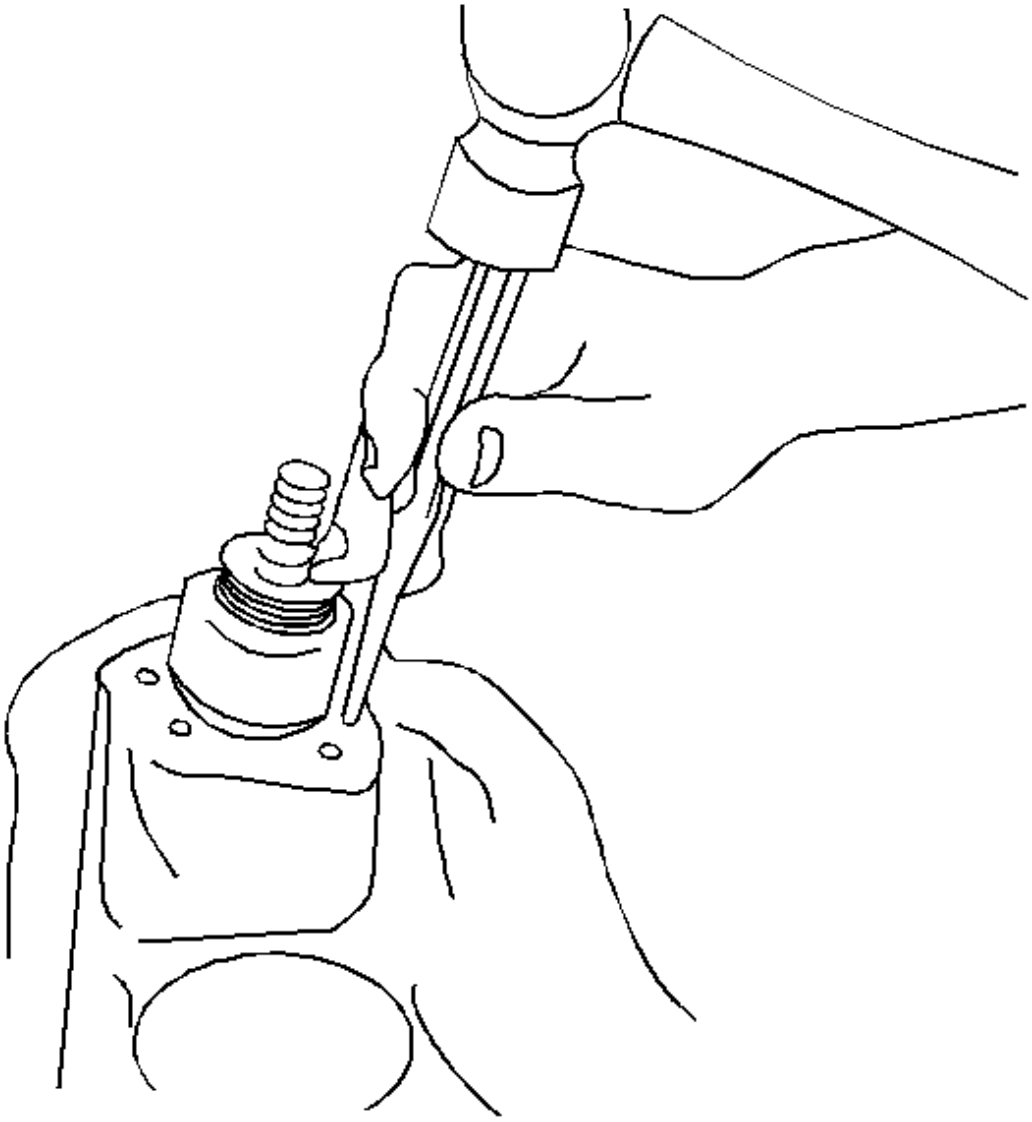

Fig. 14: Using Hammer & Drift To Remove Lower Ball Joint Rivets
Courtesy of GENERAL MOTORS COMPANY

6. Using a hammer and a drift punch, remove the remaining rivets from the control arm.

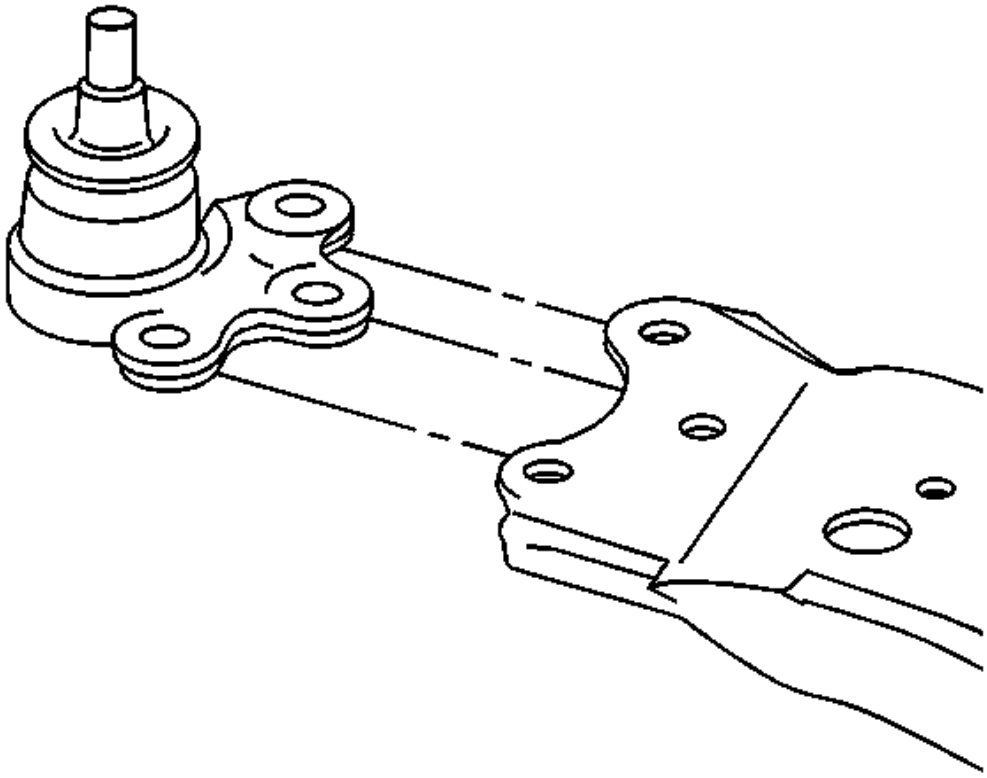

Fig. 15: Lower Ball Joint
Courtesy of GENERAL MOTORS COMPANY

7. Remove the ball joint from the lower control arm.

Installation Procedure

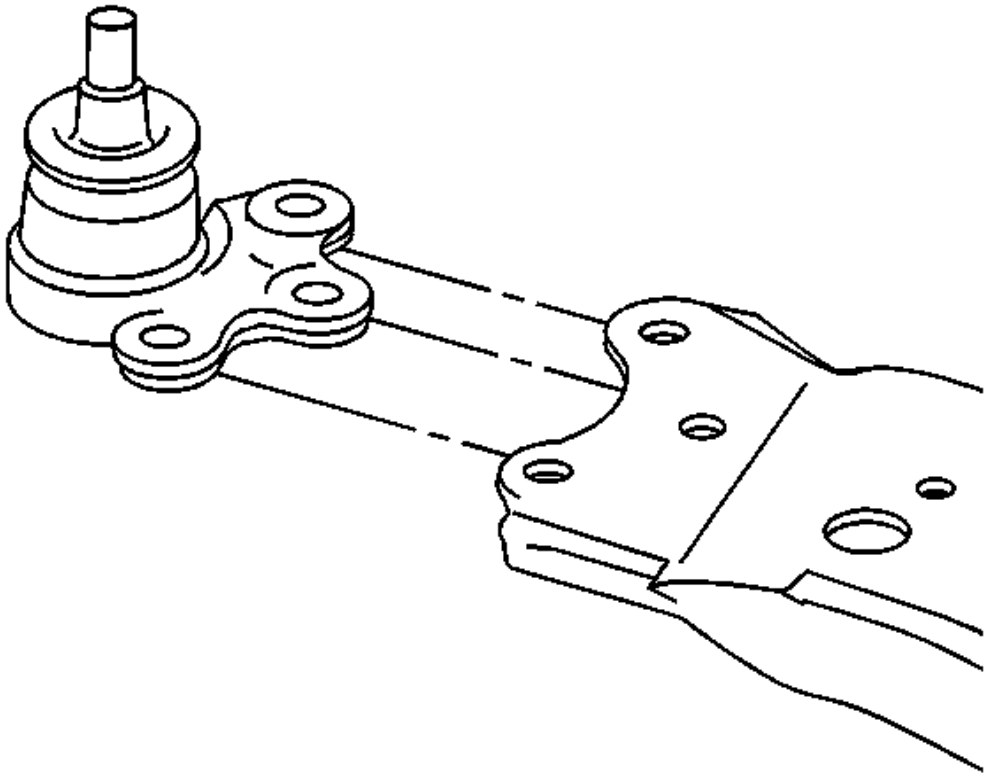

Fig. 16: Lower Ball Joint
Courtesy of GENERAL MOTORS COMPANY

1. Position the new ball joint in the lower control arm.

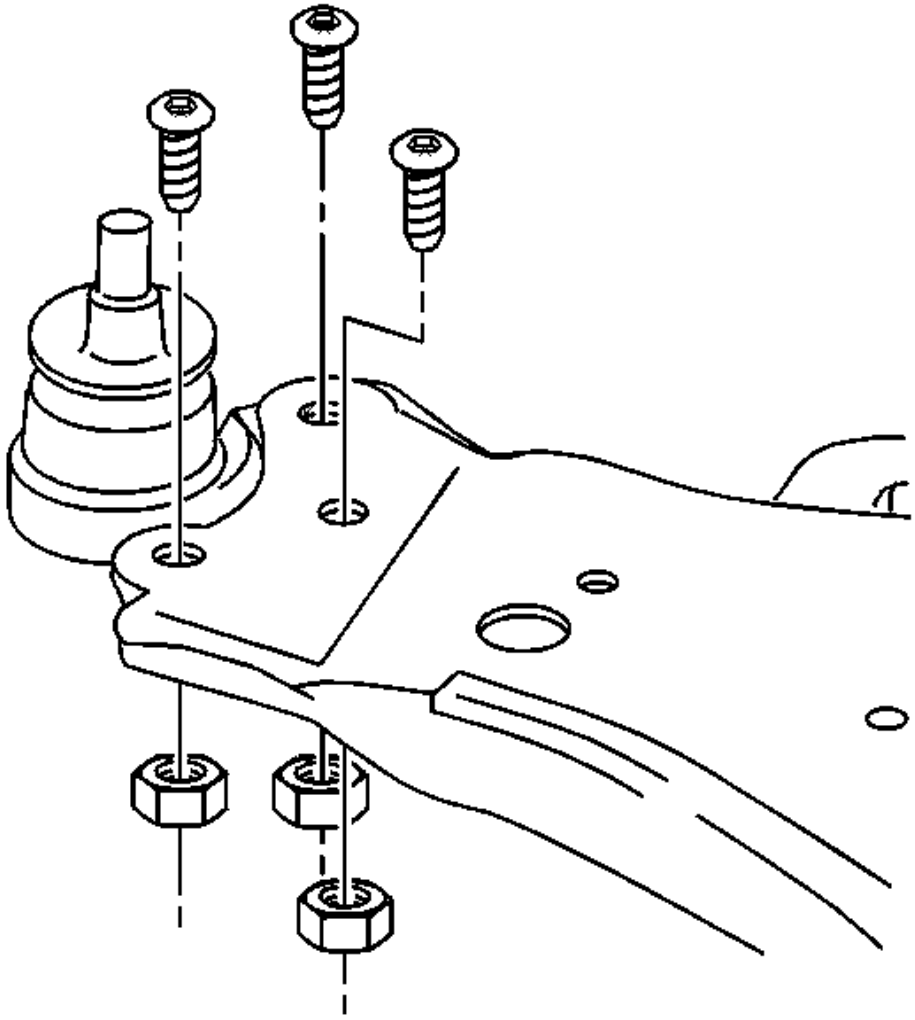

Fig. 17: Identifying Ball Joint Retaining Nuts
Courtesy of GENERAL MOTORS COMPANY

NOTE: **Install the NEW ball joint bolts facing downward.**

2. Install the NEW ball joint bolts.

CAUTION: **Refer to Fastener Caution .**

3. Install the NEW ball joint retaining nuts.

Tighten

Tighten the ball joint nuts to 68 N.m (50 lb ft).

4. Install the lower control arm. Refer to **Lower Control Arm Replacement**.
5. Install the tires and wheels. Refer to **Tire and Wheel Removal and Installation** .
6. Remove the support and lower the vehicle. Refer to **Lifting and Jacking the Vehicle**

FRONT WHEEL BEARING AND HUB REPLACEMENT

Special Tools

J 42129 Wheel Hub Remover

Removal Procedure

1. Raise and support the vehicle. Refer to **Lifting and Jacking the Vehicle** .
2. Remove the tire and wheel. Refer to **Tire and Wheel Removal and Installation** .

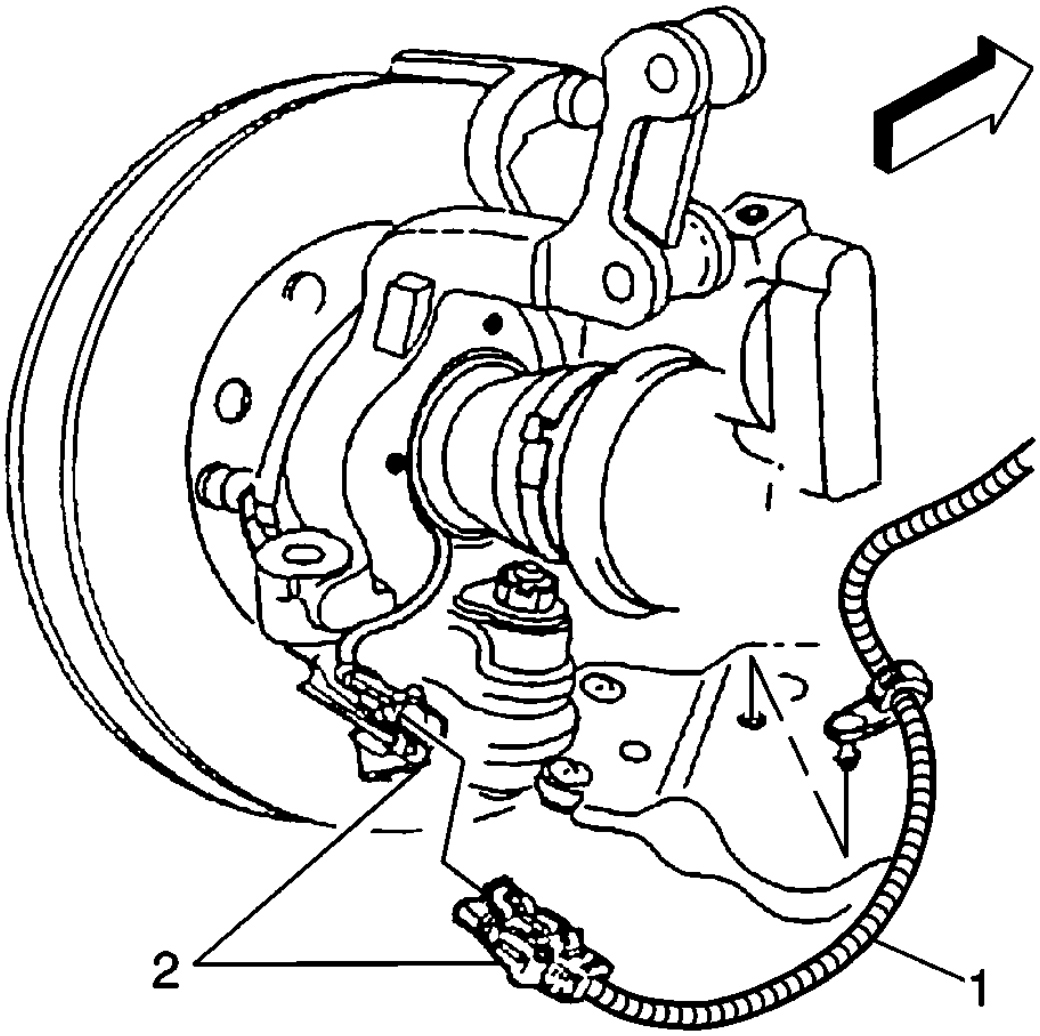

Fig. 18: View Of Wheel Speed Sensor, Connector And Harness
Courtesy of GENERAL MOTORS COMPANY

3. Disconnect the wheel speed sensor electrical connector (2), if equipped.

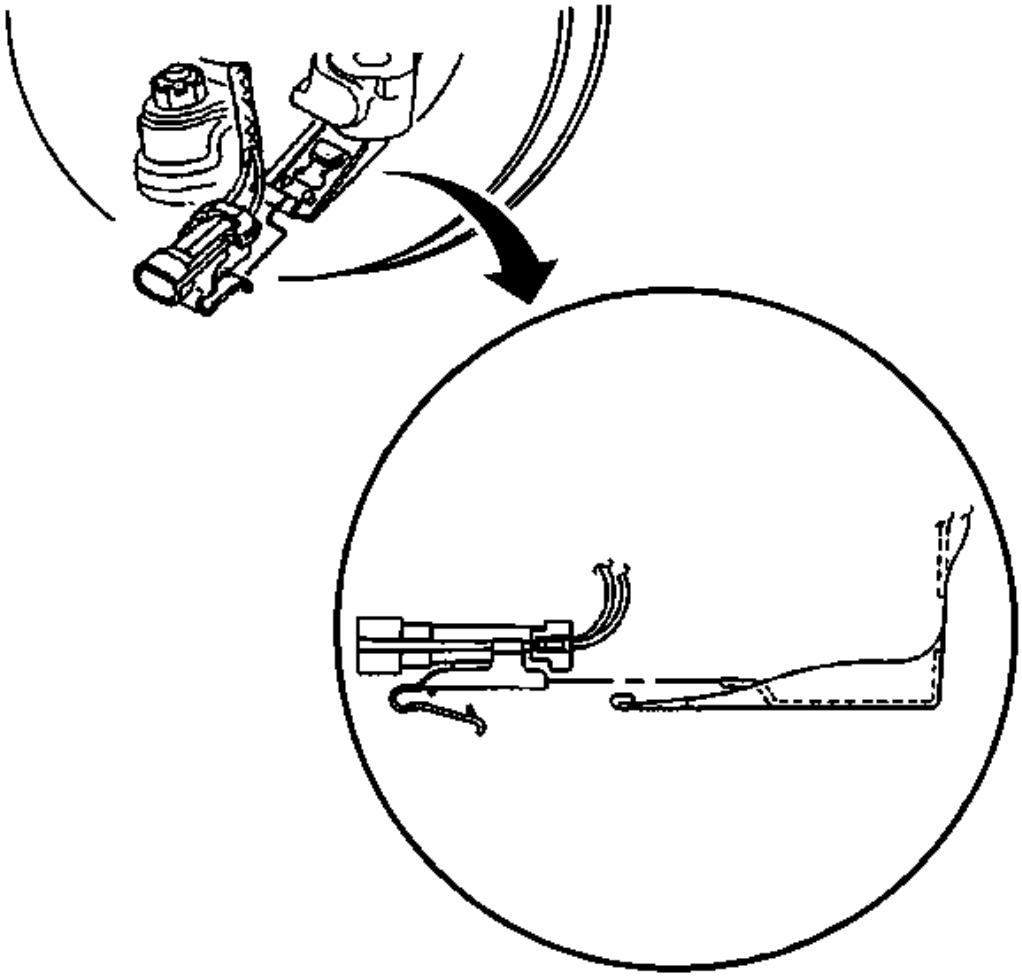

Fig. 19: View Of Wheel Speed Sensor Electrical Connector & Bracket
Courtesy of GENERAL MOTORS COMPANY

4. Remove the wheel speed sensor electrical connector from the bracket, if equipped.
5. Remove the front wheel drive shaft nut. Refer to **Wheel Drive Shaft Replacement (Left Side)** **Wheel Drive Shaft Replacement (Right Side)** .
6. Remove the brake rotor. Refer to **Front Brake Rotor Replacement** .

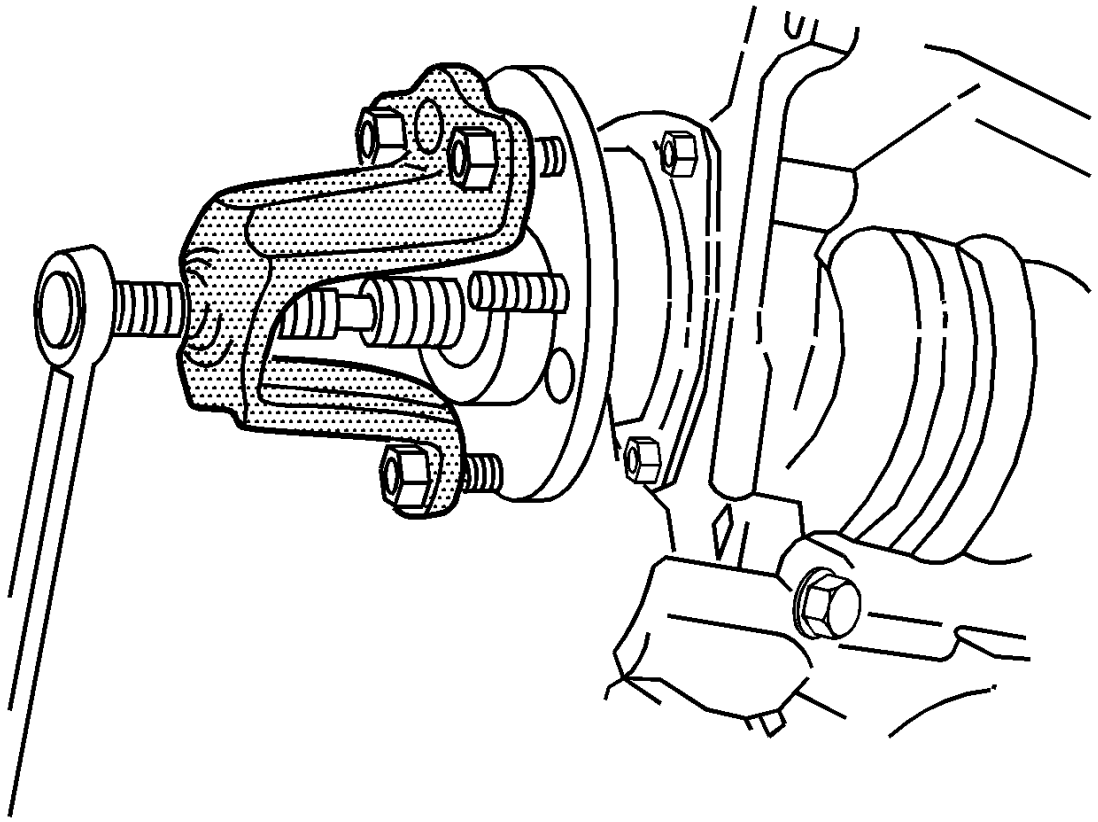

Fig. 20: Pushing Wheel Drive Shaft Out Of Wheel Bearing/Hub
Courtesy of GENERAL MOTORS COMPANY

7. Use 3 wheel nuts in order to attach the **J 42129** wheel hub remover to the wheel bearing/hub.
8. Use the **J 42129** wheel hub remover in order to push the wheel drive shaft out of the wheel bearing/hub.

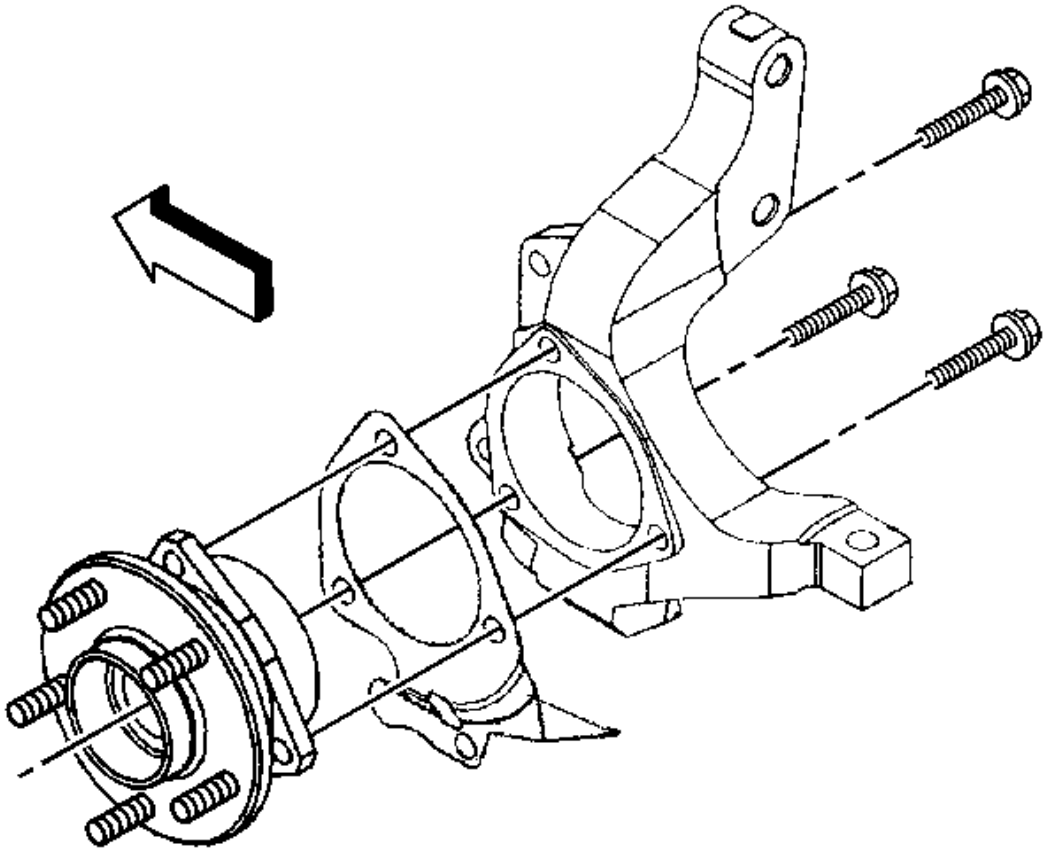

Fig. 21: View Of Wheel Bearing/Hub & Splash Shield
Courtesy of GENERAL MOTORS COMPANY

9. Remove and DISCARD the wheel bearing/hub bolts. Remove the **J 42129** wheel hub remover from the hub.

NOTE: **Ensure that the wheel drive shaft outer seal/boot is not damaged.**

10. Remove the wheel bearing/hub and splash shield-noting the position of the shield for re-installation.

Installation Procedure

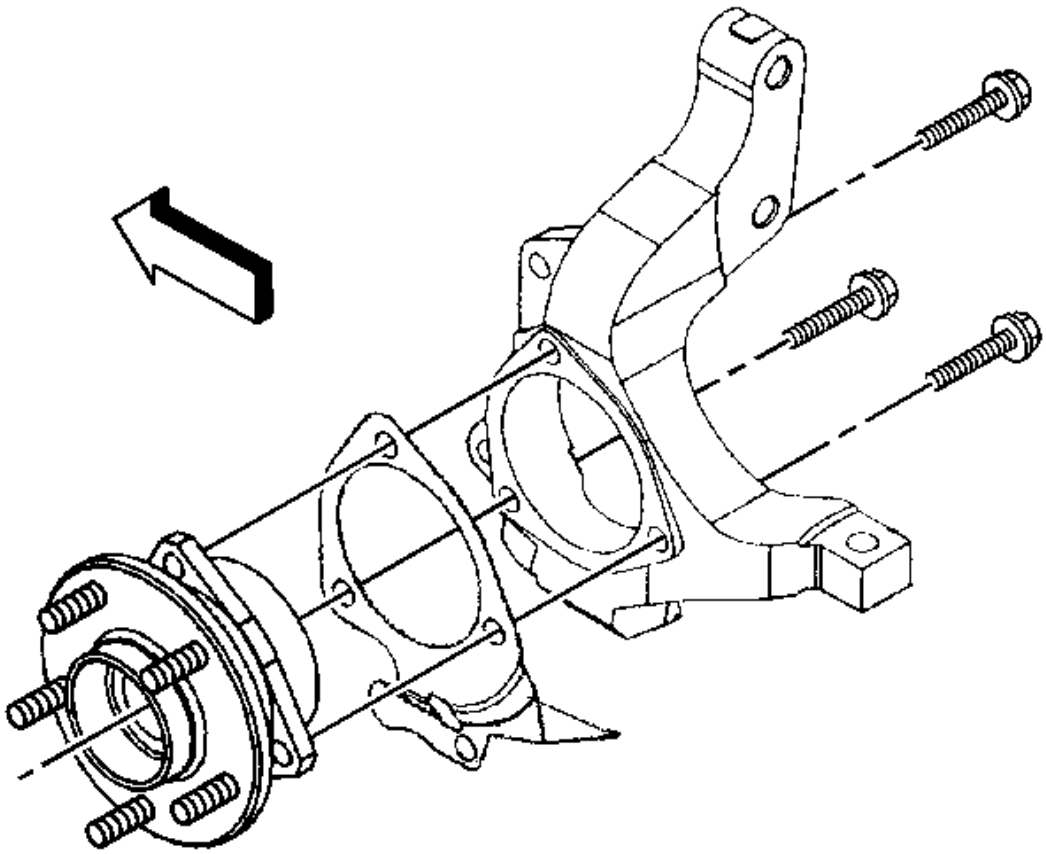

Fig. 22: View Of Wheel Bearing/Hub & Splash Shield
Courtesy of GENERAL MOTORS COMPANY

1. Install the wheel bearing/hub with the splash shield as noted during removal.

WARNING: **These fasteners MUST be replaced with new fasteners anytime they become loose or are removed. Failure to replace these fasteners after they become loose or are removed may cause loss of vehicle control and personal injury.**

CAUTION: **Refer to Fastener Caution .**

2. Install NEW wheel bearing/hub bolts.

Tighten

Tighten the NEW wheel bearing/hub bolts to 130 N.m (96 lb ft).

3. Install the brake rotor and caliper. Refer to **Front Brake Rotor Replacement** .

4. Install the front wheel drive shaft nut. Refer to **Wheel Drive Shaft Replacement (Left Side)** **Wheel Drive Shaft Replacement (Right Side)** .

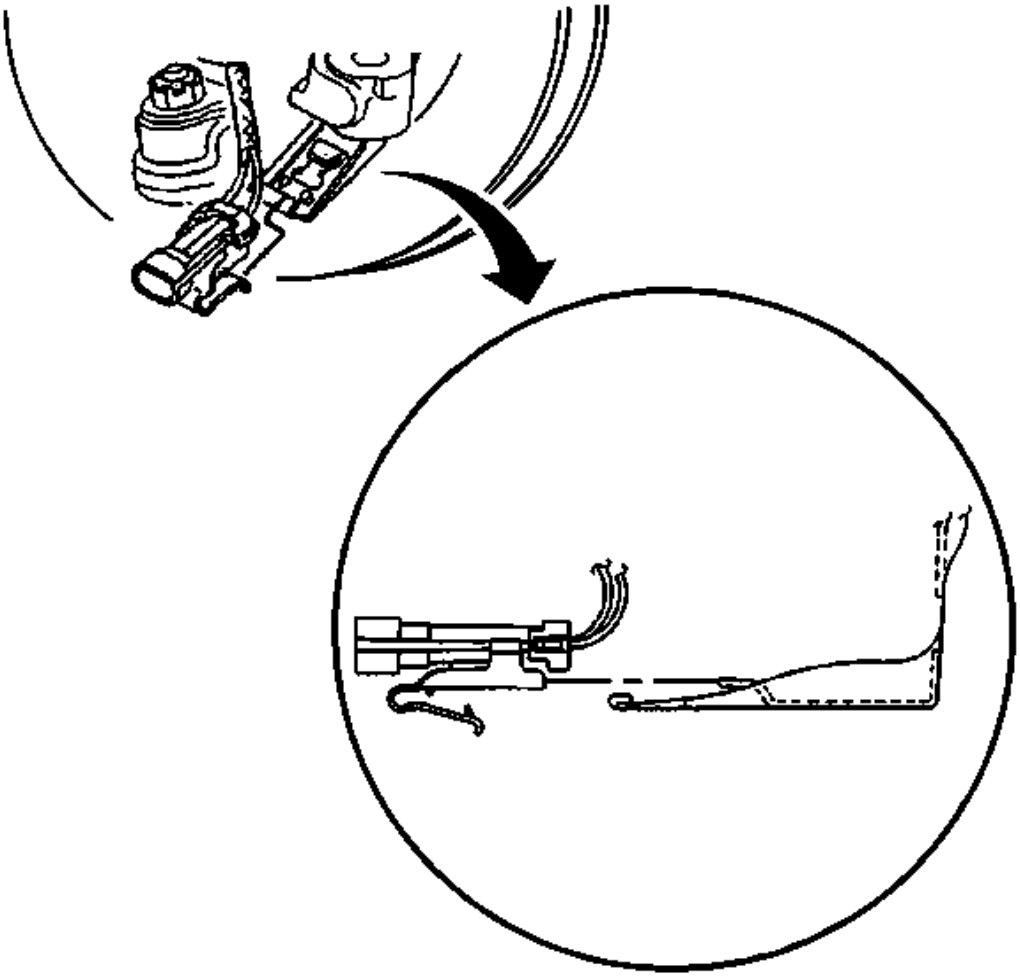

Fig. 23: View Of Wheel Speed Sensor Electrical Connector & Bracket
Courtesy of GENERAL MOTORS COMPANY

NOTE: **Ensure that the connector clip engages the bracket properly.**

5. Install the wheel speed sensor electrical connector to the bracket, if equipped.

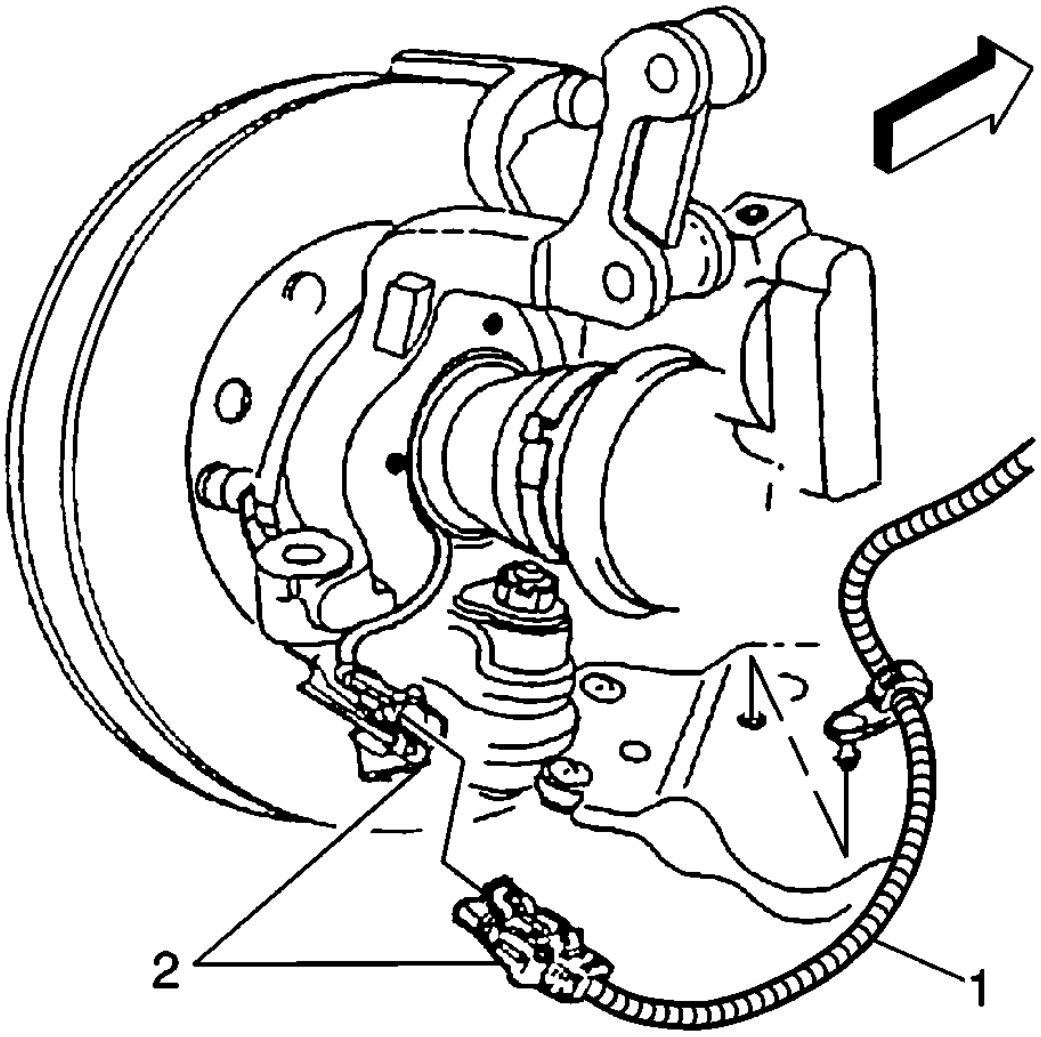

Fig. 24: View Of Wheel Speed Sensor, Connector And Harness
Courtesy of GENERAL MOTORS COMPANY

6. Connect the wheel speed sensor electrical connector (2), if equipped.
7. Install the tire and wheel. Refer to **Tire and Wheel Removal and Installation** .
8. Lower the vehicle.

STEERING KNUCKLE REPLACEMENT

Removal Procedure

1. Raise and suitably support the vehicle. Refer to **Lifting and Jacking the Vehicle** .
2. Remove the bearing/hub assembly. Refer to **Front Wheel Bearing and Hub Replacement**.
3. Remove the front lower control arm ball stud. Refer to **Lower Control Arm Replacement**.
4. Remove the outer tie rod end from the steering knuckle. Refer to **Steering Linkage Outer Tie Rod Replacement** .

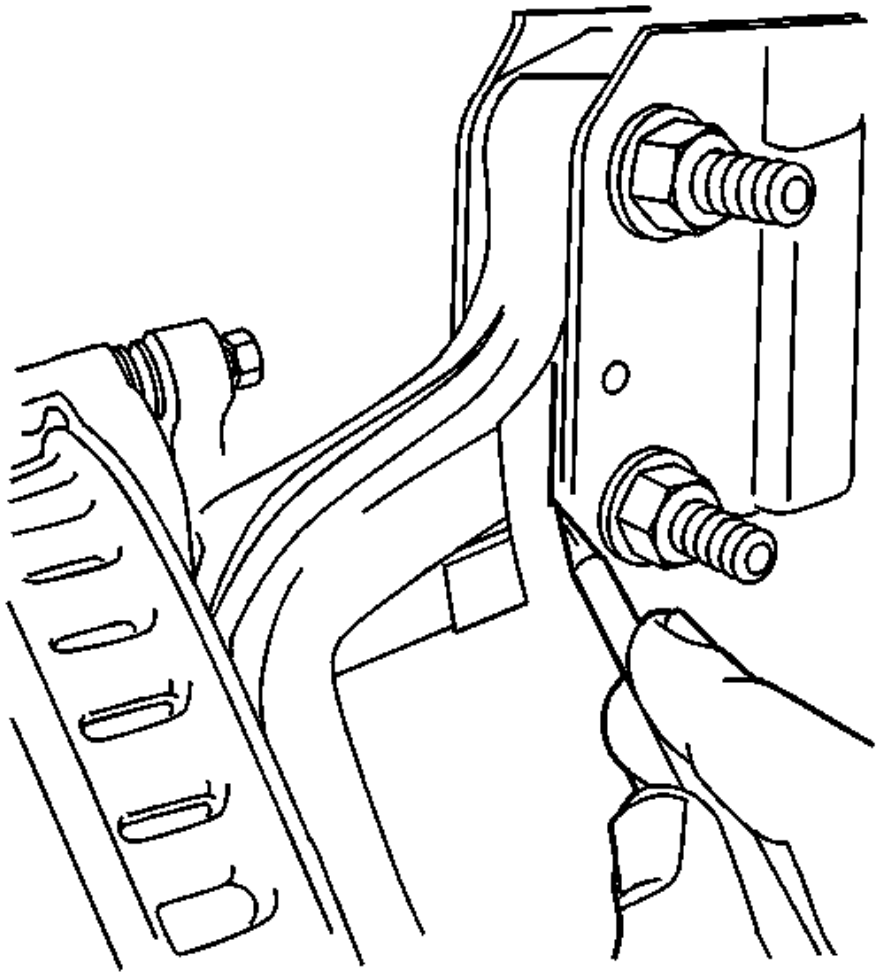

Fig. 25: Scribing Strut To Knuckle
Courtesy of GENERAL MOTORS COMPANY

NOTE: **If removing the knuckle to service other suspension or steering components, perform the following step.**

5. Scribe the strut to the knuckle.

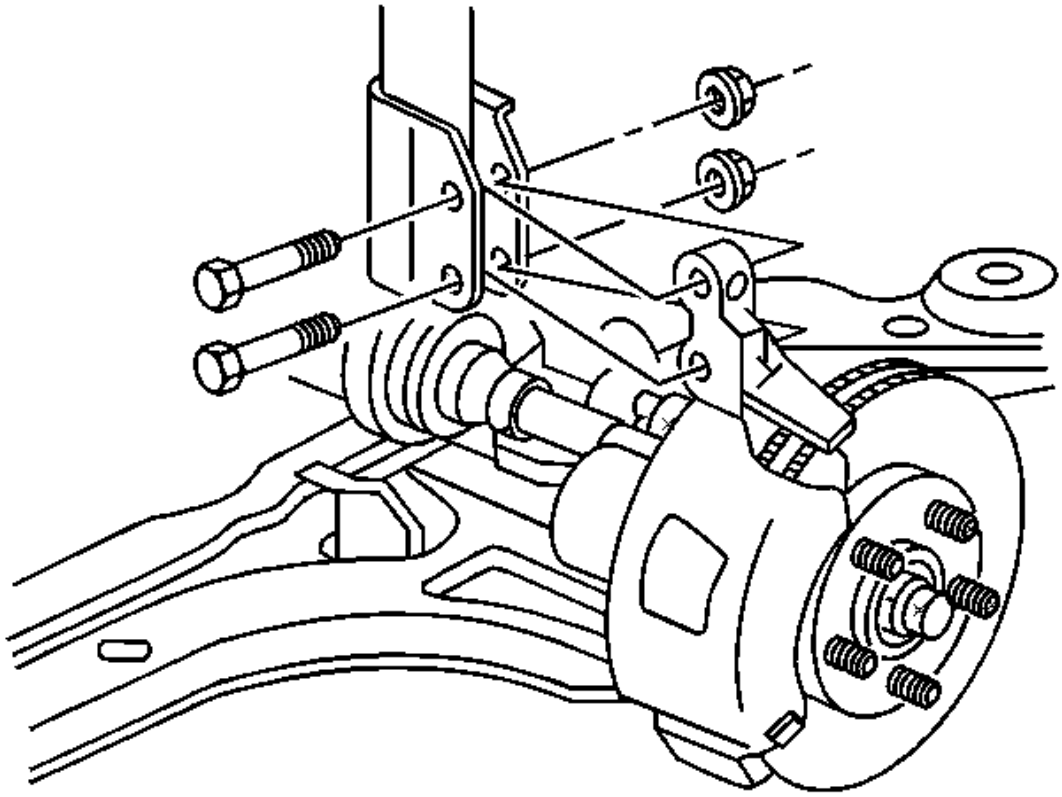

Fig. 26: View Of Steering Knuckle To Strut Bolts
Courtesy of GENERAL MOTORS COMPANY

6. Remove the bolts and nuts attaching the strut to the knuckle.
7. Remove the knuckle from the vehicle.

Installation Procedure

1. Install the knuckle to the vehicle.

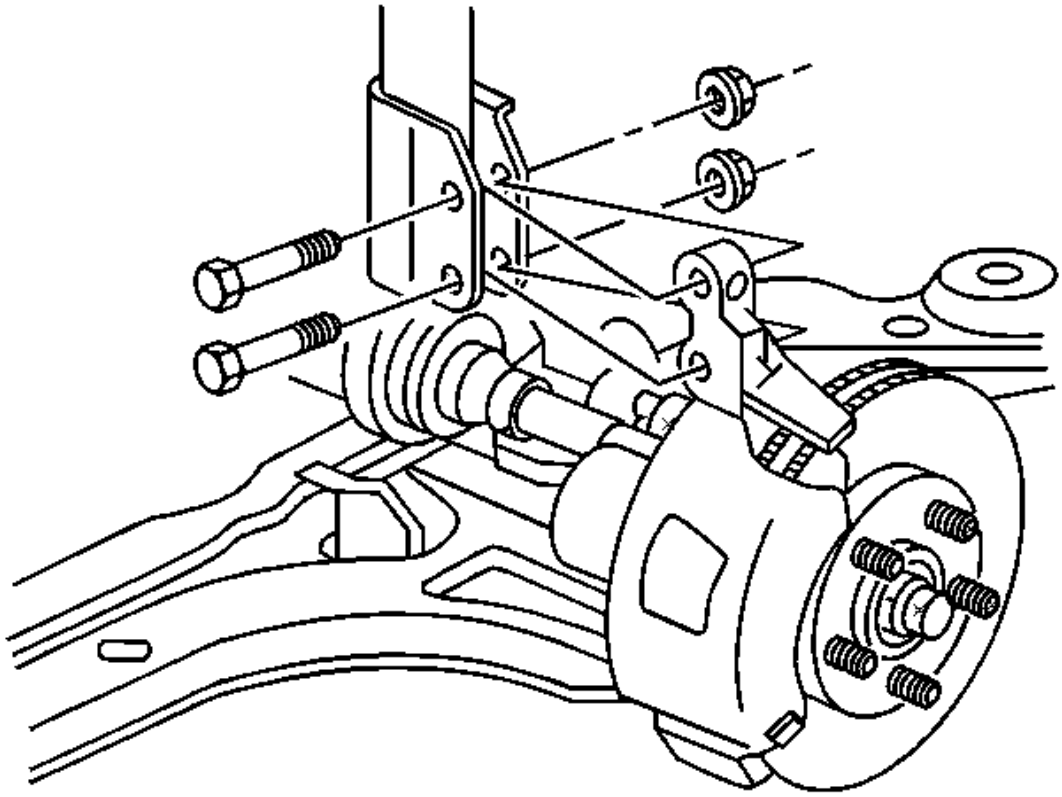

Fig. 27: View Of Steering Knuckle To Strut Bolts
Courtesy of GENERAL MOTORS COMPANY

CAUTION: Refer to Fastener Caution .

2. Install the bolts and nuts attaching the strut to the knuckle.

   Tighten

   Tighten the strut to knuckle bolts to 130 N.m (96 lb ft).

3. Install the outer tie rod to the steering knuckle. Refer to **Steering Linkage Outer Tie Rod Replacement** .
4. Connect the front lower control arm ball stud to the knuckle. Refer to **Lower Control Arm Replacement**.
5. Install the front wheel drive shaft bearing. Refer to **Front Wheel Bearing and Hub Replacement**.
6. Lower the vehicle.
7. Inspect the front wheel alignment and adjust, if necessary. Refer to **Wheel Alignment Measurement** .

LOWER CONTROL ARM REPLACEMENT

Special Tools

J 41820 Ball Joint/Stud Separator

Removal Procedure

CAUTION: Use only the recommended tools for separating the ball joint from the knuckle. Do NOT hammer or pry the ball joint from the knuckle. Failure to use the recommended tools may cause damage to the ball joint and seal.

NOTE: Use the ignition key in order to unlock the steering column.

1. Turn the steering wheel in order to move the front of the applicable wheel to the outboard most position.

NOTE: Use ONLY a frame-contact type vehicle lift or a floor jack at the recommended lift points. Do NOT use a suspension-contact type vehicle lift. Do NOT lift the vehicle by the lower control arms.

2. Raise and support the vehicle. Refer to **Lifting and Jacking the Vehicle** .
3. Remove the tire and wheel. Refer to **Tire and Wheel Removal and Installation** .

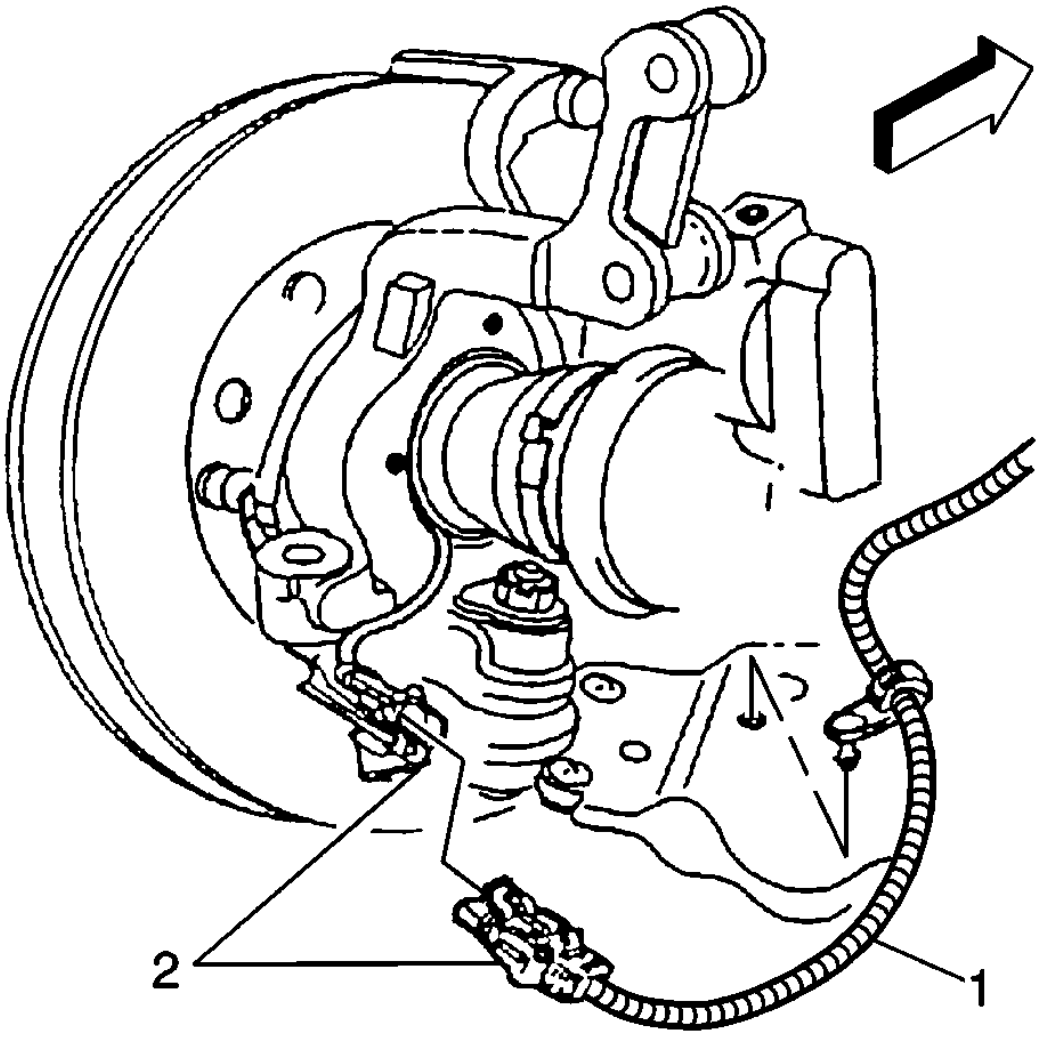

Fig. 28: View Of Wheel Speed Sensor, Connector And Harness
Courtesy of GENERAL MOTORS COMPANY

4. Disconnect the ABS wheel speed sensor connector (2), if equipped.
5. Disconnect the ABS wheel speed sensor jumper harness from the harness retainer clips, if equipped.
6. Remove the stabilizer shaft link. Refer to **Stabilizer Shaft Link Replacement**.

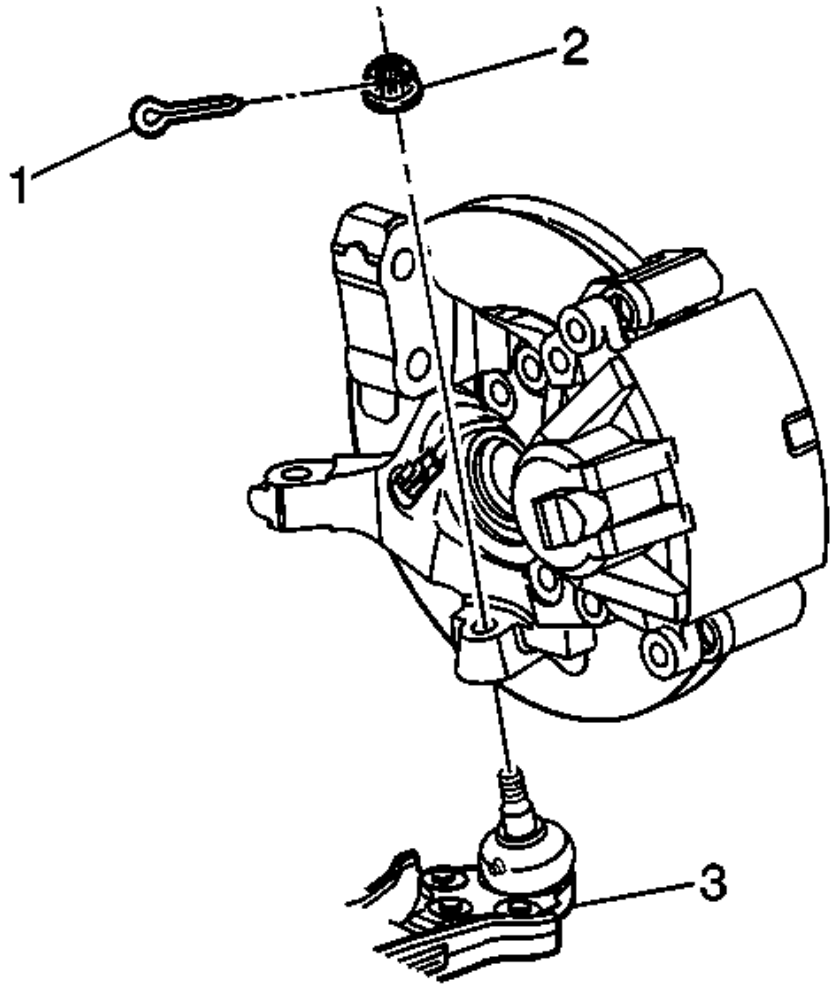

Fig. 29: Identifying Ball Stud Cotter Pin
Courtesy of GENERAL MOTORS COMPANY

7. Remove the cotter pin (1) from the ball stud (3).
8. Loosen the ball stud nut (2).

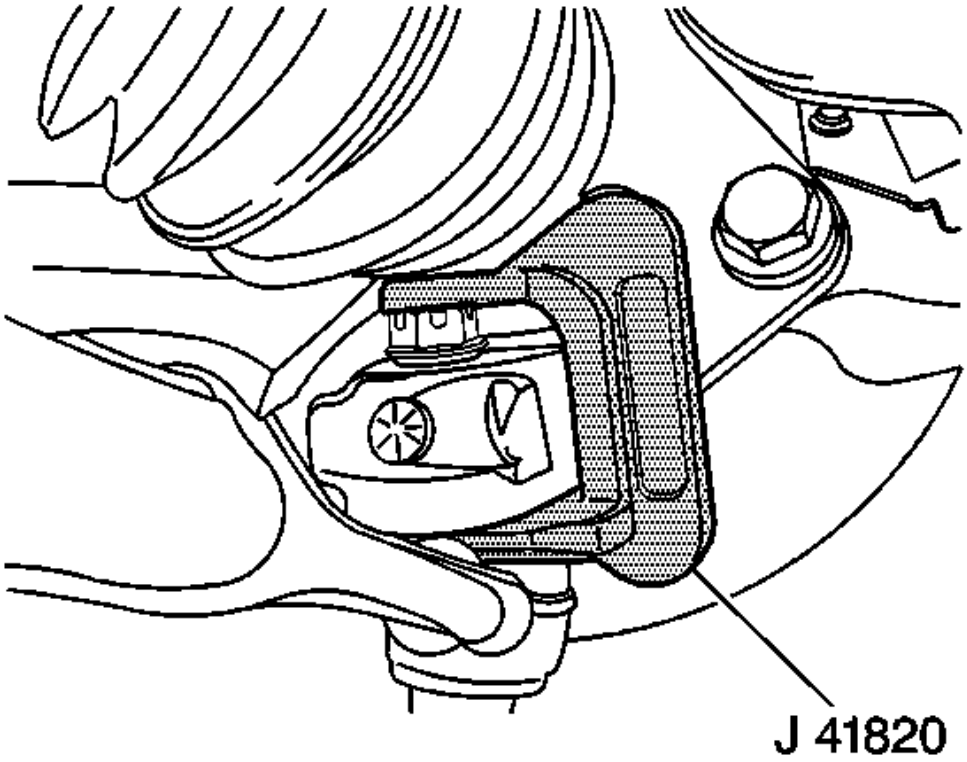

Fig. 30: Separating Ball Stud From Steering Knuckle
Courtesy of GENERAL MOTORS COMPANY

9. Install the **J 41820** ball joint/stud separator over the ball stud and lower control arm, as shown.
10. Rotate the ball stud nut counterclockwise in order to separate the ball stud from the steering knuckle.
11. Remove the **J 41820** ball joint/stud separator.
12. Remove the ball stud nut.

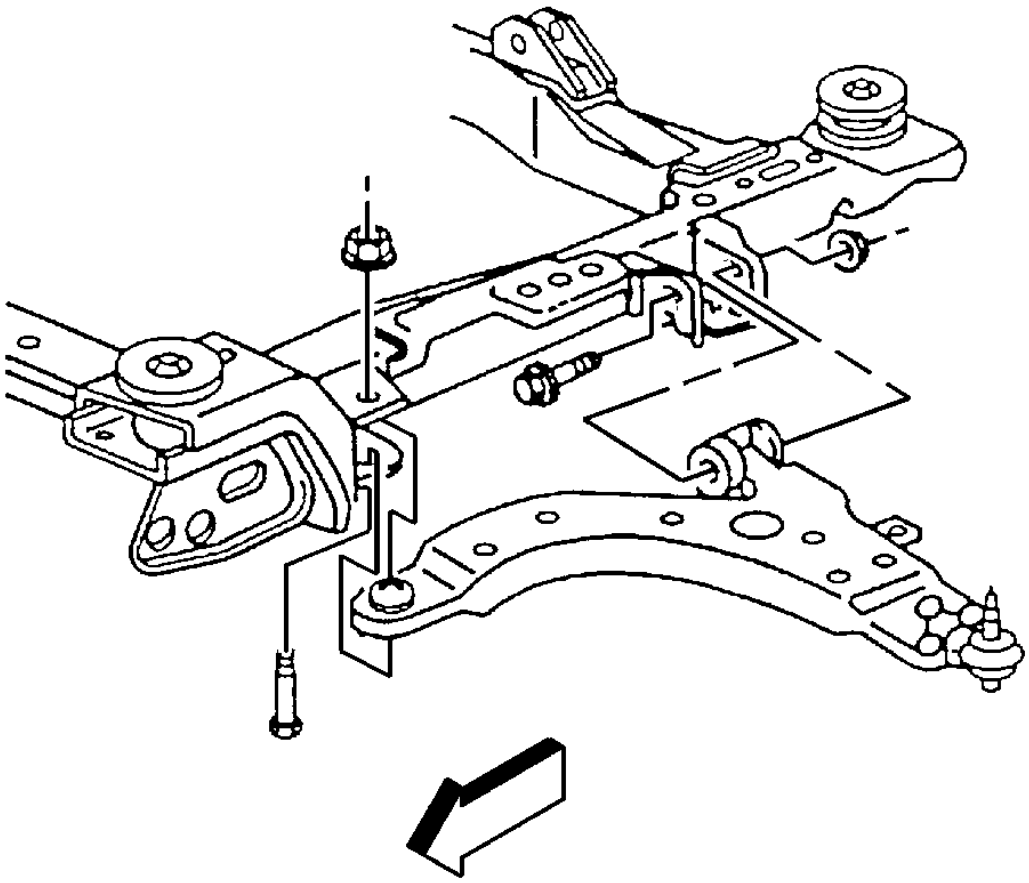

Fig. 31: View Of Lower Control Arm
Courtesy of GENERAL MOTORS COMPANY

13. Remove the lower control arm bolts and nuts.
14. Remove the lower control arm.

Installation Procedure

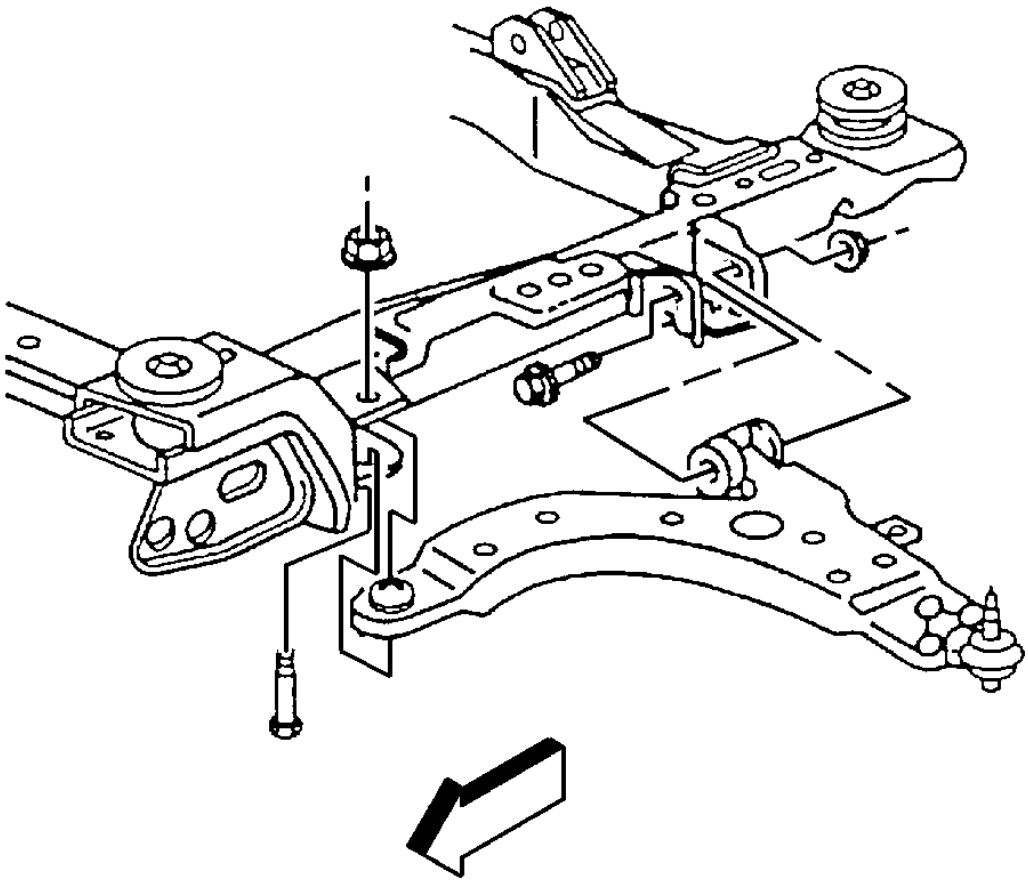

Fig. 32: View Of Lower Control Arm
Courtesy of GENERAL MOTORS COMPANY

1. Install the lower control arm.
2. Install the control arm bolts and nuts. Do not tighten at this time.

NOTE: **Align the ball stud cotter pin hole parallel to the knuckle in order to ease the cotter pin installation.**

3. Install the ball stud to the knuckle.

CAUTION: **Refer to Fastener Caution .**

NOTE: **Verify the nut is torqued to a minimum of 55 N.m.**

4. Install the ball stud castle nut.

Tighten

Tighten the ball stud castle nut to 20 N.m + 120 degrees (15 lb ft + 120 degrees).

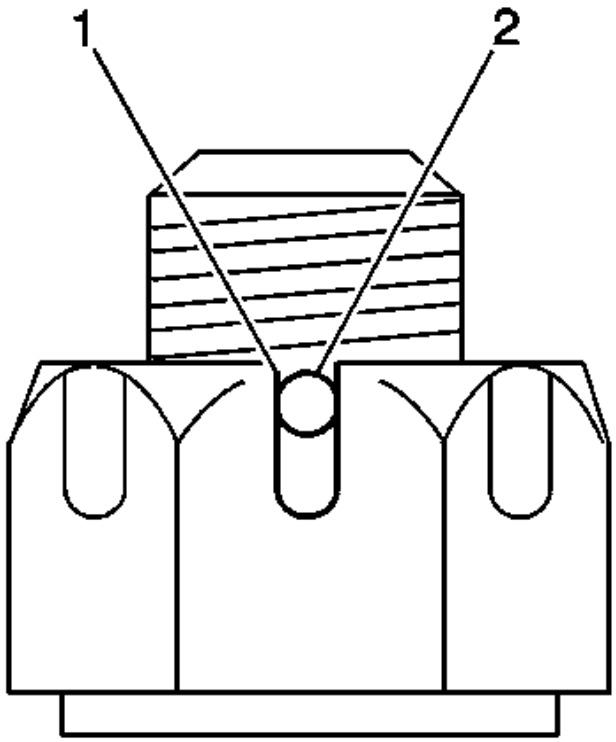

Fig. 33: Aligning Ball Stud Castle Nut Slot To The Ball Stud Cotter Pin Hole
Courtesy of GENERAL MOTORS COMPANY

NOTE: **Do NOT loosen the ball stud nut in order to align the ball stud nut slots to the ball stud cotter pin hole.**

5. If necessary, tighten the ball stud castle nut in order to align the ball stud castle nut slot (1) to the ball stud cotter pin hole (2), as shown.

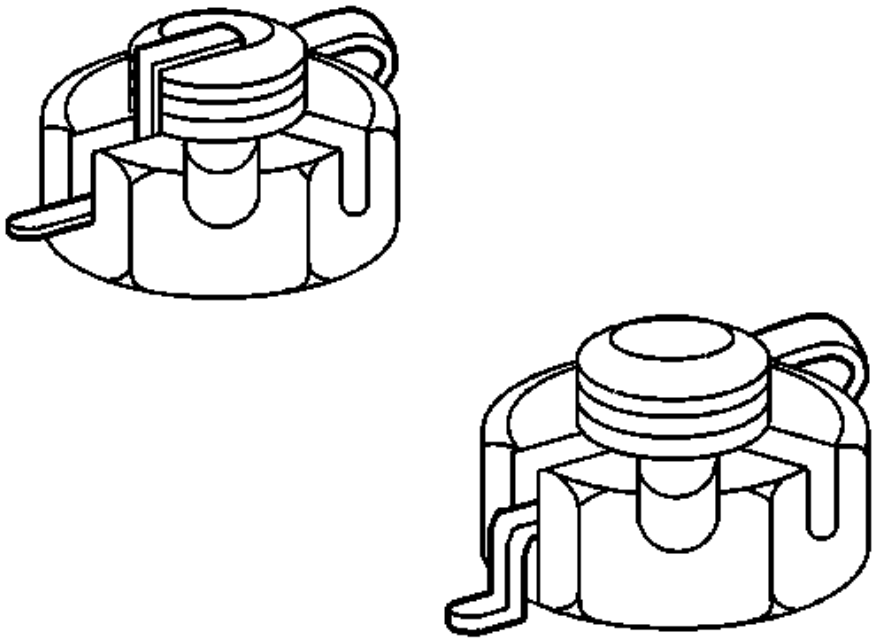

Fig. 34: Securing Cotter Pin In Ball Joint Castle Nut
Courtesy of GENERAL MOTORS COMPANY

NOTE: **Ensure that the cotter pin ends do NOT contact the ABS wheel speed sensor, the ABS sensor connector, or the drive axle.**

6. Install a NEW cotter pin and bend the ends as shown in either example.
7. Install the stabilizer shaft link. Refer to **Stabilizer Shaft Link Replacement**.
8. Install the ABS wheel speed sensor jumper harness to the harness retainer clips, if equipped.

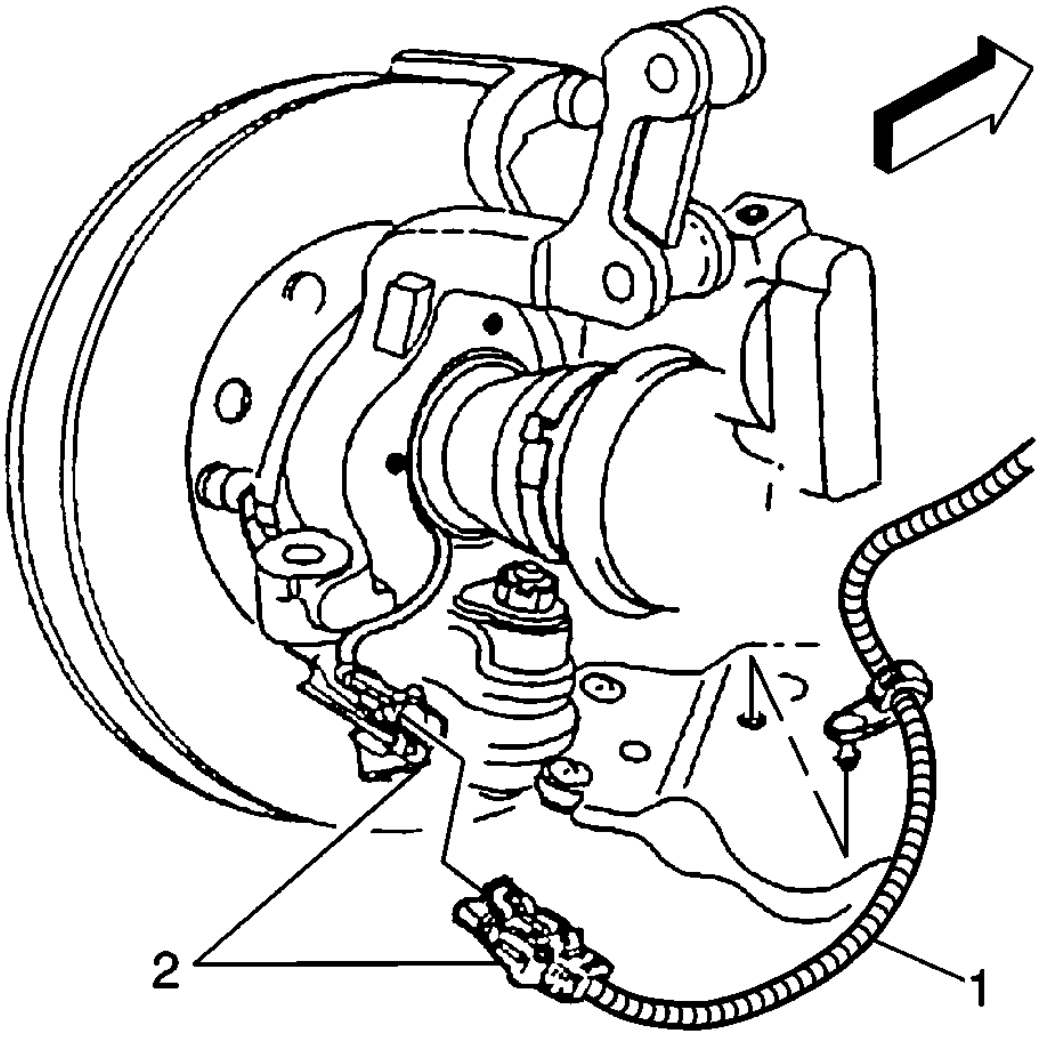

Fig. 35: View Of Wheel Speed Sensor, Connector And Harness
Courtesy of GENERAL MOTORS COMPANY

9. Install the ABS wheel speed sensor connector (2), if equipped.

NOTE: **This is a prevailing torque type fastener. This fastener may be reused ONLY if:**

- **The fastener and its counterpart are clean and free from rust.**
- **The fastener develops 3 N.m (27 lb in) of torque against its counterpart prior to the fastener seating.**

If the fastener does not meet these criteria, REPLACE the fastener.

10. Install the lower control arm nuts.

Tighten

Tighten the lower control arm nuts to 125 N.m (92 lb ft).

11. Install the tire and wheel. Refer to **Tire and Wheel Removal and Installation** .
12. Lower the vehicle.

FRONT LOWER CONTROL ARM BUSHING REPLACEMENT (VERTICAL)

Tools Required

- **J 21474-01** Control Arm Bushing Set
- **J 21474-2** Bushing Installer Remover
- **J 21474-4** Nut
- **J 21474-13** Control Arm Bushing Installer
- **J 21474-27** 1/2 Inch Puller Bolt Thrust Bearing
- **J 23444-A** High Pressure Lubricant
- **J 34126** Driven Sprocket Support Bearing Installer
- **J 35379** Front Knuckle Support

Removal Procedure

1. Remove the lower control arm. Refer to **Lower Control Arm Replacement**.
2. Secure the lower control arm in a vice.

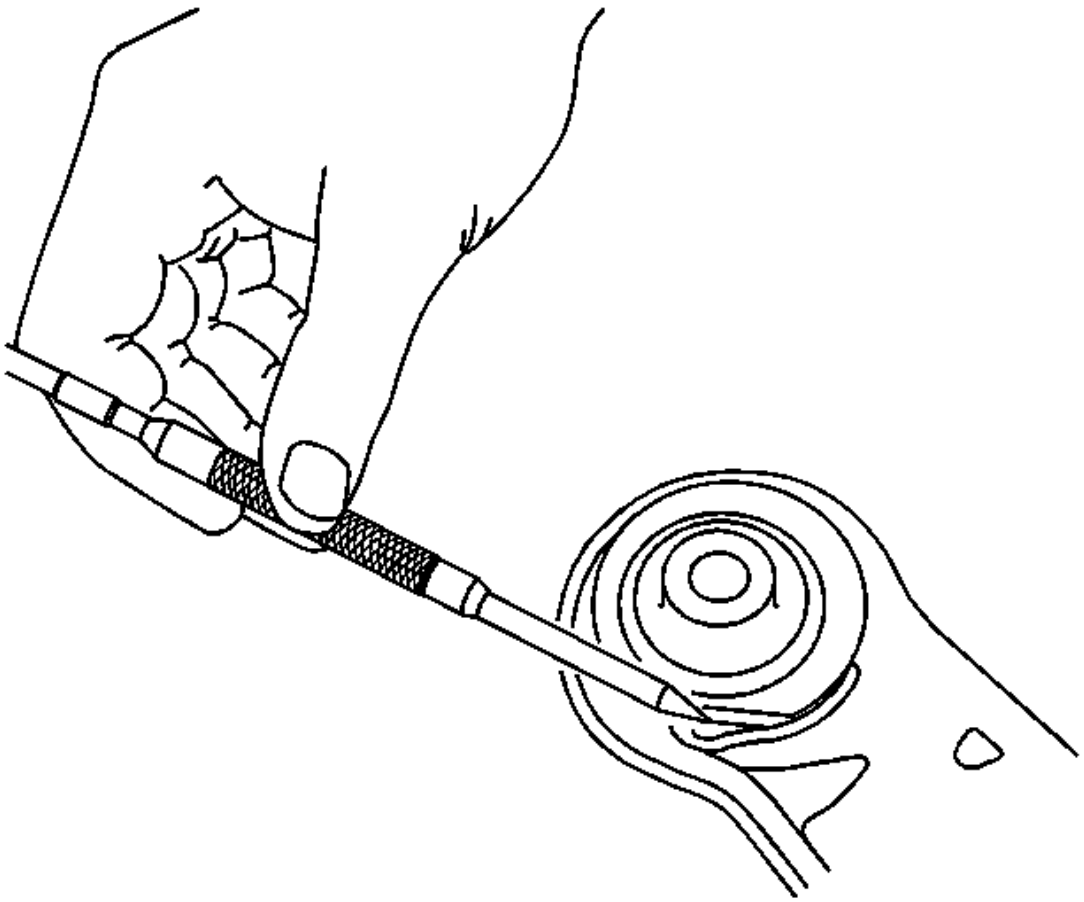

Fig. 36: Scribing Orientation Of Control Arm Bushing On Lower Control Arm
Courtesy of GENERAL MOTORS COMPANY

3. Mark the lower control arm along the flat edge of the bushing flange.

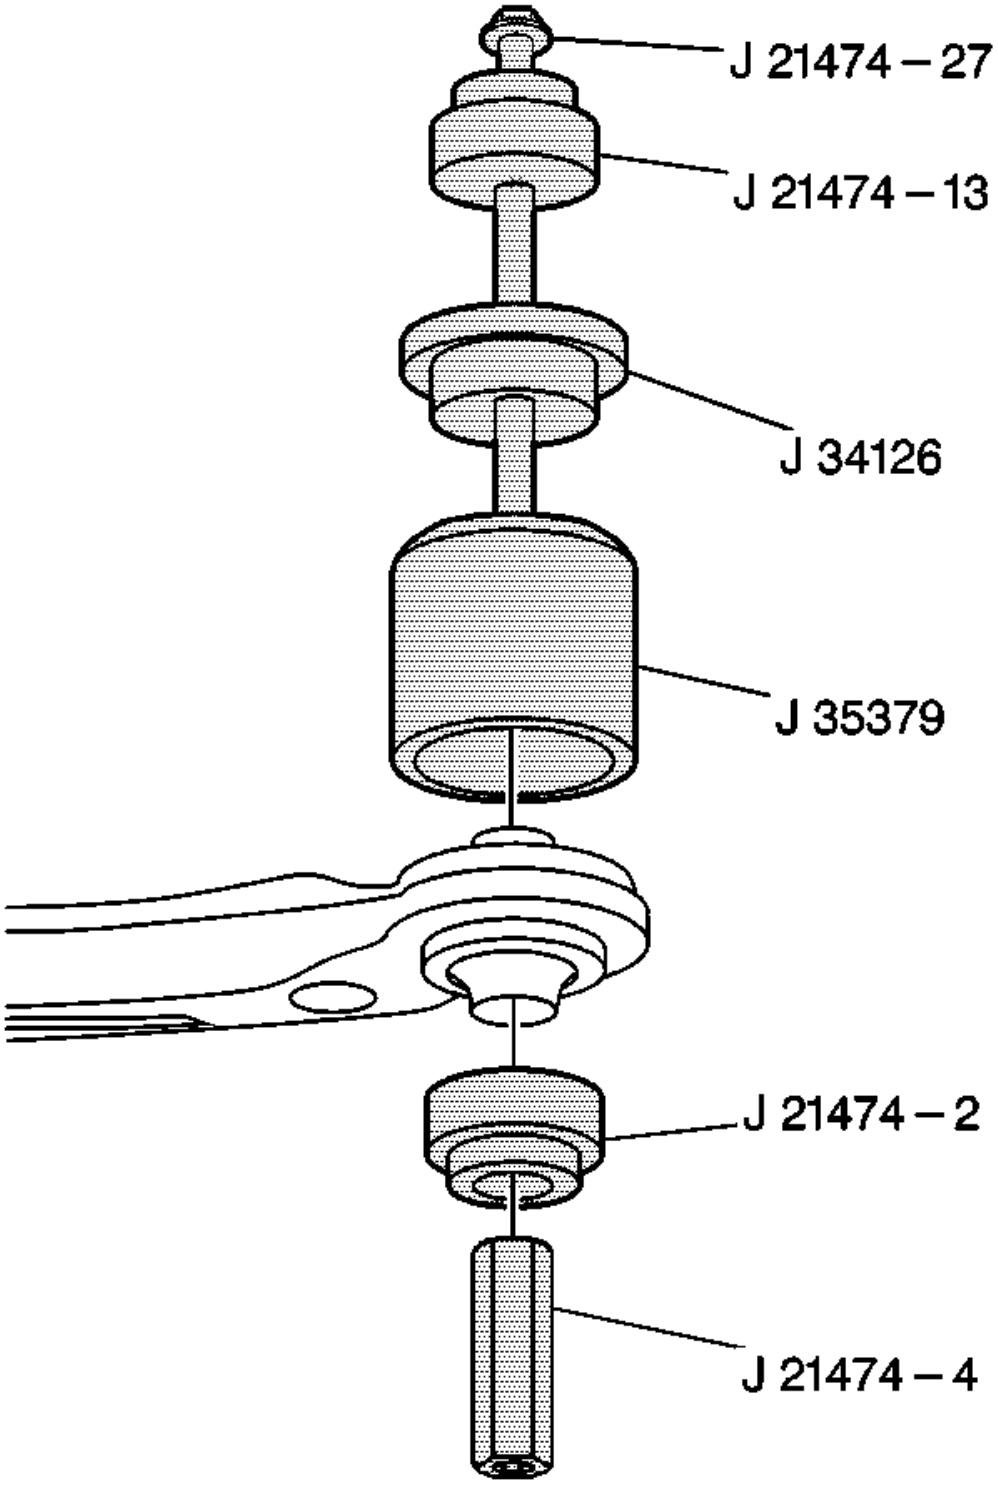

Fig. 37: Bushing Removal/Installation Tools
Courtesy of GENERAL MOTORS COMPANY

IMPORTANT: Apply **J 23444-A** high pressure lubricant or equivalent to the threads of **J 21474-27** 1/2 inch puller bolt thrust bearing.

4. Assemble the following bushing removal tools as shown:

1. **J 21474-27** 1/2 inch puller bolt thrust bearing
2. **J 21474-13** control arm bushing installer
3. **J 34126** driven sprocket support bearing installer
4. **J 35379** front knuckle support
5. **J 21474-2** bushing installer remover
6. **J 21474-4** nut

5. Tighten **J 21474-4** nut.
6. Disassemble the bushing removal tools.

Installation Procedure

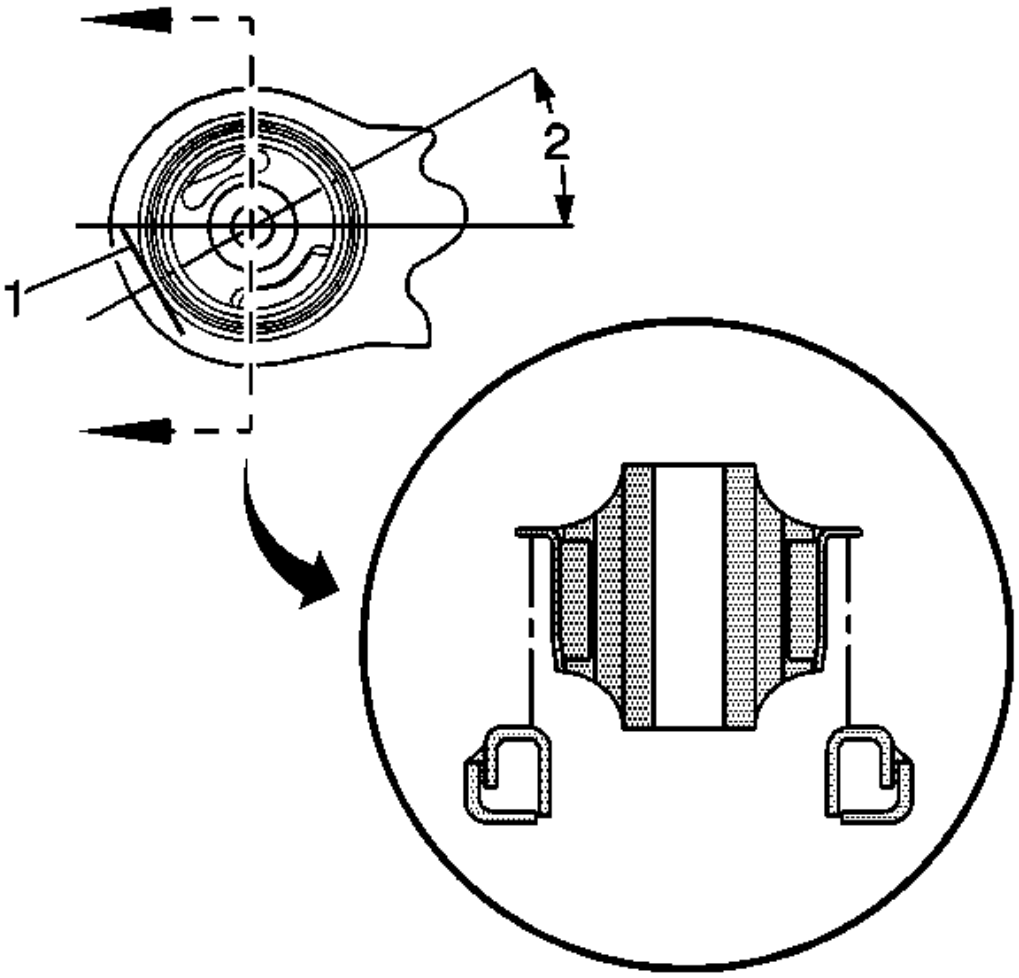

Fig. 38: Aligning Flat Edge Of Bushing Flange To Mark In Control Arm
Courtesy of GENERAL MOTORS COMPANY

IMPORTANT: You MUST install the lower control arm vertical bushing in the same position in order to maintain the original vehicle ride, handling, and road feel.

1. Align the flat edge of the bushing flange to the mark in the control arm (1). Ensure that the flat edge of the bushing flange is 30 degrees (2) from the centerline of the lower control arm. Ensure that the thin slot in the bushing is facing outboard.
2. Insert the bushing into the control arm.

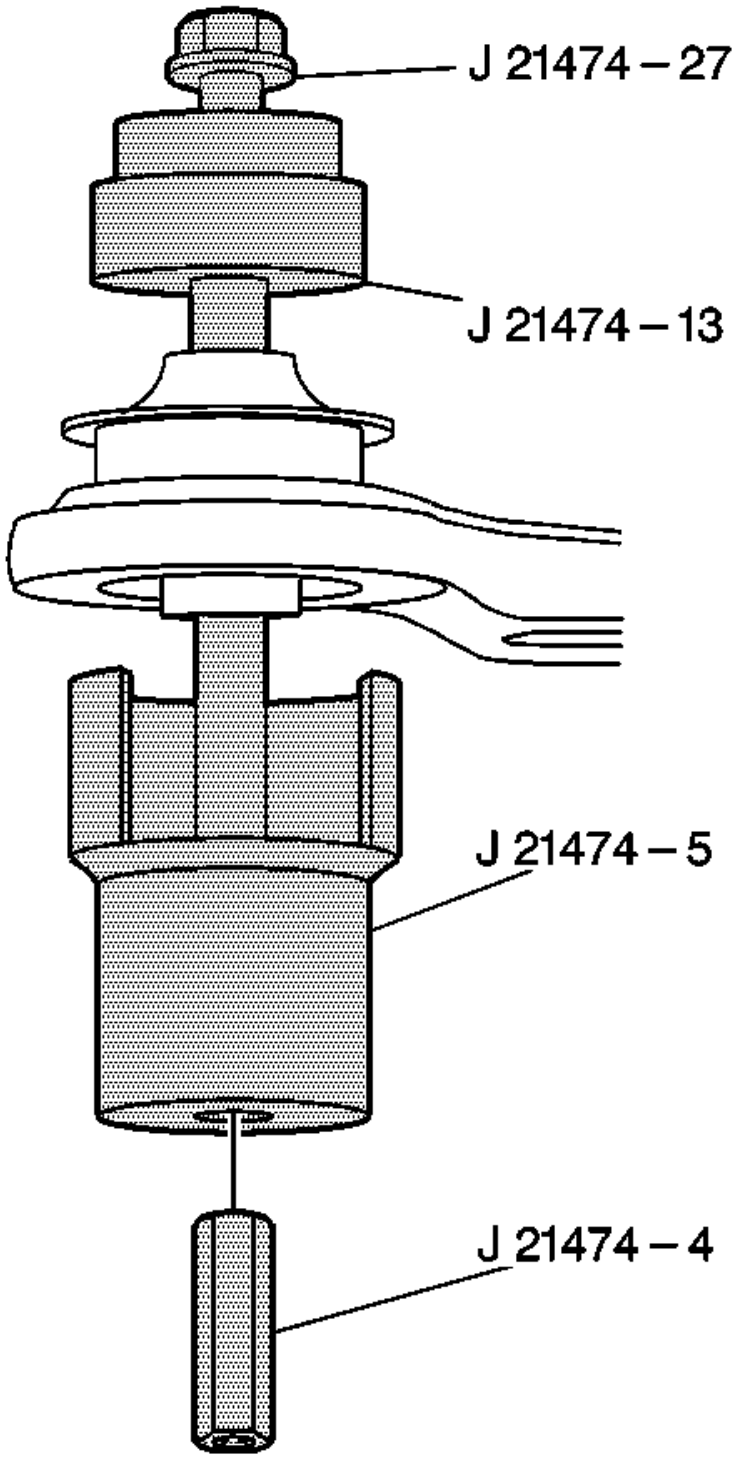

Fig. 39: Illustrating Proper Installation Of Bushing Tools
Courtesy of GENERAL MOTORS COMPANY

IMPORTANT: Apply **J 23444-A** high pressure lubricant or equivalent to the threads of **J 21474-27** 1/2 inch puller bolt thrust bearing.

3. Assemble the following bushing installation tools as shown:
    1. **J 21474-27** 1/2 inch puller bolt thrust bearing
    2. **J 21474-13** control arm bushing installer
    3. **J 21474-5** control arm bushing receiver
    4. **J 21474-4** nut
4. Tighten **J 21474-4** nut.
5. Disassemble the bushing installation tools.
6. Install the lower control arm. Refer to **Lower Control Arm Replacement**.

FRONT LOWER CONTROL ARM BUSHING REPLACEMENT (HORIZONTAL)

Tools Required

- **J 21474-01** Control Arm Bushing Service Set
- **J 21474-5** Control Arm Bushing Receiver

Removal Procedure

1. Remove the lower control arm. Refer to **Lower Control Arm Replacement**.
2. Secure the lower control arm in a vise.

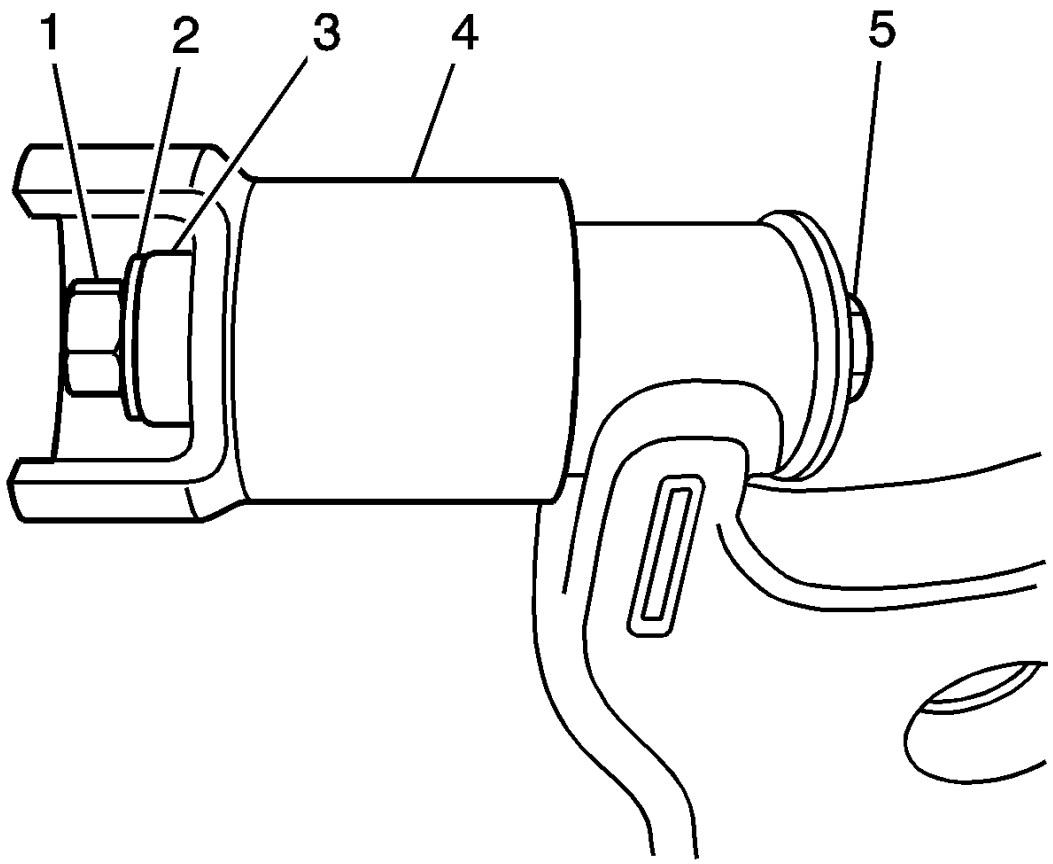

Fig. 40: Assembling Bushing Removal Tools
Courtesy of GENERAL MOTORS COMPANY

IMPORTANT: Use a 1/2 x 20 in standard thread nut with the puller bolt.

3. Assemble the bushing removal tools as indicated:
    1. The nut (1)
    2. The **J 21474-01** control arm bushing service set washer (2)
    3. The **J 21474-01** control arm bushing service set bearing (3)
    4. The **J 21474-5** control arm bushing receiver (4)
    5. The **J 21474-01** control arm bushing service set puller bolt (5)
4. Tighten the puller bolt (5) until the bushing is removed.
5. Disassemble the **J 21474-01** control arm bushing service set and **J 21474-5** control arm bushing receiver.

Installation Procedure

1. Lubricate the bushing with liquid hand soap or equivalent.

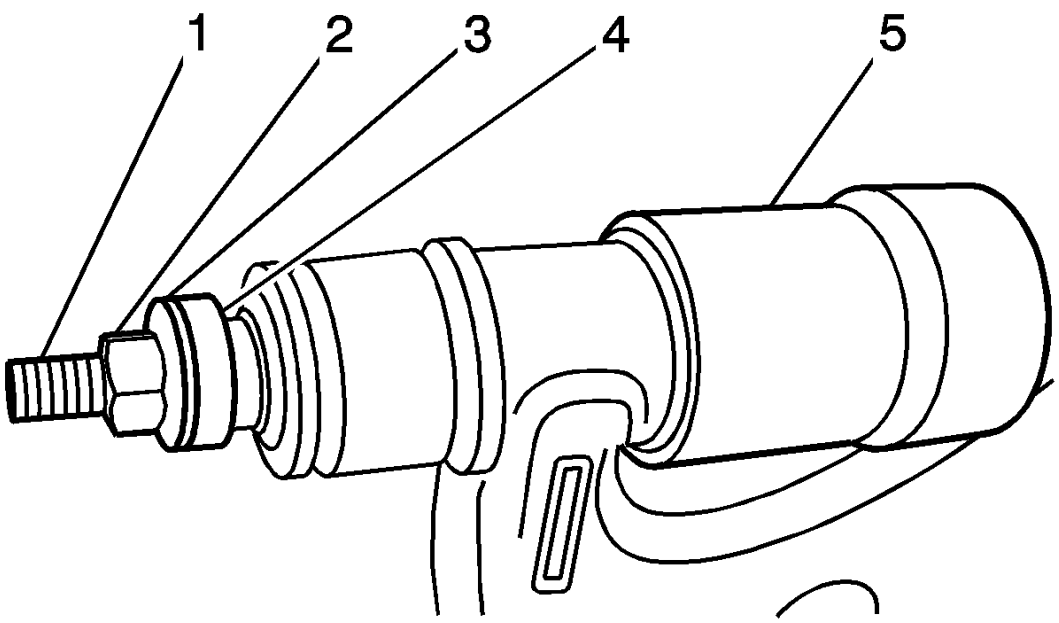

Fig. 41: Assembling Bushing Installation Tools
Courtesy of GENERAL MOTORS COMPANY

IMPORTANT: Use a 1/2 x 20 in standard thread nut with the puller bolt.

2. Assemble the following bushing installation tools as indicated :
    1. The nut (1)
    2. The **J 21474-01** control arm bushing service set washer (2)
    3. The **J 21474-01** control arm bushing service set bearing (3)
    4. The **J 21474-5** control arm bushing receiver (4)
    5. The **J 21474-01** control arm bushing service set puller bolt (5)
3. Tighten the puller bolt (5) until the bushing is installed into the control arm.
4. Disassemble the **J 21474-01** control arm bushing service set and **J 21474-5** control arm bushing receiver.
5. Remove the control arm from the vice.
6. Install the lower control arm. Refer to **Lower Control Arm Replacement**.

WHEEL STUD REPLACEMENT

Tools Required

J 6627-A Tie Rod Puller

Removal Procedure

1. Raise and support the vehicle. Refer to **Lifting and Jacking the Vehicle** .
2. Remove the tire and wheel assembly. Refer to **Tire and Wheel Removal and Installation** .
3. Without disconnecting the hydraulic brake hose, remove and support the brake caliper and bracket as an assembly.
4. Remove the brake rotor. Refer to **Front Brake Rotor Replacement** .

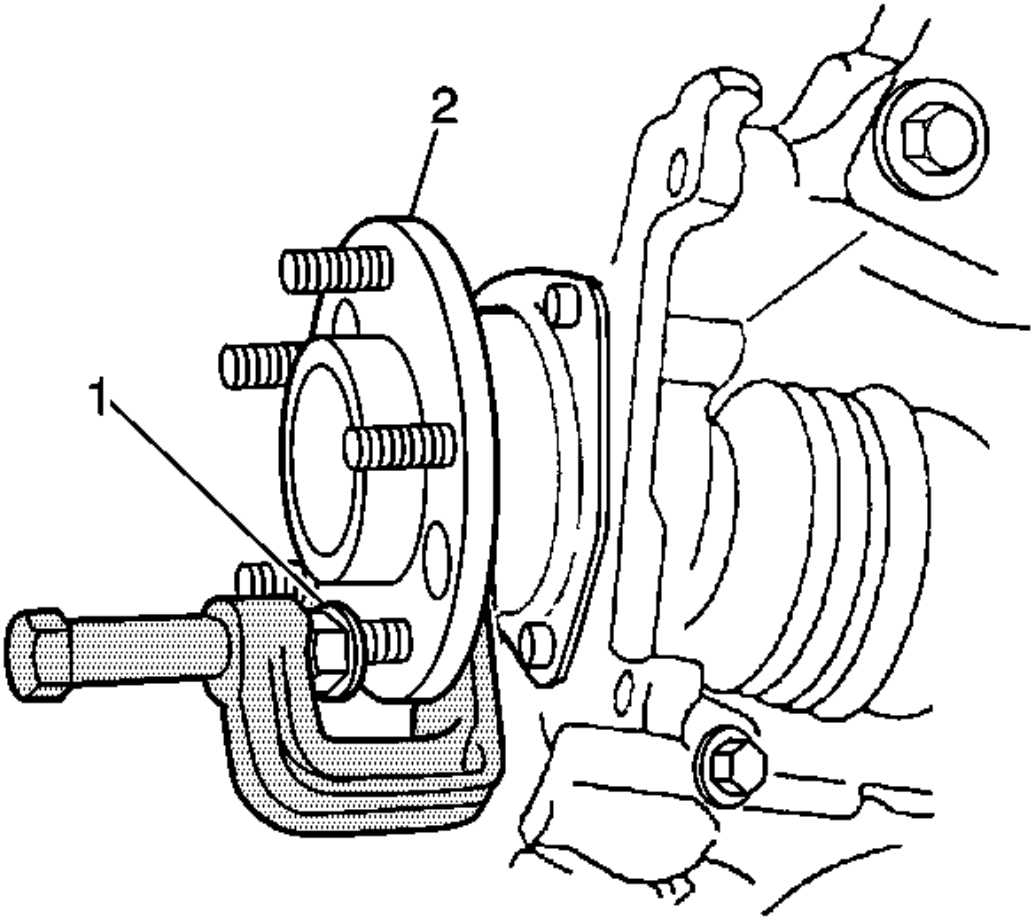

Fig. 42: Extracting Stud From Hub
Courtesy of GENERAL MOTORS COMPANY

5. Rotate the bearing hub to a position where the least amount of interference between the stud and the steering knuckle exists.
6. Using the **J 6627-A** tie rod puller , release the wheel stud (1) from the bearing hub (2) and discard the stud.

IMPORTANT: Some models may require additional clearance for stud removal.

7. If necessary, loosen the wheel bearing/hub assembly retaining bolts enough to walk the bearing away slightly from the knuckle. Refer to **Front Wheel Bearing and Hub Replacement**.

Installation Procedure

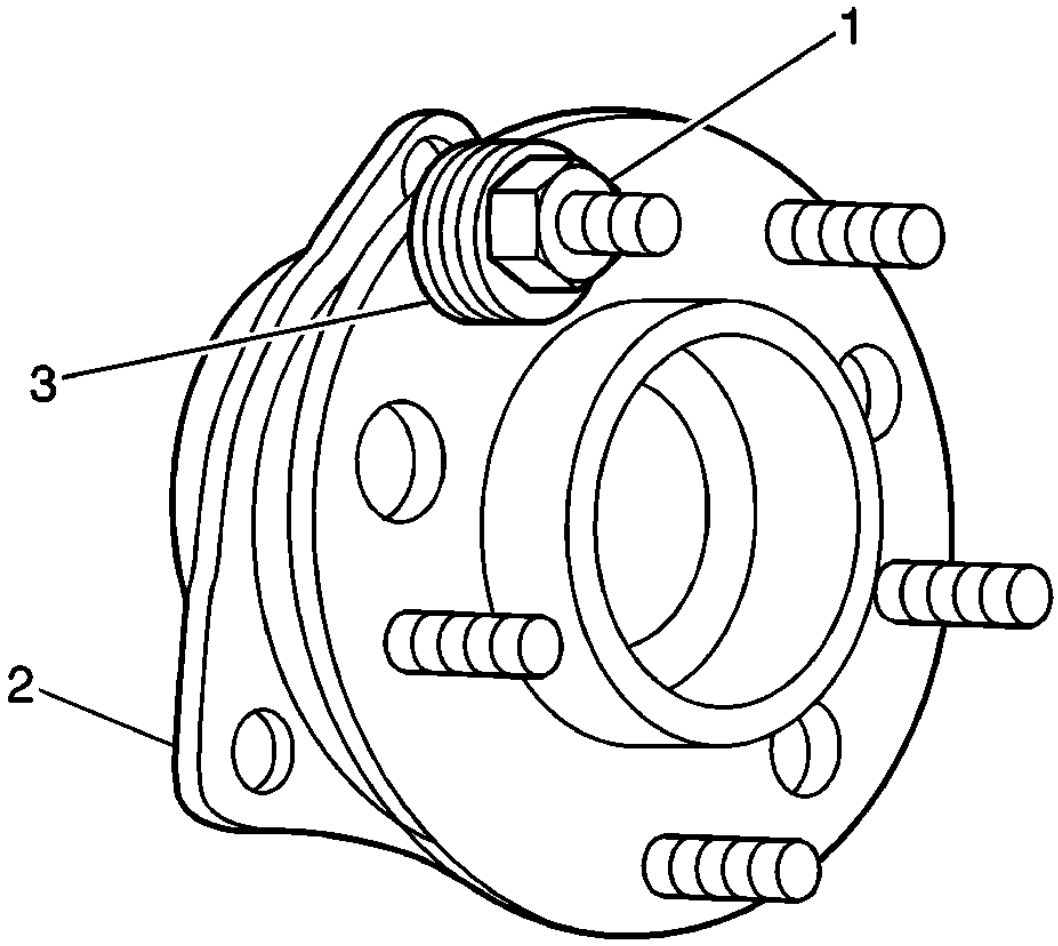

Fig. 43: Installing Wheel Stud
Courtesy of GENERAL MOTORS COMPANY

1. Install the NEW stud in the bearing hub.
2. Tighten the wheel bearing/hub assembly bolts, if loosened during removal. Refer to **Front Wheel Bearing and Hub Replacement**.
3. Add enough washers (3) in order to draw the stud into the hub (2).
4. Install the wheel nut (1) with the flat side against the washers (3).

IMPORTANT: Fully seat the wheel stud against the hub flange (2).

5. Tighten the wheel nut (1) until the head of the wheel stud is fully seated against the back of the bearing

hub flange.

6. Remove the wheel nut (1) and the washers (3).
7. Install the brake rotor, and the brake caliper and bracket as an assembly. Refer to **Front Brake Rotor Replacement** .
8. Install the tire and wheel assembly. Refer to **Tire and Wheel Removal and Installation** .
9. Lower the vehicle.

STRUT ASSEMBLY REMOVAL AND INSTALLATION

Removal Procedure

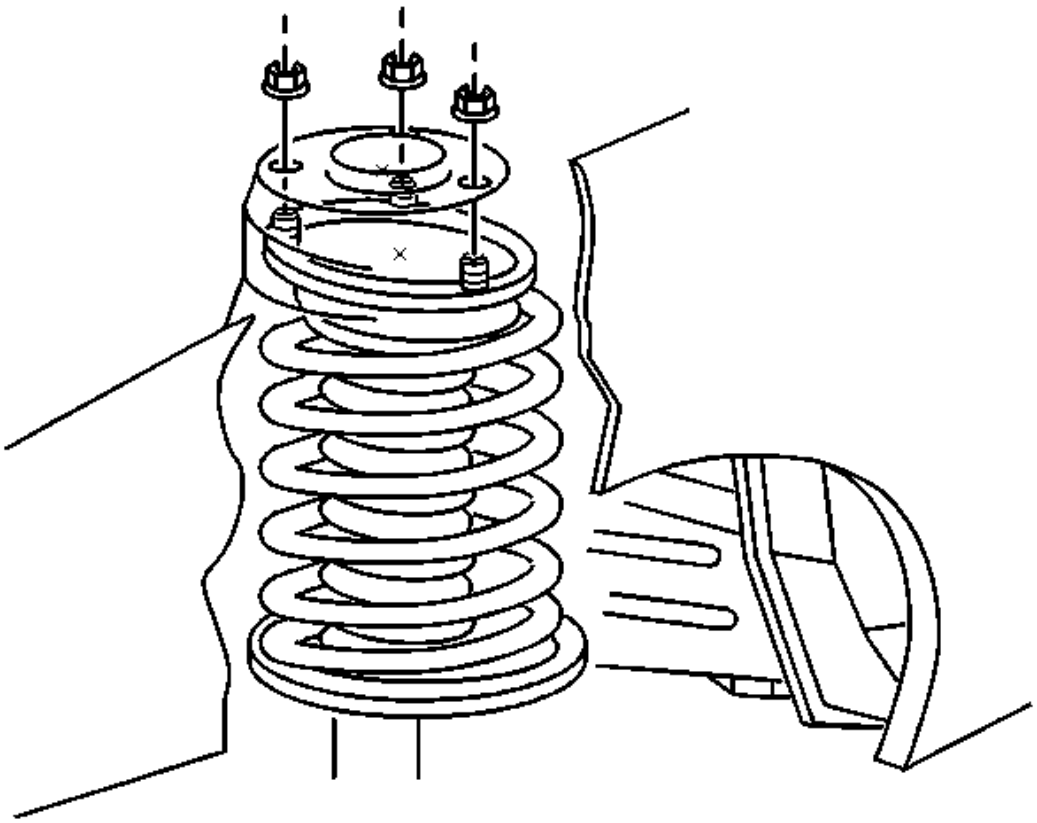

Fig. 44: Identifying Upper Strut Mounting Nuts
Courtesy of GENERAL MOTORS COMPANY

1. Remove the strut upper nuts.

NOTE: **Lift the vehicle using ONLY a frame-contact vehicle lift. Do NOT lift the vehicle using a suspension-contact vehicle lift.**

2. Raise and support the vehicle. Refer to **Lifting and Jacking the Vehicle** .
3. Remove the tire and wheel. Refer to **Tire and Wheel Removal and Installation** .

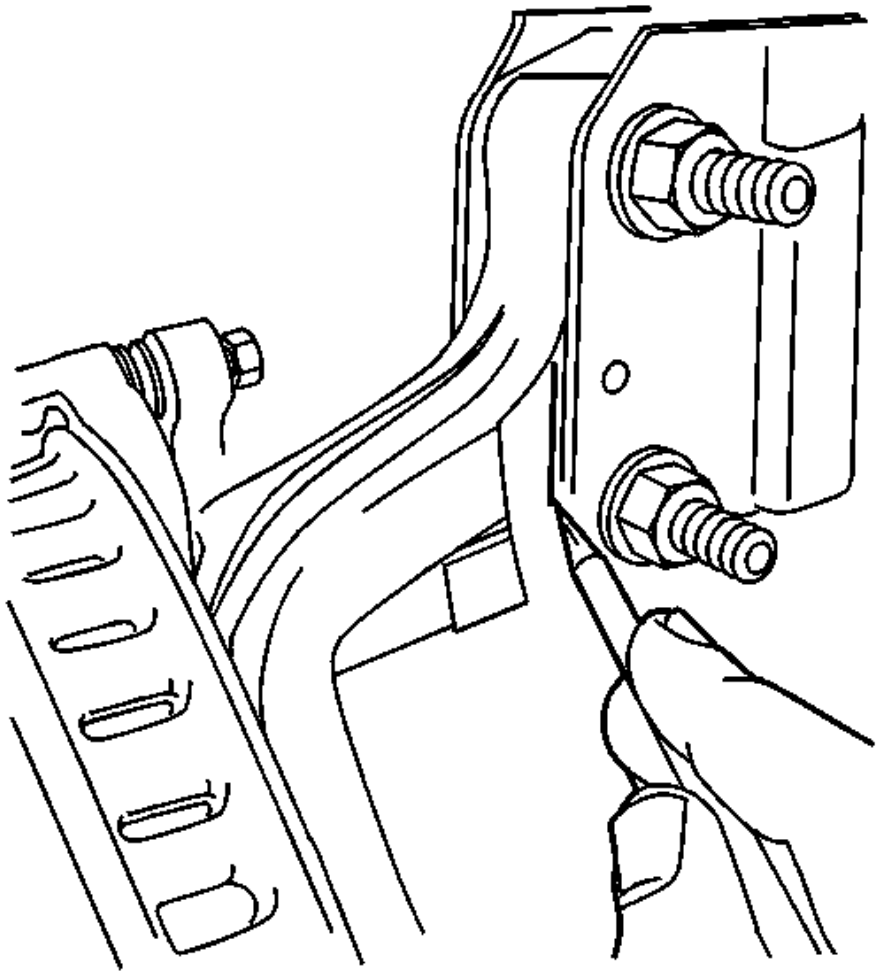

Fig. 45: Scribing Strut To Knuckle
Courtesy of GENERAL MOTORS COMPANY

4. Scribe the strut to the knuckle.

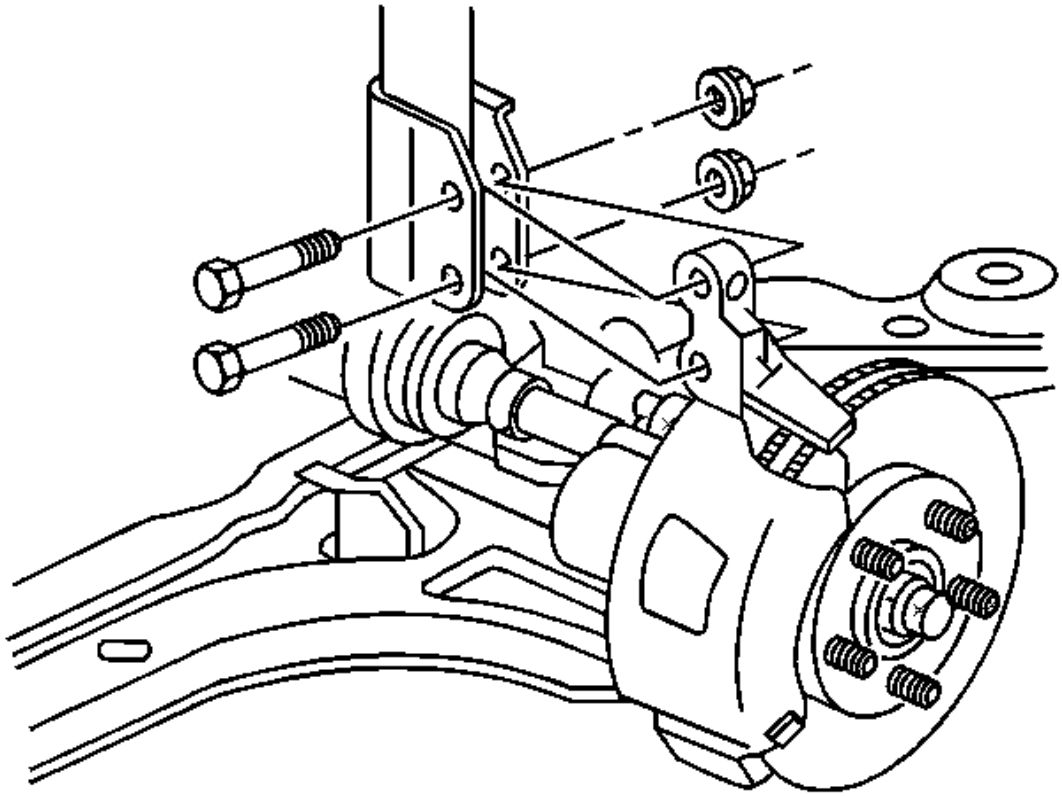

Fig. 46: View Of Steering Knuckle To Strut Bolts
Courtesy of GENERAL MOTORS COMPANY

5. Remove the strut lower bolts and nuts.
6. Remove the strut.

Installation Procedure

1. Install the strut.

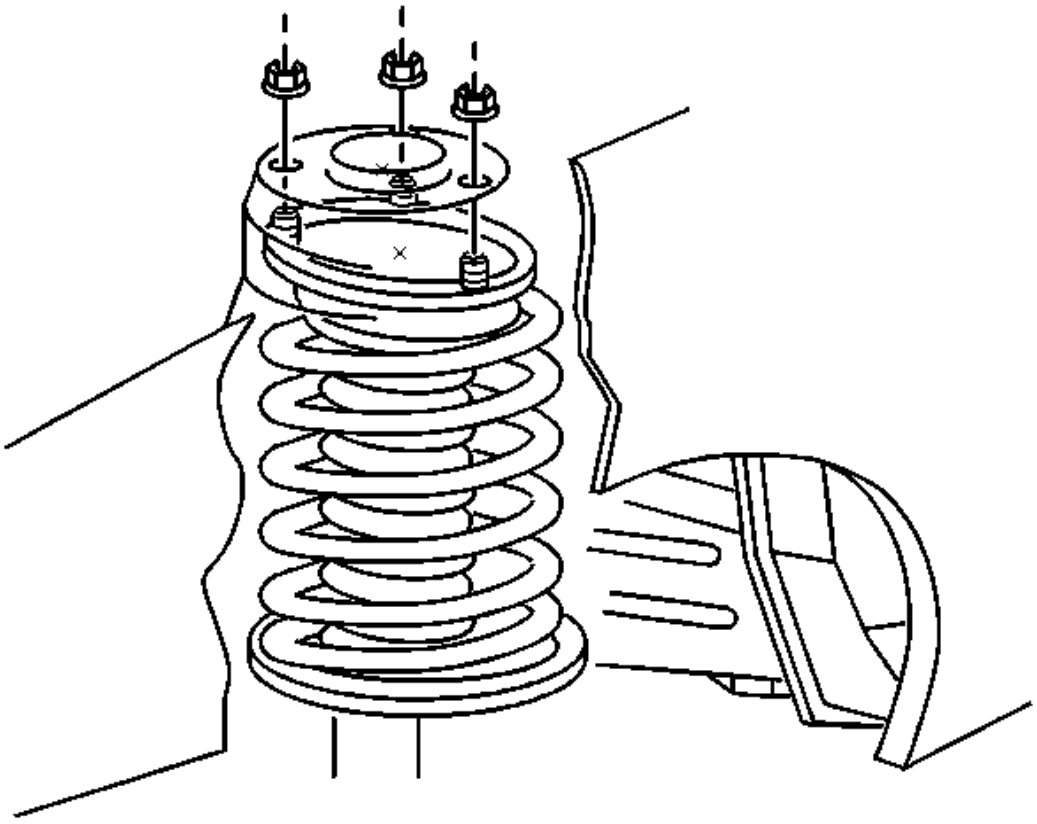

Fig. 47: Identifying Upper Strut Mounting Nuts
Courtesy of GENERAL MOTORS COMPANY

CAUTION: Refer to Fastener Caution .

2. Install the strut upper nuts.

Tighten

Tighten the strut upper nuts to 33 N.m (24 lb ft).

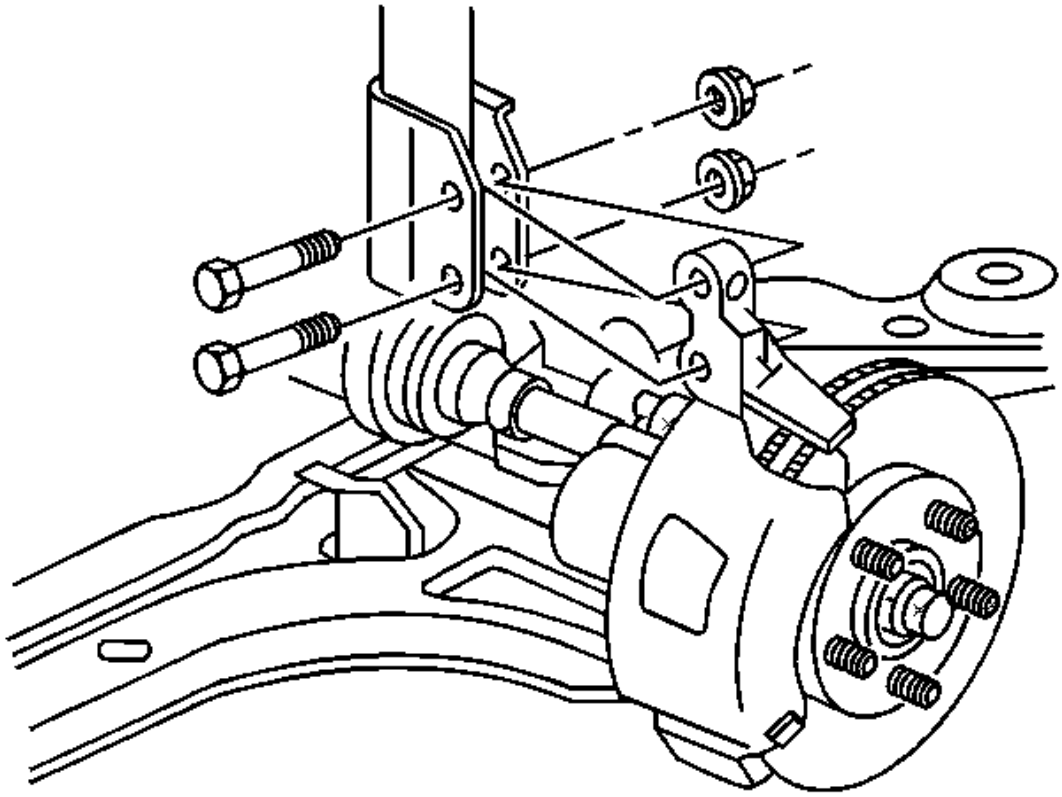

Fig. 48: View Of Steering Knuckle To Strut Bolts
Courtesy of GENERAL MOTORS COMPANY

3. Install the strut lower bolts and nuts.

NOTE: **This is a prevailing torque type fastener. This fastener may be reused ONLY if:**

- **The fastener and its counterpart are clean and free from rust.**
- **The fastener develops 3 N.m (27 lb in) of torque/drag against its counterpart prior to the fastener seating.**

If the fastener does not meet these criteria, REPLACE the fastener.

4. Align the strut to the mark on the knuckle.

Tighten

Tighten the strut lower nuts to 130 N.m (96 lb ft).

5. Install the tire and wheel. Refer to **Tire and Wheel Removal and Installation** .
6. Lower the vehicle.
7. Align the front wheels. Refer to **Wheel Alignment Measurement** .

SUSPENSION SHOCK/STRUT DISPOSAL

WARNING: Use the proper eye protection when drilling to prevent metal chips from causing physical injury.

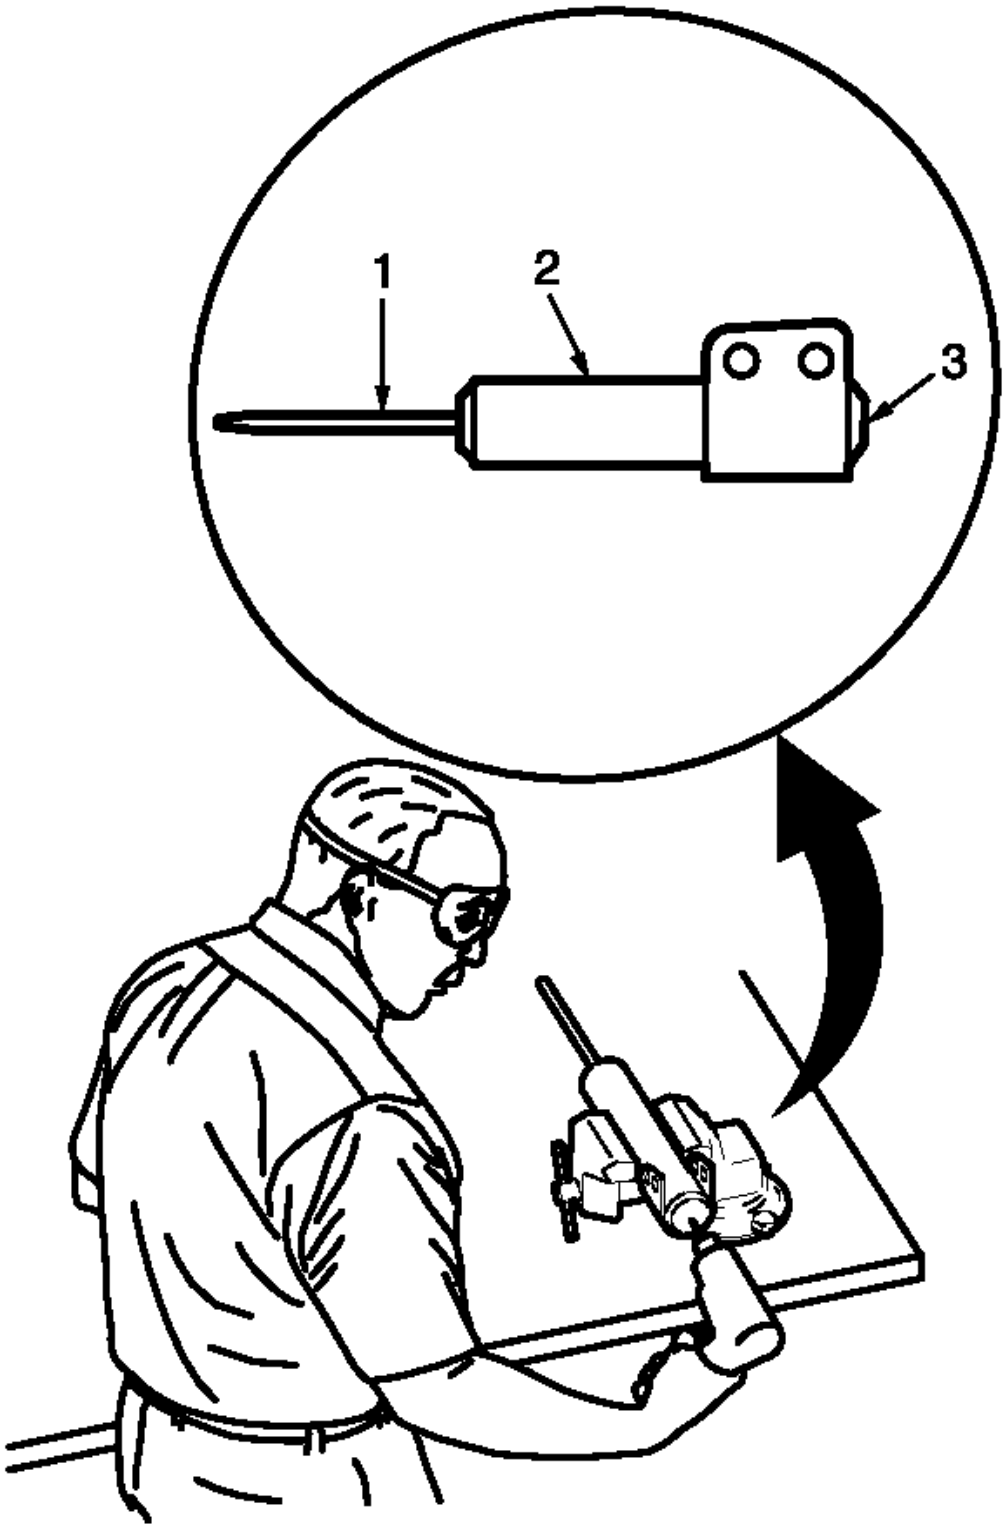

Fig. 49: Drilling Hole In Strut At Center Of End Cap
Courtesy of GENERAL MOTORS COMPANY

1. Clamp the strut in a vise horizontally with the rod (1) completely extended.
2. Drill a hole in the strut at the center of the end cap (3) using a 5 mm (3/16 in) drill bit. Gas or a gas/oil mixture will exhaust when the drill bit penetrates the strut. Use shop towels in order to contain the escaping oil.

3. Remove the strut from the vise.
4. Hold the strut over a drain pan vertically with the hole down.
5. Move the rod (1) in and out of the tube (2) to completely drain the oil from the strut.

STRUT, STRUT COMPONENT, OR SPRING REPLACEMENT

Special Tools

- **J 42991** Strut Rod Nut Socket
- **J 45400** Strut Spring Compressor

Disassembly Procedure

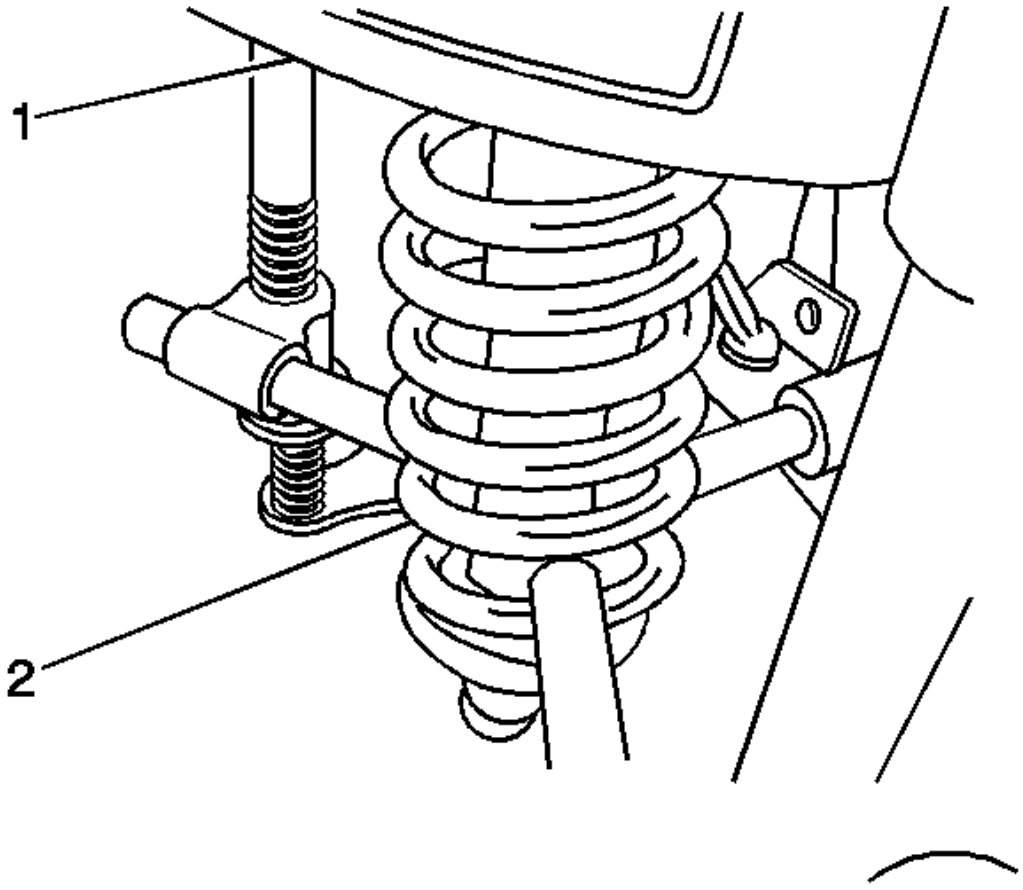

Fig. 50: Compressing/Releasing Lower Part Of Shock Spring
Courtesy of GENERAL MOTORS COMPANY

1. Remove the strut from the vehicle. Refer to **Strut Assembly Removal and Installation**.
2. Install the strut (2) in the **J 45400** strut spring compressor (1).

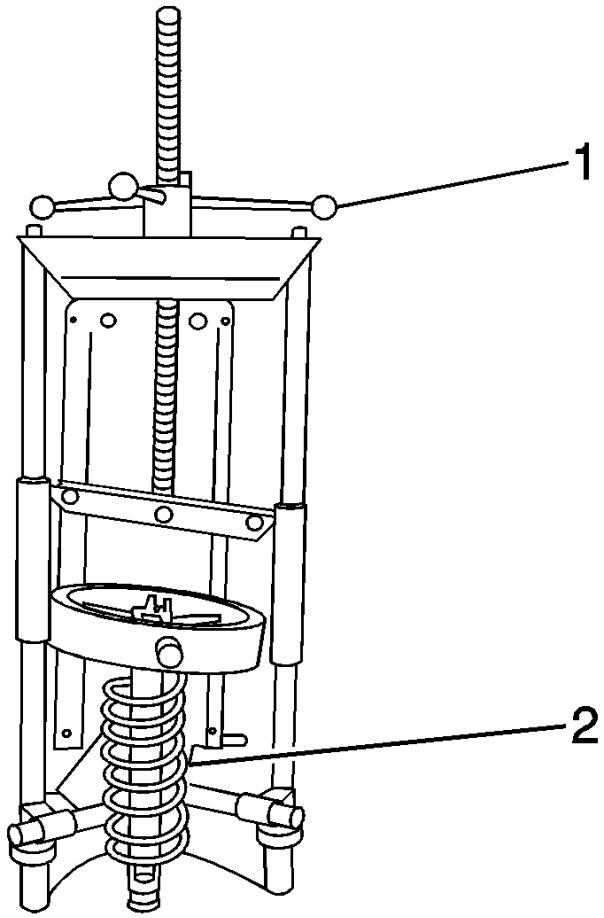

Fig. 51: View Of Compressor Forcing Screw & Coil Spring
Courtesy of GENERAL MOTORS COMPANY

NOTE: **The spring is compressed when the strut moves freely.**

3. Turn the spring compressor forcing screw (1) until the coil spring (2) is compressed.

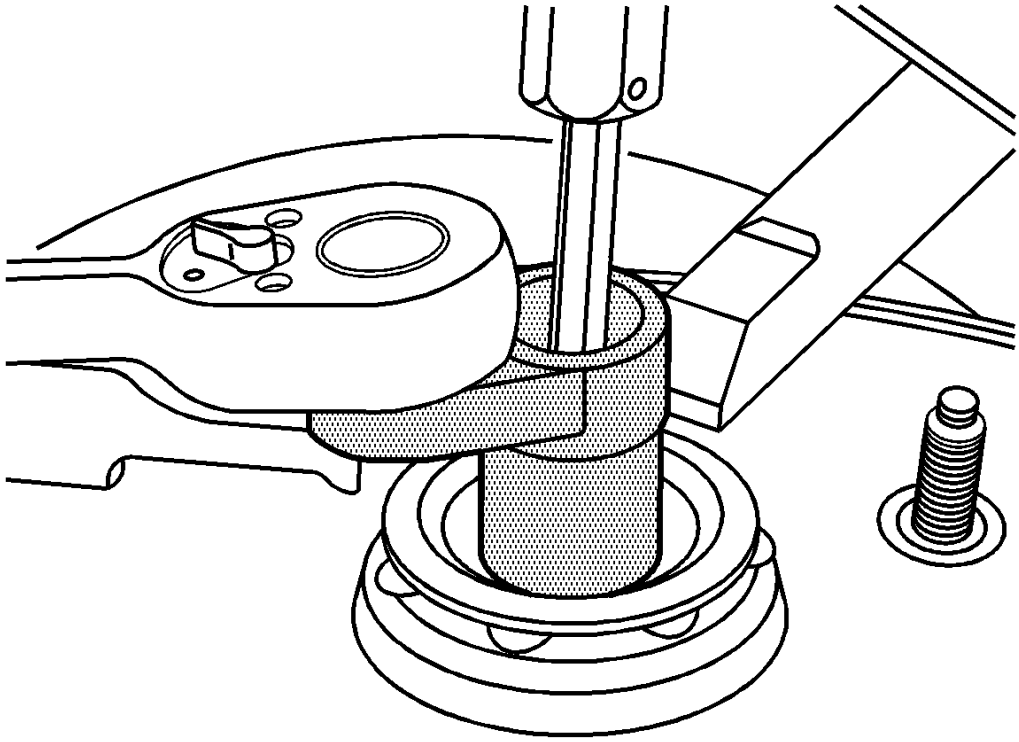

Fig. 52: View Of Special Tools & Strut Shaft
Courtesy of GENERAL MOTORS COMPANY

4. Use a 45 TORXÂ® socket in order to hold the strut shaft. Remove the upper strut mount nut by turning with **J 42991** strut rod nut socket.
5. Remove the strut from the **J 45400** strut spring compressor.

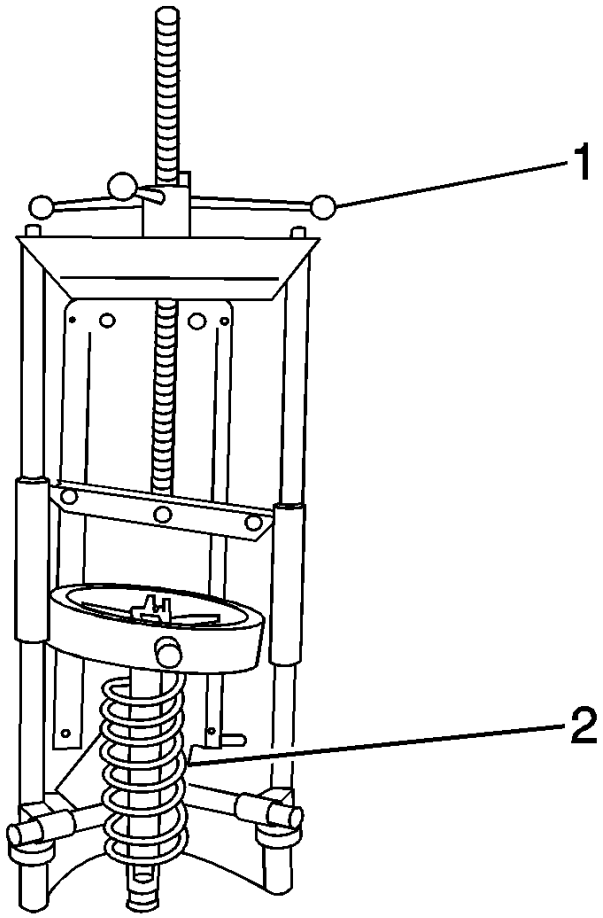

Fig. 53: View Of Compressor Forcing Screw & Coil Spring
Courtesy of GENERAL MOTORS COMPANY

6. Loosen the compressor forcing screw (1) until the upper strut mount and coil spring (2) may be removed.
7. Remove the upper strut mount and the coil spring from the **J 45400** strut spring compressor.

Assembly Procedure

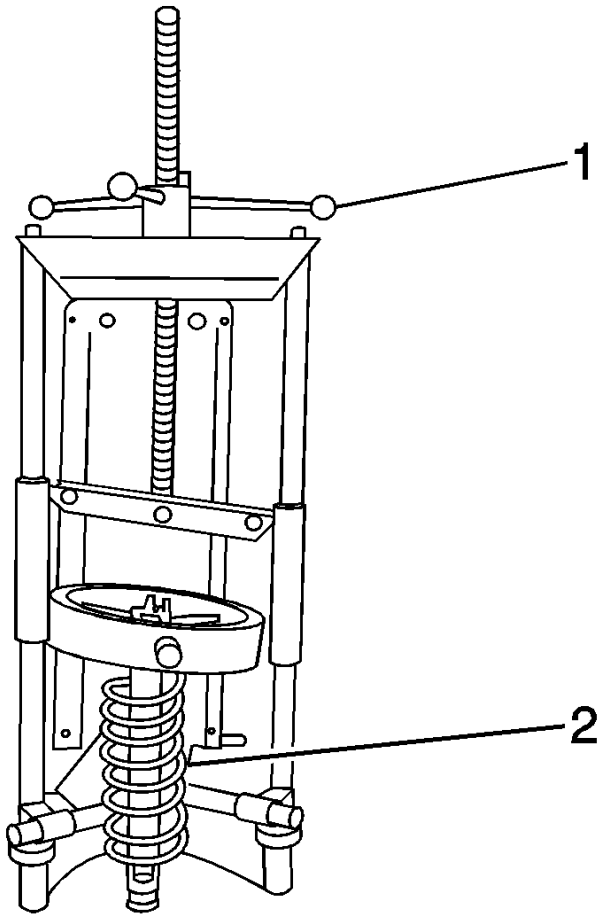

Fig. 54: View Of Compressor Forcing Screw & Coil Spring
Courtesy of GENERAL MOTORS COMPANY

1. Install the coil spring and upper strut mount to the **J 45400** strut spring compressor.
2. Turn the spring compressor forcing screw (1) until the coil spring is compressed.
3. Install the strut to the coil spring and upper strut mount.

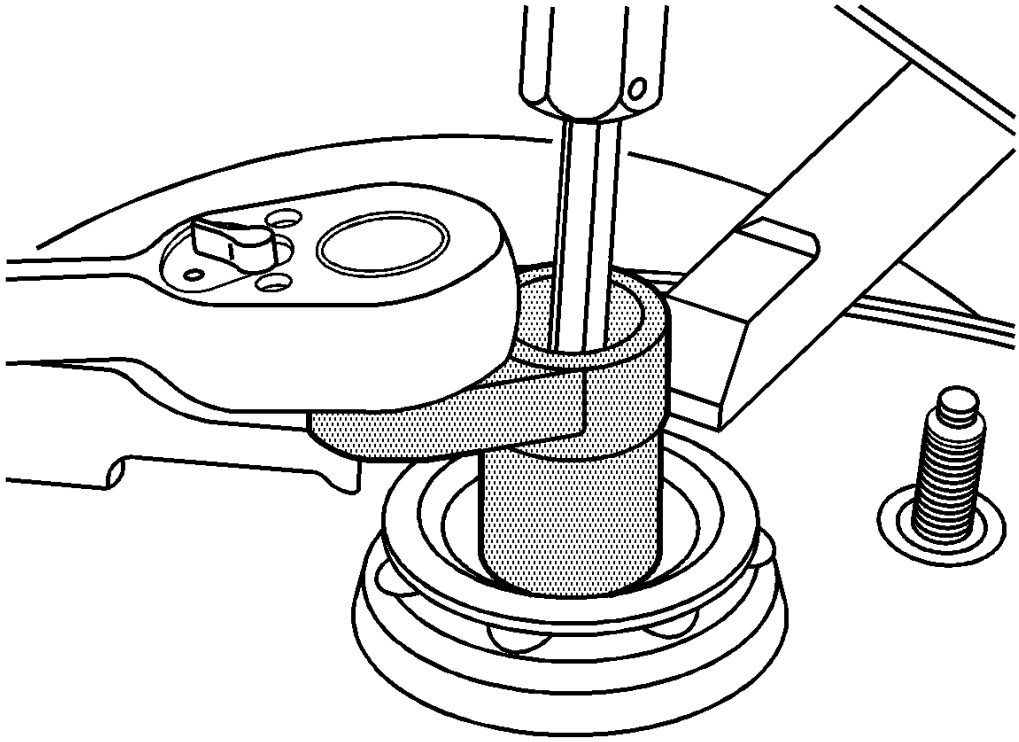

Fig. 55: View Of Special Tools & Strut Shaft
Courtesy of GENERAL MOTORS COMPANY

CAUTION: Refer to Fastener Caution .

4. Install the strut retaining nut.

   Using the **J 42991** strut rod nut socket and a 45 TORXÂ® socket, install the strut mount nut.

   Tighten

   Tighten the strut mount nut to 70 N.m (52 lb ft).

5. Remove the strut from the **J 45400** strut spring compressor.
6. Install the strut to the vehicle. Refer to **Strut Assembly Removal and Installation**.

DESCRIPTION AND OPERATION

FRONT SUSPENSION DESCRIPTION AND OPERATION

The front suspension has 2 primary purposes:

- Isolate the driver from irregularities in the road surface.
- Define the ride and handling characteristics of the vehicle.

The front suspension absorbs the impact of the tires travelling over irregular road surfaces and dissipates this energy throughout the suspension system. This process isolates the vehicle occupants from the road surface. The rate at which the suspension dissipates the energy and the amount of energy that is absorbed is how the suspension defines the vehicles ride characteristics. Ride characteristics are designed into the suspension system and are not adjustable. The ride characteristics are mentioned in this description in order to aid in the understanding of the functions of the suspension system. The suspension system must allow for the vertical movement of the tire and wheel assembly as the vehicle travels over irregular road surfaces while maintaining the tire's horizontal relationship to the road.

This requires that the steering knuckle be suspended between a lower control arm and a strut assembly. The lower control arm attaches from the steering knuckle at the outermost point of the control arm. The attachment is through a ball and socket type joint. The innermost end of the control arm attached at 2 points to the vehicle frame through semi-rigid bushings. The upper portion of the steering knuckle is attached to a strut assembly. The strut assembly then connects to the vehicle body by way of an upper bearing. The steering knuckle is allowed to travel up and down independent of the vehicle body structure and frame.

This up and down motion of the steering knuckle as the vehicle travels over bumps is absorbed predominantly by the coil spring. This spring is retained under tension over the strut assembly. A strut is used in conjunction with this system in order to dampen out the oscillations of the coil spring. A strut is a basic hydraulic cylinder. The strut is filled with oil and has a moveable shaft that connects to a piston inside the strut. Valves inside the shock absorber offer resistance to oil flow and consequently inhibit rapid movement of the piston and shaft. Each end of the shock absorber is connected in such a fashion to utilize this recoil action of a spring alone. Each end of the strut is designed as the connection point of the suspension system to the vehicle and acts as the coil spring seat. This allows the strut to utilize the dampening action to reduce the recoil of a spring alone. The lower control arm is allowed to pivot at the vehicle frame in a vertical fashion. The ball joint allows the steering knuckle to maintain the perpendicular relationship to the road surface.

Front suspensions systems utilize a stabilizer shaft. The stabilizer bar connects between the left and right lower control arm assemblies through the stabilizer link and stabilizer shaft insulators. This bar controls the amount of independent movement of the suspension when the vehicle turns. Limiting the independent movement defines the vehicles handling characteristics on turns.

REPAIR INSTRUCTIONS

REAR WHEEL BEARING AND HUB REPLACEMENT

Removal Procedure

NOTE: **The wheel bearing in the rear wheel hub is integrated into one unit. The hub is non-serviceable. If the hub and/or bearing is damaged, replace the complete hub and bearing assembly.**

1. Raise and suitably support the vehicle. Refer to **Lifting and Jacking the Vehicle** .
2. Remove the tires and wheels. Refer to **Tire and Wheel Removal and Installation** .
3. Remove the brake rotor. Refer to **Rear Brake Rotor Replacement** .

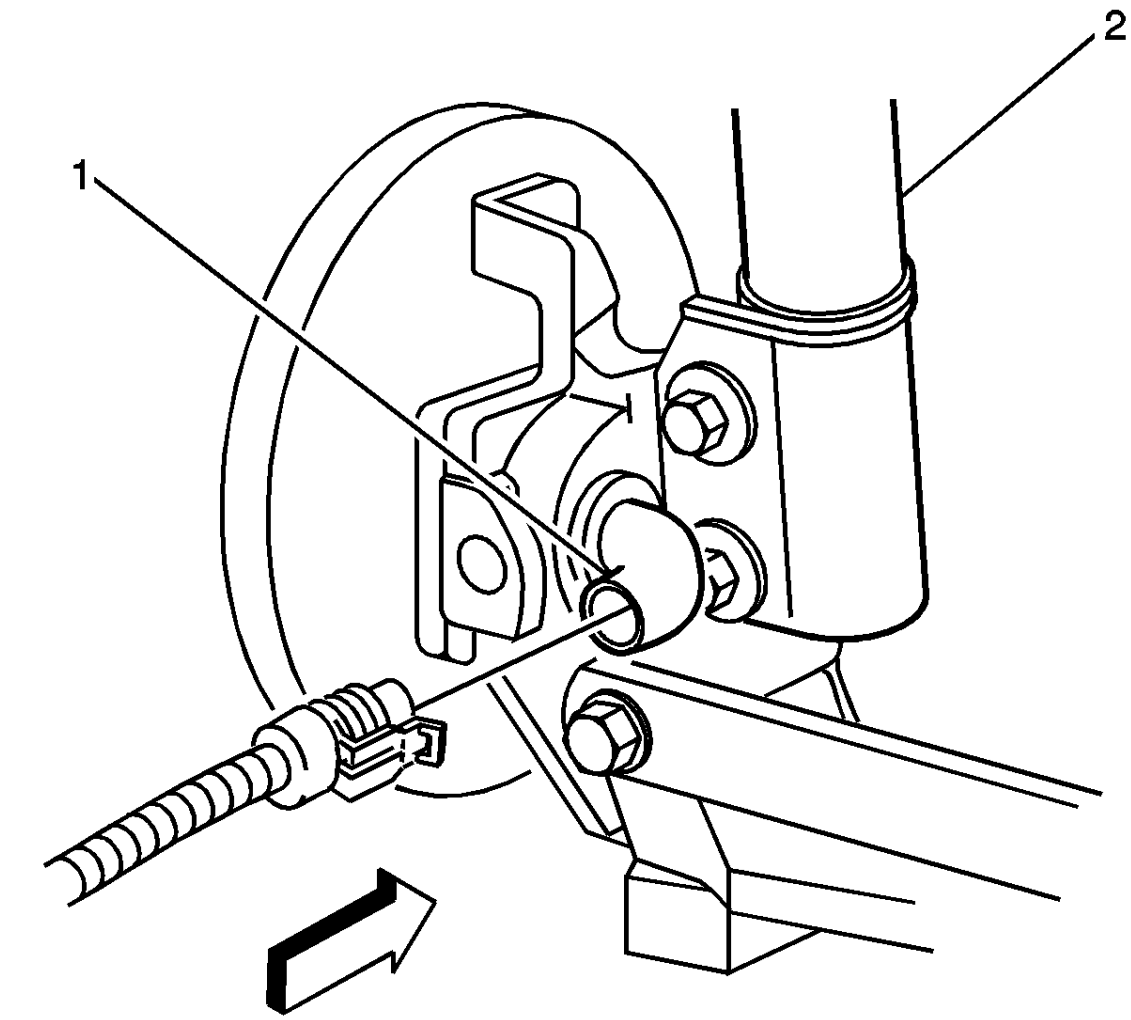

Fig. 1: Rear Wheel Speed Sensors Component View
Courtesy of GENERAL MOTORS COMPANY

4. Remove the ABS electrical connector from the wheel speed sensor (1), if equipped.
5. Remove the park brake cable from the park brake actuator. Refer to **Parking Brake Rear Cable Replacement (Z7U)** .
6. Remove the mounting bolts from the rear bearing/hub.

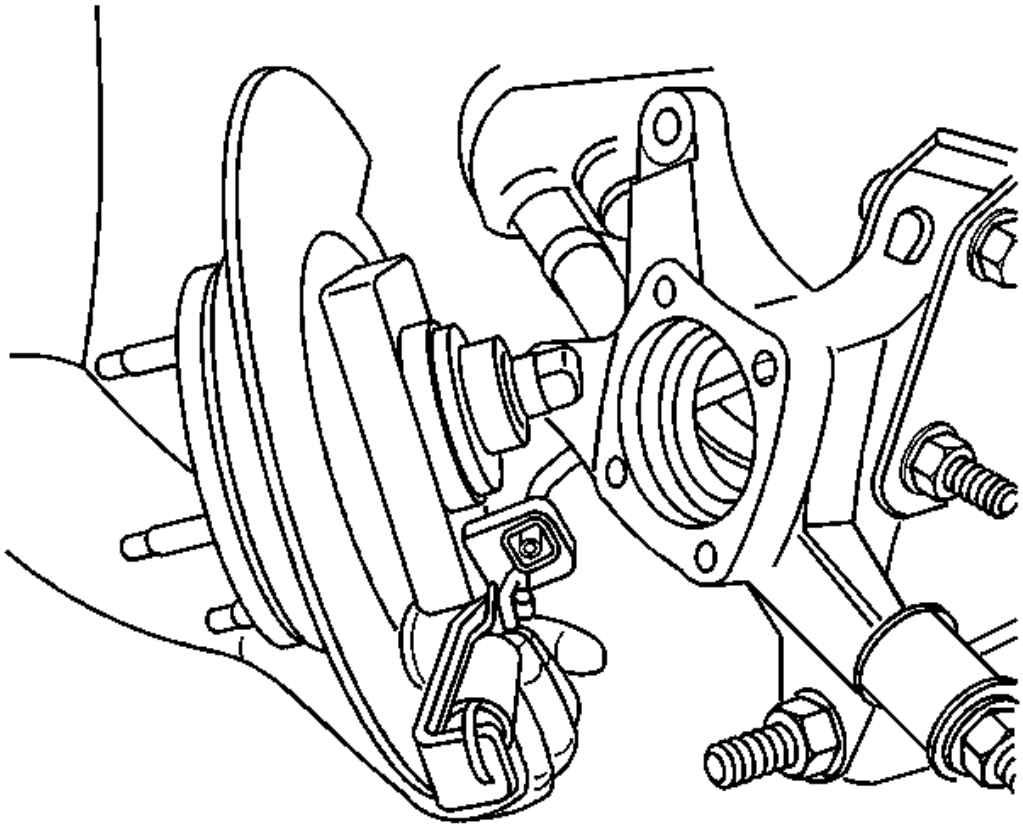

Fig. 2: Park Brake Actuator
Courtesy of GENERAL MOTORS COMPANY

7. Remove the wheel bearing/hub and park brake assembly from the knuckle.
8. Remove the park brake actuator from the rear wheel bearing/hub. Refer to **Parking Brake Rear Cable Replacement (Z7U)** .

Installation Procedure

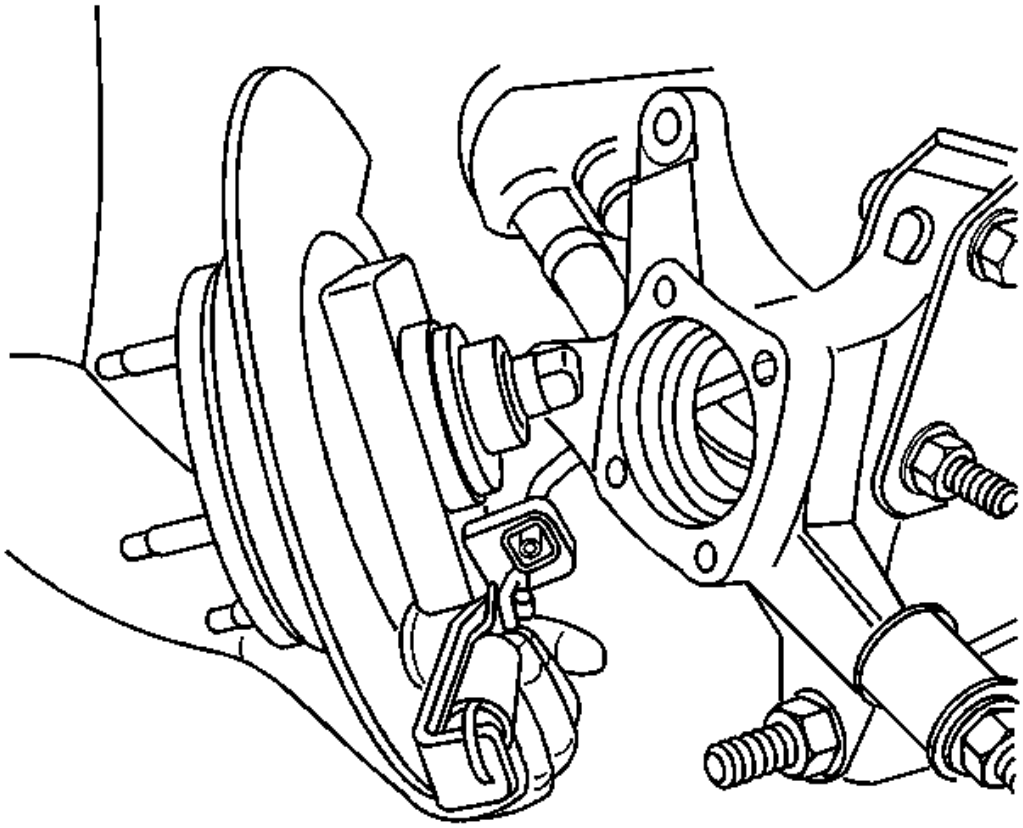

Fig. 3: Park Brake Actuator
Courtesy of GENERAL MOTORS COMPANY

1. Install the park brake actuator to the rear wheel bearing/hub. Refer to **Parking Brake Rear Cable Replacement (Z7U)** .
2. Install the wheel bearing/hub and park brake assembly to the knuckle.

CAUTION: Refer to Fastener Caution .

3. Install the wheel bearing/hub-to-knuckle bolts.

Tighten

Tighten the bolts to 75 N.m (55 lb ft).

4. Install the park brake cable to the park brake actuator. Refer to **Parking Brake Rear Cable Replacement (Z7U)** .

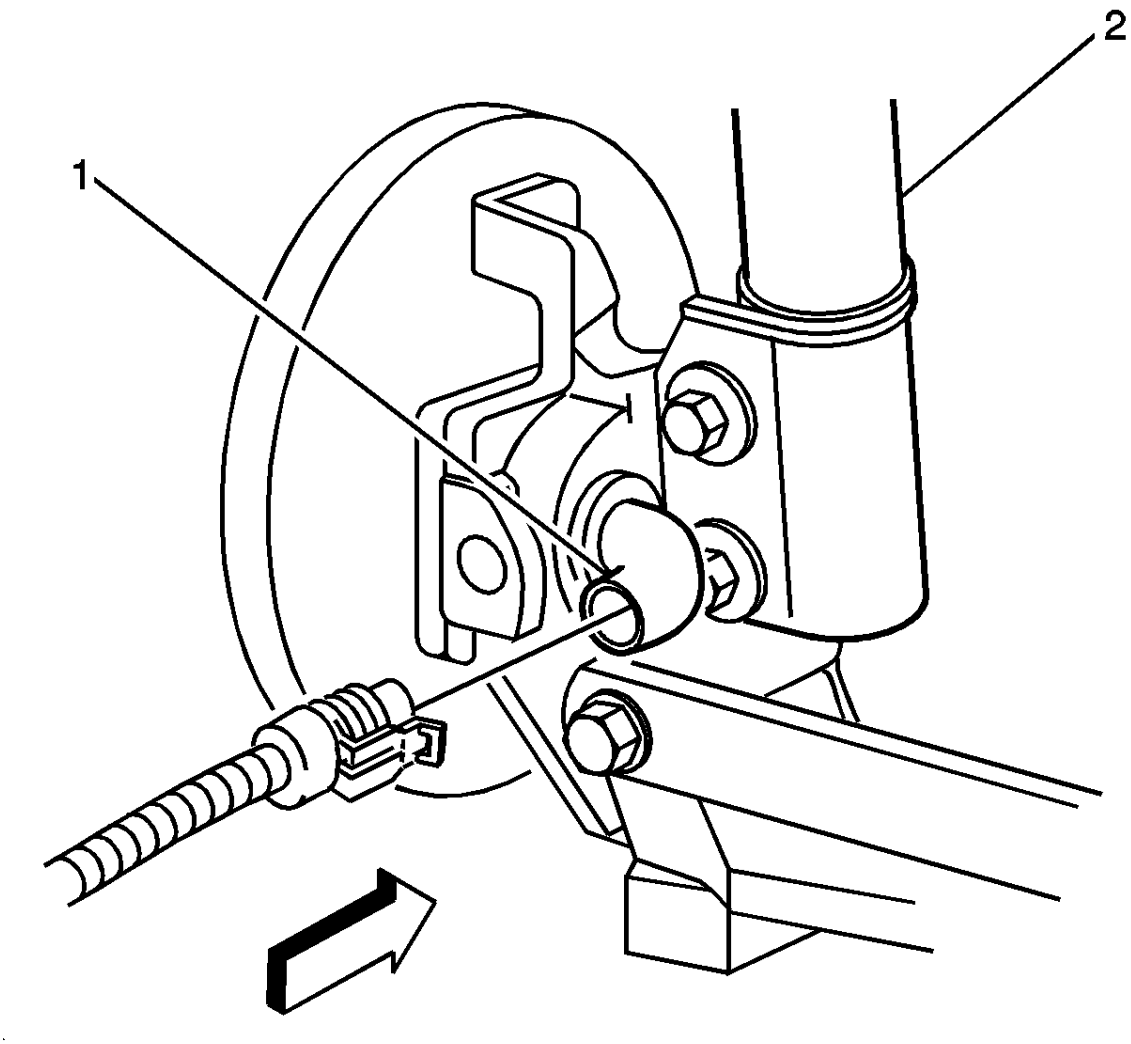

Fig. 4: Rear Wheel Speed Sensors Component View
Courtesy of GENERAL MOTORS COMPANY

5. Install the ABS electrical connector to the wheel speed sensor (1), if equipped.
6. Install the brake rotor. Refer to **Rear Brake Rotor Replacement** .
7. Install the tires and wheels. Refer to **Tire and Wheel Removal and Installation** .
8. Lower the vehicle.

SUPPORT REPLACEMENT

Removal Procedure

1. Raise and support the vehicle. Refer to **Lifting and Jacking the Vehicle** .
2. Remove the rear tires and wheels. Refer to **Tire and Wheel Removal and Installation** .
3. Remove the exhaust pipe. Refer to **Exhaust Muffler Replacement** .
4. Disconnect the brake lines from the rear suspension support. Refer to **Rear Brake Hose Replacement** .
5. Disconnect the parking brake cables and tensioner from the suspension support. Refer to **Parking Brake Rear Cable Replacement (Z7U)** .
6. Remove the stabilizer shaft from the rear suspension support. Refer to **Stabilizer Shaft Replacement**.

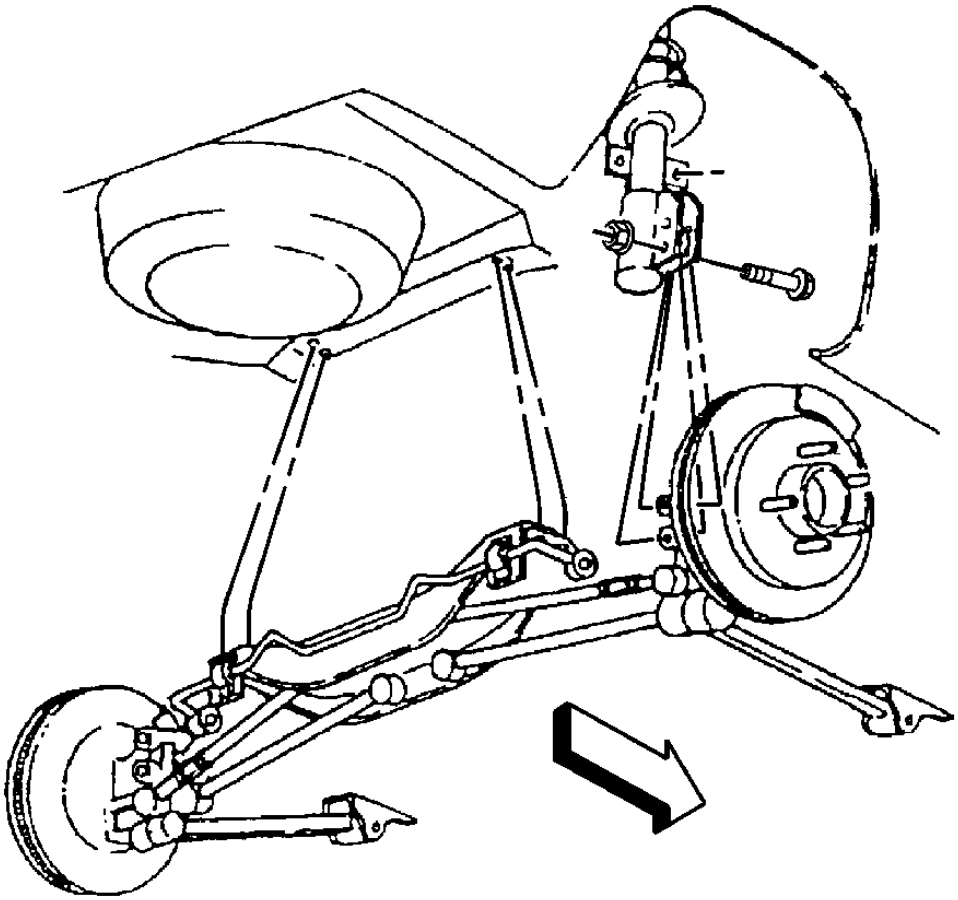

Fig. 5: Rear Suspension Components
Courtesy of GENERAL MOTORS COMPANY

NOTE: **Support the rear suspension support with jack stands before removing the mounting bolts.**

7. Remove the rear suspension support mounting bolts.
8. Remove the rear wheel spindle rods bolts from the knuckle.
9. Lower the rear suspension support in order to gain access to the rear wheel spindle rod bolts.
10. Remove the rear wheel spindle rods bolts from the rear suspension support.
11. Remove the rear suspension support.

Installation Procedure

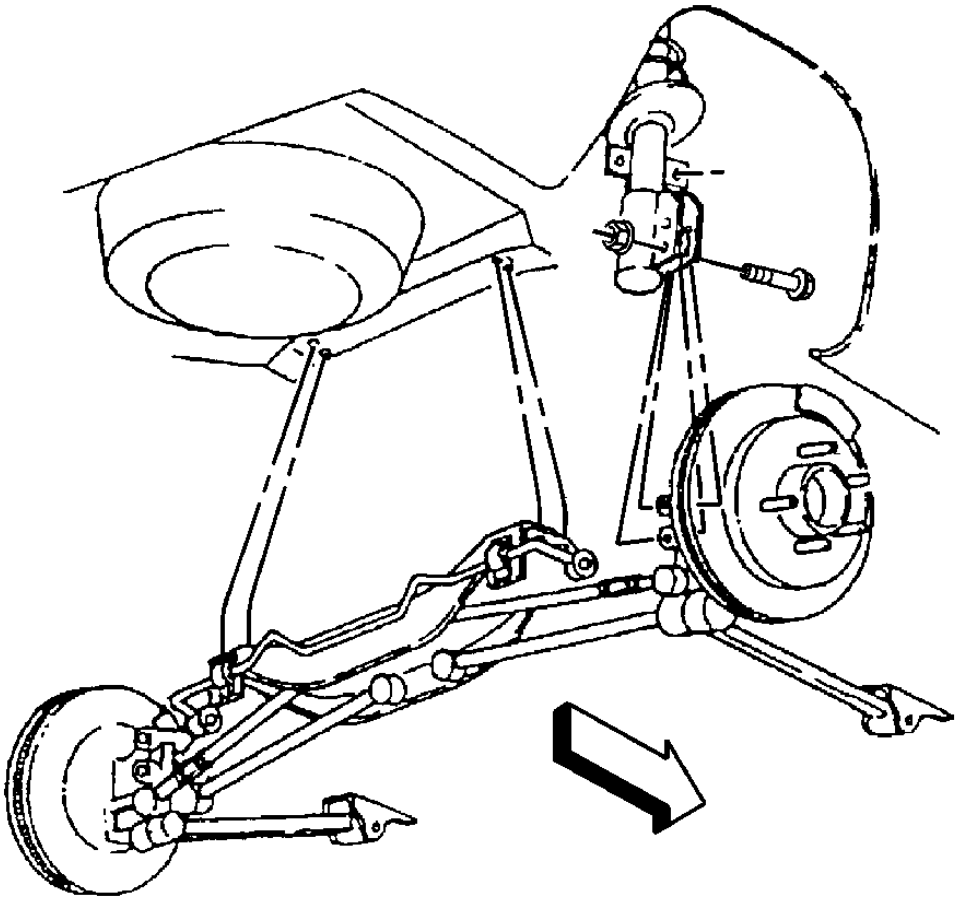

Fig. 6: Rear Suspension Components
Courtesy of GENERAL MOTORS COMPANY

1. Position the rear suspension support in place.

CAUTION: **Refer to Fastener Caution .**

2. Install the rear wheel spindle rod-to-rear suspension support bolts and nuts.

Tighten

Tighten the nuts to 135 N.m (100 lb ft).

3. Install the rear suspension support mounting bolts.

Tighten

Tighten the bolts to 110 N.m (81 lb ft).

4. Position the rear wheel spindle rod to the knuckle.
5. Install the retaining bolts and nuts to the knuckle.

Tighten

Tighten the nut to 150 N.m (111 lb ft).

6. Install the stabilizer shaft to the rear suspension support. Refer to **Stabilizer Shaft Replacement**.
7. Connect the brake lines to the rear suspension support. Refer to **Rear Brake Hose Replacement** .
8. Install the parking brake cables and the tensioner. Refer to **Parking Brake Rear Cable Replacement (Z7U)** .
9. Install the exhaust pipe. Refer to **Exhaust Muffler Replacement** .
10. Install the tires and wheels. Refer to **Tire and Wheel Removal and Installation** .
11. Lower the vehicle.
12. Adjust the rear wheel alignment. Refer to **Wheel Alignment Measurement** .

KNUCKLE REPLACEMENT

Removal Procedure

1. Raise and support the vehicle. Refer to **Lifting and Jacking the Vehicle** .
2. Remove the tire and wheel assembly. Refer to **Tire and Wheel Removal and Installation** .

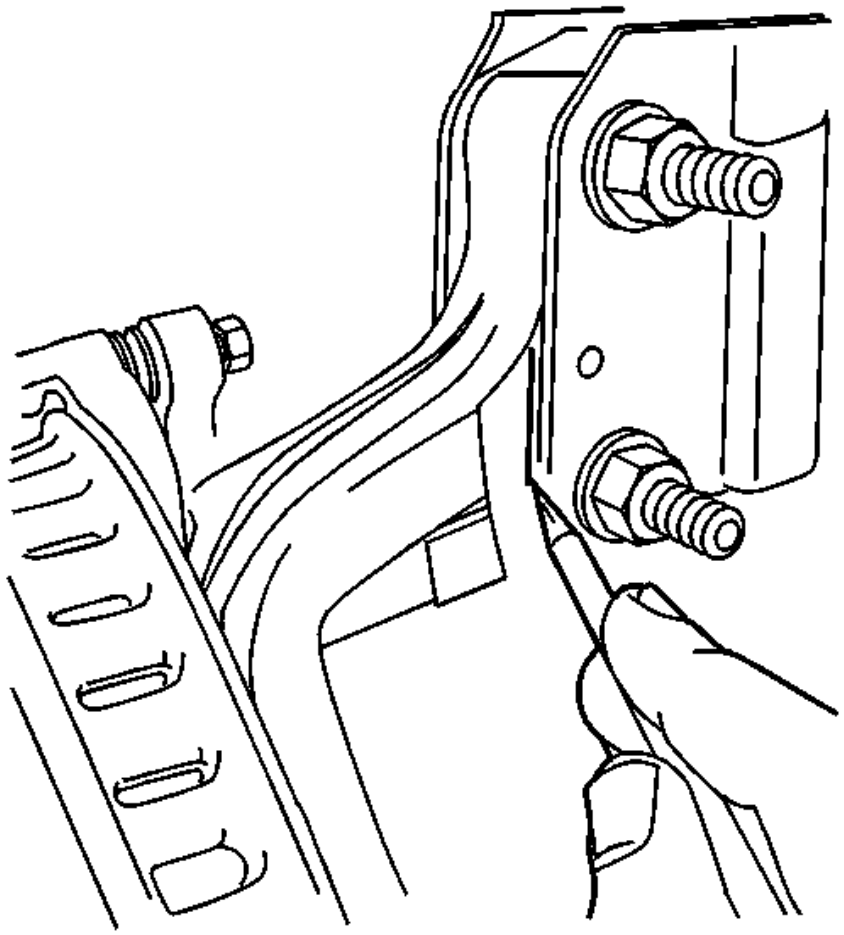

Fig. 7: Scribing Strut To Knuckle

Courtesy of GENERAL MOTORS COMPANY

NOTE: **If removing the knuckle to service other suspension components, perform the following step.**

3. Scribe the strut to the knuckle.
4. Remove the bearing/hub assembly. Refer to **Rear Wheel Bearing and Hub Replacement**.
5. Remove the rear wheel spindle rods from the knuckle. Refer to **Rear Wheel Spindle Rod Replacement**.

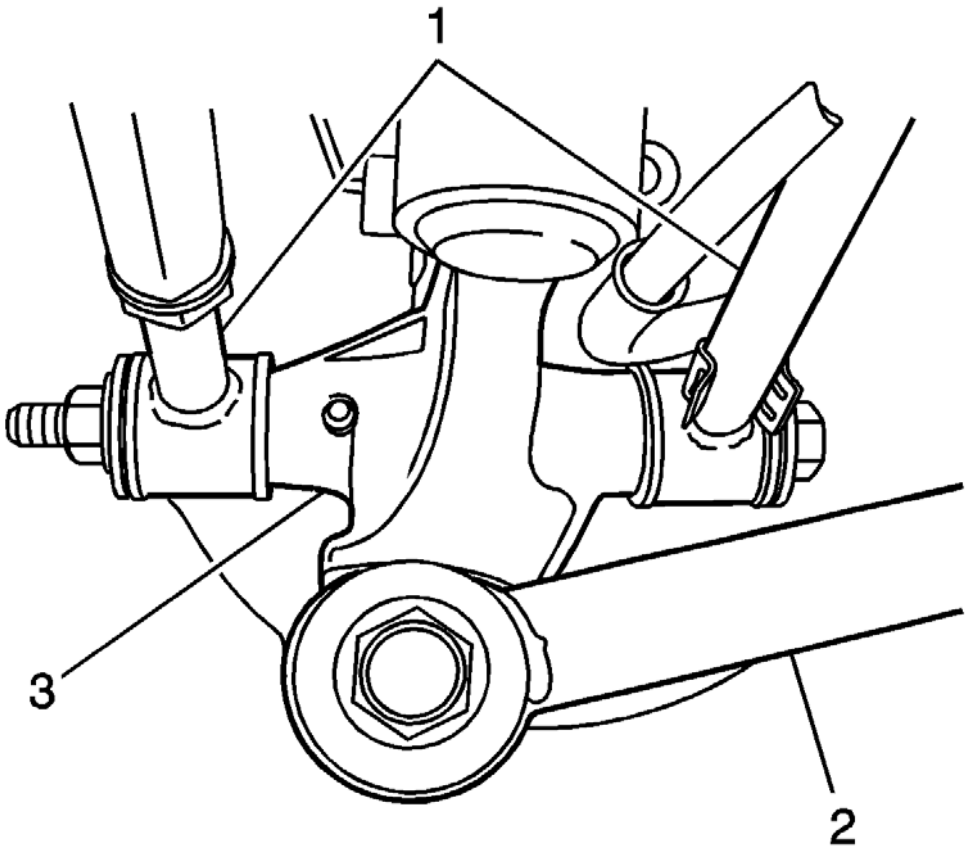

Fig. 8: View Of Trailing Arm & Knuckle
Courtesy of GENERAL MOTORS COMPANY

6. Remove the trailing arm (2) from the knuckle (3). Refer to **Trailing Arm Replacement**.

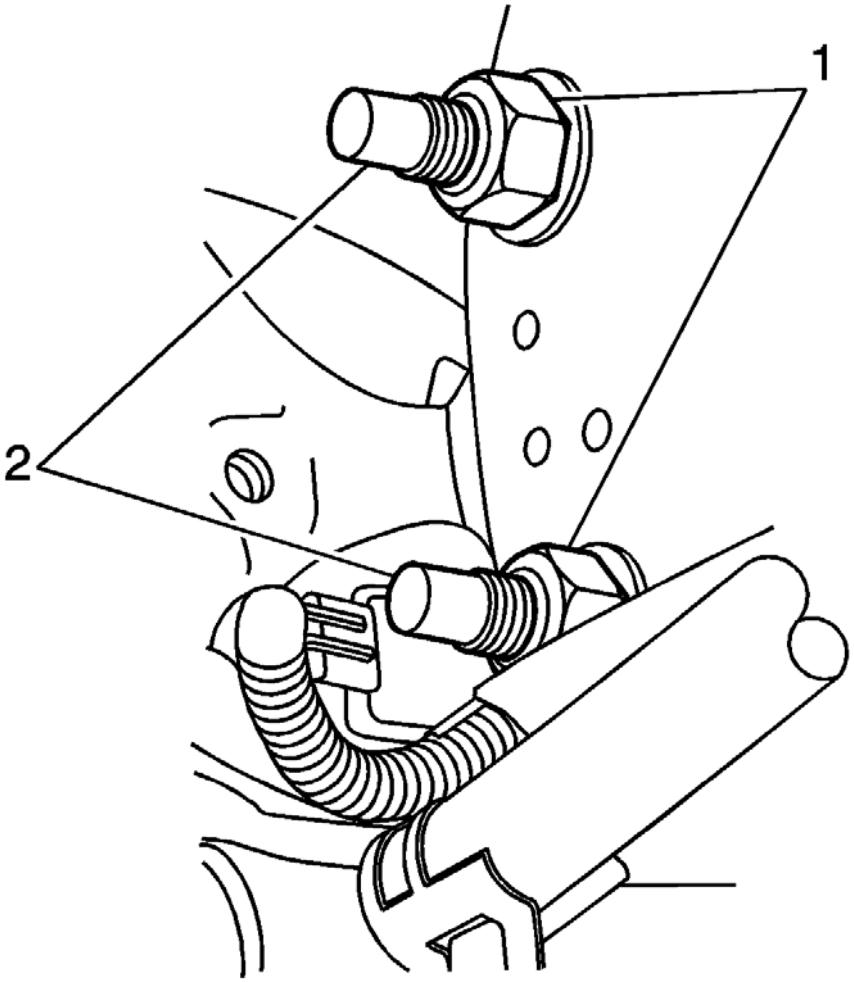

Fig. 9: Rear Strut To Knuckle
Courtesy of GENERAL MOTORS COMPANY

7. Remove the rear strut to knuckle bolts (2) and the nuts (1). Refer to **Strut Assembly Removal and Installation**.
8. Remove the knuckle from the vehicle.

Installation Procedure

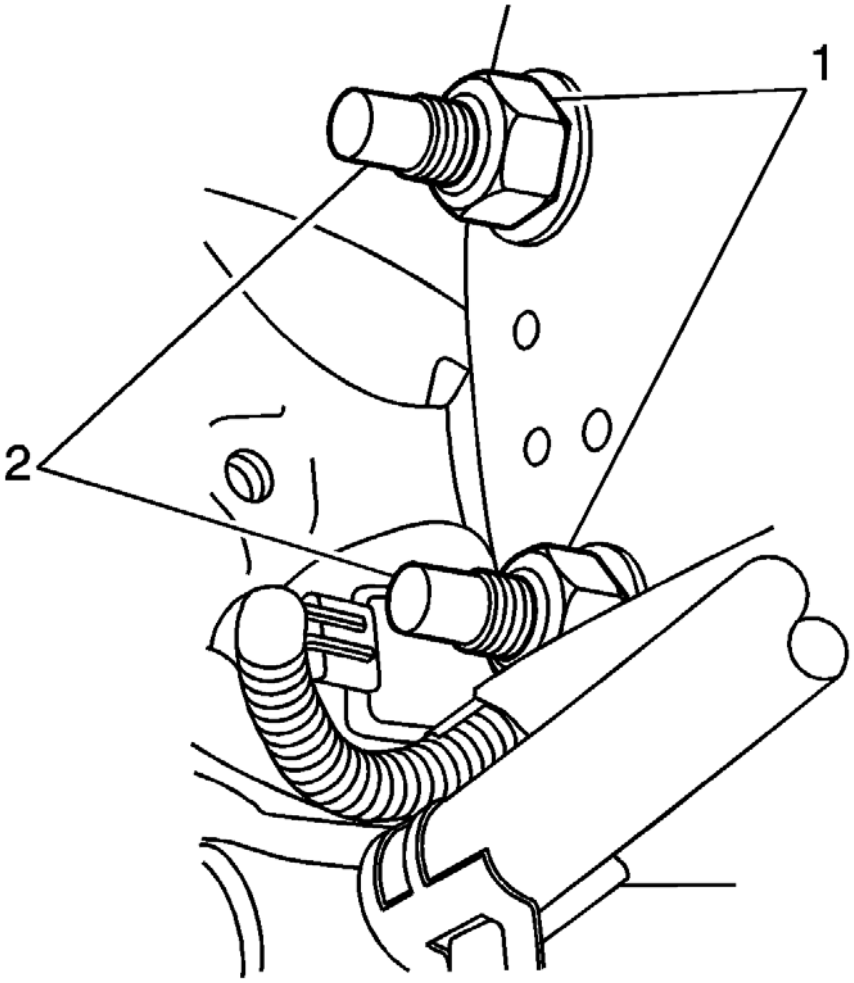

Fig. 10: Rear Strut To Knuckle
Courtesy of GENERAL MOTORS COMPANY

1. Install the knuckle to the vehicle.

NOTE: **If reinstalling the original knuckle, align the rear strut with the scribe marks on the knuckle.**

2. Hand start the strut to knuckle bolts (2) and nuts (1). Do not tighten the nuts at this time.

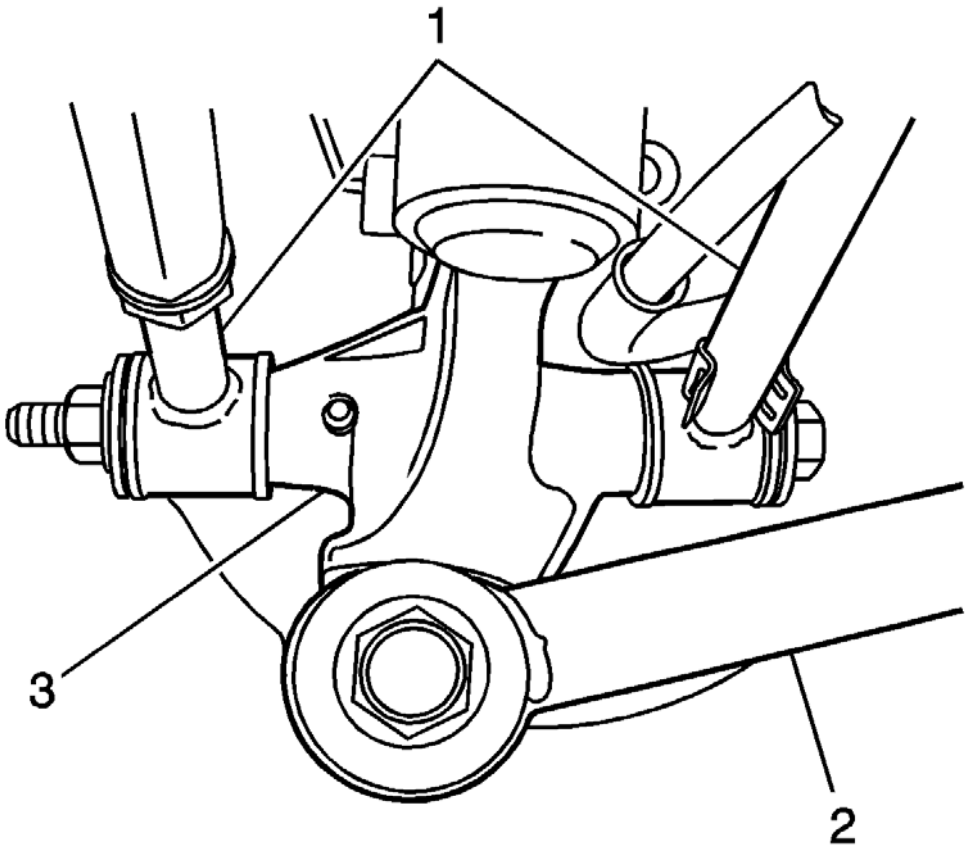

Fig. 11: View Of Trailing Arm & Knuckle
Courtesy of GENERAL MOTORS COMPANY

3. Connect the rear suspension trailing arm (2) to the knuckle (3). Refer to **Trailing Arm Replacement**.

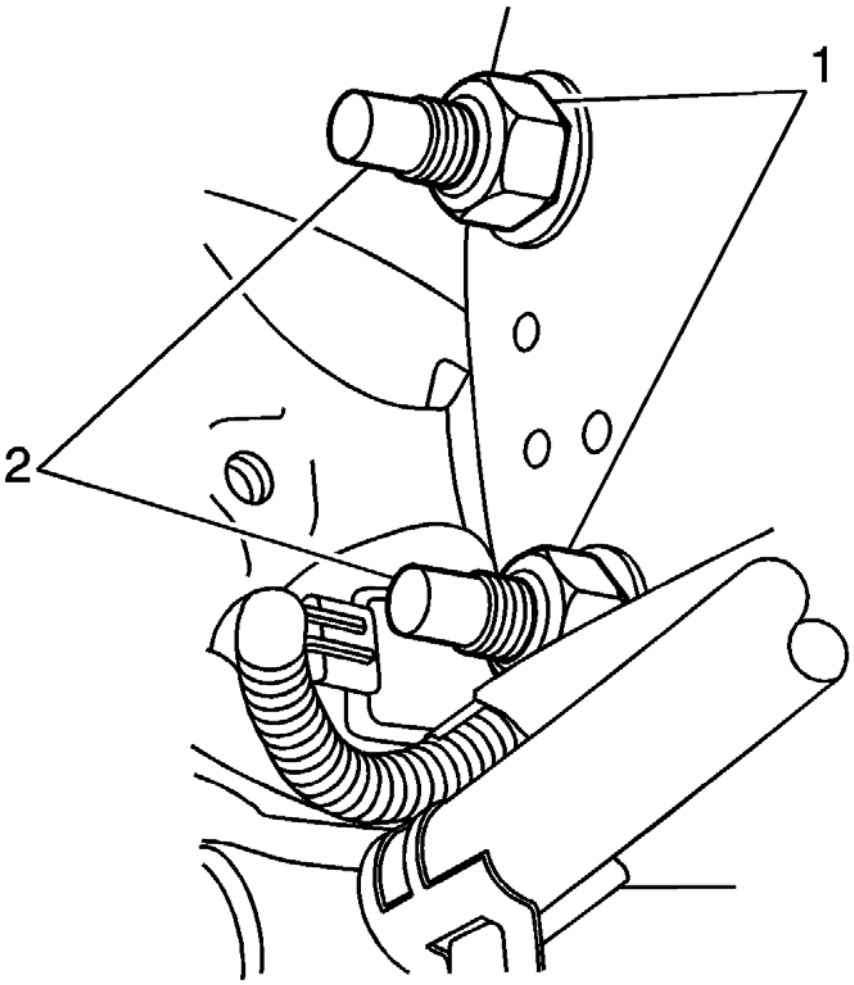

Fig. 12: Rear Strut To Knuckle
Courtesy of GENERAL MOTORS COMPANY

4. Connect the rear wheel spindle rods to the knuckle. Refer to **Rear Wheel Spindle Rod Replacement**.
5. Install the bearing/hub assembly. Refer to **Rear Wheel Bearing and Hub Replacement**.

CAUTION: Refer to Fastener Caution .

6. Tighten the strut to knuckle bolts (2) and nuts (1).

Tighten

Tighten bolts to 120 N.m (89 lb ft).

7. Install the tire and wheel assembly. Refer to **Tire and Wheel Removal and Installation** .
8. Remove the support and lower the vehicle.
9. Inspect the rear wheel alignment, adjust if necessary. Refer to **Wheel Alignment Measurement** .

STABILIZER SHAFT REPLACEMENT

Removal Procedure

1. Raise and support the vehicle. Refer to **Lifting and Jacking the Vehicle** .

2. Remove the tires and wheels. Refer to **Tire and Wheel Removal and Installation** .

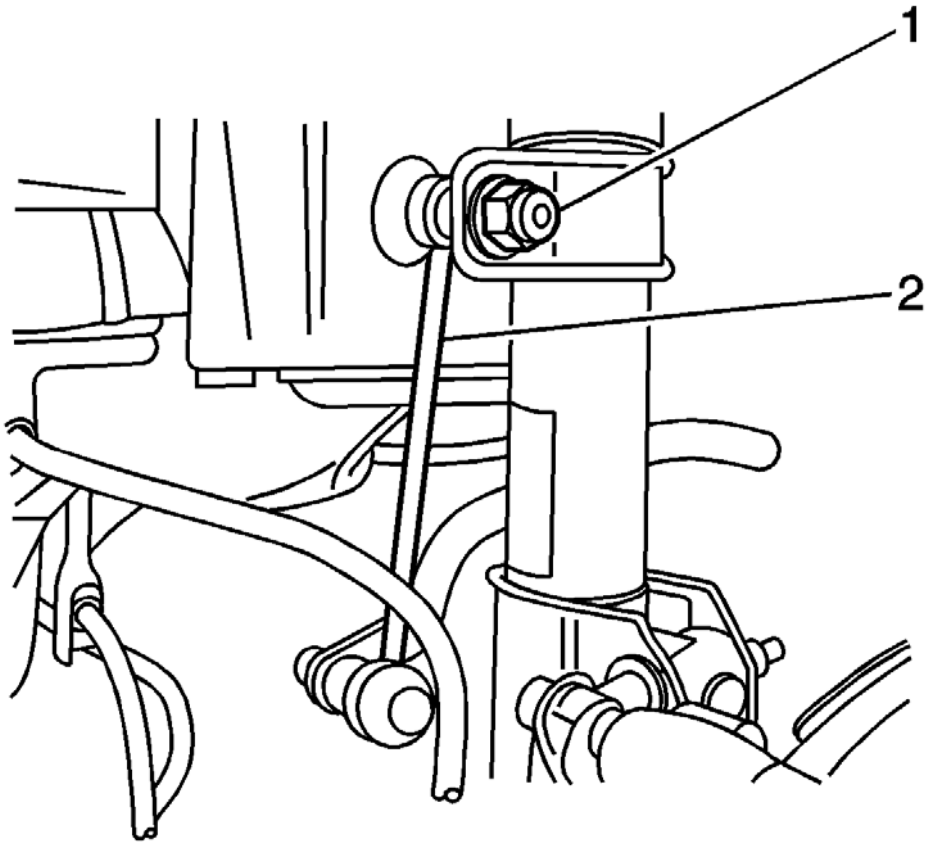

Fig. 13: View Of Stabilizer Shaft Link
Courtesy of GENERAL MOTORS COMPANY

3. Remove the left and right stabilizer shaft link nuts from the stabilizer shaft links (1).

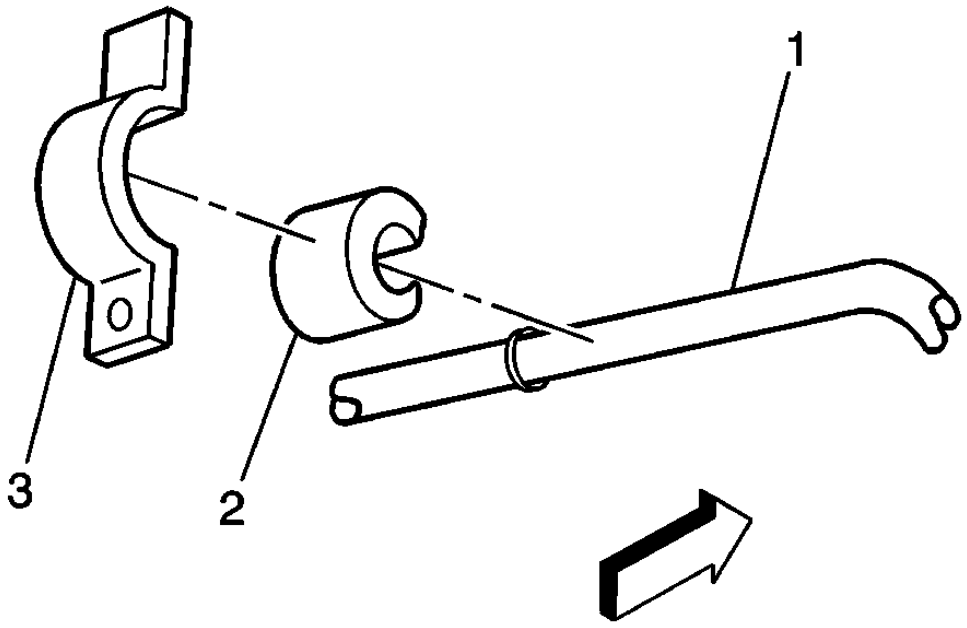

Fig. 14: Stabilizer Shaft, Insulator, & Insulator Bracket
Courtesy of GENERAL MOTORS COMPANY

4. Remove the insulator brackets (3) and the bolts from the stabilizer shaft (1).

NOTE: **If the stabilizer bar has broken, inspect the rear coil springs for witness marks indicating contact. If there is noticeable contact or paint removed , replace the coil spring.**

5. Remove the stabilizer shaft (1) from the rear suspension support.

Installation Procedure

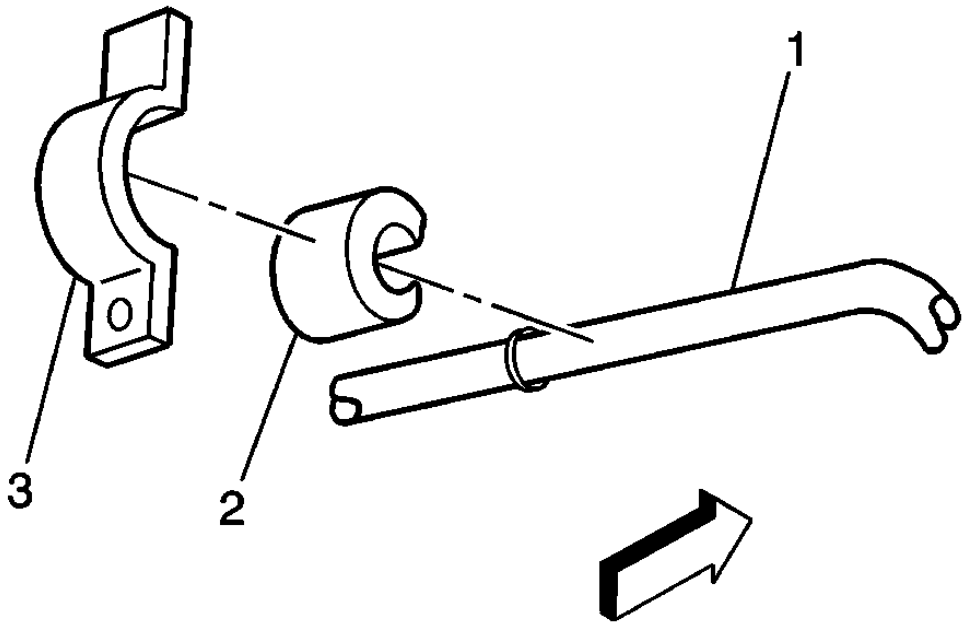

Fig. 15: Stabilizer Shaft, Insulator, & Insulator Bracket
Courtesy of GENERAL MOTORS COMPANY

1. Install the stabilizer shaft (1) to the rear suspension support.
2. Install the stabilizer shaft insulator brackets (3) and hand tighten the bolts. Do not tighten the bolts at this time.

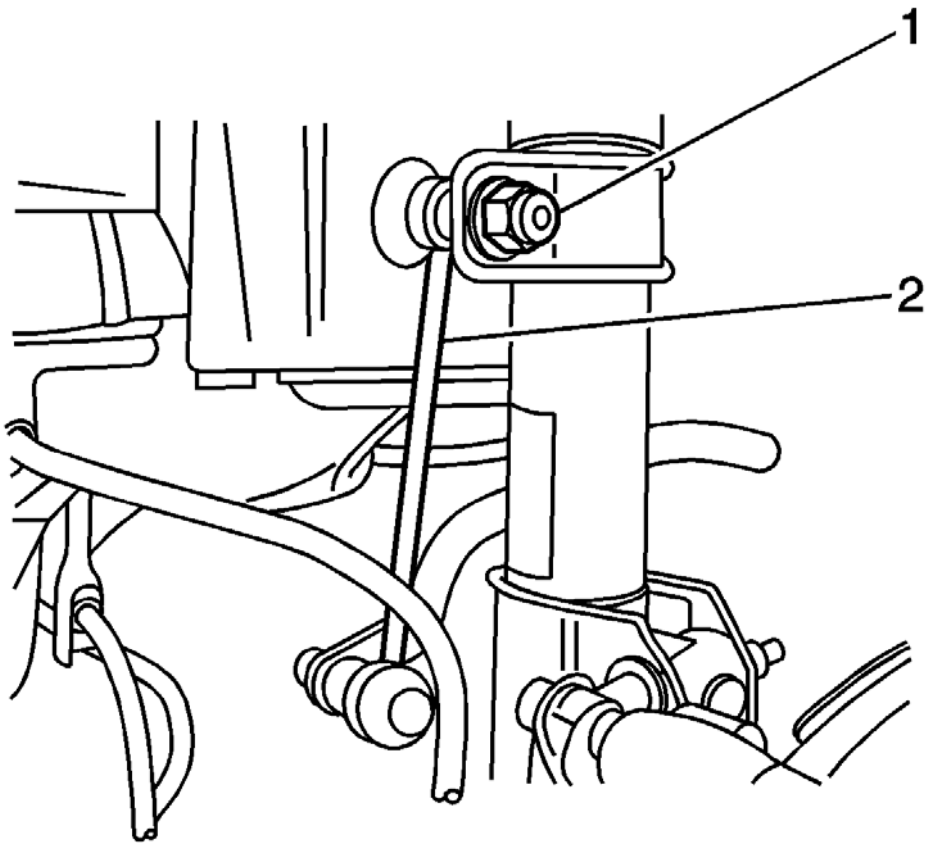

Fig. 16: View Of Stabilizer Shaft Link
Courtesy of GENERAL MOTORS COMPANY

CAUTION: Refer to Fastener Caution .

3. Install the right and left stabilizer shaft link nuts to the stabilizer shaft links (1).

   Tighten

   - Tighten the stabilizer shaft link nuts to 52 N.m (38 lb ft).
   - Tighten the stabilizer shaft insulator bracket nuts to 48 N.m (35 lb ft).
4. Install the tires and wheels. Refer to **Tire and Wheel Removal and Installation** .
5. Lower the vehicle.

STABILIZER SHAFT INSULATOR REPLACEMENT

Removal Procedure

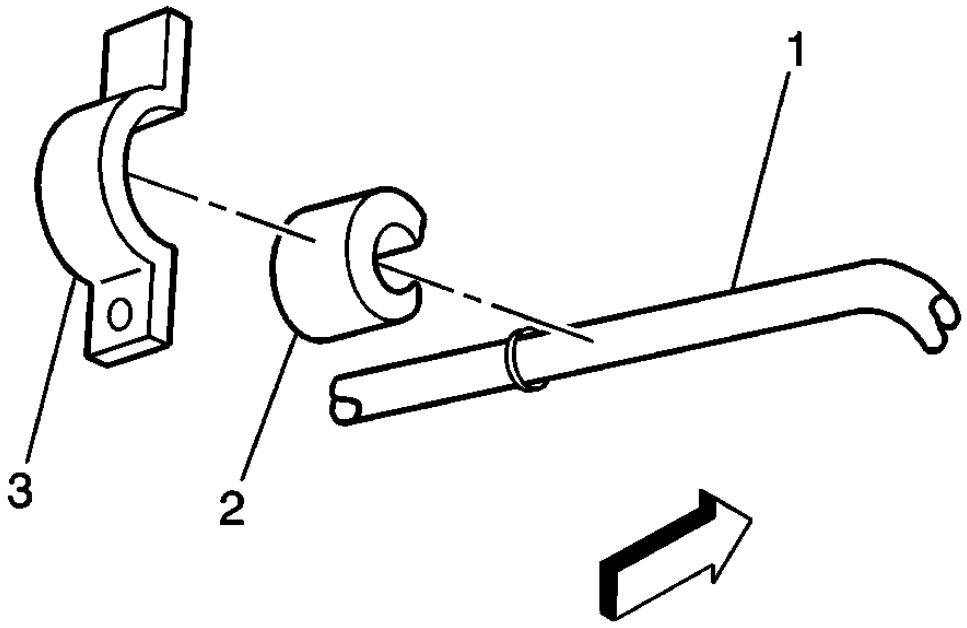

Fig. 17: Stabilizer Shaft, Insulator, & Insulator Bracket
Courtesy of GENERAL MOTORS COMPANY

1. Raise and suitably support the vehicle. Refer to **Lifting and Jacking the Vehicle** .
2. Remove the bolt from the stabilizer shaft insulator bracket (3).
3. Remove the stabilizer shaft insulator bracket.
4. Remove the stabilizer shaft insulator (2) from the stabilizer shaft.

Installation Procedure

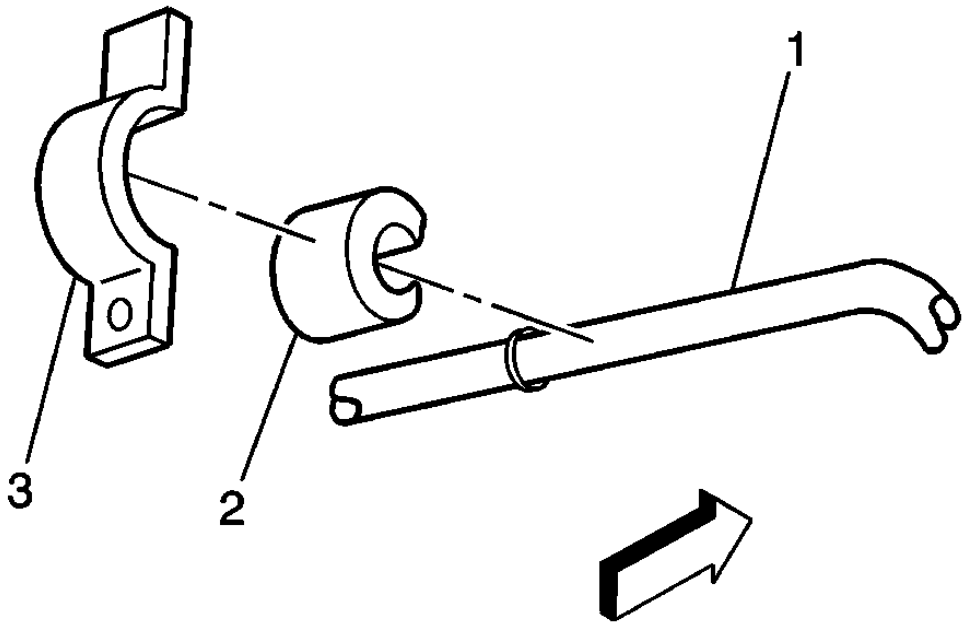

Fig. 18: Stabilizer Shaft, Insulator, & Insulator Bracket
Courtesy of GENERAL MOTORS COMPANY

1. Install the stabilizer shaft insulator (2) to the stabilizer shaft.
2. Install the stabilizer shaft insulator bracket (3).

CAUTION: Refer to Fastener Caution .

3. Install the stabilizer shaft bracket nuts.

Tighten

Tighten the bolts to 48 N.m (35 lb ft).

4. Lower the vehicle.

STABILIZER SHAFT LINK REPLACEMENT

Removal Procedure

1. Raise and support the vehicle. Refer to **Lifting and Jacking the Vehicle** .

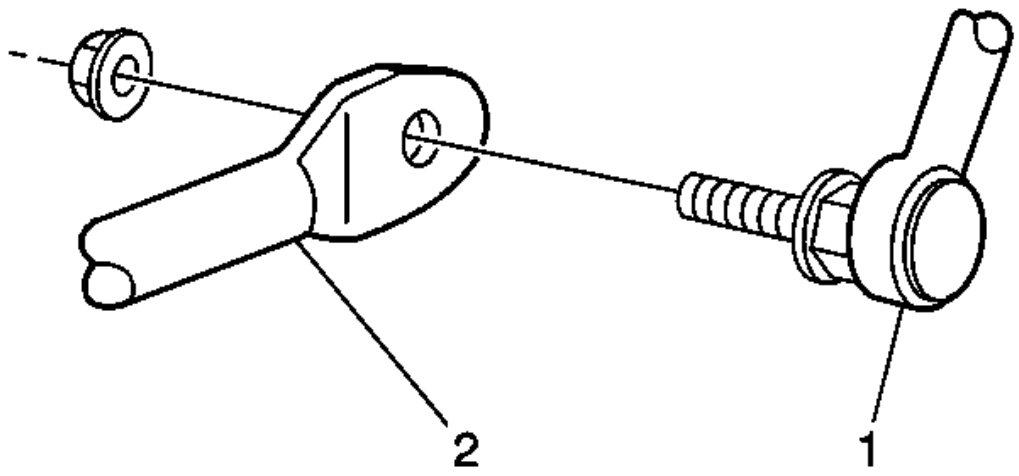

Fig. 19: View Of Stabilizer Shaft And Link
Courtesy of GENERAL MOTORS COMPANY

2. Remove the stabilizer shaft link nut from the stabilizer shaft link (1) and the stabilizer shaft (2).

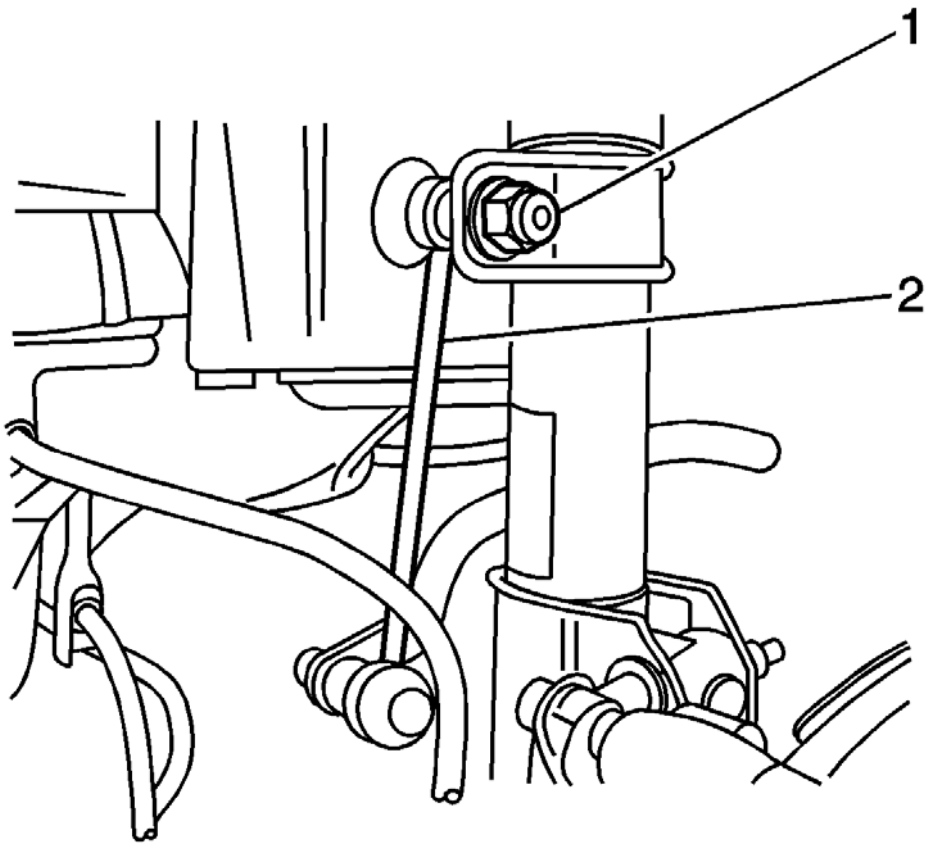

Fig. 20: View Of Stabilizer Shaft Link
Courtesy of GENERAL MOTORS COMPANY

3. Remove the stabilizer shaft link nut from the stabilizer shaft link (1) and the strut.
4. Remove the stabilizer shaft link (1) from the vehicle.

Installation Procedure

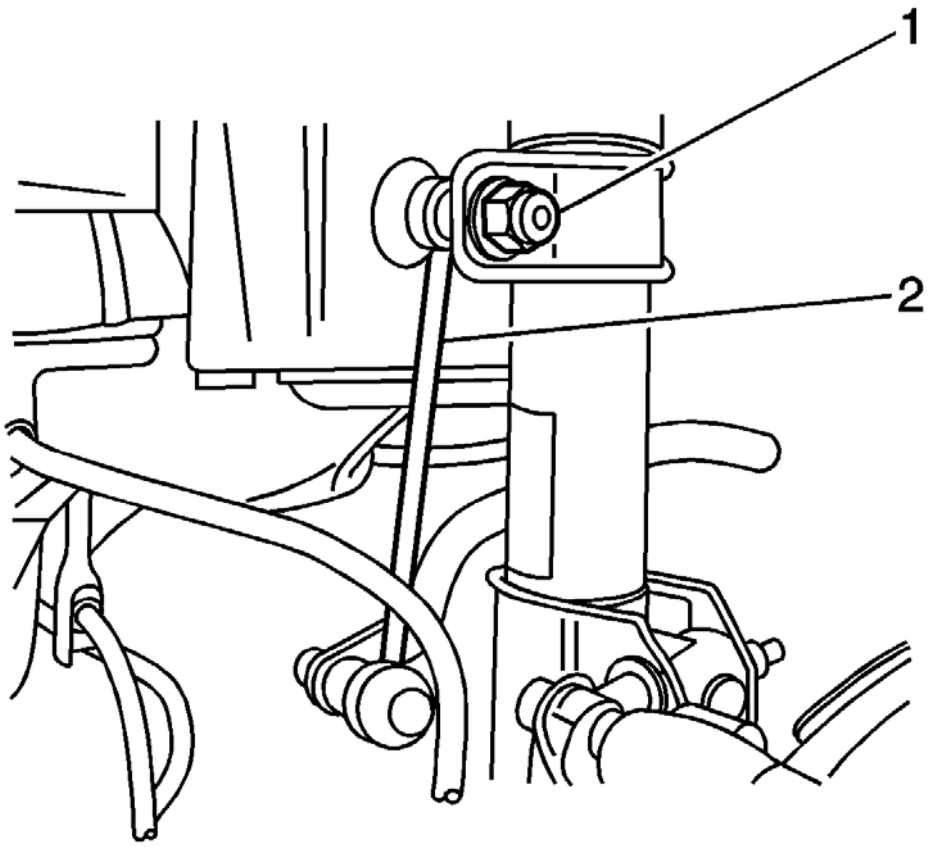

Fig. 21: View Of Stabilizer Shaft Link
Courtesy of GENERAL MOTORS COMPANY

1. Install the stabilizer shaft link (1) to the vehicle.
2. Connect the stabilizer shaft link (1) to the stabilizer shaft (2).

CAUTION: Refer to Fastener Caution .

3. Install the lower stabilizer shaft link nut to the stabilizer shaft link (1) and the stabilizer shaft (2).

Tighten

Tighten the nut to 50 N.m (37 lb ft).

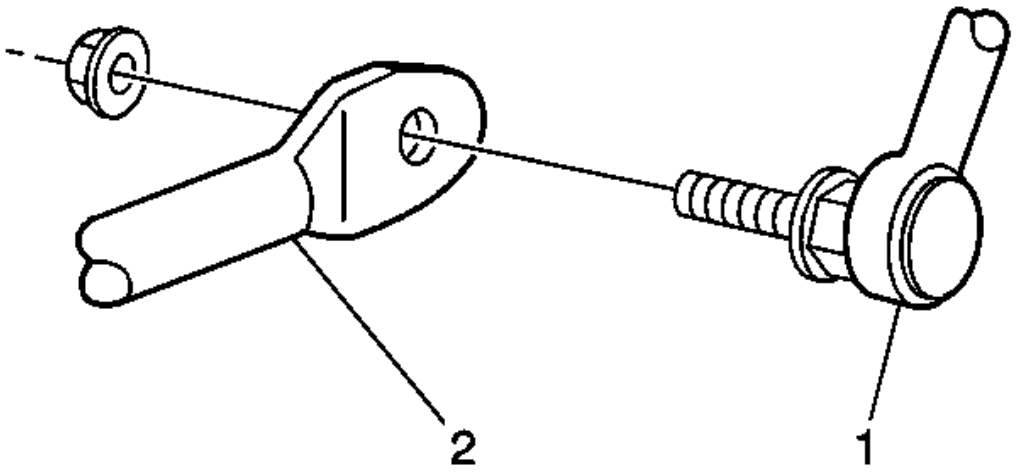

Fig. 22: View Of Stabilizer Shaft And Link
Courtesy of GENERAL MOTORS COMPANY

4. Connect the stabilizer shaft link (1) to the strut.
5. Install the upper stabilizer shaft link nut to the stabilizer shaft link (1) and the strut.

   Tighten

   Tighten the nut to 52 N.m (38 lb ft).

6. Lower the vehicle.

TRAILING ARM REPLACEMENT

Removal Procedure

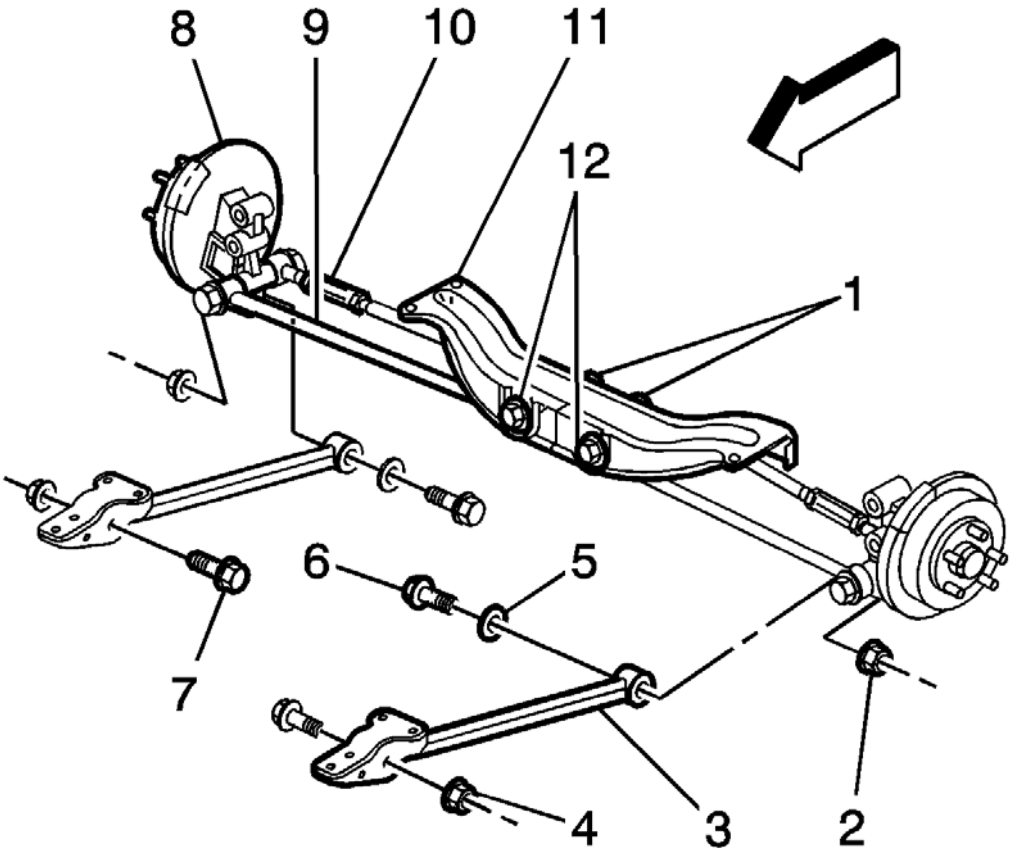

Fig. 23: Rear Suspension
Courtesy of GENERAL MOTORS COMPANY

1. Raise and support the vehicle. Refer to **Lifting and Jacking the Vehicle** .
2. Remove the bolt (6) and nut (2) from the trailing arm (3) and the knuckle (8).
3. Remove the nut (4) and bolt (7) from the trailing arm (3) and the trailing arm bracket.
4. Remove the trailing arm (3) from the vehicle.

Installation Procedure

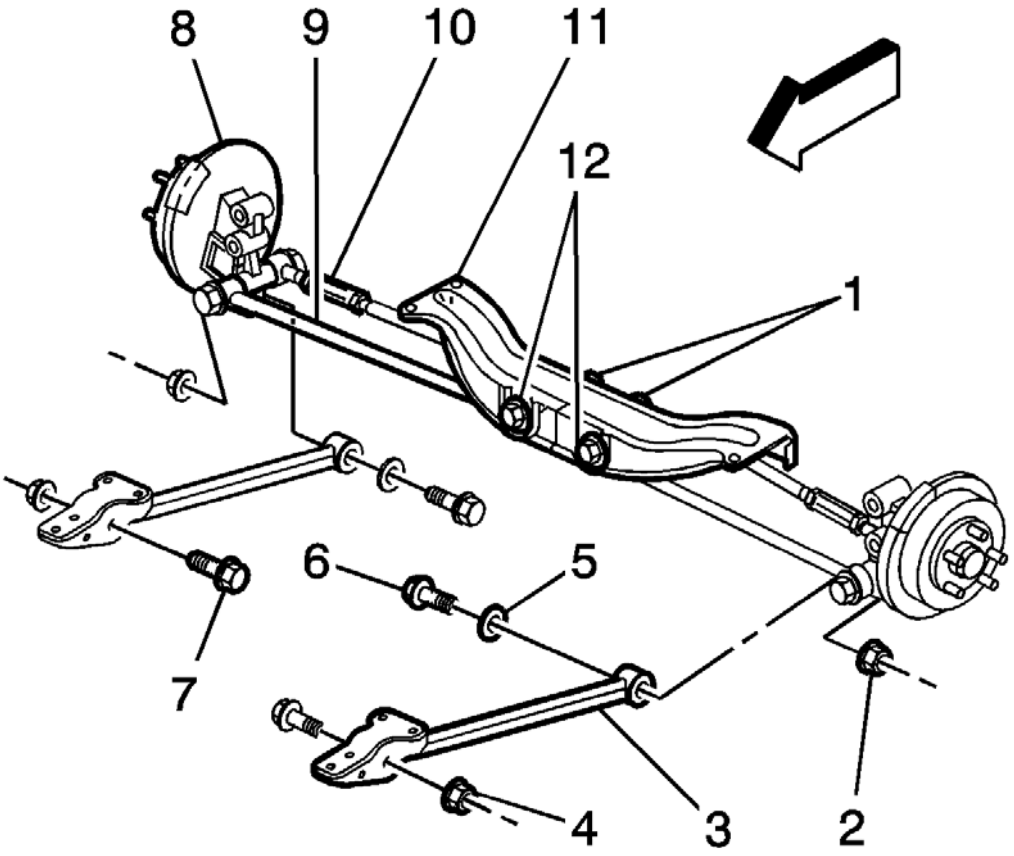

Fig. 24: Rear Suspension
Courtesy of GENERAL MOTORS COMPANY

1. Install the trailing arm (3) to the trailing arm bracket.

CAUTION: Refer to Fastener Caution .

2. Install the bolt (7) and nut (4) to the trailing arm (3) and the trailing arm bracket.

Tighten

Tighten the bolt and nut to 105 N.m (77 lb ft).

3. Install the trailing arm (3) to the knuckle (8).
4. Install the bolt (6) and nut (2) to the trailing arm (3) and the knuckle (8).

Tighten

Tighten the nut to 240 N.m (177 lb ft).

5. Lower the vehicle.

REAR WHEEL SPINDLE ROD REPLACEMENT

Removal Procedure

1. Raise and support the vehicle. Refer to **Lifting and Jacking the Vehicle** .
2. Remove the tire and wheel assembly. Refer to **Tire and Wheel Removal and Installation** .

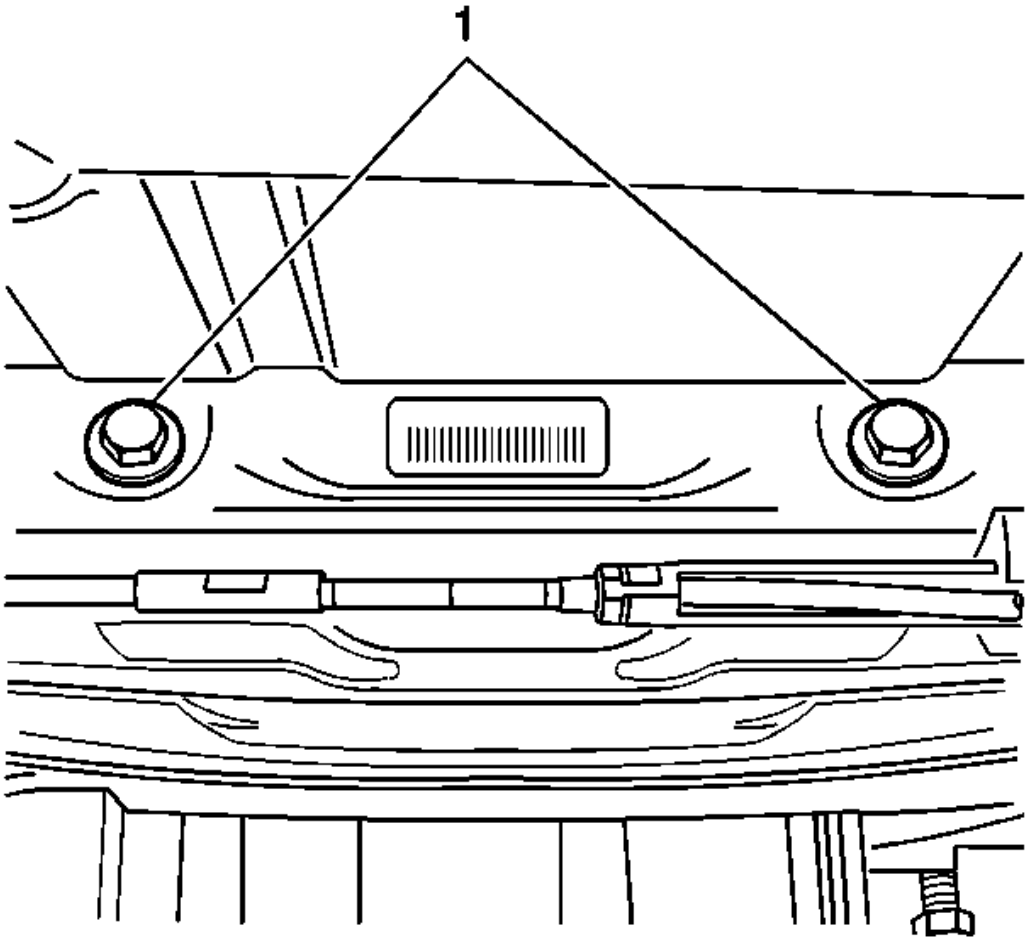

Fig. 25: View Of Spindle Rod And Rear Suspension Support Bolt
Courtesy of GENERAL MOTORS COMPANY

NOTE: **Use a transmission jack or suitable hoist stands to prop the rear suspension support.**

3. Lower the rear suspension support to gain clearance to the spindle rod to knuckle bolt. Refer to **Support Replacement**.
4. Remove the bolt (1) and nut from the spindle rod and the rear suspension support.

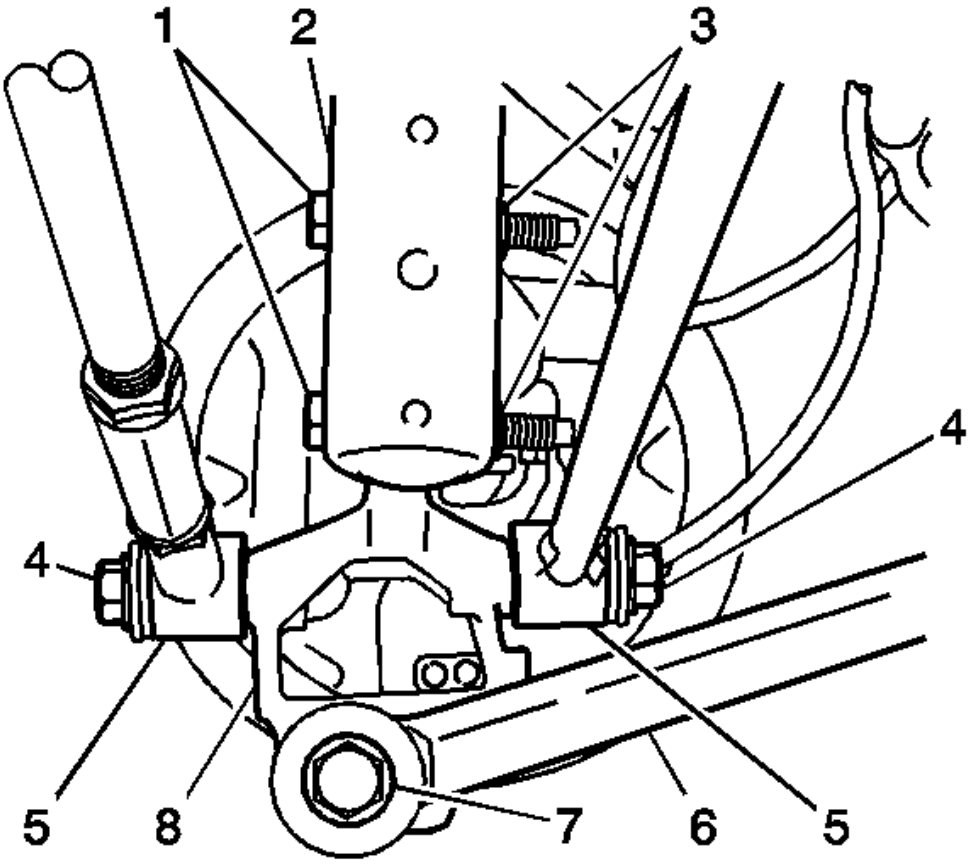

Fig. 26: View Of Spindle Rod, Knuckle, And Bolt
Courtesy of GENERAL MOTORS COMPANY

5. Remove the spindle rod to knuckle bolt (4) and nut.
6. Push the spindle rod to knuckle bolt (4) forward enough to provide clearance for the spindle rod (5) removal.
7. Remove the spindle rod (5) from the vehicle.

Installation Procedure

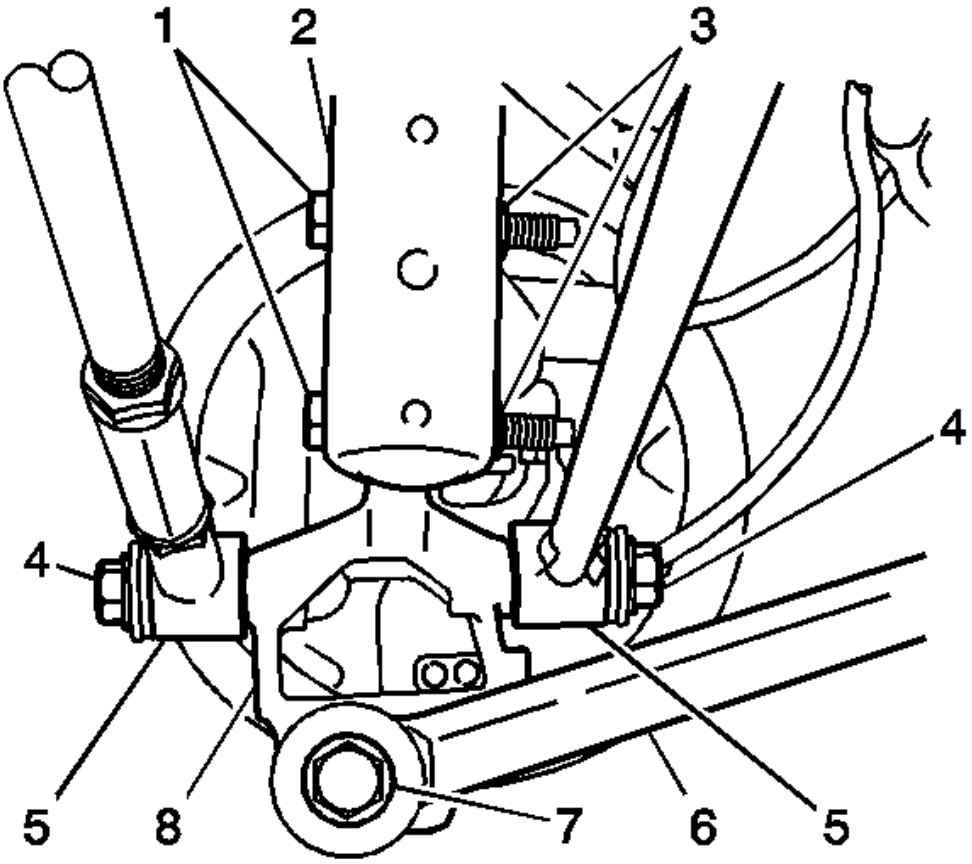

Fig. 27: View Of Spindle Rod, Knuckle, And Bolt
Courtesy of GENERAL MOTORS COMPANY

1. Install the spindle rod (5) to the vehicle.
2. Install the spindle rod (5) to the knuckle (8).

CAUTION: Refer to Fastener Caution .

3. Install the spindle rod to knuckle bolt (4) and nut.

Tighten

Tighten the nut to 150 N.m (110 lb ft).

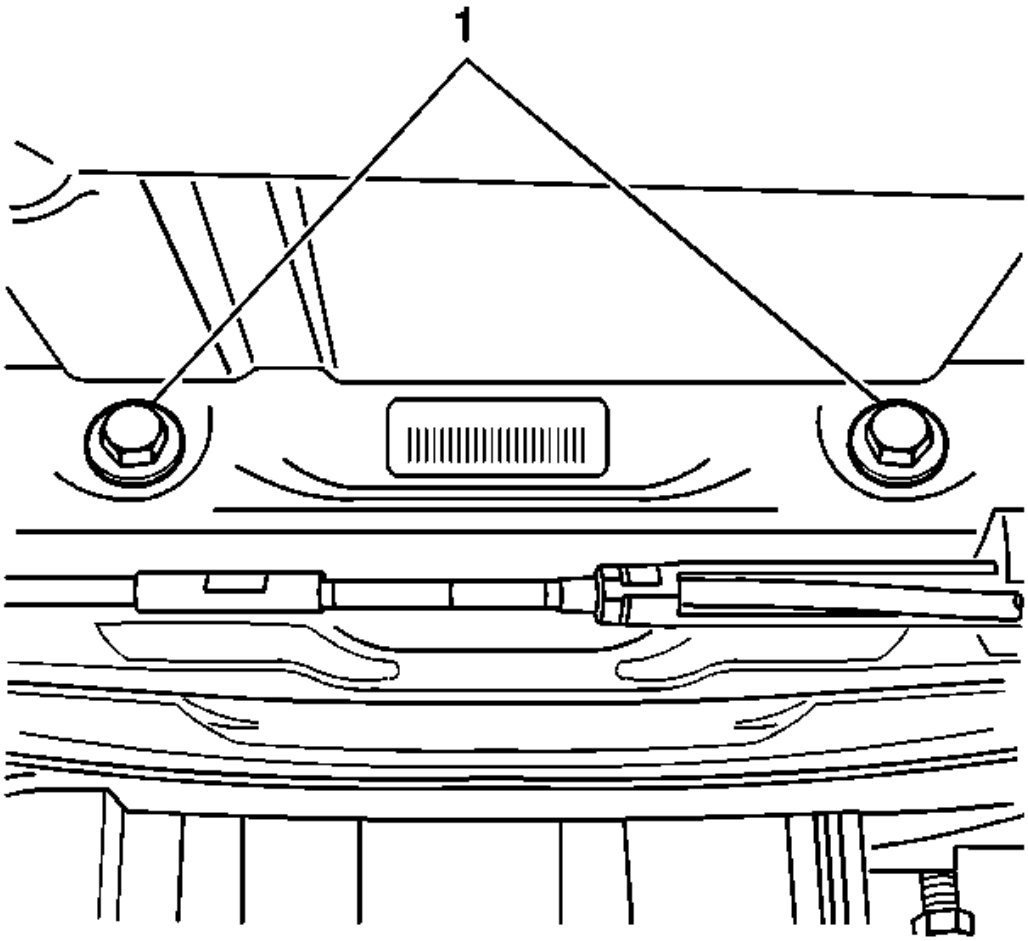

Fig. 28: View Of Spindle Rod And Rear Suspension Support Bolt
Courtesy of GENERAL MOTORS COMPANY

4. Install the spindle rod to the rear suspension support.
5. Install the bolt (1) and nut to the rear suspension support.

Tighten

Tighten the bolt to 135 N.m (100 lb ft).

6. Install the rear suspension support. Refer to **Support Replacement**.
7. Install the tire and wheel assembly. Refer to **Tire and Wheel Removal and Installation** .
8. Lower the vehicle.
9. Adjust the wheel toe angle. Refer to **Wheel Alignment Specifications** .

STRUT ASSEMBLY REMOVAL AND INSTALLATION

Removal Procedure

CAUTION: Care should be taken to avoid chipping or scratching the coating when handling the suspension coil spring. Damage to the coating can cause premature failure.

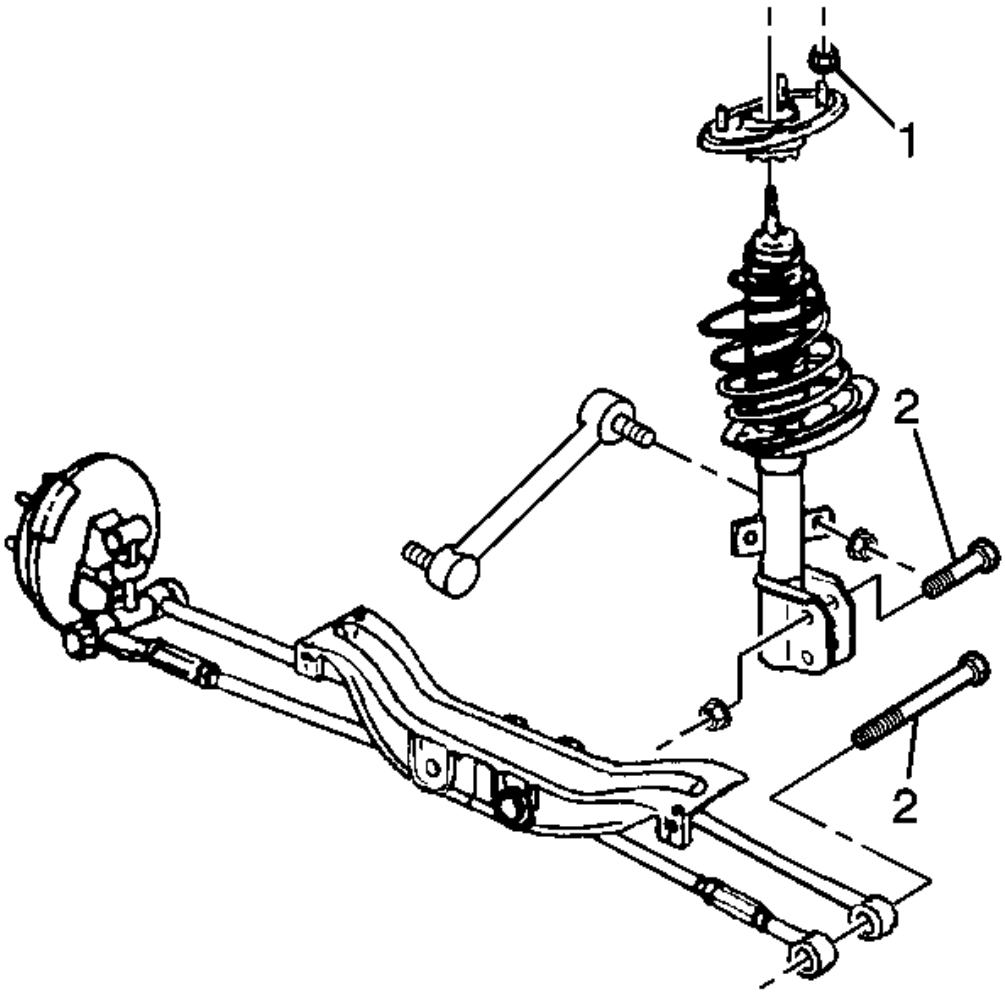

Fig. 29: View Of Strut-To-Body Mount Nuts And Brake Hose Bracket Bolt
Courtesy of GENERAL MOTORS COMPANY

1. Remove the strut-to-body mount nuts (1).
2. Raise and support the vehicle. Refer to **Lifting and Jacking the Vehicle** .
3. Remove the tire and wheel assembly. Refer to **Tire and Wheel Removal and Installation** .
4. Remove the stabilizer shaft link from the strut. Refer to **Stabilizer Shaft Link Replacement**.
5. Remove the bolt (2) from the brake hose bracket and the strut assembly.

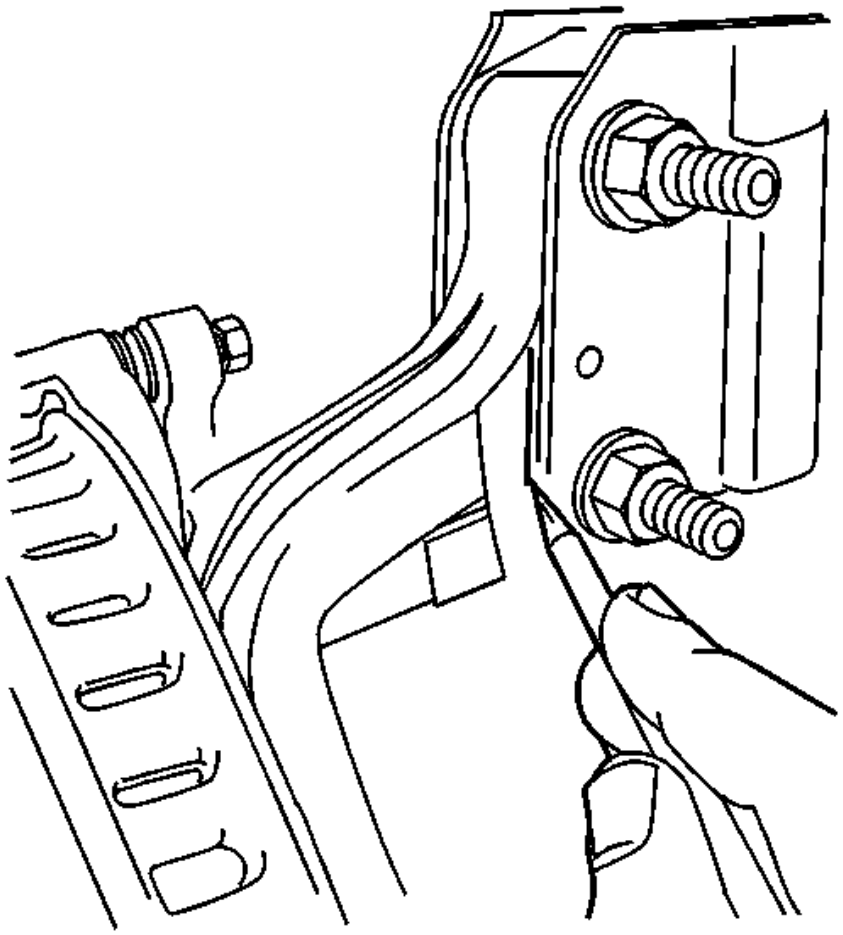

Fig. 30: Scribing Strut To Knuckle
Courtesy of GENERAL MOTORS COMPANY

6. Scribe the strut to the knuckle.

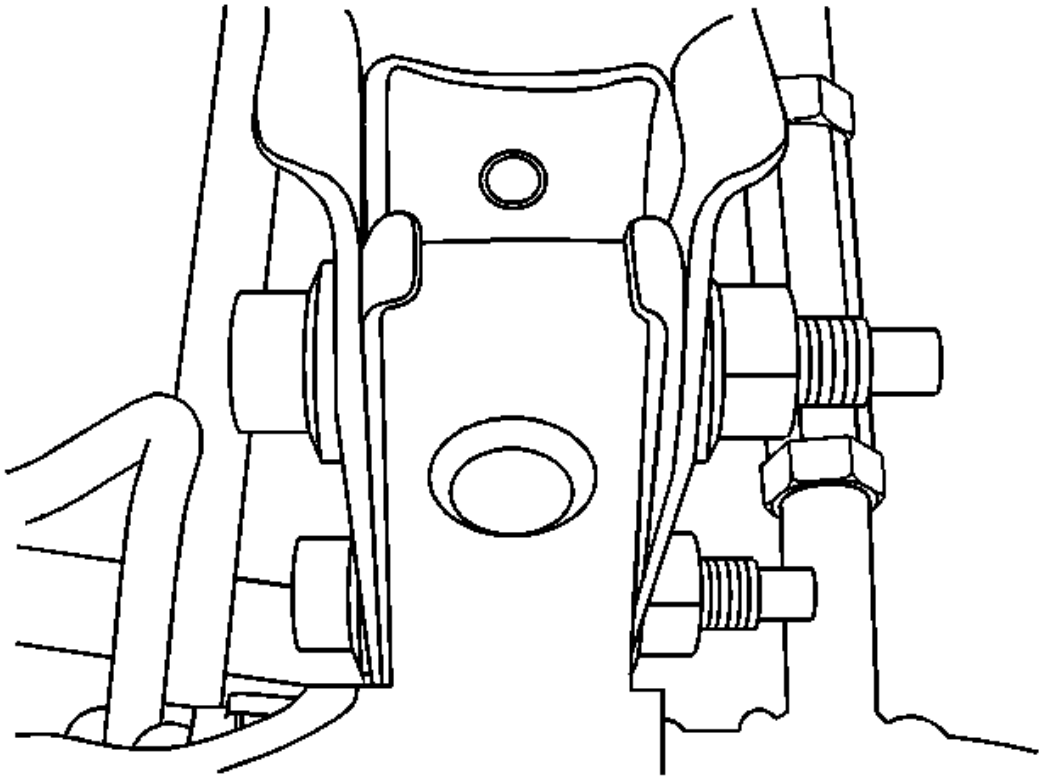

Fig. 31: View Of Strut
Courtesy of GENERAL MOTORS COMPANY

CAUTION: The knuckle must be retained after the strut-to-knuckle bolts have been removed. Failure to observe this may cause ball joint and/or wheel drive shaft damage.

7. Remove the strut to knuckle bolts.
8. Remove the strut from the vehicle.

Installation Procedure

CAUTION: Care should be taken to avoid chipping or scratching the coating when handling the suspension coil spring. Damage to the coating can cause premature failure.

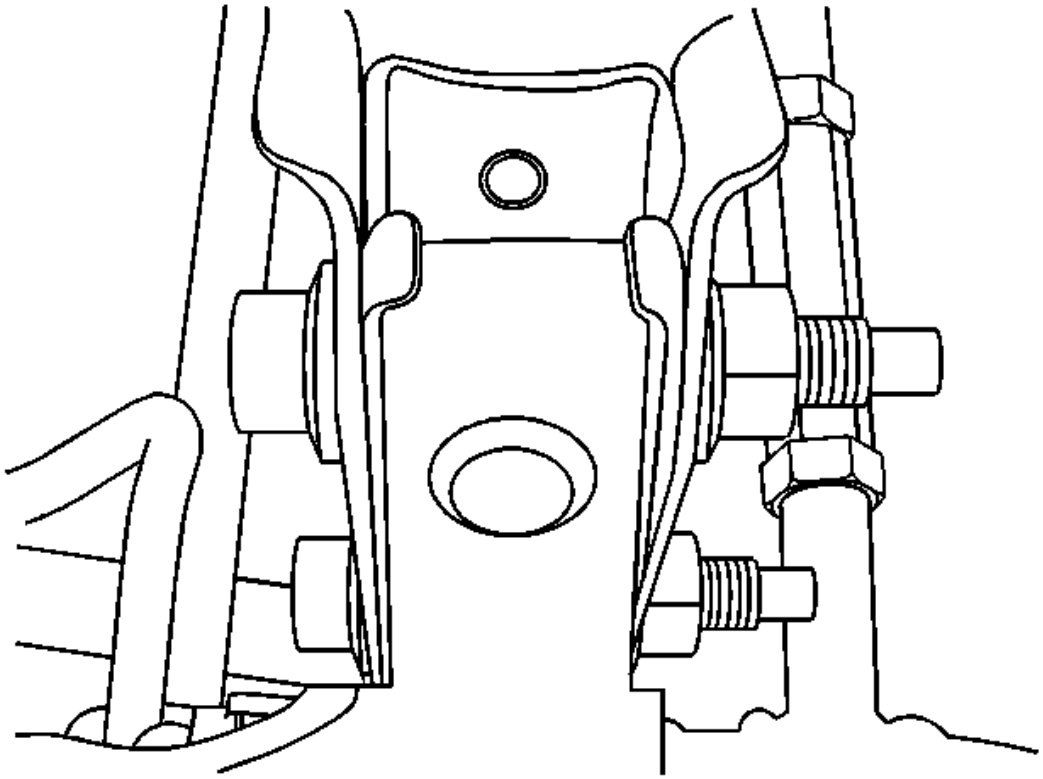

Fig. 32: View Of Strut
Courtesy of GENERAL MOTORS COMPANY

1. Install the strut into place.

CAUTION: Refer to Fastener Caution .

2. Install the strut to knuckle bolts.

Tighten

Tighten the strut to knuckle bolts and nuts to 120 N.m (89 lb ft).

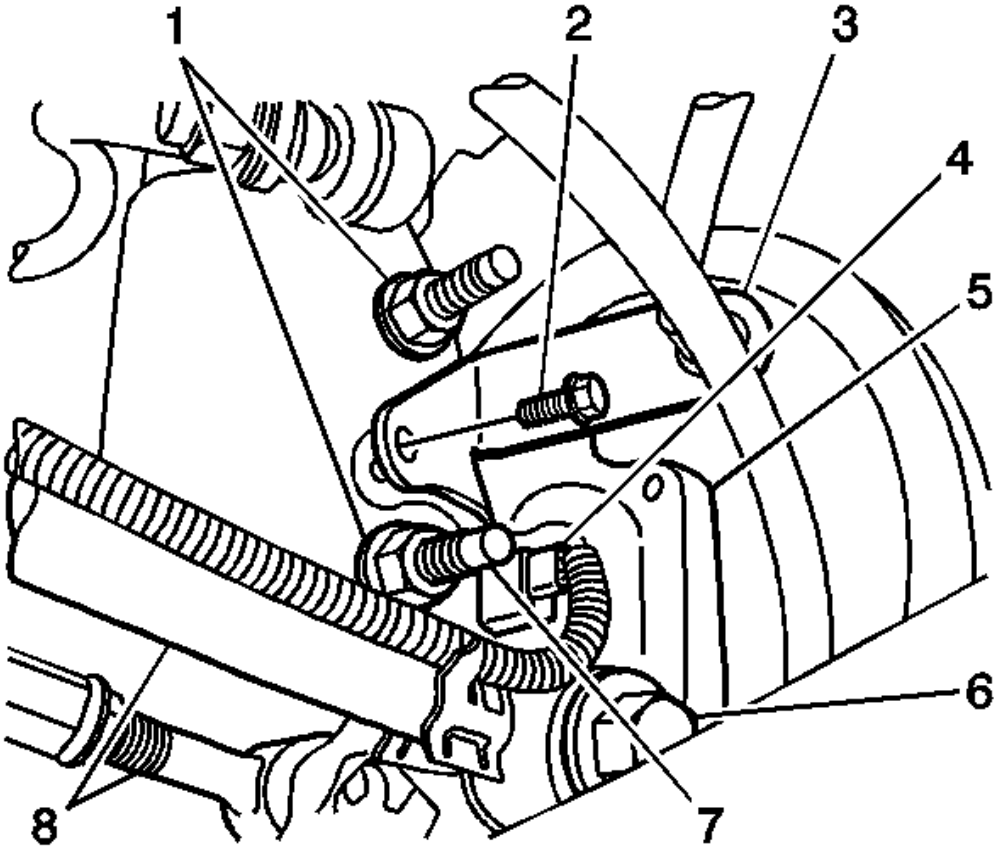

Fig. 33: View Of Brake Hose Bracket And Bolt And Strut Assembly
Courtesy of GENERAL MOTORS COMPANY

3. Install the bolt (2) to the brake hose bracket (3) and the strut assembly.

   Tighten

   Tighten the bolt to 10 N.m (89 lb in).

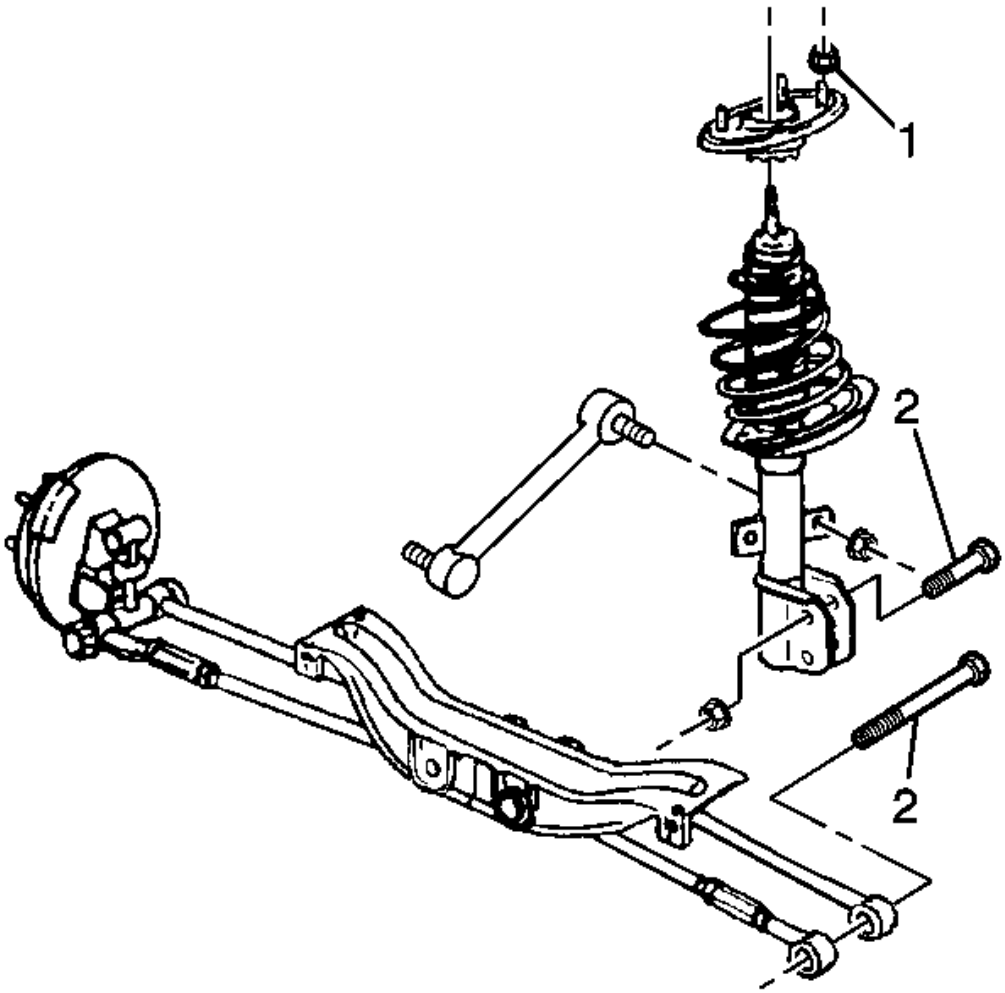

Fig. 34: View Of Strut-To-Body Mount Nuts And Brake Hose Bracket Bolt
Courtesy of GENERAL MOTORS COMPANY

4. Connect the stabilizer shaft link to the strut. Refer to **Stabilizer Shaft Link Replacement**.
5. Install the tire and wheel. Refer to **Tire and Wheel Removal and Installation** .
6. Install strut to body mount nuts (1).

   Tighten

   Tighten the strut to body mount nuts to 45 N.m (33 lb ft).

7. Lower the vehicle.
8. Adjust the rear wheel alignment. Refer to **Wheel Alignment Specifications** .

SUSPENSION SHOCK/STRUT DISPOSAL

WARNING: Gas charged shock absorbers contain high pressure gas. Do not remove the snap ring from inside the top of the tube. If the snap ring is removed, the contents of the shock absorber will come out with extreme force which may result in personal injury.

WARNING: To prevent personal injury, wear safety glasses when centerpunching and drilling the shock absorber. Use care not to puncture the shock absorber tube with the centerpunch.

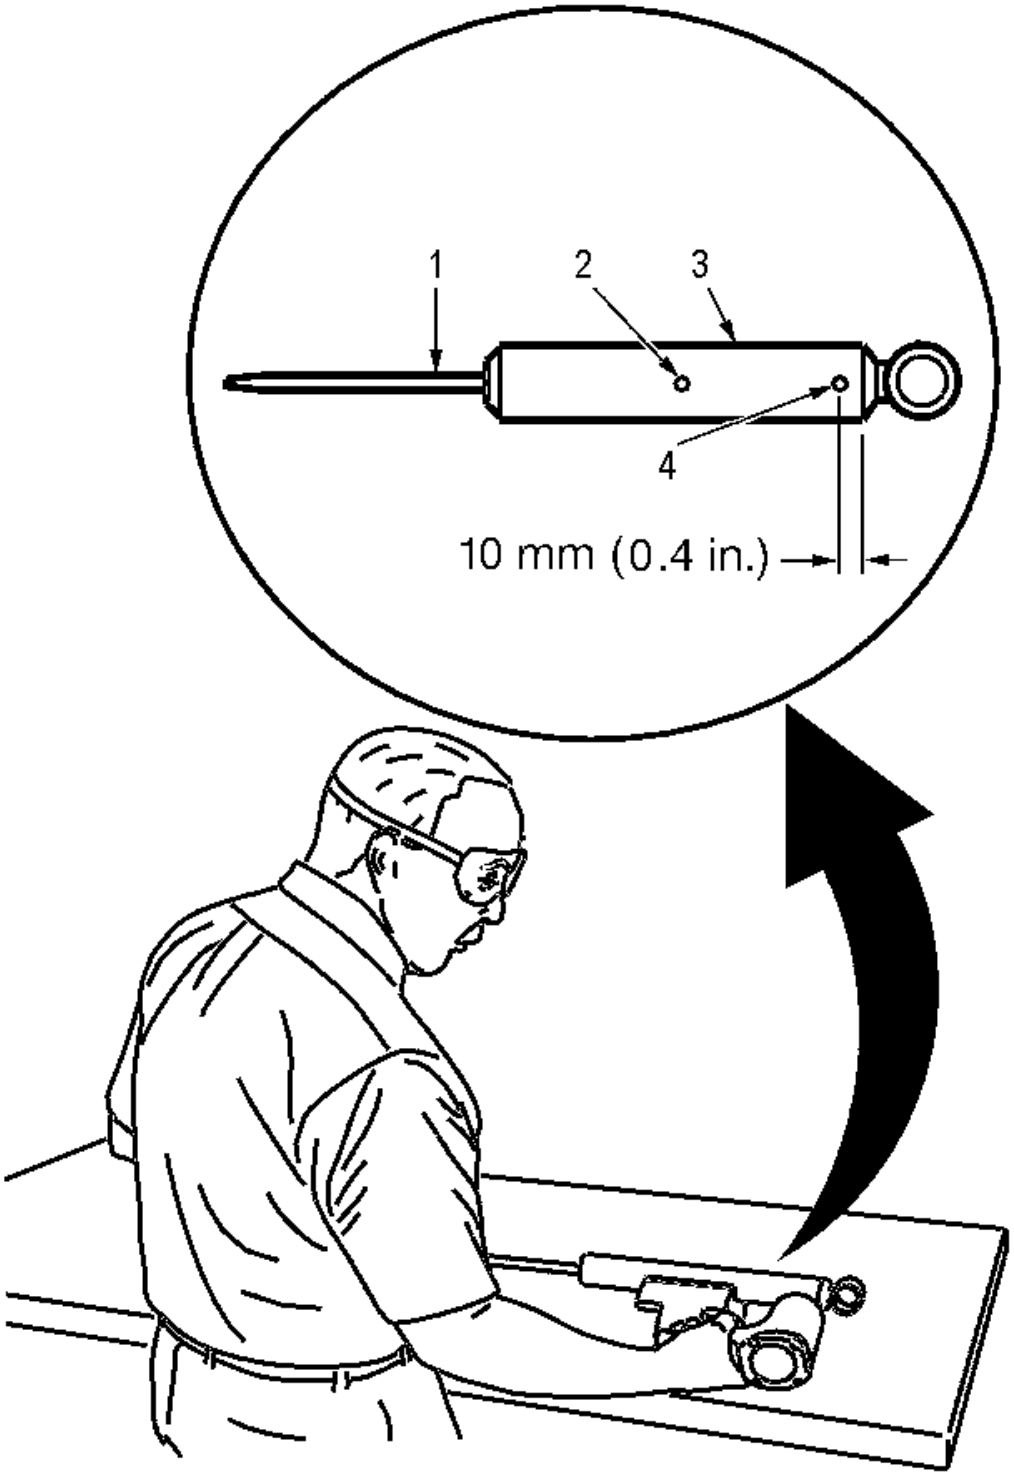

Fig. 35: Drilling Hole In Shock Absorber At Centerpunched Locations
Courtesy of GENERAL MOTORS COMPANY

1. Make an indentation 10 mm (0.4 in) from the bottom (4) of the tube (3) using a centerpunch.
2. Clamp the shock absorber in a vise horizontally with the shock absorber rod (1) completely extended.

3. Drill a hole in the shock absorber at the centerpunch (4) using a 5 mm (3/16 in) drill bit. Gas or a gas/oil mixture will exhaust when the drill bit penetrates the shock absorber. Use shop towels in order to contain the escaping oil.
4. Make an indentation in the middle (2) of the tube (3) with a centerpunch.
5. Drill a second hole in the shock absorber at the centerpunch (2) using a 5 mm (3/16 in) drill bit. Oil will exhaust when the drill bit penetrates the shock absorber. Use shop towels in order to contain the escaping oil.
6. Remove the shock absorber from the vise. Hold the shock absorber over a drain pan horizontally with the holes down. Move the rod (1) in and out of the tube (3) to completely drain the oil from the shock absorber.

STRUT, STRUT COMPONENT, OR SPRING REPLACEMENT

Special Tools

- **J 42991** Strut Rod Nut Socket
- **J 45400** Strut Spring Compressor

Disassembly Procedure

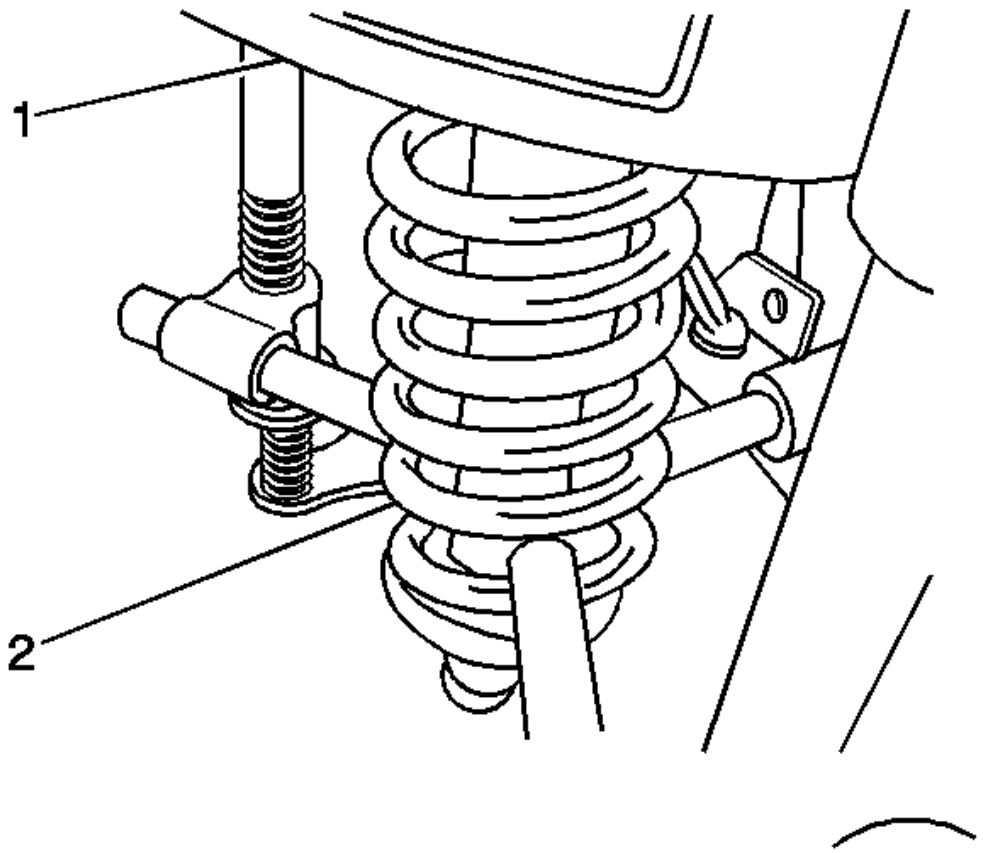

Fig. 36: Compressing/Releasing Lower Part Of Shock Spring
Courtesy of GENERAL MOTORS COMPANY

1. Remove the strut from the vehicle. Refer to **Strut Assembly Removal and Installation**.

2. Install the strut (2) in the **J 45400** Strut Spring Compressor (1).

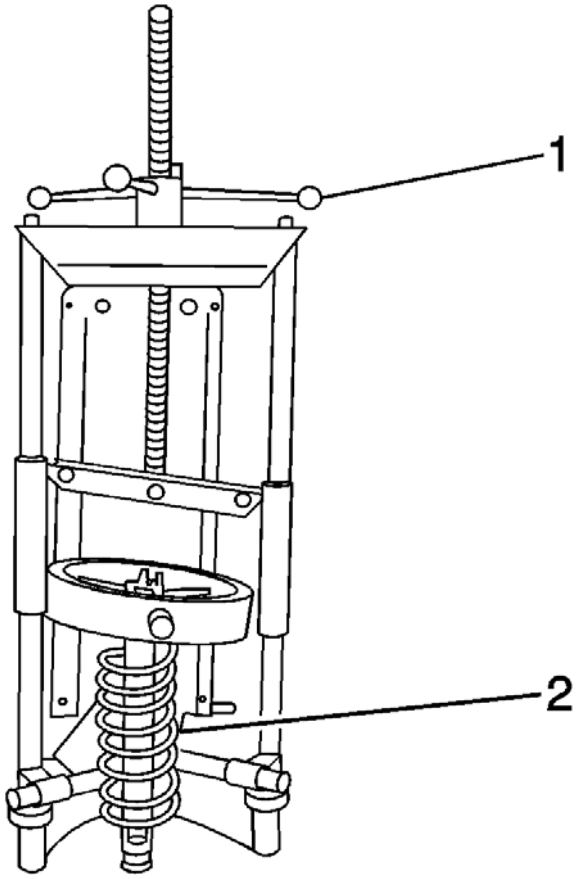

Fig. 37: View Of Compressor Forcing Screw & Coil Spring
Courtesy of GENERAL MOTORS COMPANY

NOTE: **The spring is compressed when the strut moves freely.**

3. Turn the spring compressor forcing screw (1) until the coil spring (2) is compressed.

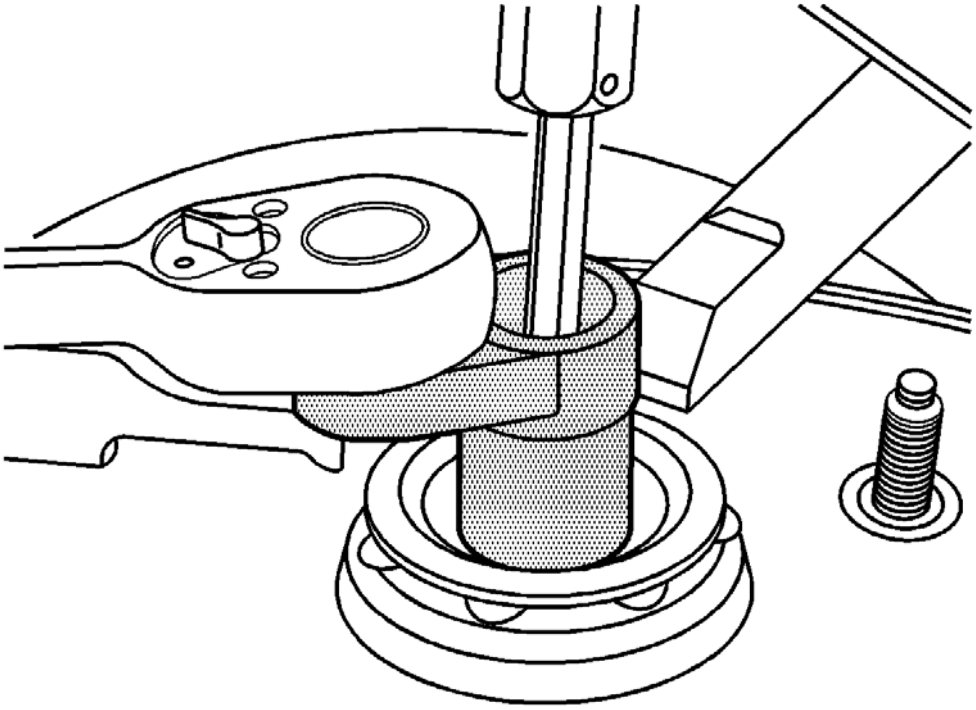

Fig. 38: View Of Special Tools & Strut Shaft
Courtesy of GENERAL MOTORS COMPANY

4. Use a 45 TORXÂ® socket in order to hold the strut shaft. Remove the upper strut mount nut by turning with **J 42991** Strut Rod Nut Socket.
5. Remove the strut from the **J 45400** Strut Spring Compressor.

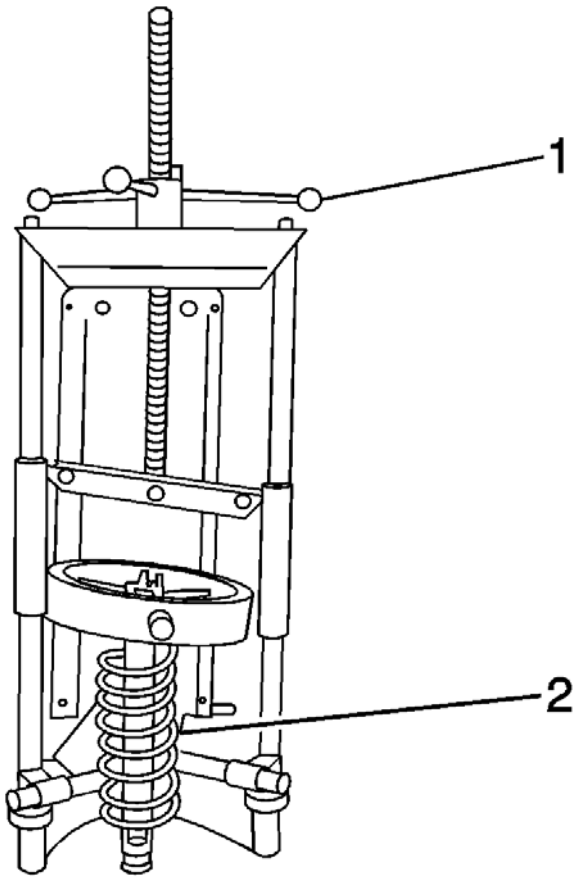

Fig. 39: View Of Compressor Forcing Screw & Coil Spring
Courtesy of GENERAL MOTORS COMPANY

6. Loosen the compressor forcing screw (1) until the upper strut mount and coil spring (2) may be removed.
7. Remove the upper strut mount and the coil spring from the **J 45400** Strut Spring Compressor.

Assembly Procedure

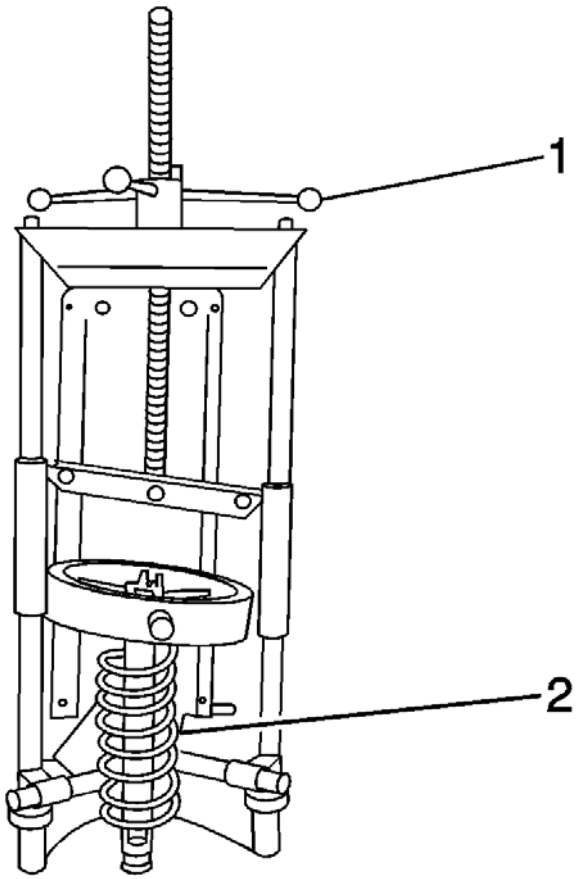

Fig. 40: View Of Compressor Forcing Screw & Coil Spring
Courtesy of GENERAL MOTORS COMPANY

1. Install the coil spring and upper strut mount to the **J 45400** Strut Spring Compressor.
2. Turn the spring compressor forcing screw (1) until the coil spring is compressed.
3. Install the strut to the coil spring and upper strut mount.

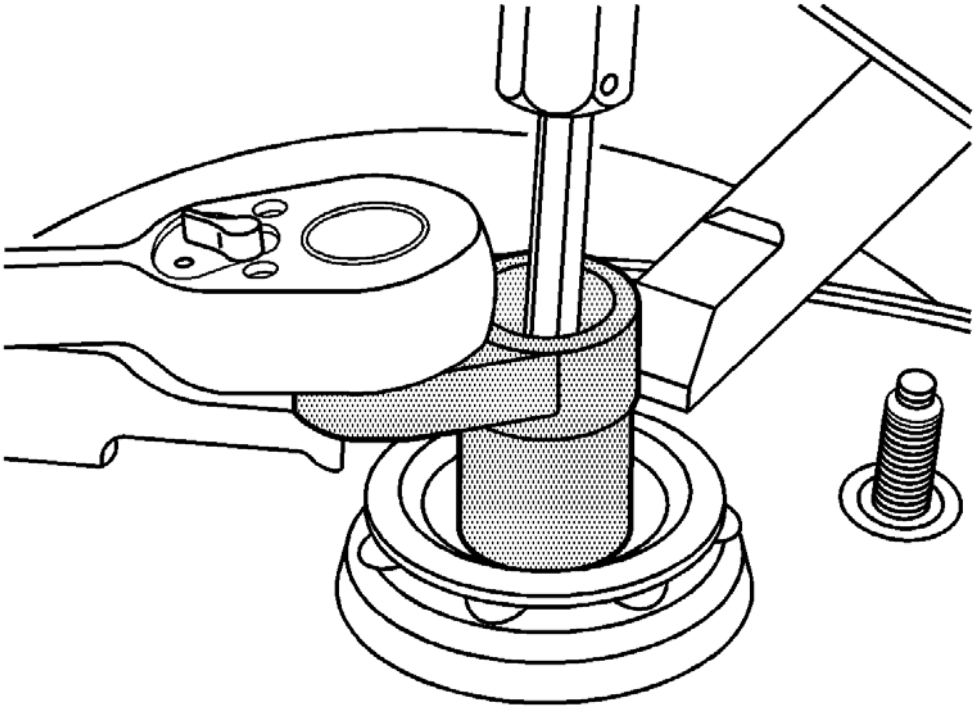

Fig. 41: View Of Special Tools & Strut Shaft
Courtesy of GENERAL MOTORS COMPANY

CAUTION: Refer to Fastener Caution .

4. Install the strut rod to mount nut.

   Using the **J 42991** Strut Rod Nut Socket and a 45 TORXÂ® socket, tighten the strut mount nut.

   Tighten

   Tighten the strut mount nut to 75 N.m (55 lb ft).

5. Remove the strut from the **J 45400** Strut Spring Compressor.
6. Install the strut to the vehicle. Refer to **Strut Assembly Removal and Installation**.

WHEEL STUD REPLACEMENT

Special Tools

J 6627-A Tie Rod Puller

For regional equivalent tools, refer to **Special Tools**.

Removal Procedure

1. Raise and support the vehicle. Refer to **Lifting and Jacking the Vehicle** .
2. Remove the tire and wheel assembly. Refer to **Tire and Wheel Removal and Installation** .
3. Remove the rear wheel bearing/hub assembly. Refer to **Rear Wheel Bearing and Hub Replacement**.

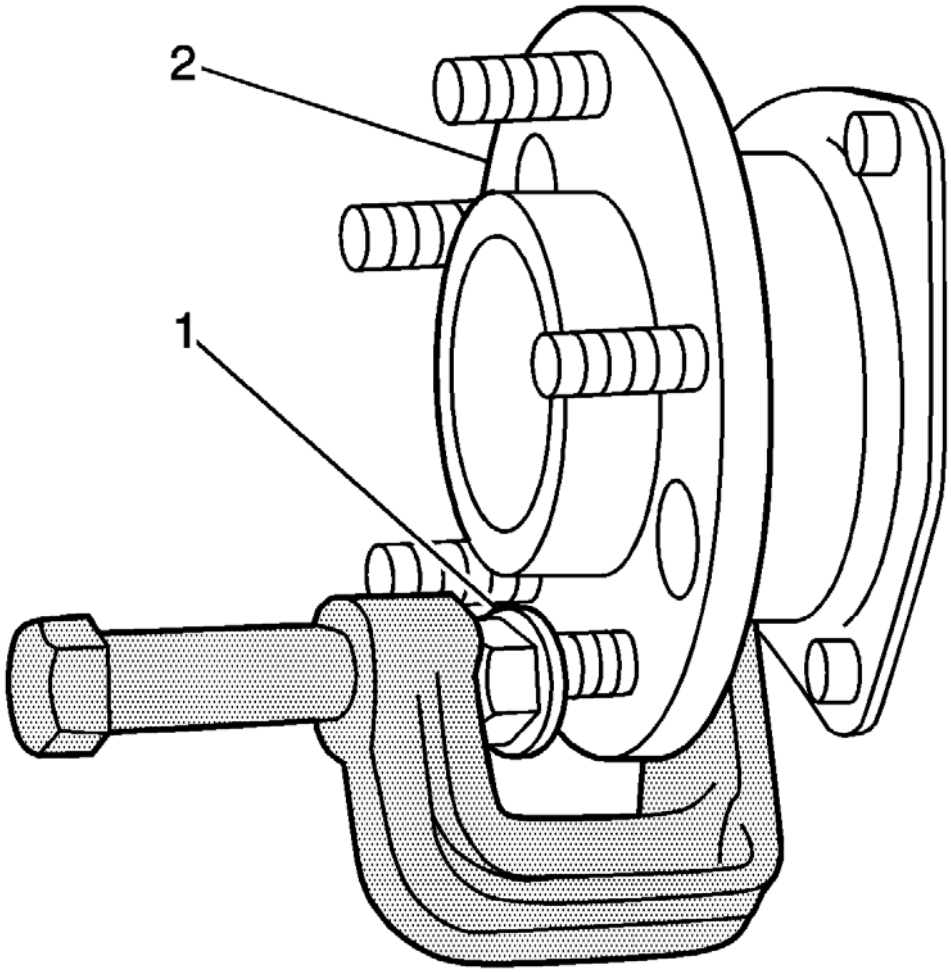

Fig. 42: View Of Stud And Hub
Courtesy of GENERAL MOTORS COMPANY

NOTE: **Insert the wheel bearing/hub in a suitable holding devise.**

4. Using the **J 6627-A** puller (1), remove the wheel stud from the wheel bearing/hub (2).

Installation Procedure

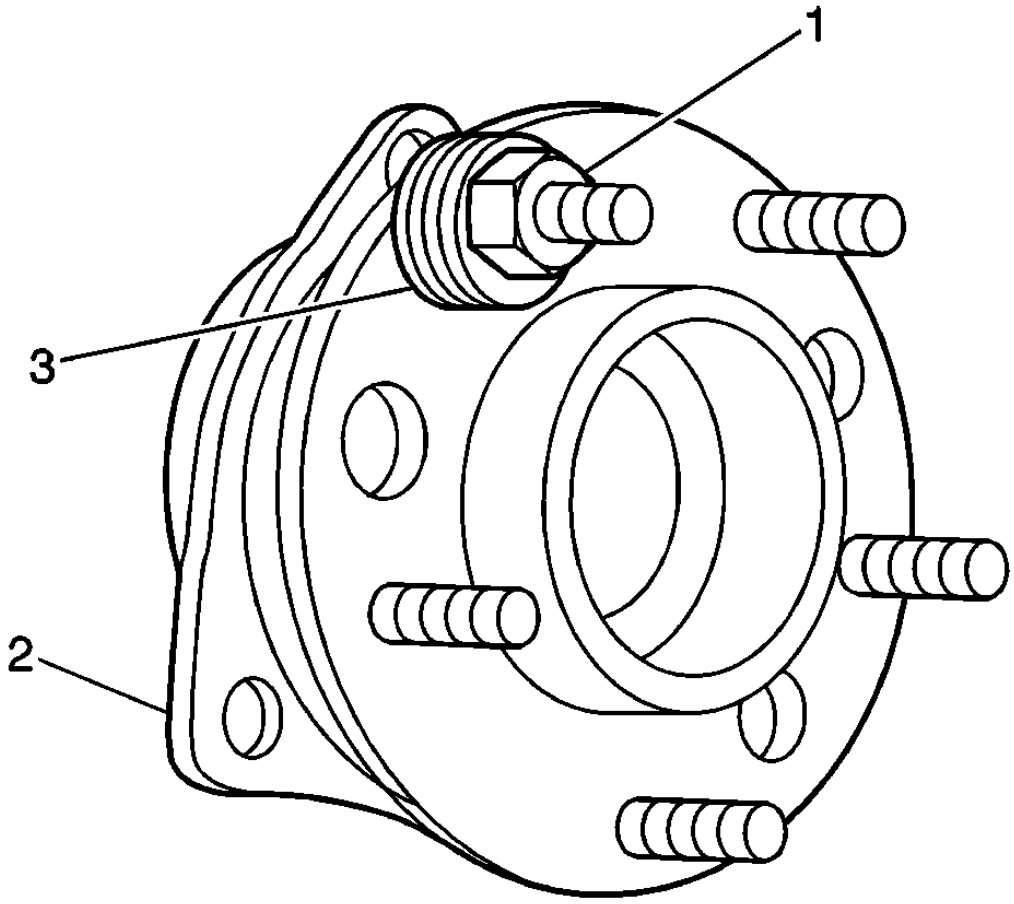

Fig. 43: Installing Wheel Stud
Courtesy of GENERAL MOTORS COMPANY

1. Install a replacement stud in the wheel hub.
2. Add enough washers (3) in order to draw the stud into the hub (2).
3. Install the wheel nut (1) with the flat side against the washers (3).

NOTE: **Fully seat the wheel stud against the hub flange (2).**

4. Tighten the wheel nut (1) until the wheel stud is fully seated against the hub flange.
5. Remove the wheel nut (1) and the washers (3).
6. Install the rear wheel bearing/hub assembly. Refer to **Rear Wheel Bearing and Hub Replacement**.
7. Install the tire and wheel assembly. Refer to **Tire and Wheel Removal and Installation** .
8. Lower the vehicle.

DESCRIPTION AND OPERATION

REAR SUSPENSION DESCRIPTION AND OPERATION

The rear suspension utilizes coil springs over struts and light weight aluminum knuckles. Each wheel is mounted to a

tri-link independent suspension system. The 3 links are identified as the inverted U-channel trailing arm and the tubular front and rear rods.

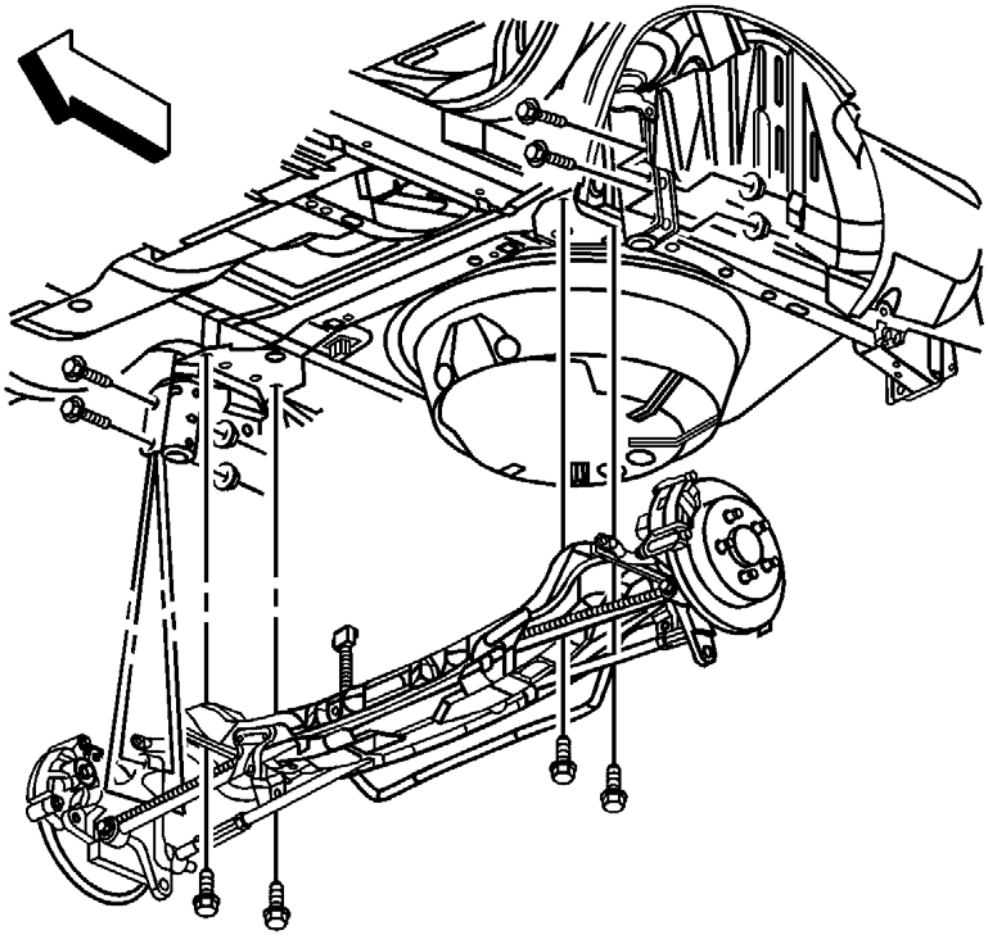

Fig. 44: View Of Rear Suspension
Courtesy of GENERAL MOTORS COMPANY

Parallel links allow the rear wheels to deflect upward when the rear wheels hit a road hazard, without moving the toe angle in a positive direction. An advantage of this suspension system is the reduction of unsprung and overall weight. Handling is improved with the independent action of each rear wheel. The rods control the lateral wheel deflection.

Several techniques are employed to achieve this independent wheel movement. The tri-link design may be compared to a right angle. The wheel is located at the right angle formed by the rods and the trailing arm. The ends of the tri-links hinge in order to provide vertical wheel travel. The solid links force the wheel to travel through a controlled arc whose fore-aft position is determined by the trailing arm, and whose lateral position is determined by the rods.

Aside from maintaining geometric wheel location, each portion of the suspension has additional functions. The knuckle supports the brake caliper. All brake torque and braking forces are transmitted through the tri-links and the strut. The final duty of the rods is to maintain the camber angle of the wheel throughout the wheel's travel, and to allow for setting the toe. The overall result of this rear suspension geometry is to maintain the rear wheels in a near vertical position at all times.

The stabilizer shaft attaches to the stabilizer bar drop link and extends rearward, where the stabilizer connects to the rear suspension support by 2 rubber bushings and mounting brackets.

A non-serviceable unit hub and bearing bolts to the knuckle. This hub and bearing is a sealed, maintenance-free unit.

Check the suspension system periodically for the following conditions:

- Shock absorbency
- Bushing durability
- Tightness of attaching bolts
- Visible damage
- Misalignment
- Excessive wear

DIAGNOSTIC INFORMATION AND PROCEDURES

SYMPTOMS - SUSPENSION GENERAL DIAGNOSIS

IMPORTANT: The following steps must be completed before using the symptom tables.

1. Determine whether the vehicle is equipped with an electrically assisted or active suspension system. Perform electrical diagnosis prior to beginning mechanical diagnosis.
2. Review the system description and operation in order to familiarize yourself with the system functions. Refer to the appropriate description and operation:
   - **Front Suspension Description and Operation**
   - **Rear Suspension Description and Operation**
   - **General Description**

Visual/Physical Inspection

- Inspect for aftermarket devices which could affect the operation of any of the Suspension subsystems.
- Inspect the easily accessible or visible system components for obvious damage or conditions which could cause the symptom.
- Inspect for proper tire size and inflation pressure. Refer to **Vehicle Certification, Tire Placard, Anti-Theft, and Service Parts ID Label** .

Symptom List

Refer to a symptom diagnostic procedure from the following list in order to diagnose the symptom:

- **Ride Diagnosis**
- **Vehicle Leads/Pulls**
- **Body Leans or Sways in Corners**
- **Suspension Bottoms**
- **Torque Steer**
- **Memory Steer**
- **Noise Diagnosis - Front Suspension**
- **Noise Diagnosis - Rear Suspension**
- **Suspension Strut and Shock Absorber Testing - On Vehicle**
- **Wheel Bearings Diagnosis**

- **Radial Tire Lead/Pull Correction**

RIDE DIAGNOSIS

Step	Action	Yes	No
1	Did you review the General Description and perform the necessary inspections?	Go to **Step 2**	Go to **Symptoms - Suspension General Diagnosis**
2	IMPORTANT: Verify the vehicle suspension package RPO. Verify that the ride is too soft or too hard.Does the vehicle ride normally?	System OK	Go to **Step 3**
3	Check the tire inflation and adjust to specifications. Refer to **Vehicle Certification, Tire Placard, Anti-Theft, and Service Parts ID Label** . Did you adjust the tire pressure?	Go to **Step 6**	Go to **Step 4**
4	Inspect the vehicle trim height. Refer to **Trim Height Inspection**. Did you find and correct the condition?	Go to **Step 6**	Go to **Step 5**
5	Inspect the following suspension components for wear or damage: • Shock Absorbers-Refer to **Suspension Strut and Shock Absorber Testing - On Vehicle**. • Springs Did you find and correct the condition?	Go to **Step 6**	-
6	Drive the vehicle in order to verify the repair. Did you correct the condition?	System OK	Go to **Step 3**

VEHICLE LEADS/PULLS

Step	Action	Yes	No
DEFINITION: At a constant highway speed on a typical straight road, lead/pull is the amount of effort required at the steering wheel to maintain the vehicle straight path.			
1	Did you review the General Description and perform the visual/physical inspections?	Go to **Step 2**	Go to **Symptoms - Suspension General Diagnosis**
2	Road test the vehicle in order to verify the complaint. Does the vehicle operate normally?	System OK	Go to **Step 3**
3	Inspect the tire/wheel assemblies for: • Correct tire pressure-Refer to the tire placard. • Correct tire size-Refer to the tire placard. • Abnormal tire wear or damage	Go to **Step 9**	Go to **Step 4**

Step	Action	Yes	No
	Did you find and correct the condition?		
4	Perform the **Radial Tire Lead/Pull Correction** . Did you find and correct the condition?	Go to **Step 9**	Go to **Step 5**
5	Inspect and correct/adjust the suspension and steering systems for: • Vehicle trim height-Refer to **Trim Height Inspection**. • Excessively worn, loose, or damaged components Did you find and correct the condition?	Go to **Step 9**	Go to **Step 6**
6	Inspect the brake system for brake drag. With the vehicle suspended on a hoist, brake drag can be identified by rotating each wheel several times and observing whether more force is needed to rotate the left wheel or the right wheel. Refer to **Brakes Drag** . Did you find and correct the condition?	Go to **Step 9**	Go to **Step 7**
7	Inspect the wheel alignment and adjust as necessary. Refer to **Wheel Alignment Measurement** . Did you correct the condition?	Go to **Step 9**	Go to **Step 8**
8	Inspect the steering gear for unequal effort. The vehicle must be suspended on a hoist, the engine running, and the transmission in park or neutral. Grasp the tire assembly and manually simulate a turn from the left of center and the right of center observing whether more force is needed to turn to the left or to the right. If this condition exists, replace the steering gear. Did you correct the condition?	System OK	Go to **Step 3**
9	Operate the vehicle in order to verify the repair. Did you correct the condition?	System OK	Go to **Step 3**

BODY LEANS OR SWAYS IN CORNERS

Step	Action	Yes	No
1	Did you review the General Description and perform the necessary inspections?	Go to **Step 2**	Go to **Symptoms - Suspension General Diagnosis**
2	Verify the vehicle leans or sways in corners. Does the vehicle operate normally?	System OK	Go to **Step 3**
3	Inspect the following components for wear or damage: • Rear Coil Springs • Front Coil Springs	Go to **Step 5**	Go to **Step 4**

Step	Action	Yes	No
	Are the components worn or damaged?		
4	1. Inspect the stabilizer shaft link for wear or damage. 2. Repair as necessary. Did you find and correct the condition?	Go to **Step 6**	Go to **Step 2**
5	Replace the springs as necessary. Did you complete the repair?	Go to **Step 6**	-
6	Operate the vehicle in order to verify the repair. Did you correct the condition?	System OK	Go to **Step 3**

SUSPENSION BOTTOMS

Step	Action	Yes	No
DEFINITION: A loud bang or thump that can usually be felt and/or heard when the vehicle is driven over bumps. This condition is commonly noticed when the vehicle trim height is too low.			
1	Did you review the General Description and perform the necessary inspections?	Go to **Step 2**	Go to **Symptoms - Suspension General Diagnosis**
2	Verify that the suspension bottoms. Does the vehicle operate normally?	System OK	Go to **Step 3**
3	Inspect for vehicle overloading and correct the overloading condition as necessary. Refer to **Vehicle Certification, Tire Placard, Anti-Theft, and Service Parts ID Label** for specifications. Did you find and correct the condition?	Go to **Step 6**	Go to **Step 4**
4	Inspect the following components: • Inspect the shock absorbers. Refer to **Suspension Strut and Shock Absorber Testing - On Vehicle**. • Inspect for damaged coil springs, torsion bar or leaf springs and replace as necessary. Did you find and correct the condition?	Go to **Step 6**	Go to **Step 5**
5	Inspect the vehicle trim height. Refer to **Trim Height Inspection**. Did you complete the trim height inspection procedure?	Go to **Step 6**	-
6	Operate the vehicle in order to verify the repair. Did you correct the condition?	System OK	Go to **Step 3**

TORQUE STEER

Step	Action	Yes	No
DEFINITION: On a dry, smooth, flat road, the vehicle has a left or right steering force only during acceleration.			

Step	Action	Yes	No
1	Did you review the General Description and perform the necessary inspections?	Go to **Step 2**	Go to **Symptoms - Suspension General Diagnosis**
2	1. Drive the vehicle on a straight, smooth, flat road. 2. Press the accelerator and determine if any additional steering input is required to maintain a straight ahead direction. 3. Repeat this test with the vehicle traveling in the opposite direction in order to eliminate crosswind effects. Lead/pull caused by unlevel roads and crosswinds are considered normal. Does the vehicle exhibit torque steer when the accelerator is pressed?	Go to **Step 3**	System OK
3	1. Drive the vehicle on a straight, smooth, flat road at 64-97 km/h (40-60 mph). 2. Remove your foot from the accelerator. 3. Shift the transmission into NEUTRAL in order to allow the vehicle to coast. 4. Is any additional steering input required to maintain a straight ahead direction. 5. Repeat this test with the vehicle traveling in the opposite direction in order to eliminate crosswind effects. Lead/pull caused by unlevel roads and crosswinds are considered normal. Does the vehicle direction change when the steering wheel is momentarily released?	Go to **Vehicle Leads/Pulls**	Go to **Step 4**
4	Inspect the front suspension and powertrain mounts for worn or damaged components and repair as necessary. Did you find and correct the condition?	Go to **Step 6**	Go to **Step 5**
5	Inspect the vehicle trim height. Refer to **Trim Height Inspection**. Did you find and correct the condition?	Go to **Step 6**	-
6	Operate the vehicle in order to verify the repair. Did you correct the condition?	System OK	-

MEMORY STEER

Step	Action	Yes	No
DEFINITION: A lead or pull in the direction the driver previously turned the vehicle. Additionally, after turning in the opposite direction, the vehicle will want to lead or pull in that direction.			
1	Did you review the General Description and perform the necessary inspections?	Go to **Step 2**	Go to **Symptoms - Suspension General Diagnosis**

Step	Action	Yes	No
2	Verify that memory steer is present. Does the system operate normally?	System OK	Go to **Step 3**
3	1. Raise and support the vehicle. Refer to **Lifting and Jacking the Vehicle** . 2. Lubricate the tie rod ends and the ball joints if applicable. 3. Inspect the suspension system for worn or damaged components. 4. Repair as necessary. Did you find and correct the condition?	Go to **Step 7**	Go to **Step 4**
4	Inspect for binding strut bearings. 1. Disconnect the strut from the steering knuckle. 2. If the strut is abnormally difficult to rotate, repair or replace the upper bearing mount. Did you find and complete the repair?	Go to **Step 7**	Go to **Step 5**
5	Inspect for binding in the lower ball joints. If joint is binding, replace the joint. Did you find and complete the repair?	Go to **Step 7**	Go to **Step 6**
6	Inspect the wheel alignment and adjust as necessary. Refer to **Wheel Alignment Measurement** . Did you complete the wheel alignment?	Go to **Step 7**	-
7	Operate the vehicle in order to verify the repair. Did you correct the condition?	System OK	-

NOISE DIAGNOSIS - FRONT SUSPENSION

Step	Action	Yes	No
DEFINITION: Any noise emitted from the front of the vehicle that is induced by VEHICLE SPEED or DRIVING TERRAIN as related to the front suspension.			
1	Did you review the General Description and perform the necessary inspections?	Go to **Step 2**	Go to **Symptoms - Suspension General Diagnosis**
2	Attempt to duplicate the condition. Road test the vehicle. Did you duplicate the condition?	Go to **Step 3**	System OK
3	Is the noise reactive to vehicle load or speed?	Go to **Step 4**	Go to **Step 7**
4	Inspect the tires for the following condition: • Proper tire Inflation and adjust as necessary. Refer to **Vehicle Certification, Tire Placard, Anti-Theft, and Service Parts ID Label** . • Unusual tire wear. Refer to **Vibration Analysis - Tire and Wheel** .	Go to **Step 14**	Go to **Step 5**

Step	Action	Yes	No
	• Inspect the wheel nuts for looseness and tighten as necessary. Refer to **Fastener Specifications** . Did you find and correct the condition?		
5	Inspect the front wheel bearings. Refer to **Wheel Bearings Diagnosis**. Did you find and correct the condition?	Go to **Step 14**	Go to **Step 6**
6	Inspect for transaxle noise. Refer to **Symptoms - Automatic Transmission** . Did you find and correct the condition?	Go to **Step 14**	Go to **Step 7**
7	Bounce the front of the vehicle in order to duplicate the noise. Did you duplicate the noise?	Go to **Step 8**	Go to **Step 9**
8	1. Raise and support the vehicle. Refer to **Lifting and Jacking the Vehicle** . 2. Inspect the front suspension components for looseness. Refer to **Fastener Specifications** . 3. Inspect the front suspension components for damage and repair as necessary. Did you find and correct the condition?	Go to **Step 14**	Go to **Step 9**
9	1. Install the **J 39570** Chassis Ear or equivalent. 2. Bounce the front of the vehicle, using the **J 39570** Chassis Ear or equivalent, in order to locate the source of the noise. If necessary road test the vehicle. 3. Repair or replace any damaged components as necessary. Did you find and correct the condition?	Go to **Step 14**	Go to **Step 10**
10	Inspect the ball joints and steering components for the following conditions. • Lack of lubrication where applicable. • Looseness in the steering linkage. • Looseness in the tie rods. Refer to **Steering Linkage Outer Tie Rod Replacement** , or **Steering Linkage Inner Tie Rod Replacement** . Did you find and correct the condition?	Go to **Step 14**	Go to **Step 11**
11	Inspect for damaged shock absorbers. Refer to **Suspension Strut and Shock Absorber Testing - On Vehicle**. Did you find and correct the condition?	Go to **Step 14**	Go to **Step 12**

Step	Action	Yes	No
12	Inspect the front stabilizer shaft and stabilizer shaft links for damage and repair as necessary. Refer to **Stabilizer Shaft Replacement** , or **Stabilizer Shaft Link Replacement** . Did you find and correct the condition?	Go to **Step 14**	Go to **Step 13**
13	Inspect for control arm damage and repair as necessary. Refer to **Lower Control Arm Replacement** . Did you find and correct the condition?	Go to **Step 14**	-
14	Operate the system in order to verify the repair. Did you correct the condition?	System OK	Go to **Step 3**

NOISE DIAGNOSIS - REAR SUSPENSION

Step	Action	Yes	No
DEFINITION: Any noise emitted from the rear of the vehicle that is induced by VEHICLE SPEED or DRIVING TERRAIN as related to the rear suspension.			
1	Did you review the General Description and perform the necessary inspections?	Go to **Step 2**	Go to **Symptoms - Suspension General Diagnosis**
2	Attempt to duplicate the condition. Road test the vehicle. Did you duplicate the condition?	Go to **Step 3**	System OK
3	Is the noise reactive to vehicle load or speed?	Go to **Step 4**	Go to **Step 6**
4	Perform the following Inspections: • Inspect and adjust the tire Inflation. Refer to **Vehicle Certification, Tire Placard, Anti-Theft, and Service Parts ID Label** . • Inspect for unusual tire wear. Refer to **Vibration Analysis - Tire and Wheel** . • Inspect the wheel nuts for looseness. Refer to **Fastener Specifications** . Did you find and correct the condition?	Go to **Step 10**	Go to **Step 5**
5	Inspect the rear wheel bearings. Refer to **Wheel Bearings Diagnosis**. Did you find and correct the condition?	Go to **Step 10**	Go to **Step 6**
6	Bounce the rear of the vehicle in order to duplicate the noise. Did you duplicate the noise?	Go to **Step 7**	Go to **Step 9**

Step	Action	Yes	No
7	1. Raise the vehicle. Refer to **Lifting and Jacking the Vehicle** . 2. Inspect the rear suspension components for looseness. Refer to **Fastener Specifications** . 3. Inspect the rear suspension components for damage and repair as necessary. Did you find and correct the condition?	Go to **Step 10**	Go to **Step 8**
8	Inspect the rear shock absorber. Refer to **Suspension Strut and Shock Absorber Testing - On Vehicle**. Did you find and correct the condition?	Go to **Step 10**	Go to **Step 9**
9	1. Install the **J 39570** Chassis Ear Chassis Ear or equivalent. 2. Bounce the rear of the vehicle, using the **J 39570** Chassis Ear or equivalent, in order to locate the source of the noise. If necessary, road test the vehicle. 3. Repair or replace any defective component as necessary. Did you find and correct the condition?	Go to **Step 10**	System OK
10	Operate the system in order to verify the repair. Did you correct the condition?	System OK	Go to **Step 3**

LOWER CONTROL ARM BALL JOINT INSPECTION

Special Tools

J 8001 Dial Indicator Set

NOTE:

- **The vehicle must rest on a level surface**
- **The vehicle must be stable. DO NOT rock the vehicle on the floor.**

1. Raise and support the vehicle. Refer to **Lifting and Jacking the Vehicle** .
2. Clean and inspect the ball joint seal for cuts or tears. If the ball joint seal is damaged, replace the ball joint or lower control arm as applicable for this vehicle.

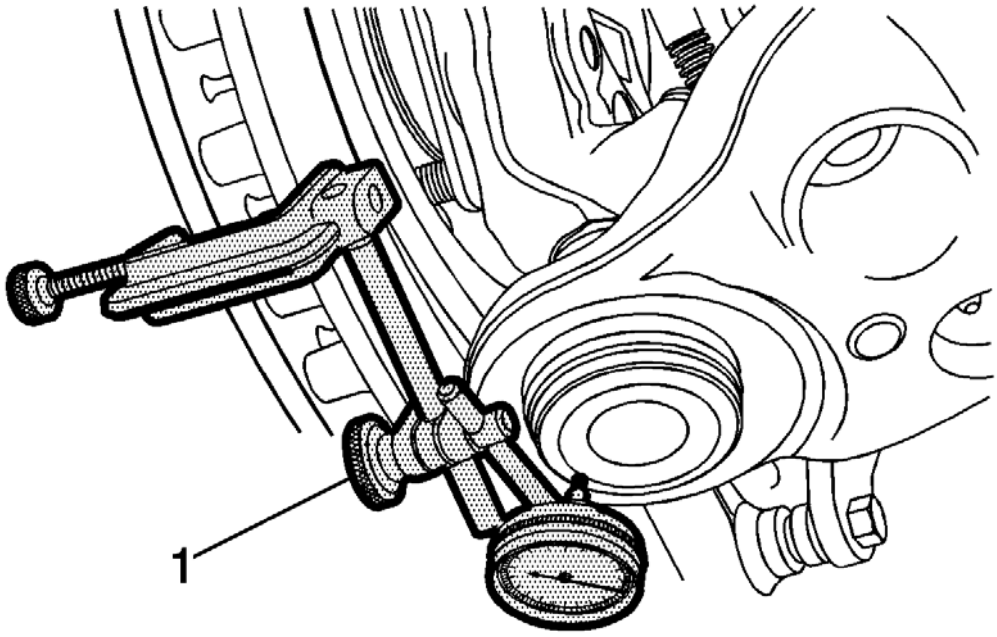

Fig. 1: Measuring Vertical Lash In Ball Joint
Courtesy of GENERAL MOTORS COMPANY

3. Install the **J 8001** dial indicator , to measure the vertical lash of the ball joint.

CAUTION: Do not pry in such a way that the ball joint seal is contacted. Damage to the seal may result.

4. Gently lift or pry between the knuckle and the lower control arm to induce ball joint movement, record the measurement
5. If dial indicator is reading more than 0.5 mm (0.02 in), replace the ball joint or lower control arm as applicable for this vehicle.

SUSPENSION STRUT AND SHOCK ABSORBER TESTING - ON VEHICLE

Step	Action	Yes	No
1	Did you review the General Description and perform the necessary inspections?	Go to **Step 2**	Go to **Symptoms - Suspension General Diagnosis**
2	Verify that the customer's concern is present. Does the vehicle operate normally?	System OK	Go to **Step 3**

Step	Action	Yes	No
3	IMPORTANT: A light film of oil on the top portion of the shock reservoir is normal. Inspect each strut or shock absorber for external fluid leakage.Is a strut or shock absorber leaking?	Go to **Step 5**	Go to **Step 4**
4	1. Use your hands in order to lift up and push down each corner of the vehicle 3 times. 2. Remove your hands from the vehicle. 3. Locate a shock or strut that exceeds 2 cycles. Did you locate shock or strut that exceeds 2 cycles?	Go to **Step 5**	Go to **Step 6**
5	IMPORTANT: Inspect the vehicle trim height in order to correct any possible causes of shock/strut failures. Refer to **Trim Height Inspection**. Replace the strut or shock absorber. Refer to **Strut, Strut Component, or Spring Replacement** , for the front suspension or **Strut Assembly Removal and Installation** for the rear suspension.Did you complete the repair?	Go to **Step 6**	-
6	Operate the vehicle in order to verify the repair. Did you correct the condition?	System OK	Go to **Step 3**

WHEEL BEARINGS DIAGNOSIS

Step	Action	Values	Yes	No
1	Did you review the General Description and perform the necessary inspections?	-	Go to **Step 2**	Go to **Symptoms - Suspension General Diagnosis**
2	1. Install the **J 39570** Chassis Ear Chassis Ear. IMPORTANT: A noise heard during left turns is a good indicator of a noisy right wheel bearing. A noise heard during right turns is a good indicator of a noisy left wheel bearing. 2. Road test the vehicle to verify the location of the noise. Drive the vehicle on a smooth road at a moderate speed range. While driving, turn the wheel to the left and the right to apply loads to each wheel corner. Is the noise present at the wheel bearing?	48-72 km/h (30-45 mph)	Go to **Step 7**	Go to **Step 3**

Step	Action	Values	Yes	No
3	1. Raise and support the vehicle. Refer to **Lifting and Jacking the Vehicle** . 2. Remove the tire and wheel. Refer to **Tire and Wheel Removal and Installation** . 3. Ensure the wheel drive shaft nut is properly tightened. Refer to **Fastener Specifications** . Are the nuts fastened to the correct specified value?	-	Go to **Step 4**	Go to **Step 8**
4	IMPORTANT: Support the vehicle by the lower control arms or the rear axle to prevent movement during wheel bearing/hub inspection. 1. Mount and secure the **J 8001** Dial Indicator to the steering knuckle. 2. Firmly push the hub flange towards the vehicle. 3. Ensure that the dial indicator contacts the vertical surface of the hub as close as possible to the center of the flange. 4. Firmly pull the hub flange away from the vehicle in order to inspect the total travel indicator by the dial indicator. Is the measurement greater then the specified value?	0.127 mm (0.005 in)	Go to **Step 7**	Go to **Step 5**
5	Inspect for tire or wheel damage. Refer to **Tire and Wheel Assembly Runout Measurement - On-Vehicle** . Did you find and correct the condition?	Â	Go to **Step 9**	Go to **Step 6**
6	Inspect the front and/or rear suspension. Refer to **Noise Diagnosis - Front Suspension**, or **Noise Diagnosis - Rear Suspension**. Did you find and correct the condition?	-	Go to **Step 9**	Go to **Step 2**
7	Replace the wheel bearing. Refer to **Front Wheel Bearing and Hub Replacement** , or **Rear Wheel Bearing and Hub Replacement** . Did you complete the repair?	-	Go to **Step 9**	-
8	Remove the old wheel drive shaft nut and install a NEW wheel drive shaft nut. Tighten to the specified value. Refer to **Fastener Specifications** . Did you complete the repair?	-	Go to **Step 9**	-

Step	Action	Values	Yes	No
9	Road test the vehicle to verify the repair. Does the vehicle operate normally?	-	System OK	Go to **Step 3**

TRIM HEIGHT INSPECTION

Trim Height Measurements

Trim height is a predetermined measurement relating to vehicle ride height. Incorrect trim heights can cause bottoming out over bumps, damage to the suspension components, and symptoms similar to wheel alignment problems. Check the trim heights when diagnosing suspension concerns and before checking the wheel alignment.

Perform the following before measuring the trim heights:

1. Set the tire pressures to the pressure shown on the certification label. Refer to **Vehicle Certification, Tire Placard, Anti-Theft, and Service Parts ID Label** .
2. Check the fuel level. Add additional weight if necessary to simulate a full tank.
3. Make sure the rear compartment is empty except for the spare tire.
4. Make sure the vehicle is on a level surface, such as an alignment rack.
5. Close the doors.
6. Close the hood.
7. All dimensions are measured vertical to the ground. Trim heights should be within 13 mm (0.5 in) to be considered correct.

Z Height Measurement

The Z height dimension measurement determines the proper ride height for the front end of the vehicle. There is no adjustment procedure. Repair may require replacement of suspension components.

1. Lift the front bumper of the vehicle up about 38 mm (1.5 in).
2. Gently remove your hands. Let the vehicle settle.
3. Repeat this operation for a total of 3 times.

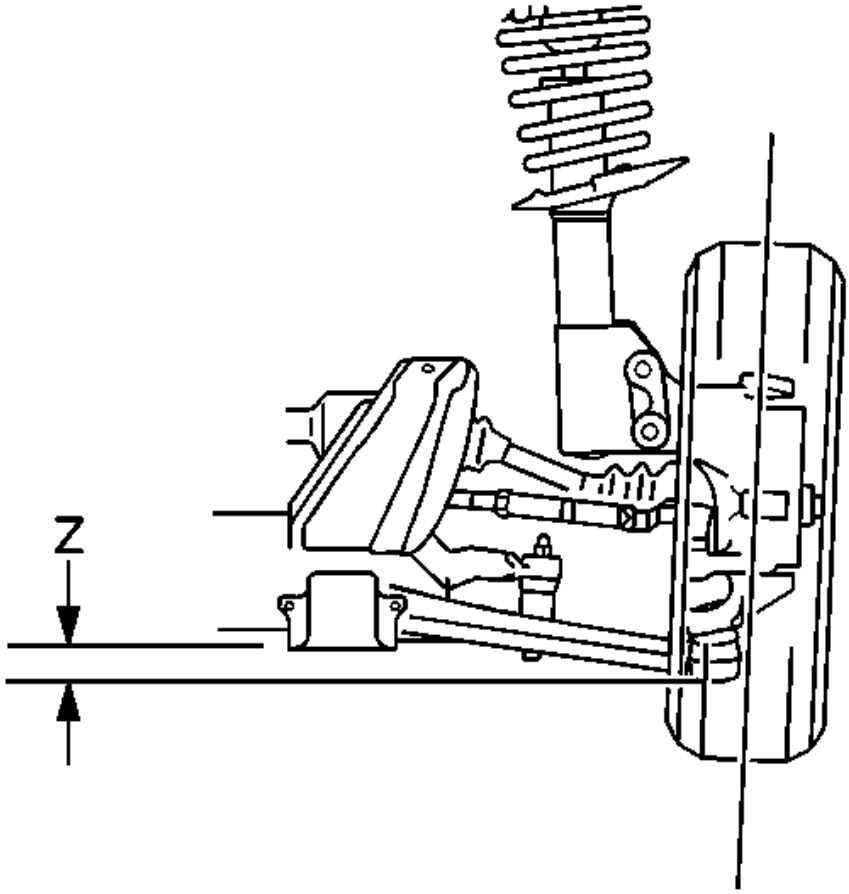

Fig. 2: Measuring "Z" Height Dimension
Courtesy of GENERAL MOTORS COMPANY

4. Measure from the pivot bolt center line down to the lower corner of the lower ball joint in order to obtain the Z height measurement.
5. Push the front bumper of the vehicle down about 38 mm (1.5 in).
6. Gently remove your hands.
7. Allow the vehicle to settle into position.
8. Repeat the jouncing operation 2 more times for a total of 3 times.
9. Measure the Z dimension.
10. The true Z height dimension number is the average of the high and the low measurements. Refer to **Trim Height Specifications**.

D Height Measurement

The D height dimension measurement determines the proper rear end ride height. There is no adjustment procedure. Repair may require replacement of suspension components.

1. With the vehicle on a flat surface, lift upward on the rear bumper 38 mm (1.5 in).
2. Gently remove your hands.

Allow the vehicle to settle into position.

3. Repeat the jouncing operation 2 more times for a total of 3 times.

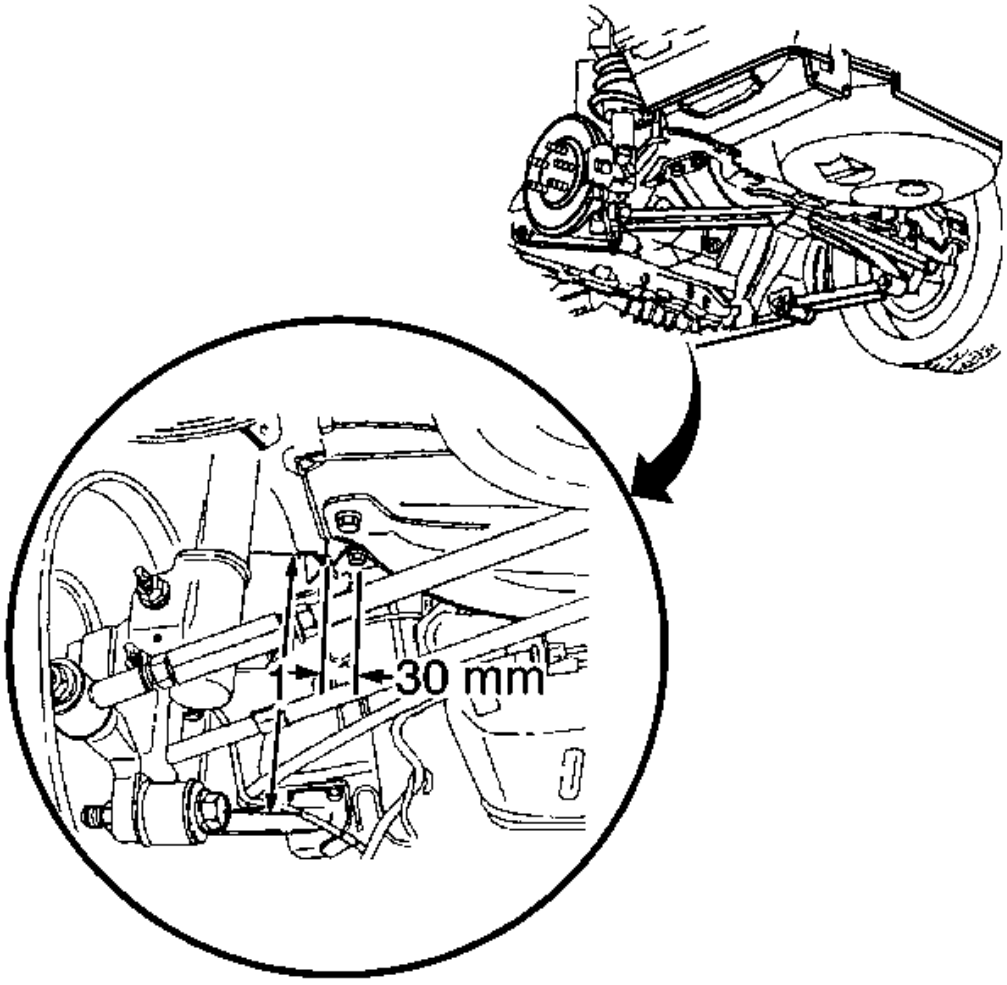

Fig. 3: Measuring D Height Dimension
Courtesy of GENERAL MOTORS COMPANY

4. The D height is measured from a point 30 mm (1.1 in) outboard of the rear brake hose bracket bolt centerline to the bolt centerline of the trailing arm to the knuckle attachment.
5. Push the rear bumper downward to 38 mm (1.5 in).
6. Gently remove your hands.

Allow the vehicle to settle into position.

7. Repeat the jouncing operation 2 more times for a total of 3 times.
8. Measure the D height dimension.
9. The true D height dimension number is the average of the high and the low measurements. Refer to **Trim Height Specifications**.
10. If these measurements are out of specifications, inspect for the following conditions:
    - Improper weight distribution

- Collision damage
- Worn or damaged suspension components

Measuring the P and R Dimension

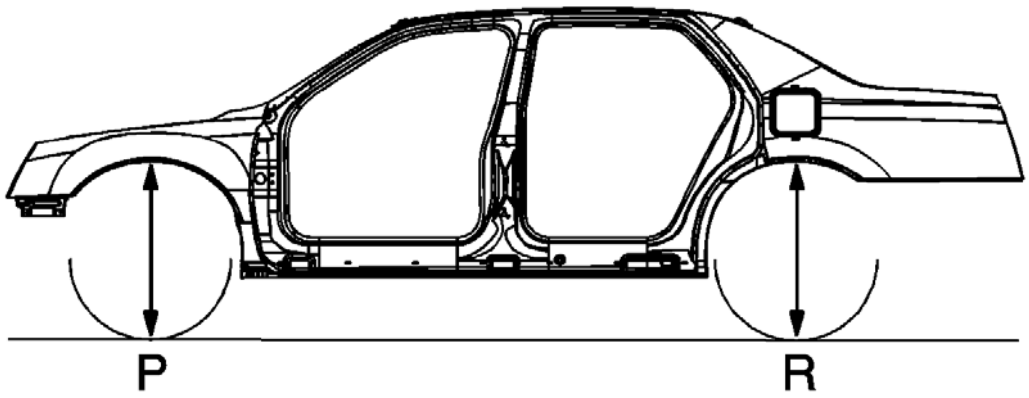

Fig. 4: Locating P And R Dimension Measurement Areas
Courtesy of GENERAL MOTORS COMPANY

Use the following procedure to check the P and R dimensions.

1. Use your hands to lift the front bumper approximately 38 mm (1.59 in).
2. Remove your hands and allow the vehicle to lower.
3. Use your hands to jounce the front of the vehicle downward approximately 38 mm (1.59 in).
4. Remove your hands and allow the vehicle to rise.
5. The dimension (P) for the left and right side of the vehicle is measured from the bottom lip of the wheel opening to the ground measured at the center line of the front wheel.
6. Compare the measurement to the specification table. Refer to **Trim Height Specifications**.
7. If the measurement is outside of the specified range, replace the front springs. Refer to **Strut, Strut Component, or Spring Replacement** .
8. Use your hands to lift the rear bumper approximately 38 mm (1.59 in).
9. Remove your hands and allow the vehicle to lower.

10. Use your hands to jounce the rear of the vehicle downward approximately 38 mm (1.59 in).
11. The dimension (R) for the left and right side of the vehicle is measured from the bottom lip of the wheel opening to the ground measured at the center line of the rear wheel.
12. Compare the measurement to the specification table. Refer to **Trim Height Specifications**.
13. If the measurement is outside of the specified range, replace the rear springs. Refer to **Strut, Strut Component, or Spring Replacement** .

DIAGNOSTIC INFORMATION AND PROCEDURES

DTC C0569: SYSTEM CONFIGURATION ERROR

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

DTC C0569 00

System Configuration Error

Circuit/System Description

If the tire type and pressure selection information is not entered with the scan tool during the remote control door lock receiver (RCDLR) setup, the tire pressure monitor indicator icon on the instrument panel cluster (IPC) will flash for 1 minute and then remain illuminated after the ignition switch is cycled ON and the IPC bulb check is complete. If equipped, the driver information center (DIC) will also display a service tire monitor type message. Under these circumstances, DTC C0569 will be set and the tire type and pressure information will need to be entered for the system to function correctly.

Conditions for Running the DTC

The ignition is ON.

Conditions for Setting the DTC

The RCDLR has not undergone the programming procedure.

Action Taken When the DTC Sets

- The tire pressure monitor indicator icon on the instrument panel cluster (IPC) flashes for 1 minute and then remains illuminated after the ignition switch is cycled ON and the IPC bulb check is complete.
- If equipped, the driver information center (DIC) displays the suspect tire pressure as dashes.
- If equipped, the DIC displays a service tire monitor type message.

Conditions for Clearing the DTC

A current DTC will clear when the RCDLR has undergone the tire type and pressure selection setup procedure and 1 ignition cycle has occurred.

Diagnostic Aids

A newly replaced RCDLR will set DTC C0569 after programming on its initial ignition ON cycle if the module setup information has not been entered. The Tire Type and Tire Pressure Selection setup must be performed with the scan tool.

Reference Information

Description and Operation

Tire Pressure Monitor Description and Operation

Scan Tool Reference

Control Module References for scan tool information

Circuit/System Verification

Verify that the DTC C0569 is not set.

- If the DTC is set, perform the RCDLR tire type and pressure selection setup with the scan tool and cycle the ignition. If the DTC resets, replace the RCDLR.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the diagnostic procedure.

Control Module References for RCDLR replacement, setup, and programming

DTC C0750, C0755, C0760, OR C0765: LOW TIRE PRESSURE SENSOR SIGNAL

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

Left Rear Low Tire Pressure Sensor Signal Invalid

DTC C0765 00

Right Rear Low Tire Pressure Sensor

DTC C0765 08

Right Rear Low Tire Pressure Sensor Signal Invalid

Circuit/System Description

The tire pressure monitor (TPM) system has a radio frequency (RF) transmitting pressure sensor in each wheel/tire assembly. As vehicle speed increases, centrifugal force closes the sensors internal roll switch, which puts the sensor into Rolling mode. The remote control door lock receiver (RCDLR) receives and translates the data contained in the tire pressure sensor RF transmissions into sensor presence, sensor mode, and tire pressure. Once vehicle speed is greater than 40 km/h (25 mph), the RCDLR waits for the sensors to go into rolling mode. If one or more sensors do not go into rolling mode, or do not transmit at all, the RCDLR will set DTC C0750, C0755, C0760, or C0765 respectively.

Conditions for Running the DTC

Vehicle speed is greater than 40 km/h (25 mph).

Conditions for Setting the DTC

- A sensor does not transmit for 18 minutes.
- A sensor low battery condition.

Action Taken When the DTC Sets

- The tire pressure monitor indicator icon on the instrument panel cluster (IPC) flashes for 1 minute and then remains illuminated after the ignition switch is cycled ON and the IPC bulb check is complete.
- If equipped, the driver information center (DIC) displays the suspect tire pressure as dashes.
- If equipped, the DIC displays a service tire monitor type message.

Conditions for Clearing the DTC

- A current DTC will clear when the malfunction is no longer present and 1 ignition cycle occurs.
- The RCDLR automatically clears the history DTC when a current DTC is not detected in 100 consecutive drive cycles.

Diagnostic Aids

- Some aftermarket wheel valve stem holes are located further from the wheel rim than original equipment wheels. When using the TPM special tool to activate a sensor, ensure the tool antenna is no further than 15 cm (6 in) from the sensor and is aiming upward.
- Aftermarket wheel valve stem locations can cause a sensor to not function correctly.
- A sensor may have been damaged due to a previous wheel/tire service or flat tire event.
- The use of other than GM approved tire sealants can obstruct the sensor pressure sensing port and cause inaccurate tire pressure readings. If this condition is verified, remove the sealer from the tire and replace the sensor. Refer to **Tire Pressure Indicator Sensor Replacement**.
- Occasionally sensor transmissions are not received by the RCDLR due to vehicle level RF interference from items such as but not limited to aftermarket ignition systems, DVD players, CB radios, or metallic type window tinting.
- The sensor activation procedure may have to be repeated up to 3 times before determining a sensor is malfunctioning. In the event a particular sensor's information is displayed on the special tool upon activation but the horn does not chirp, it may be necessary to rotate the wheel valve stem to a different position due to the RF signal is being blocked by another component.
- Occasionally sensors can become mislocated due to previous tire rotations where the sensor learn procedure was not performed or stray sensor transmissions have been received from other vehicles . Always learn the sensors to ensure the DTC set is for that actual physical corner of the vehicle. Refer to **Tire Pressure Indicator Sensor Learn**.
- A sensor low battery condition will set a sensor DTC but will not illuminate the low tire pressure indicator or display a message on the DIC, if equipped. The sensor battery condition can be verified in the scan tool RCDLR data list. If a sensor low battery condition is indicated on the scan tool, the sensor will need to be replaced. Refer to **Tire Pressure Indicator Sensor Replacement**.

Special Tools

EL-46079/J-46079 Tire Pressure Monitor Diagnostic Tool

Circuit/System Verification

1. Using the **EL-46079/J-46079** tool , activate each tire pressure sensor and record each sensors transmission data and physical location. Verify **EL-46079/J-46079** tool displays the 8-digit ID number, accurate tire pressure Â±27.6 kPa (4 psi), Learn Mode, and at least a 1/4 graph signal strength displayed.

- If any of the parameters listed above are not displayed, replace the suspect tire pressure sensor.

2. With the scan tool, verify tire pressure sensors ID and locations displayed on the scan tool match the IDs and locations recorded from the special tool.
   - If the IDs and locations do not match, perform the **Tire Pressure Indicator Sensor Learn**.
3. Enable the TPM learn mode. Use the **EL-46079/J-46079** tool in simulate mode to learn 4 simulated sensor transmissions into the RCDLR. Verify that all 4 simulated sensor locations, IDs, and tire pressures displayed on the TPM special tool match the corresponding scan tool parameters displayed.
   - If the scan tool does not match, replace the RCDLR.
4. Test drive the vehicle above 40 km/h (25 mph) for greater than 2 minutes. With the scan tool, observe the suspect Pressure Sensor Mode data parameter. Verify the sensor mode changes to Rolling.
   - If the Pressure Sensor Mode does not change, replace the suspect tire pressure sensor.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the diagnostic procedure.

- **Tire Pressure Indicator Sensor Replacement**
- **Tire Pressure Indicator Sensor Learn**
- **Control Module References** for RCDLR replacement, programming, and setup

DTC C0775: LOW TIRE PRESSURE SYSTEM SENSORS NOT LEARNED

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

DTC C0775

Low Tire Pressure System Sensors Not Learned

Circuit/System Description

If the tire pressure sensor learn procedure has not been performed, the tire pressure monitor indicator icon on the instrument panel cluster (IPC) will flash for 1 minute and then remain illuminated after the ignition switch is cycled ON and the IPC bulb check is complete. If equipped, the driver information center (DIC) will also display a service tire monitor type message. Under these circumstances, DTC C0775 will be set and the tire pressure sensor learn procedure will need to be performed for the system to function correctly.

Conditions for Running the DTC

The ignition is ON.

Conditions for Setting the DTC

The remote control door lock receiver (RCDLR) has not undergone the tire pressure sensor learn procedure.

Action Taken When the DTC Sets

- The tire pressure monitor indicator icon on the instrument panel cluster (IPC) will flash for 1 minute and then remain illuminated after the ignition switch is cycled ON and the IPC bulb check is complete.
- If equipped, the driver information center (DIC) displays a service tire monitor type warning message.

Conditions for Clearing the DTC

A current DTC will clear when the RCDLR has undergone the tire pressure sensor learn procedure and 1 ignition cycle has occurred.

Diagnostic Aids

A newly replaced RCDLR will set DTC C0775 on its initial ignition ON cycle. The tire pressure sensor learn procedure must be performed.

Circuit/System Verification

Verify that the DTC C0775 is not set.

- If the DTC is set, perform the tire pressure sensor learn procedure. Cycle the ignition. If the DTC resets, replace the RCDLR.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the diagnostic procedure.

- **Tire Pressure Indicator Sensor Learn**
- **Control Module References** for RCDLR replacement, setup, and programming

SYMPTOMS - TIRE PRESSURE MONITORING

1. Perform the **Diagnostic System Check - Vehicle** , before using the Symptom Tables in order to verify that all of the following are true:
   - There are no DTCs set.
   - The control modules can communicate via the serial data link.
2. Review the system operation in order to familiarize yourself with the system functions. Refer to **Tire Pressure**

Monitor Description and Operation.

Visual/Physical Inspection

- Inspect if tires are inflated per placard values.
- Inspect for aftermarket devices which could affect the operation of the Tire Pressure Monitoring (TPM) System. Refer to **Checking Aftermarket Accessories** .
- Inspect the easily accessible or visible system components for obvious damage or conditions which could cause the symptom.

Intermittent

Faulty electrical connections or wiring may be the cause of intermittent conditions. Refer to **Testing for Intermittent Conditions and Poor Connections** .

Symptom List

Refer to **Low Tire Pressure Indicator Malfunction** in order to diagnose the symptom.

LOW TIRE PRESSURE INDICATOR MALFUNCTION

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

Circuit/System Description

The remote control door lock receiver (RCDLR) receives a radio frequency (RF) transmission from each tire pressure sensor. Each sensor has its own unique identification (ID) code, which it transmits as part of each RF message, that must be learned into the RCDLR memory. Once all 4 IDs have been learned and vehicle speed is greater than 40 km/h (25 mph), the RCDLR continuously compares IDs in received transmission to its learned IDs to determine if all 4 sensors are present. If the RCDLR detects a low tire pressure condition or a malfunction in the system, it will send a serial data message to the instrument panel cluster (IPC) requesting the appropriate tire pressure monitor indicator illumination and also to display the appropriate data message on the driver information center (DIC), if equipped.

Diagnostic Aids

- If unsure about the condition, cycle the ignition and observe the tire pressure monitor indicator icon. If the tire pressure monitor indicator icon is continuously illuminated after the IPC bulb check is completed, a low tire pressure condition is present. Check the tires for damage or leaks and inflate to the tire placard specifications. Refer to **Vehicle Certification, Tire Placard, Anti-Theft, and Service Parts ID Label** , . If the tire pressure monitor indicator icon flashes for 1 minute after the IPC bulb check is completed and then remains illuminated, a tire pressure monitor system DTC is set. Perform the **Diagnostic System Check - Vehicle** to proceed with the proper diagnosis.
- Temperature can greatly effect tire pressures. Low tire pressure on a cold morning may cause the tire pressure monitor indicator icon to turn ON. The air pressure in the tire increases as the ambient temperature rises or as the tire warms up while the vehicle is driven. The pressure may increase enough to exceed the predetermined low pressure threshold which will turn OFF the tire pressure monitor indicator icon .
- Some aftermarket wheel valve stem holes are located further from the wheel rim than original equipment

wheels. When using the TPM special tool to activate a sensor, ensure the tool antenna is no further than 15 cm (6 in) from the sensor and is aiming upward.

- Aftermarket wheel value stem locations can cause a sensor to not function correctly.
- A sensor may have been damaged due to a previous wheel/tire service or flat tire event.
- The use of other than GM approved tire sealants can obstruct the sensor pressure sensing port and cause inaccurate tire pressure readings. If this condition is verified, remove the sealer from the tire and replace the sensor. Refer to **Tire Pressure Indicator Sensor Replacement**.
- Occasionally sensor transmissions are not received by the RCDLR due to vehicle level RF interference from items such as but not limited to aftermarket ignition systems, DVD players, CB radios, or metallic type window tinting.
- The sensor activation procedure may have to be repeated up to 3 times before determining a sensor is malfunctioning. In the event a particular sensor's information is displayed on the special tool upon activation but the horn does not chirp, it may be necessary to rotate the wheel valve stem to a different position due to the RF signal is being blocked by another component.
- Occasionally sensors can become mislocated due to previous tire rotations where the sensor learn procedure was not performed or stray sensor transmissions have been received from other vehicles. Always learn the sensors to ensure the DTC set is for that actual physical corner of the vehicle. Refer to **Tire Pressure Indicator Sensor Learn**.

Special Tools

J 46079 Tire Pressure Monitor Diagnostic Tool

Circuit/System Verification

NOTE: **Low tire pressure in one or more tires is indicated by a continuously illuminated tire pressure monitor indicator icon after the IPC bulb check is completed. If equipped with a DIC, a check tire pressure type message will also be displayed. It is not necessary to perform the Learn procedure for a low tire condition.**

When a TPM DTC is set, the tire pressure monitor indicator icon will flash for 1 minute after the IPC bulb check is completed and then remains illuminated. If equipped with a DIC, a service tire monitor type message will also be displayed.

1. Verify all tires are inflated to the proper pressure Â±10%. Refer to **Vehicle Certification, Tire Placard, Anti-Theft, and Service Parts ID Label** .
    - If not within the specified range, adjust all tire pressures to specification and drive the vehicle over 40 km/h (25 mph) for greater than 2 minutes. Verify the tire pressure monitor indicator icon is OFF.
2. Using the **J 46079** tire pressure monitor diagnostic tool , activate each B2 Tire Pressure Sensor and record each sensor tire pressure reading. Check the tire pressures with a known accurate hand held tire pressure gauge. Verify that the pressure readings from the special tool do not differ more than 27.6 kPa (4 psi) from the actual tire pressure readings.
    - If not within the specified range, replace the appropriate B2 Tire Pressure Sensor.
3. Using a scan tool, enable the TPM learn mode. Use the **J 46079** tire pressure monitor diagnostic tool in simulate mode to learn 4 simulated sensor transmissions into the RCDLR. Observe tire pressures in the scan tool data display. Verify the simulated tire pressures do not differ more than +/-27.6 kPa (4 psi) of the scan tool reading.
    - If not within the specified range, replace the RCDLR.
4. Using a scan tool, perform the instrument panel special functions Lamp Test. Command the instrument panel warning lamps ON and OFF. Verify the tire pressure monitor indicator icon turns ON and OFF.
    - If the tire pressure monitor icon does not turn ON and OFF, replace the IPC.
5. Ignition ON, use the scan tool to setup the Tire Type/Pressure Selection in the RCDLR Module Setup menu. Refer to the **Vehicle Certification, Tire Placard, Anti-Theft, and Service Parts ID Label** . Drive the vehicle over 40 km/h (25 mph) for greater than 2 minutes. Verify the tire pressure monitor indicator icon is OFF.
    - If the tire pressure monitor indicator icon is ON, replace the RCDLR.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the diagnostic procedure.

- **Tire Pressure Indicator Sensor Replacement**
- **Tire Pressure Indicator Sensor Learn**
- **Control Module References** for IPC or RCDLR replacement, setup, and programming

REPAIR INSTRUCTIONS

TIRE PRESSURE INDICATOR SENSOR REPLACEMENT

Removal Procedure

1. Raise the vehicle on a suitable support. Refer to **Lifting and Jacking the Vehicle** .
2. Remove the tire/wheel assembly from the vehicle. Refer to **Tire and Wheel Removal and Installation** .
3. Dismount the tire from the rim. Refer to **Tire Dismounting and Mounting** .

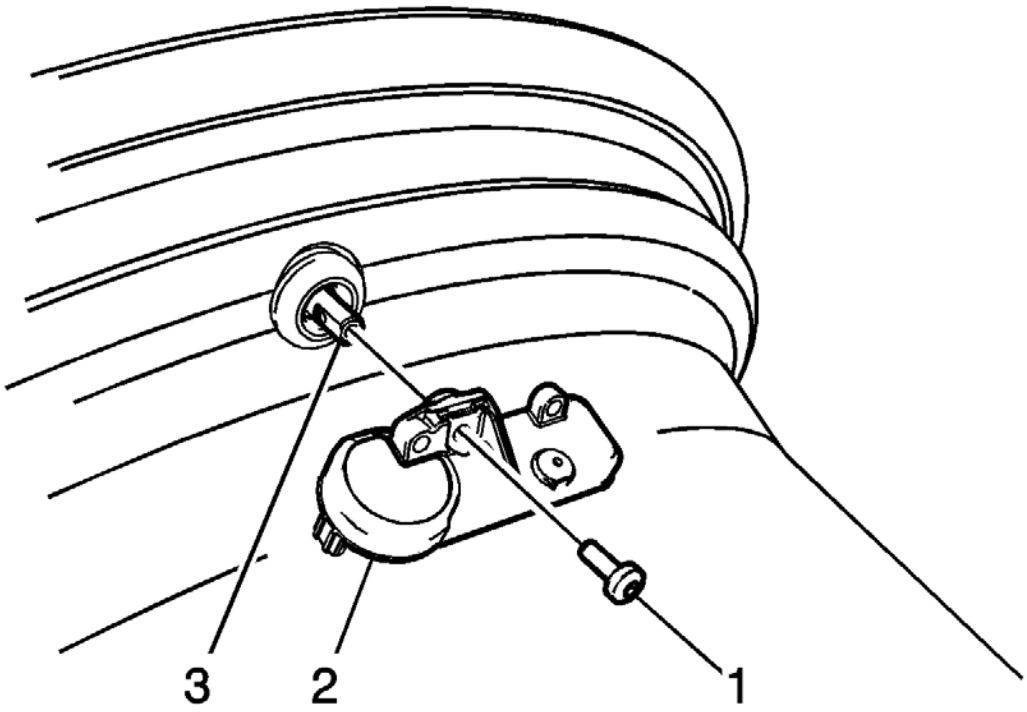

Fig. 1: View Of Tire Pressure Indicator Sensor
Courtesy of GENERAL MOTORS COMPANY

NOTE: **When servicing the tire pressure sensor always use a new SchraderÂ® tire pressure monitor (TPM) and a new TORX screw during installation.**

4. Remove the TORX screw (1) from the tire pressure sensor (2) and pull it straight off the tire pressure valve stem (3).

CAUTION: **Do not scratch or damage the clear coating on aluminum wheels with the tire changing equipment. Scratching the clear coating could cause the aluminum wheel to corrode and the clear coating to peel from the wheel.**

5. Remove the tire pressure valve stem by pulling it through the rim.

Installation Procedure

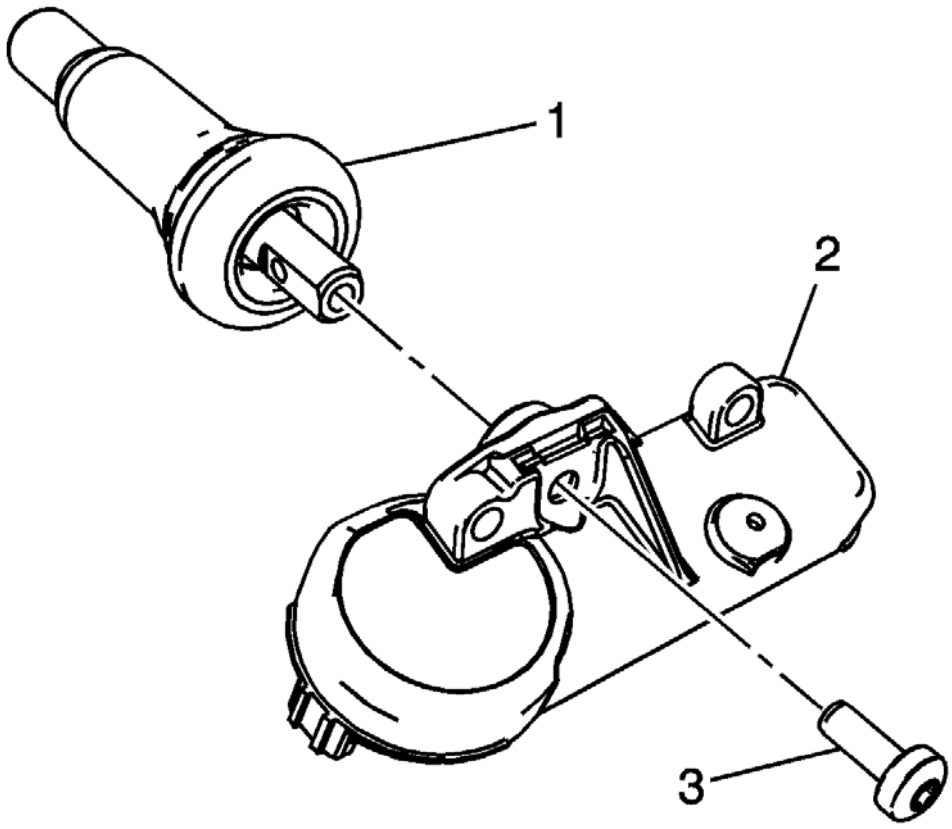

Fig. 2: View Of Tire Pressure Indicator Sensor
Courtesy of GENERAL MOTORS COMPANY

CAUTION: **Refer to Fastener Caution .**

NOTE:

- **Ensure the flat of the valve, lines up with the flats of the snap in the enclosure.**
- **TPM valves and TORX screws are one-time use only.**

1. Assemble the tire pressure sensor (2) to the valve stem and install the new TORX screw (3) and tighten to 1.3 N.m (11.5 lb in).

NOTE: **Use and approved tire mounting lubricant. DO NOT use silicon or corrosive base compounds to lubricate the tire bead and the wheel rim. A corrosive type compound can cause tire or rim deterioration.**

2. Apply tire soap to the rubber portion of the valve stem (1).

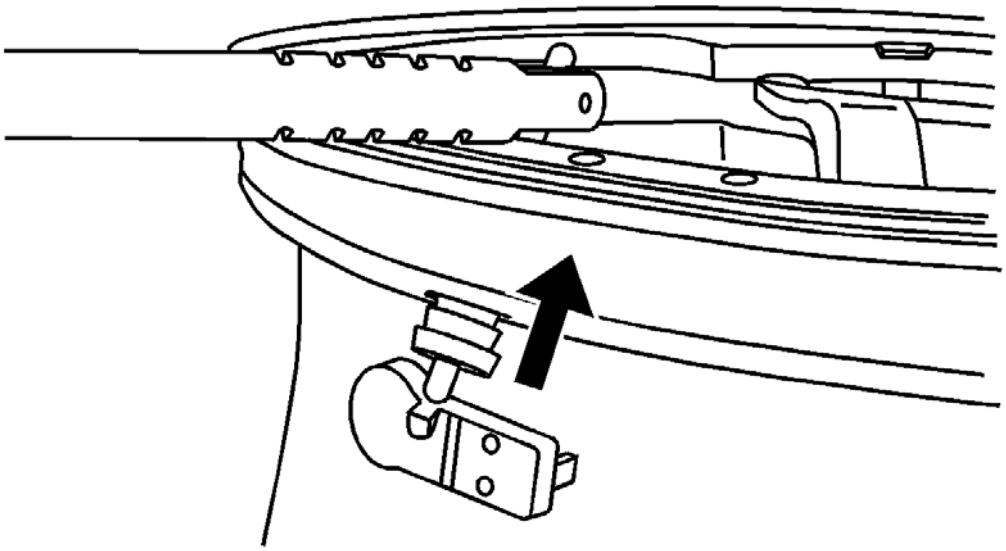

Fig. 3: View Of Tire Valve Stem Mounting Tool
Courtesy of GENERAL MOTORS COMPANY

3. Using a tire valve stem mounting tool, pull the valve stem through in a direction parallel to the valve hole on the rim.

NOTE: **Snap Fit TPM sensors are still shipped in the OFF mode. However, the TPM no longer needs to be spun to remove it from the OFF mode. The sensor will exit its OFF state when the tire is inflated. The technician can then program the vehicle as normal.**

4. Mount the tire to the rim. Refer to **Tire Dismounting and Mounting** .
5. Install the tire/wheel assembly on the vehicle. Refer to **Tire and Wheel Removal and Installation** .
6. Lower the vehicle.
7. Learn the tire pressure sensors. Refer to **Tire Pressure Indicator Sensor Learn**.

TIRE PRESSURE INDICATOR SENSOR LEARN

Special Tools

- **EL-46079** Tire Pressure Monitor Diagnostic Tool

or

- **EL-50448** Tire Pressure Monitor Sensor Activation Tool

For equivalent regional tools, refer to **Special Tools**.

Learn Mode Description

The tire pressure monitor (TPM) system uses the instrument panel cluster (IPC), body control module (BCM), remote control door lock receiver (RCDLR), keyless entry transmitter, 4 radio frequency transmitting pressure sensors, and the serial data circuit to perform the TPM learn mode functions. The sensor learn procedure must be performed after every tire rotation, RCDLR replacement, or sensor replacement. Once the learn mode has been enabled, each of the sensors unique identification codes can be learned into the RCDLR memory. When a sensor ID has been learned, the RCDLR sends a serial data message to the BCM to sound a horn chirp. This verifies the sensor has transmitted its ID and the RCDLR has received and learned it. The RCDLR must learn the sensor IDs in the proper sequence to determine correct sensor location. The first learned ID is assigned to the left front location, the second to right front, the third to right rear and the fourth to left rear. The turn signals will individually illuminate indicating which location is to be learned in the proper sequence.

Sensor Functions Using EL-46079, EL-50448, or Equivalent

Each sensor has an internal low frequency coil. When the TPM special tool is used in activate mode, it produces a low frequency transmission that activates the sensor. The sensor responds to a low frequency activation by transmitting in learn mode. When the RCDLR receives a learn mode transmission while in TPM learn mode, it will assign that sensors ID to the location on the vehicle relative to the order in which it was learned.

Learn Mode Cancellation

The learn mode will cancel if the ignition is cycled to OFF or if more than 2 minutes has elapsed for any sensor that has not been learned. If the learn mode is cancelled before the first sensor is learned, the original sensor IDs will be maintained. If the learn mode is canceled after the first sensor is learned, the following will occur:

- All stored sensor IDs will be invalidated in the RCDLR memory.
- If equipped, the DIC will display dashes instead of tire pressures.
- DTC C0775 will be set.

These conditions will now require the learn procedure to be repeated for the system to function properly.

TPM Learn Procedure

NOTE: **In the event a particular sensor's information is displayed on the special tool upon activation but the horn does not chirp, it may be necessary to rotate the wheel valve stem to a different position due to the sensor signal is being blocked by another component.**

TPM Learn Enable Methods

1. Ignition ON, initiate the TPM Learn Mode using one of the following procedures:
    - Using a scan tool, initiate the TPM Learn Mode. A double horn chirp will sound indicating the Learn Mode has been enabled. The left front turn signal will also be illuminated.
    - On vehicles equipped with keyless entry, simultaneously press the keyless entry transmitters lock and unlock buttons until a double horn chirp sounds indicating the Learn Mode has been enabled. The left

front turn signal will also be illuminated.

- On vehicles not equipped with keyless entry, press and release the driver information center (DIC) INFO button until the TIRE LEARN message appears on the DIC display. Press and hold the SET/RESET button until a double horn chirp sounds indicating the Learn Mode has been enabled. The left front turn signal will also be illuminated.

2. Starting with the left front tire, active the sensor by holding the antenna of the TPM special tool aimed upward against the tire sidewall close to the wheel rim at the valve stem location. Press and release the Activate button. Ensure that the transmit indicator on the special tool indicates that the sensor activation signal is being transmitted. Wait for a horn chirp. If the horn does not chirp, repeat the sensor activation sequence with the tool. Once the horn chirp has sounded, the sensor information is learned and the turn signal in the next location to be learned will illuminate.
3. After the horn chirp has sounded and the right front turn signal is illuminated, repeat step 2 for the remaining 3 sensors in the following order:
    1. Right front
    2. Right rear
    3. Left rear
4. When the left rear sensor has been learned and a double horn chirp has sounded, the learn process is complete and the RCDLR exits the learn mode.

DESCRIPTION AND OPERATION

TIRE PRESSURE MONITOR DESCRIPTION AND OPERATION

The tire pressure monitor (TPM) system warns the driver when a significant loss, or gain of tire pressure occurs in any of the 4 tires and allows the driver to display the individual tire pressures and their locations on the driver information center (DIC).

The system uses the body control module (BCM), driver information center (DIC), instrument panel cluster (IPC), remote control door lock receiver (RCDLR), a radio frequency (RF) transmitting pressure sensor in each wheel/tire assembly, and the serial data circuit to perform the system functions. Each sensor has an internal power supply with a 10 year service life.

When the vehicle is stationary, the sensors internal accelerometer is inactive, which puts the sensors into a stationary state. In this state the sensors sample tire pressure once every 30 seconds and do not transmit at all if the tire pressure does not change. As vehicle speed increases, centrifugal force activates the sensors internal accelerometer causing the sensors to go into rolling mode. In this mode, the sensors sample tire pressure once every 30 seconds and transmit in rolling mode once every 60 seconds. The RCDLR receives and translates the data contained in each sensors RF transmission into sensor presence, sensor mode, and tire pressure. The RCDLR sends the tire pressure and tire location data to the DIC via the serial data circuit where they are displayed.

The sensors continuously compare their last pressure sample to their current pressure sample and will transmit in re-measure mode if a 8.3 kPa (1.2 psi) change in tire pressure has been detected in either a stationary or rolling state. When the TPM system detects a significant loss, or gain of tire pressure, the tire pressure monitor indicator icon is illuminated on the IPC and if equipped, a check tire pressure type message is displayed on the DIC. Both the indicator icon and DIC message can be cleared by adjusting the tire pressures to the recommended kPa/psi and driving the vehicle above 40 km/h (25 mph) for at least 2 minutes.

If power is disconnected from the RCDLR or if the vehicle battery is disconnected each TPM sensor ID is retained but all of the tire pressure information is lost. Under these circumstances the RCDLR cannot assume that the tire

pressures were maintained over an unknown period of time. If equipped, the DIC will display all dashes and the scan tool will indicate a default tire pressure value of 1020 kPa (148 psi) for each tire. Driving the vehicle above 40 km/h (25 mph) for at least 2 minutes will activate the sensors causing the DIC to display the current tire pressures. The Tire Pressure Monitor Diagnostic Tool special tool or the pressure increase/decrease method may also be used to activate the sensors as well.

The RCDLR has the ability to detect malfunctions within the TPM system. In the event a DTC is set, the tire pressure monitor indicator icon on the IPC will flash for 1 minute and then remain illuminated after the ignition is turned ON and the IPC bulb check has been completed. Any malfunction detected will cause the DIC to display a service tire monitor system type message. For more information on other functions of the RCDLR, refer to **Keyless Entry System Description and Operation** .

DIAGNOSTIC INFORMATION AND PROCEDURES

TIRE DIAGNOSIS - IRREGULAR OR PREMATURE WEAR

Tire Wear

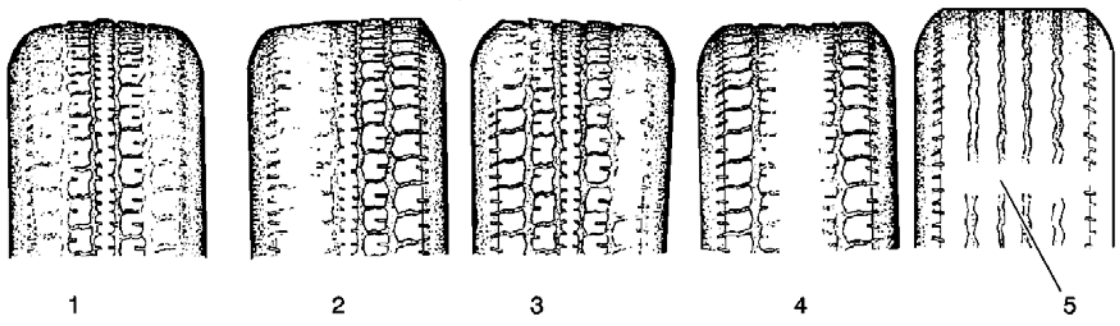

Fig. 1: Identifying Types Of Tire Wear
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Under-Inflation, Hard Cornering, Lack of Regular Rotation

Callout	Component Name
2	Incorrect Wheel Alignment, Hard Cornering, Lack of Regular Rotation
3	Incorrect Wheel Alignment
4	Over-Inflation, Heavy Acceleration, Lack of Regular Rotation
5	Normal Wear to the Wear Indicator

Inspection Procedure

1. Inspect the front tire wear.
2. Inspect the rear tire wear.
3. Rotate the tires if any of the following conditions exist:
    - The amount of time or mileage since the last tire rotation matches the maintenance schedule.
    - The outer tread blocks are worn more than the middle tread blocks (1).
    - The outer tread blocks are worn more than the inner tread blocks (2).
    - The middle tread blocks are worn more than the outer tread blocks (4).
4. Measure the wheel alignment if any of the following conditions exist:
    - The tread blocks have feathered edges (3).
    - The outer tread blocks are worn more than the inner tread blocks (2).
    - The inner tread blocks are worn more than the outer tread blocks (2).
5. Inspect the struts or the shock absorbers if the tire tread exhibits a cupped appearance (3).

TIRE DIAGNOSIS - WADDLE COMPLAINT

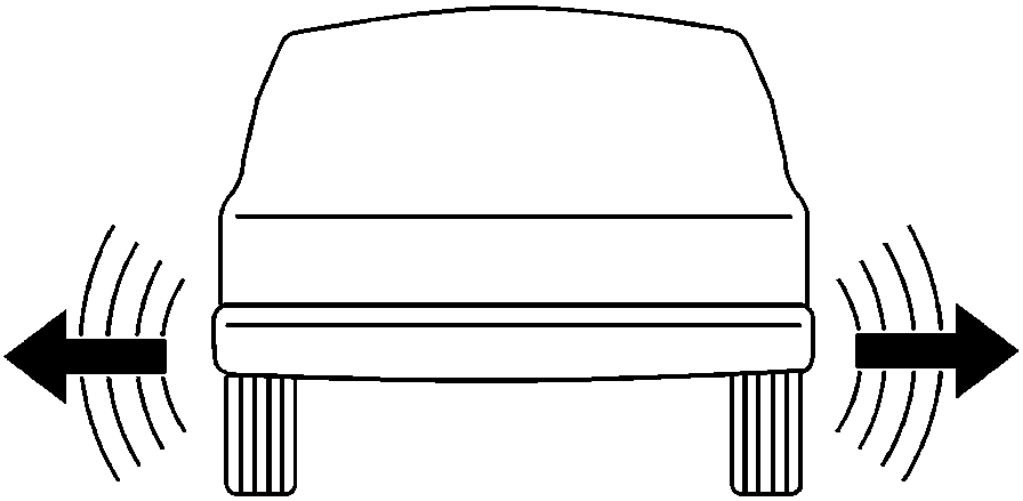

Fig. 2: Identifying Tire Wobble/Waddle
Courtesy of GENERAL MOTORS COMPANY

Tire waddle is a side to side movement at the front of the vehicle and/or the rear of the vehicle. Tire waddle can be caused by the following conditions:

- A steel belt not being straight within the tire
- Excessive lateral runout of the tire
- Excessive lateral runout of the wheel

The tire waddle is most noticeable at a low speed of about 8-48 km/h (5-30 mph). Tire waddle may appear as ride roughness at 80-113 km/h (50-70 mph). Tire waddle may appear as a vibration at 80-113 km/h (50-70 mph).

Inspection Procedure

1. Raise and support the vehicle with safety stands. Refer to **Lifting and Jacking the Vehicle** .

WARNING: Wear gloves when inspecting the tires in order to prevent personal injury

from steel belts sticking through the tire.

2. Perform the following preliminary inspection:
    1. Mark the tire with a crayon in order to note the start and the stop position.
    2. Rotate each tire and wheel by hand.
    3. Inspect the tire for bulges or bent wheels. Replace as necessary.
3. Use tire substitution in order to identify the faulty tire. Perform the following steps for a tire substitution check:
    1. Use a comparable tire in order to replace each tire, one at a time.
    2. Test drive the vehicle.
    3. If the problem is tire or wheel related, you will eliminate the problem when you remove the faulty tire from the vehicle.

WHEEL MOUNTING SURFACE CHECK

Replace any wheels that are bent or dented, or have excessive lateral or radial runout. Wheels with runout greater than specified may cause objectionable vibrations.

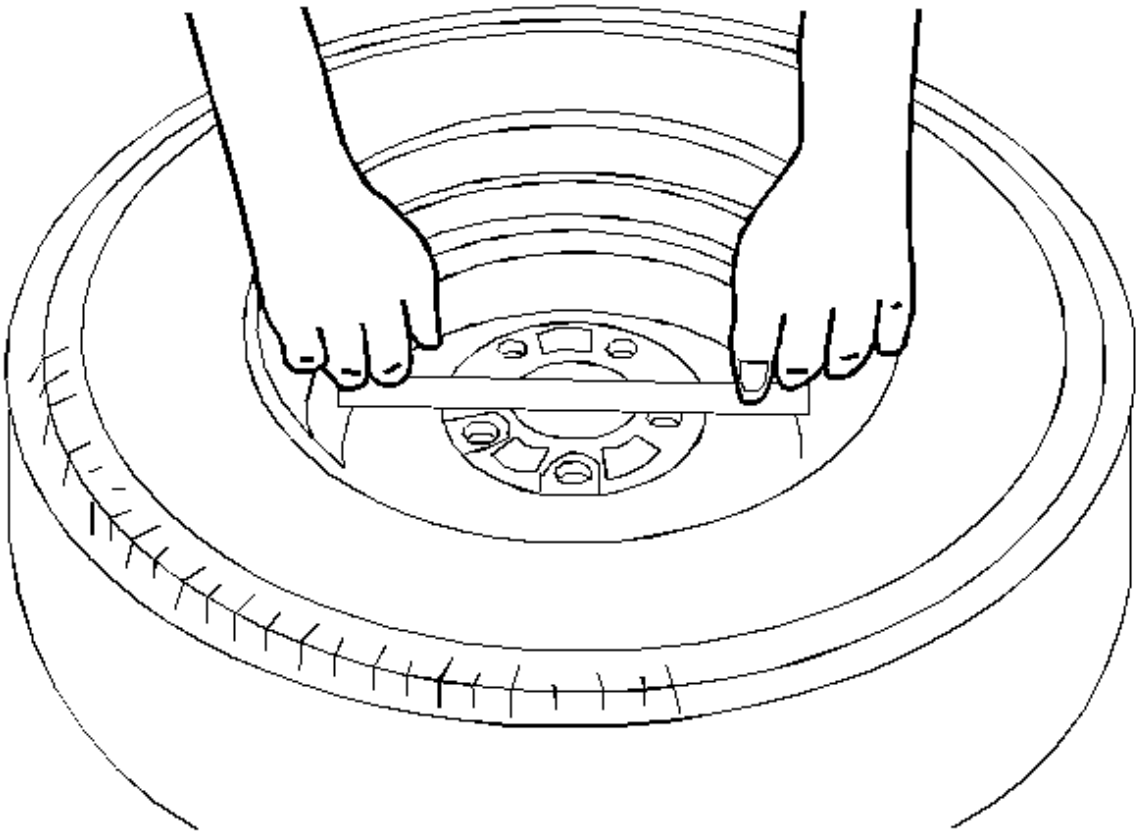

Fig. 3: Checking Wheel Mounting Surface
Courtesy of GENERAL MOTORS COMPANY

1. Use a straight edge 203-229 mm (8-9 in) long. Place the straight edge on the wheel inboard mounting surface. Try to rock the straightedge up and down within the mounting surface.

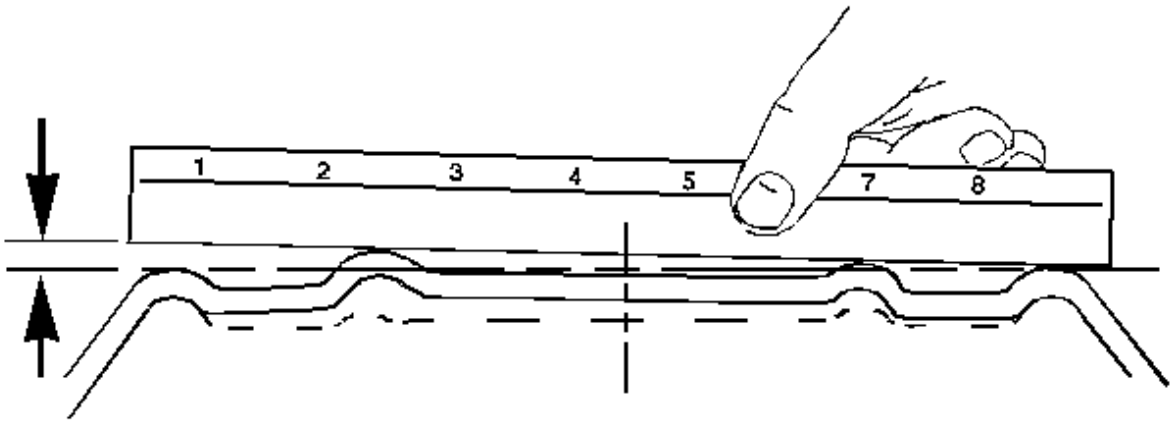

Fig. 4: Inspecting Wheel Inboard Mounting Surface
Courtesy of GENERAL MOTORS COMPANY

2. Repeat this procedure on at least 3-4 different positions on the inboard mounting surface.
    - The outer ring of the mounting surface normally is raised above everything inside the mounting surface.
    - The mounting surface will be raised above the outer ring if the wheel mounting surface has been bent on a tire changer.
    - If you can rock the straight edge, the mounting surface is bent and you must replace the wheel.

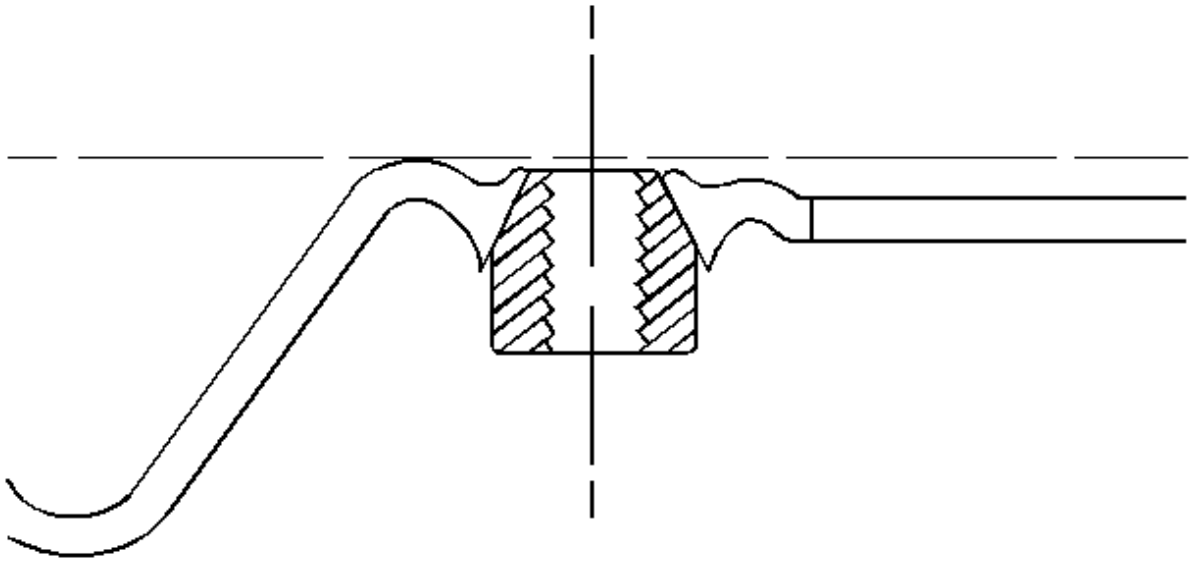

Fig. 5: Inspecting Mounting Wheel/Nut Holes For Damage Caused From Over-Torquing The Wheel/Nuts
Courtesy of GENERAL MOTORS COMPANY

3. Inspect the mounting wheel/nut holes for damage caused from over-torquing the wheel/nuts. Inspect for collapsed wheel/nut bosses. Inspect for cracked wheel bosses.

CAUTION: The use of non-GM original equipment wheels may cause:

- **Damage to the wheel bearing, the wheel fasteners and the wheel**
- **Tire damage caused by the modified clearance to the adjacent vehicle components**
- **Adverse vehicle steering stability caused by the modified scrub radius**
- **Damage to the vehicle caused by the modified ground clearance**
- **Speedometer and odometer inaccuracy**

NOTE:

- **Replacement wheels must be equivalent to the original equipment wheels in the following ways:**
  - **The load capacity**
  - **The wheel diameter**
  - **The rim width**
  - **The wheel offset**
  - **The mounting configuration**
- **A wheel of the incorrect size or type may affect the following conditions:**
  - **Wheel and hub-bearing life**
  - **Brake cooling**
  - **Speedometer/odometer calibration**
  - **Vehicle ground clearance**
  - **Tire clearance to the body and the chassis**

4. Replace the wheel if the wheel is bent.
5. Replace the wheel if the wheel/nut boss area is cracked.

Identify steel wheels with a 2 or 3-letter code stamped into the rim near the valve stem. Aluminum wheels have the code, the part number, and the manufacturer identification cast into the back side of the wheel.

RADIAL TIRE LEAD/PULL CORRECTION

Lead/Pull Correction Table

Step	Action	Yes	No
DEFINITION: Lead/pull is the deviation of the vehicle from a straight path on a level road with no pressure on the steering wheel. Lead is usually caused by the following conditions: • Poor tire construction • Uneven brake assemblies • Improper tire and wheel alignment In the front tires (rear tires will not cause lead) Tire construction can be a cause of lead in a vehicle. An example of this is placement of the belt. Off center belts on radial tires can cause the tire to develop a side force while rolling straight down the road, and the tire will tend to roll like a cone. Use the lead/pull correction table in order to verify that improper tire and wheel alignment is not mistaken for tire lead.			
1	Inspect and repair/replace the tire/wheel assemblies for the following conditions: • Correct tire pressure • Excessive/uneven tire wear • Correct tire size	Go to **Step 2**	-

Step	Action	Yes	No
	• Excessive radial/lateral wheel runout • Out of balance Is the action complete?		
2	Inspect and repair the front and rear suspensions for the following conditions: • Damage • Excessive wear • Loose components • Excessive wheel bearing play Is the action complete?	Go to **Step 3**	-
3	Inspect and repair the power steering gear and pump for the following conditions: • Damage • Excessive wear Is the action complete?	Go to **Step 4**	-
4	1. Cross-switch the front tire/wheel assemblies. 2. Road test the vehicle. Does the vehicle still lead/pull?	Go to **Step 5**	System OK
5	Does the vehicle lead/pull in the opposite direction?	Go to **Step 6**	Go to **Braking Action Uneven - Pulls to One Side**
6	1. Cross-switch the left front tire/wheel assembly with the left rear tire/wheel assembly. 2. Road test the vehicle. Does the vehicle still lead/pull?	Go to **Step 7**	Go to **Step 8**
7	1. Cross-switch the right front tire/wheel assembly with the right rear tire/wheel assembly. 2. Road test the vehicle. Does the vehicle still lead/pull?	Go to **Braking Action Uneven - Pulls to One Side**	Go to **Step 9**
8	Replace the left rear tire. Is the repair complete?	System OK	-
9	Replace the right rear tire. Is the repair complete?	System OK	-

REPAIR INSTRUCTIONS

ALUMINUM WHEEL POROSITY REPAIR

1. Remove the tire and wheel. Refer to **Tire and Wheel Removal and Installation**.
2. Inflate the tire to the manufactures specified pressure as stated on the tire.
3. Submerge the tire/wheel into a water bath in order to locate the leak.
4. Inscribe a mark on the wheel in order to indicate the leak areas.
5. Inscribe a mark on the tire at the valve stem in order to indicate the orientation of the tire to the wheel.
6. Remove the tire from the wheel. Refer to **Tire Dismounting and Mounting**.

   IMPORTANT: Do not damage the exterior surface of the wheel.

7. Use number 80 grit sandpaper to scuff the inside of the rim surface at the leak area.
8. Use general purpose cleaner such as 3MÂ®, P/N 08984 or equivalent, to clean the leak area.
9. Apply 3 mm (0.12 in) thick layer of adhesive/sealant, GM P/N 12378478 (Canadian P/N 88900041) or equivalent, to the leak area.
10. Allow for the adhesive/sealant to dry.
11. Align the inscribed mark on the tire with the valve stem on the wheel.
12. Install the tire to the wheel. Refer to **Tire Dismounting and Mounting**.
13. Pressurize the tire to 276 kPa (40 psi).
14. Submerge the tire/wheel into a water bath in order ensure the leak is sealed.
15. Inflate the tire to the specified pressure as stated on the tire placard.
16. Balance the tire and wheel. Refer to **Tire and Wheel Assembly Balancing - Off Vehicle** .
17. Install the tire and wheel. Refer to **Tire and Wheel Removal and Installation**.

ALUMINUM WHEEL REFINISHING

Finish Damage Evaluation Procedure

NOTE:

- **If the wheels are chrome-plated, do not re-plate or refinish the wheels.**
- **If the wheels are polished aluminum, do not refinish the wheels in the dealer environment. Utilize a refinisher that meets manufacturer guidelines.**

1. Inspect the wheels for damage from uncoated wheel balance weights or from automatic car wash facilities.
2. Inspect the wheels for the following conditions:
   - Corrosion
   - Scrapes
   - Gouges
3. Verify the damage is not deeper than what sanding can remove.

4. Inspect the wheels for cracks. If a wheel has cracks, discard the wheel.
5. Inspect the wheels for bent rim flanges. If a rim flange is bent, discard the wheel.

Refinishing Procedure

WARNING: **To avoid serious personal injury when applying any two part component paint system, follow the specific precautions provided by the paint manufacturer. Failure to follow these precautions may cause lung irritation and allergic respiratory reaction.**

1. Remove the tire and wheel assembly from the vehicle. Refer to **Tire and Wheel Removal and Installation**.
2. Remove the balance weights from the wheel.
3. Remove the tire from the wheel. Refer to **Tire Dismounting and Mounting**.
4. Use a suitable cleaner in order to remove the following contaminants from the wheel:
   - Lubricants
   - Wax
   - Dirt

NOTE:
- **Do not re-machine the wheel.**
- **Do not use chemicals in order to strip the paint from the wheel.**

5. Use plastic media blasting in order to remove the paint from the wheel.
6. If the wheel had a machined aluminum finish, spin the wheel and use sand paper in order to restore the circular machined appearance.

NOTE: **The wheel mounting surface and the wheel nut contact surface must remain free of paint.**

7. Mask the wheel mounting surface and the wheel nut contact surface.
8. Follow the paint manufacturer's instructions for painting the wheel.
9. Unmask the wheel.
10. Install a new valve stem.

NOTE: **Use new coated balance weights in order to balance the wheel.**

11. Install the tire to the wheel. Refer to **Tire Dismounting and Mounting**.
12. Use a suitable cleaner in order to remove the following contaminants from the wheel mounting surface:
    - Corrosion
    - Overspray
    - Dirt
13. Install the tire and wheel assembly to the vehicle. Refer to **Tire and Wheel Removal and Installation**.

TIRE AND WHEEL REMOVAL AND INSTALLATION

Special Tools

- **CH-41013** Rotor Resurfacing Kit
- **CH-42450-A** Wheel Hub Resurfacing Kit

For equivalent regional tools, refer to **Special Tools**.

Removal Procedure

1. Raise and support the vehicle. Refer to **Lifting and Jacking the Vehicle** .
2. Remove the wheel center cap, if equipped.

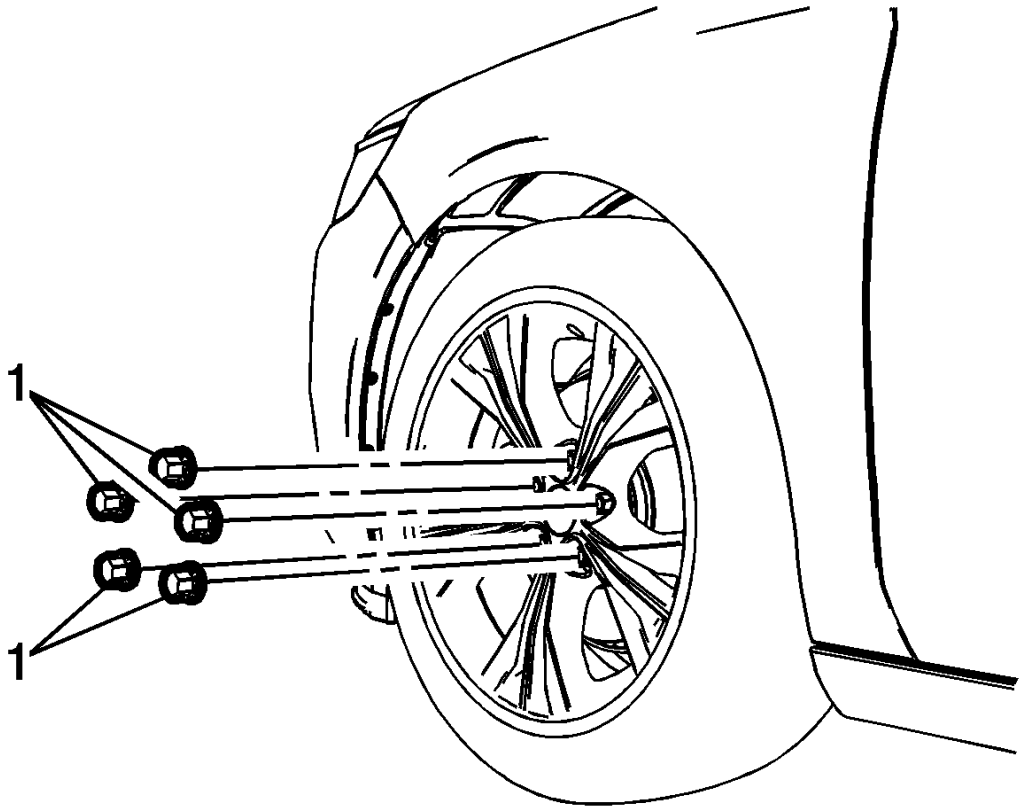

Fig. 6: Wheel Nut Caps
Courtesy of GENERAL MOTORS COMPANY

3. Remove the wheel nut caps (1), if equipped.

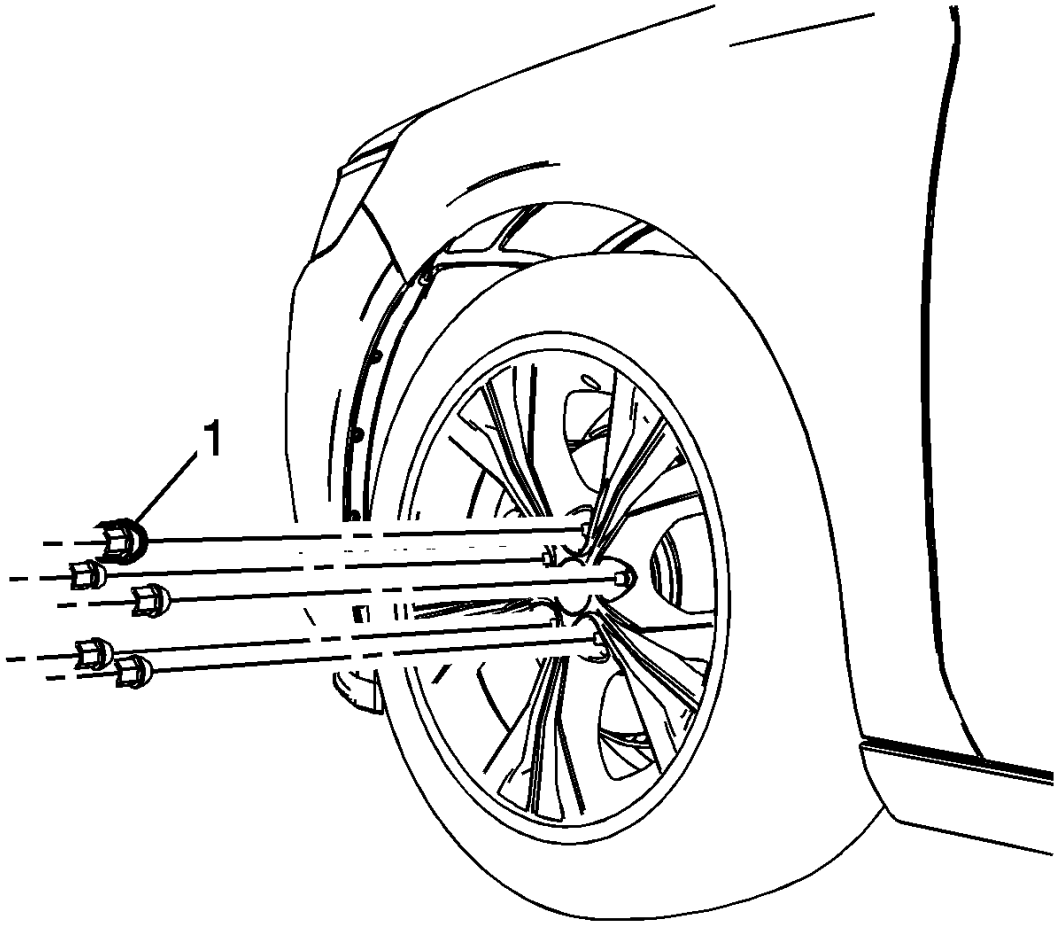

Fig. 7: Wheel Nuts
Courtesy of GENERAL MOTORS COMPANY

4. Remove the wheel nuts (1).

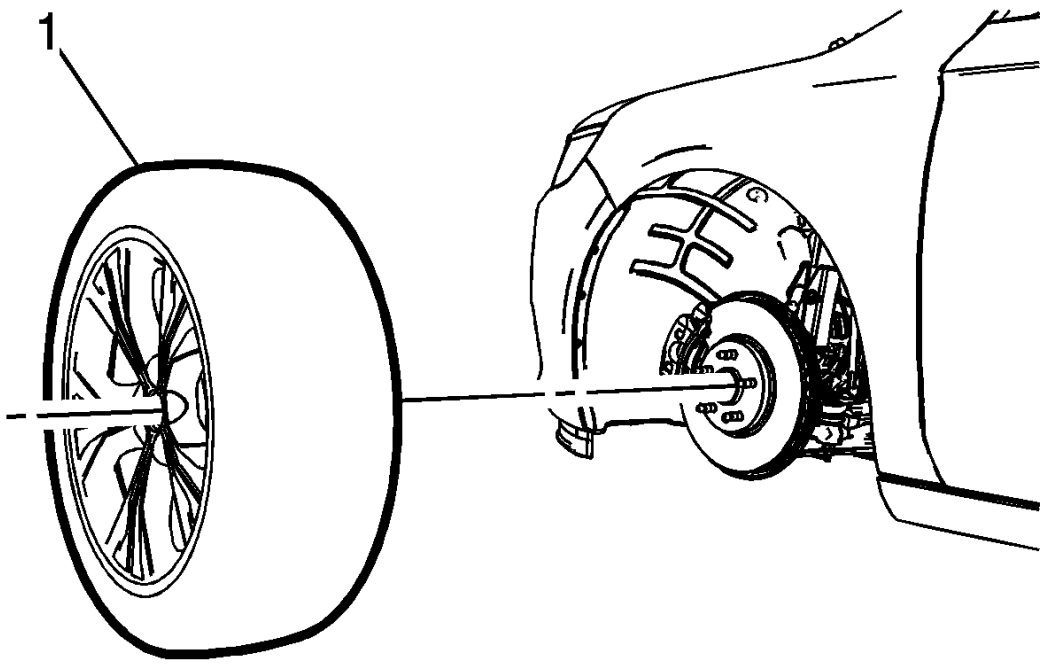

Fig. 8: Tire & Wheel Assembly
Courtesy of GENERAL MOTORS COMPANY

5. Remove the tire and wheel assembly (1).

WARNING: If penetrating oil gets on the vertical surfaces between the wheel and the rotor or drum it could cause the wheel to work loose as the vehicle is driven, resulting in loss of control and an injury accident.

CAUTION: Removing the wheel may be difficult because of foreign materials or a tight fit between the wheel and the hub/rotor. Slightly tap the tire side wall with a rubber mallet in order to remove the wheel. Failure to follow these instructions may result in damage to the wheel.

CAUTION: Never use heat to loosen a tight wheel bolt or nut. This can shorten the life of wheel and damage wheel bearings.

6. If the tire and wheel assembly is difficult to remove or cannot be removed, perform the following steps:
   - Hand install the wheel nuts.
   - Loosen the wheel nuts 2 complete turns.

- Lower the vehicle.
- Rock the vehicle from side to side.
- Repeat the procedure if necessary.

7. When the tire and wheel assembly loosens, raise and support the vehicle. Refer to **Lifting and Jacking the Vehicle** .
8. Remove the wheel nuts.
9. Remove the tire and wheel assembly.

Installation Procedure

WARNING: **Before installing the wheels, remove any buildup of corrosion on the wheel mounting surface and brake drum or disc mounting surface. Installing wheels with poor metal-to-metal contact at the mounting surfaces can cause wheel nuts to loosen. This can cause a wheel to come off when the vehicle is moving, causing loss of control and possibly personal injury.**

NOTE: **Do not use power grinding tools to clean the brake rotor or drum to wheel mating surfaces.**

1. Using a wire brush or wire wheel, clean the wheel to brake rotor or drum mating surface.
2. Using the **CH-41013** Rotor Resurfacing Kit , clean the rotor or drum to wheel contact area.
3. Using the **CH-42450-A** Wheel Hub Resurfacing Kit , clean the surfaces around the wheel studs.
4. Clean the threads of the wheel studs.
5. If the threads of the wheel stud are damaged, replace the wheel stud. Refer to **Wheel Stud Replacement** , or **Wheel Stud Replacement** .
6. After cleaning all of the wheel and brake rotor or drum contact areas, use brake cleaner or denatured alcohol to remove any dirt and debris from the wheel nuts and the brake rotor or drum.
7. Inspect and clean the contact areas of the wheel. Refer to **Wheel Mounting Surface Check**.

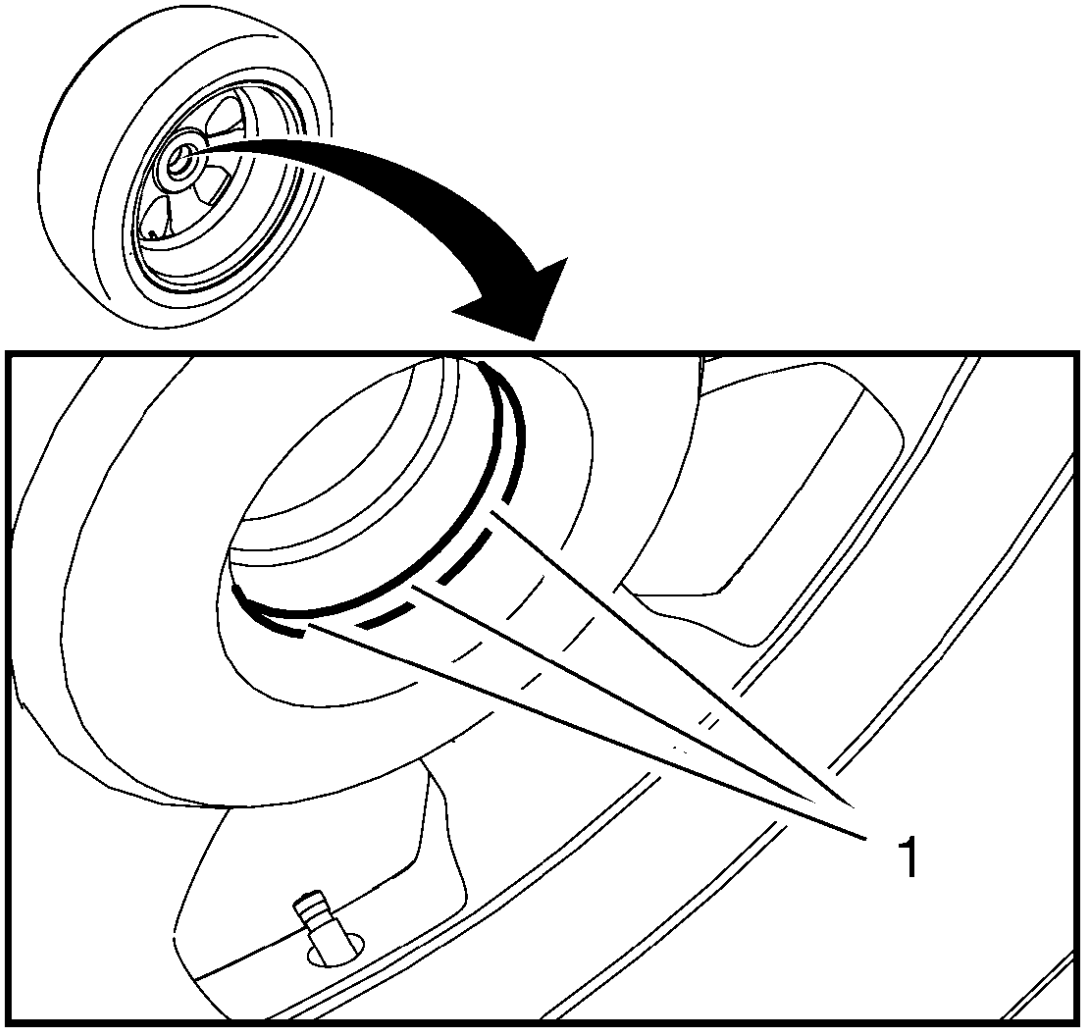

Fig. 9: Rim Inner Center Seat
Courtesy of GENERAL MOTORS COMPANY

8. Apply a small amount of lubricant to the inner diameter of the wheel hub pilot hole (1) where it contacts the wheel hub flange. Refer to **Adhesives, Fluids, Lubricants, and Sealers**.

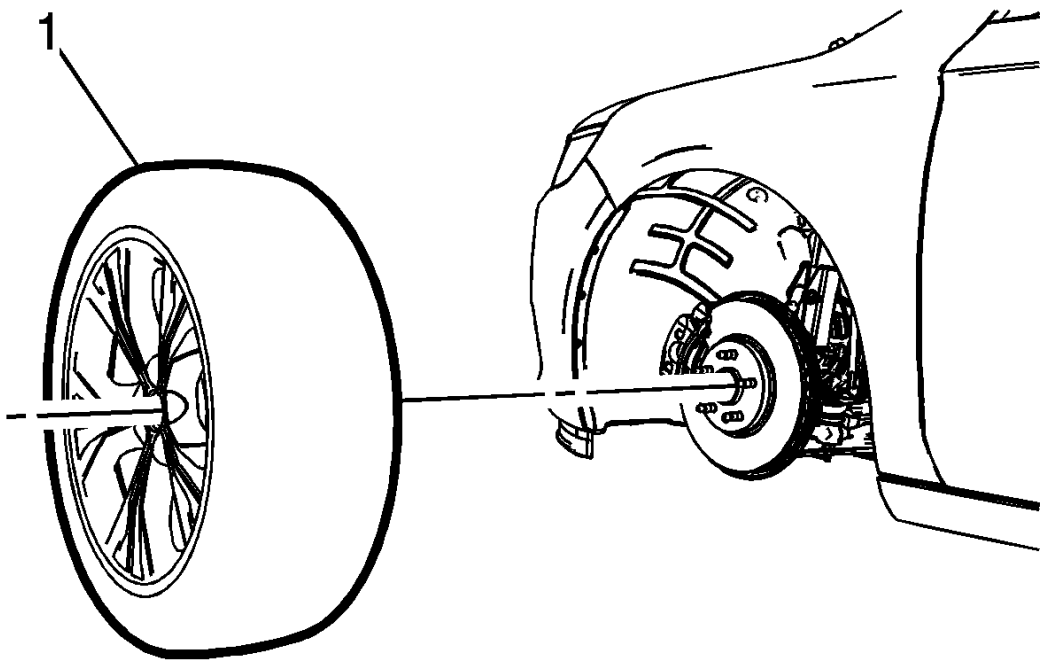

Fig. 10: Tire & Wheel Assembly
Courtesy of GENERAL MOTORS COMPANY

9. Install the tire and wheel assembly (1).

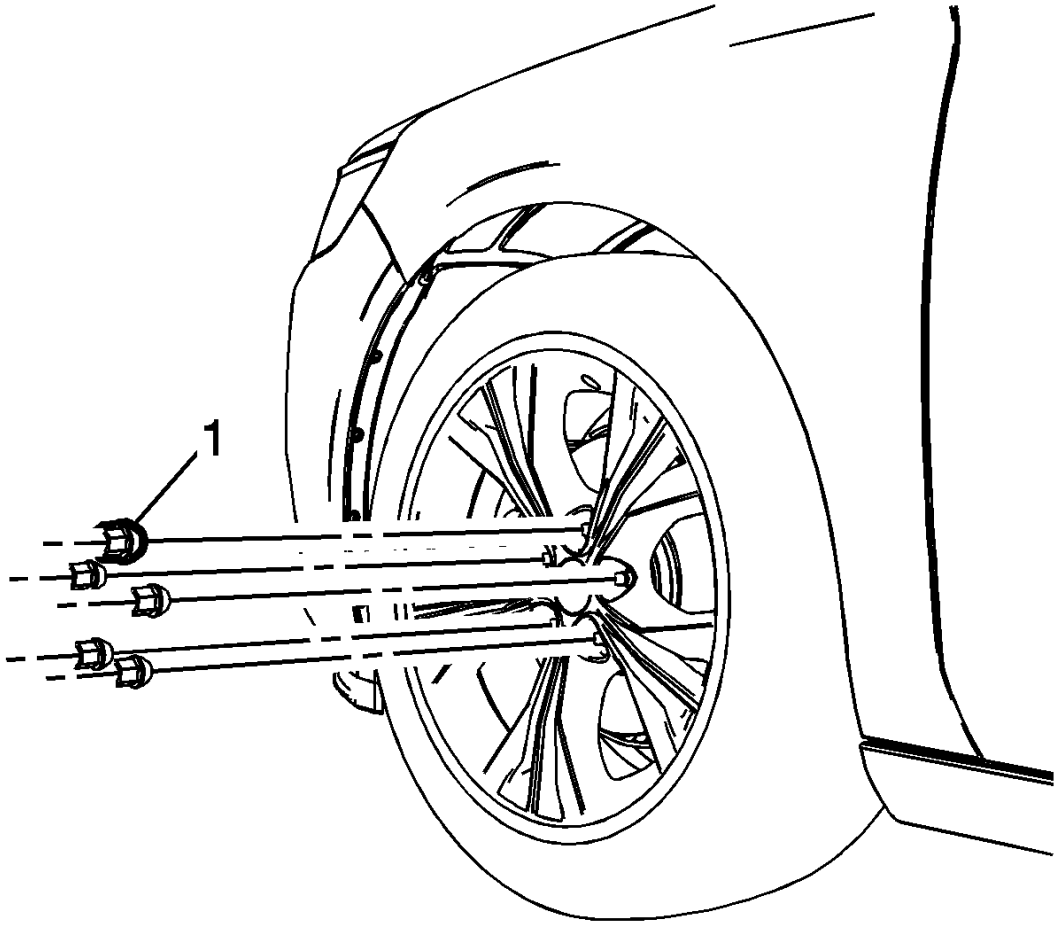

Fig. 11: Wheel Nuts
Courtesy of GENERAL MOTORS COMPANY

WARNING: Never grease or lubricate wheel nuts, studs and mounting surfaces. Wheel nuts, studs, and mounting surfaces must be clean and dry. Tightening the lubricated parts can cause damage to the wheel studs. This can cause a wheel to come off when the vehicle is moving, causing loss of control and possibly personal injury.

10. Hand install the wheel nuts (1).

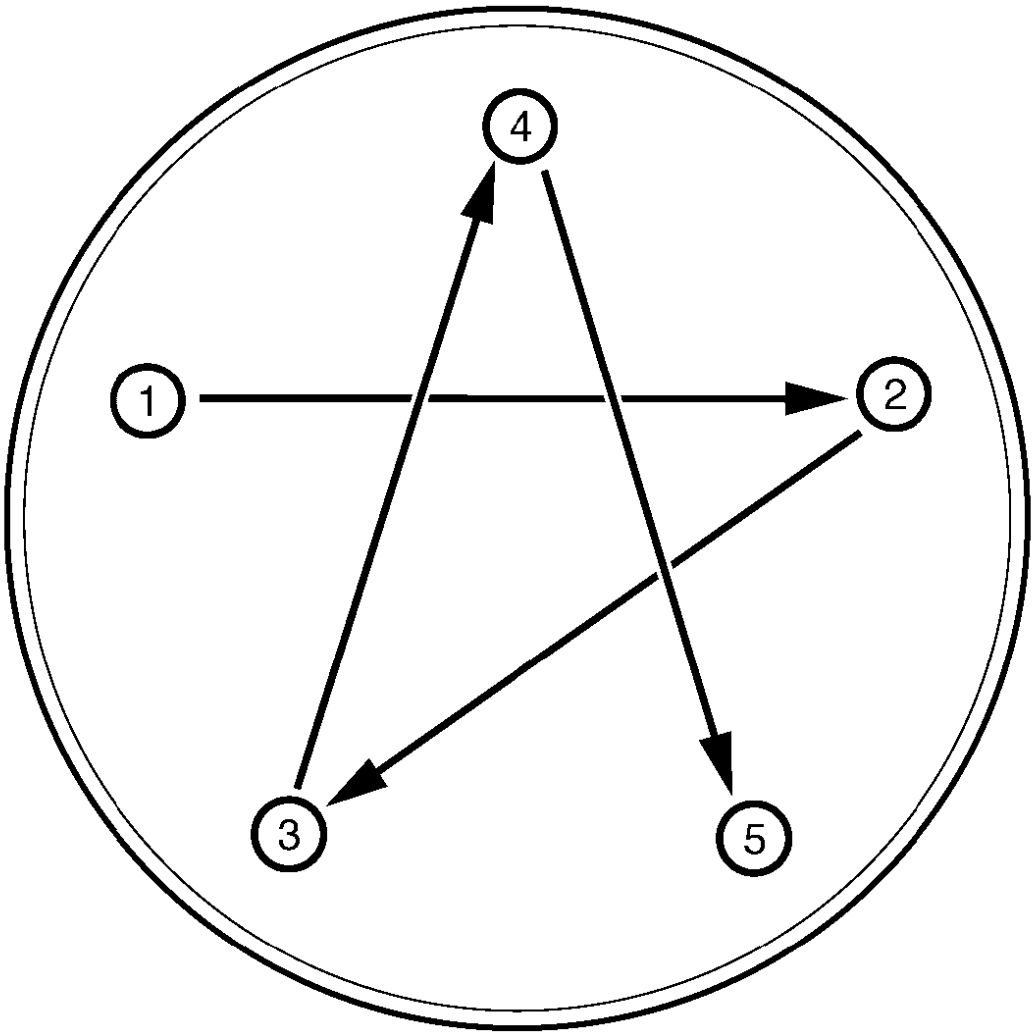

Fig. 12: Wheel Nut Tightening Sequence
Courtesy of GENERAL MOTORS COMPANY

CAUTION: **Improperly tightened wheel bolts or nuts can lead to brake pulsation and rotor damage. In order to avoid expensive brake repairs, evenly tighten the wheel bolts or nuts to the proper torque specification.**

CAUTION: **Refer to Fastener Caution .**

11. Using a torque wrench and the appropriate socket, alternately and evenly tighten the wheel nuts in the sequence illustrated.
    - If equipped with aluminum wheels, tighten the wheel nuts to 126 N.m (93 lb ft).
    - If equipped with steel wheels, tighten the wheel nuts to 140 N.m (103 lb ft).

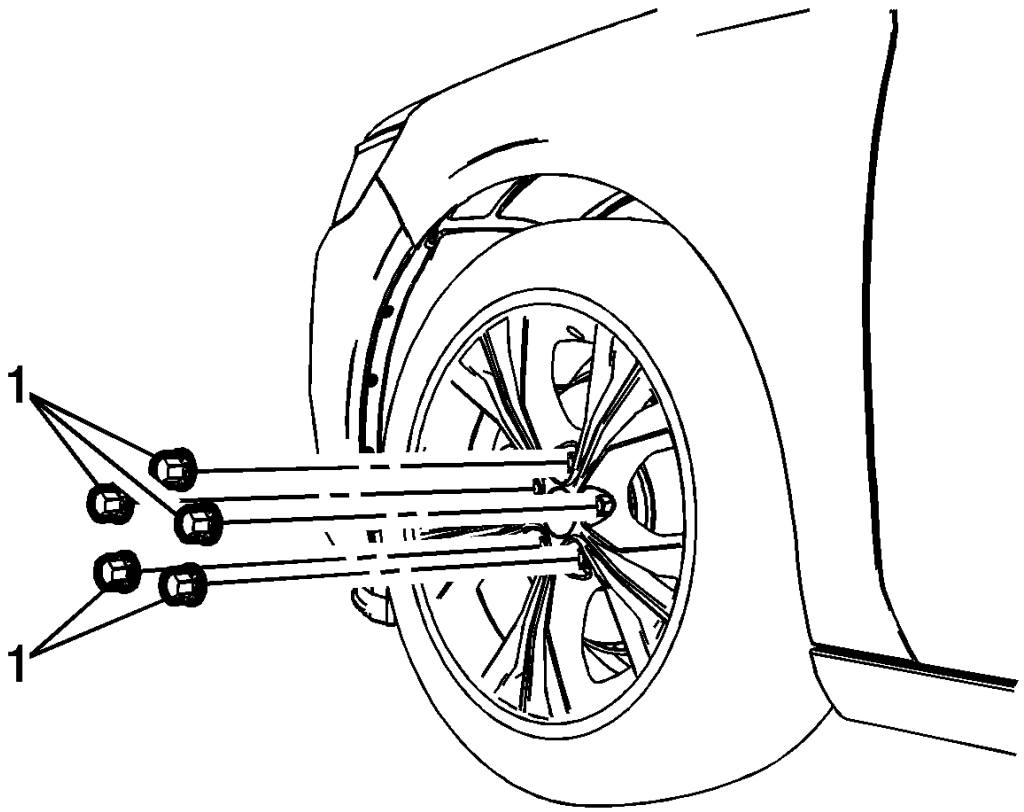

Fig. 13: Wheel Nut Caps
Courtesy of GENERAL MOTORS COMPANY

12. Install the wheel nut caps (1), if equipped.
13. Install the wheel center cap, if equipped.

TIRE REPAIR

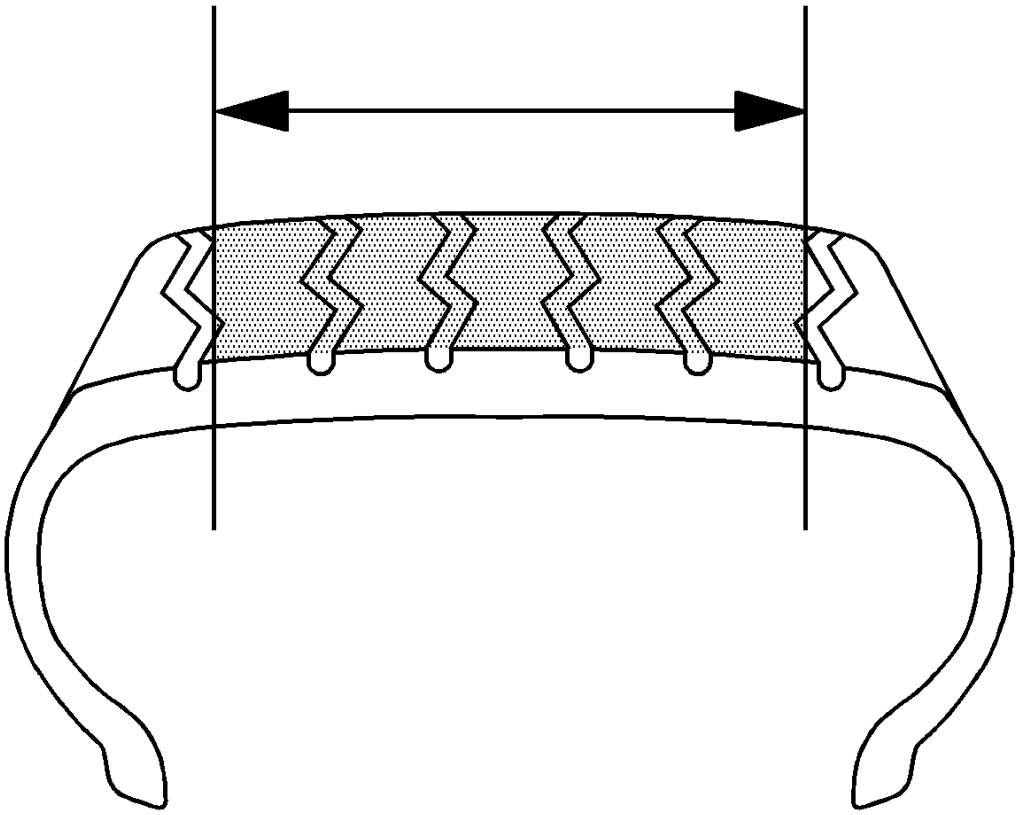

Fig. 14: Identifying Repairable Area On A Radial Tire
Courtesy of GENERAL MOTORS COMPANY

WARNING:

- **Tire changing can be dangerous and should be done by trained professionals using proper tools and procedures. Always read and understand any manufacturer's warnings contained in their customers literature or molded into the tire sidewall.**
- **Serious eye and ear injury may result from not wearing adequate eye and ear protection while repairing tires.**
- **NEVER inflate beyond 275 kPa (40 pounds) pressure to seat beads.**
- **NEVER stand, lean or reach over the assembly during inflation.**

Repairable area on a radial tire.

NOTE:

- **NEVER repair tires worn to the tread indicators 1.59 mm (2/32 in) remaining depth.**
- **NEVER repair tires with a tread puncture larger than 6.35 mm (1/4 in).**
- **NEVER substitute an inner tube for a permissible or non-permissible**

repair.

- **NEVER perform an outside-in tire repair (plug only, on the wheel).**
- **Every tire must be removed from the wheel for proper inspection and repair.**
- **Regardless of the type of repair used, the repair must seal the inner liner and fill the injury.**
- **Consult with repair material supplier/manufacturer for repair unit application procedures and repair tools/repair material recommendations.**

Three basic steps for tire puncture repair:

1. Remove the tire from the wheel for inspection and repair.
2. Fill the injury (puncture) to keep moisture out.
3. Seal the inner liner with a repair unit to prevent air loss.

External Inspection

1. Prior to demounting, inspect the tire surface, the valve and the wheel for the source of the leak by using a water and soap solution. Mark the injured area and totally deflate the tire by removing the valve core.
2. Demount the tire from the wheel and place the tire on a well-lighted spreader.

Internal Inspection

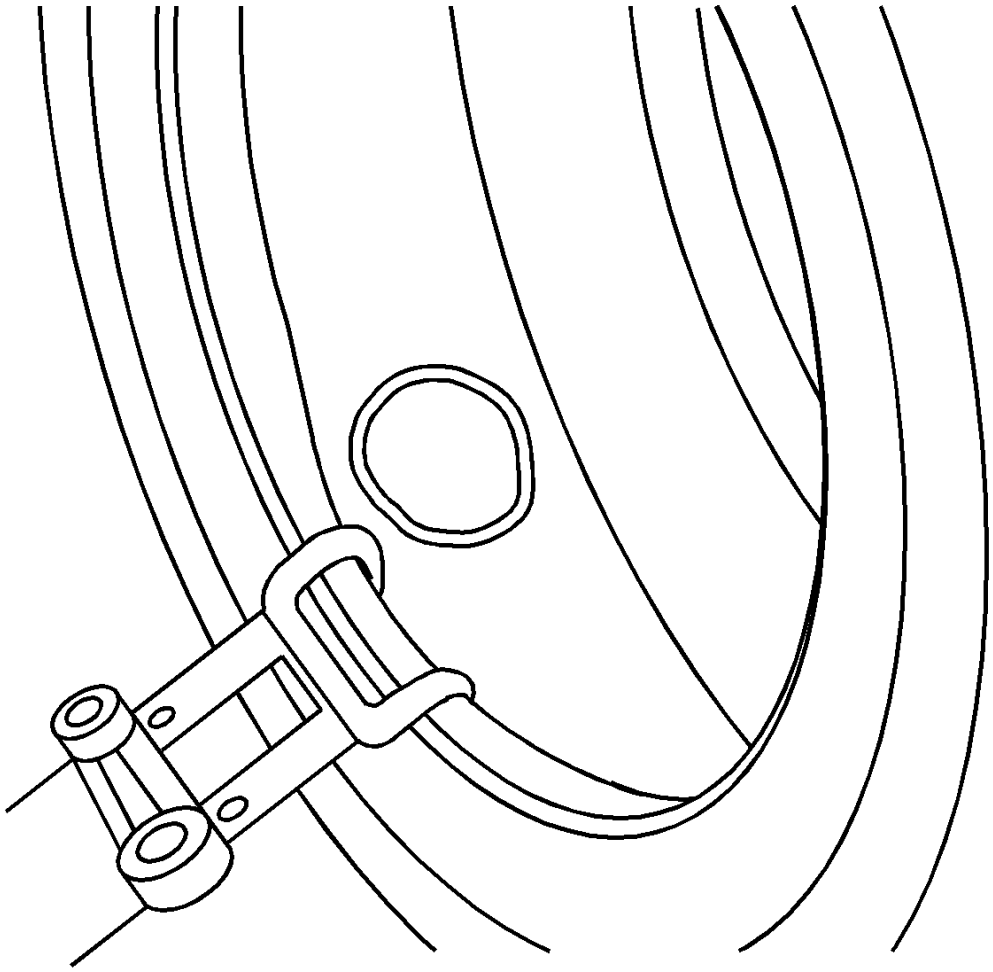

Fig. 15: Marking Tire Puncture Location
Courtesy of GENERAL MOTORS COMPANY

1. Spread the beads and mark the puncture with a tire crayon.
2. Inspect the inner tire for any signs of internal damage.
3. Remove the puncturing object, noting the direction of the penetration.
4. Probe the injury with a blunt awl in order to determine the extent and direction of the injury.
5. Remove any loose foreign material from the injury.
6. Punctures exceeding 6.35 mm (1/4 in) should not be repaired.

Cleaning

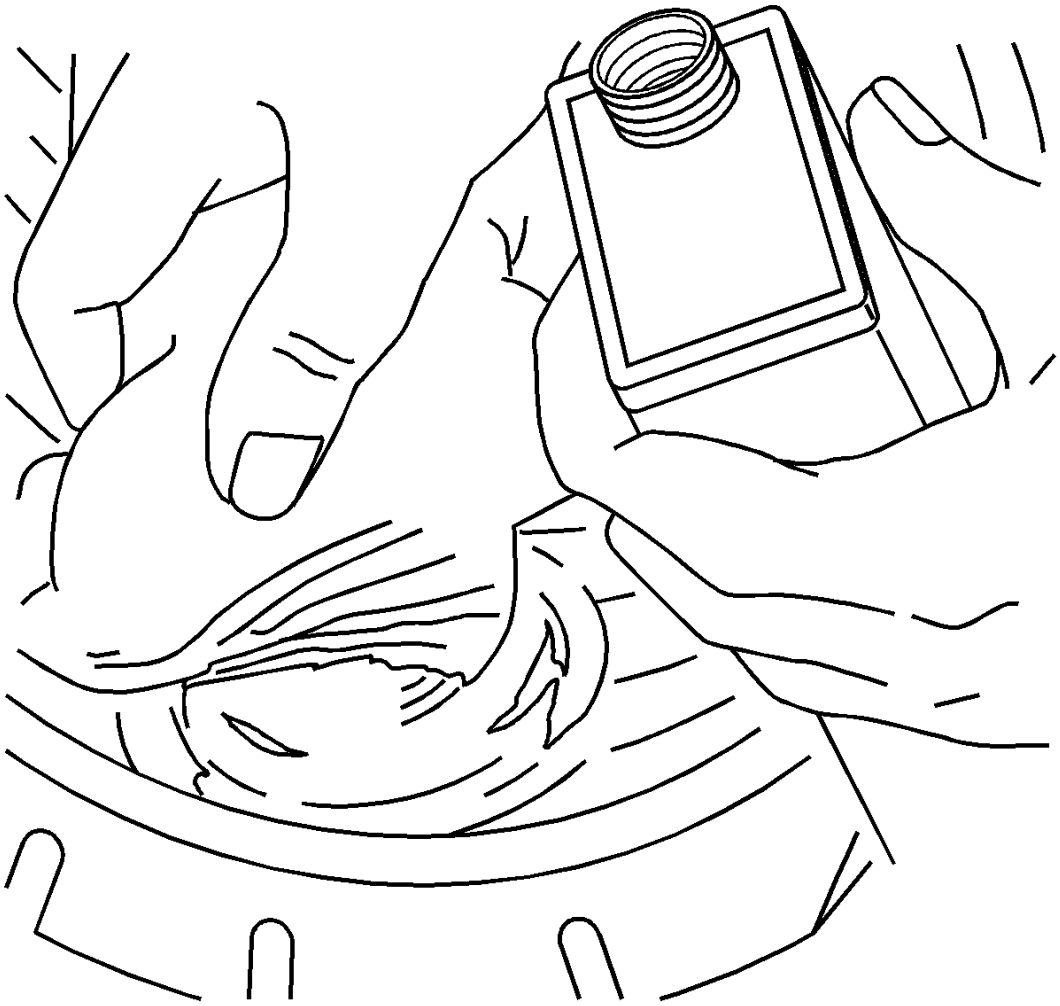

Fig. 16: Cleaning Repair Area
Courtesy of GENERAL MOTORS COMPANY

1. Clean the area around the puncture thoroughly with a proper liner cleaner, clean cloth and a scraper. This step serves to remove dirt and mold lubricants to insure proper adhesion and non-contamination of the buffing tool.
2. Refer to information on the product or manufacturer's Material Safety Data Sheet and follow guidelines for handling and disposal.

Clean the Injury Channel

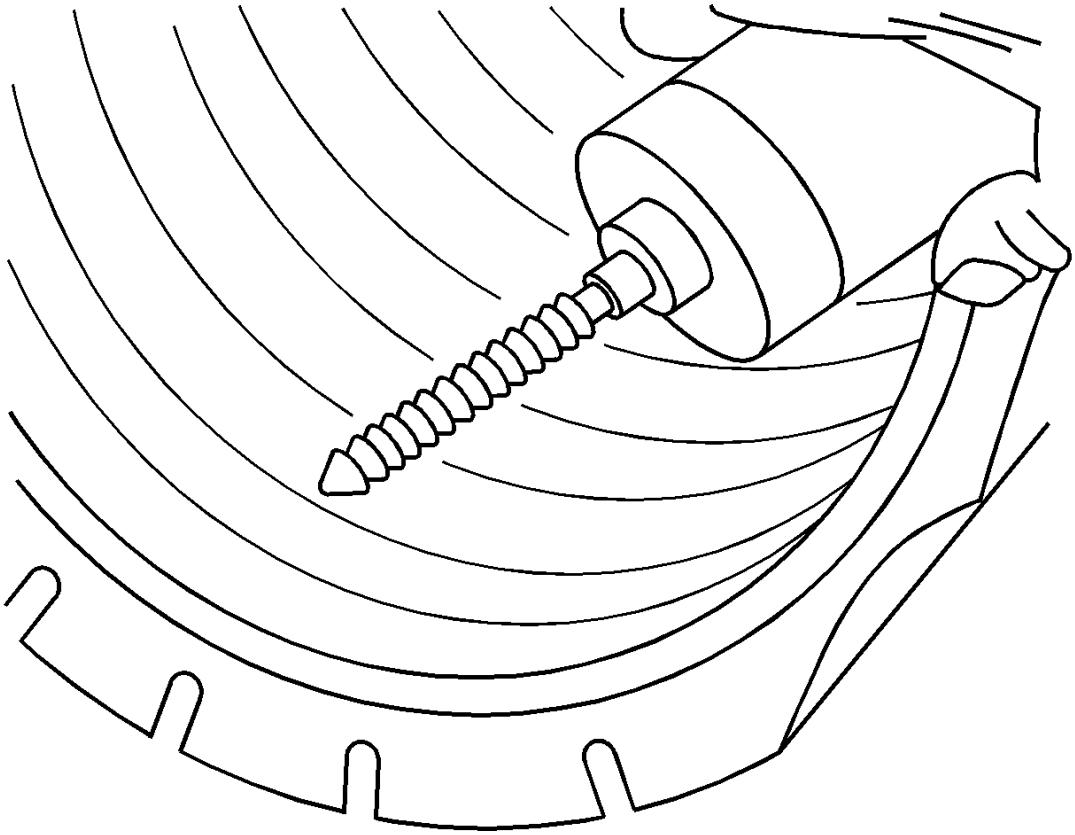

Fig. 17: Reaming Puncture Channel
Courtesy of GENERAL MOTORS COMPANY

1. Use a proper hand reamer, carbide cutter or drill bit to ream the puncture channel from the inside of the tire in order to clean the injury.
2. Remove steel wires protruding above the liner surface to prevent damage to the repair unit.
3. Consult your repair material supplier for recommended reaming tool(s).

Fill the Injury

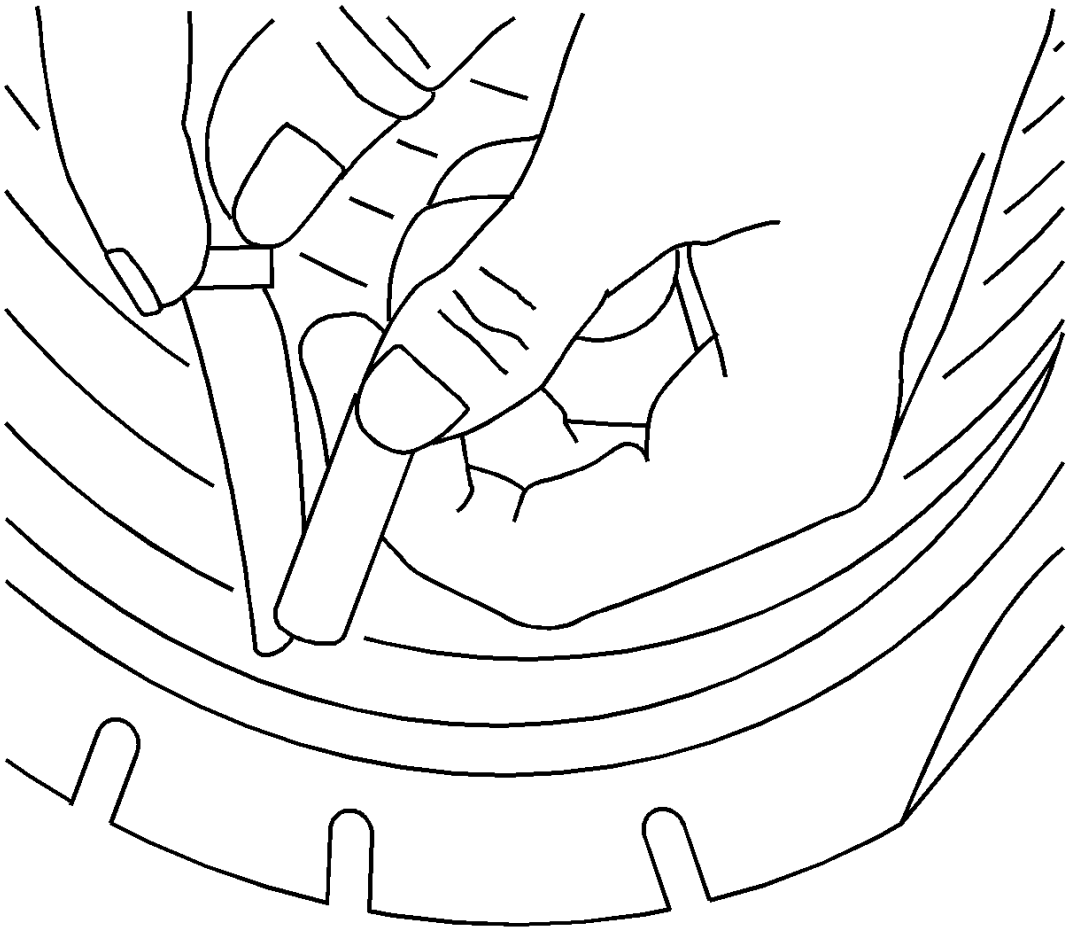

Fig. 18: Filling Injury Location
Courtesy of GENERAL MOTORS COMPANY

1. It is necessary to fill the injury channel to provide back up for the repair unit and to prevent moisture from entering the tire fabric and steel wires.
2. For combination repair/plug units skip this step. Cement the injured channel and fill the injury from the inside of the tire with the repair plug per repair material manufacturer recommendations. Without stretching the plug, cut the plug off just above the inside tire surface.
3. Consult your repair material supplier for proper repair material selection.

Repair Unit Selection

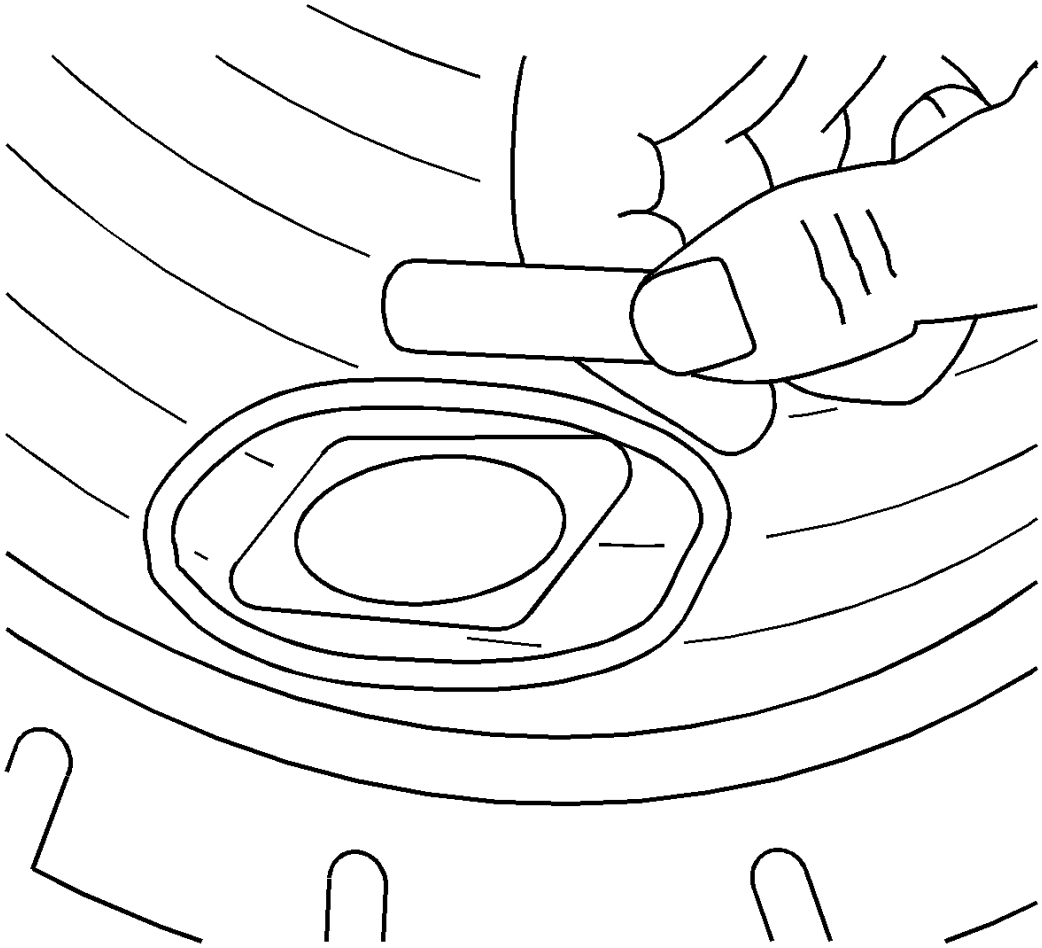

Fig. 19: Outlining Tire Injury Area
Courtesy of GENERAL MOTORS COMPANY

NOTE: **Do not install the repair unit in this step.**

1. Center the repair unit over the injury as a reference and outline an area larger than the unit so that buffing will not remove the crayon marks.
2. Remove the repair unit.
3. DO NOT overlap previous or multiple repair units.
4. Consult your repair material supplier for proper repair unit selection.

Buffing

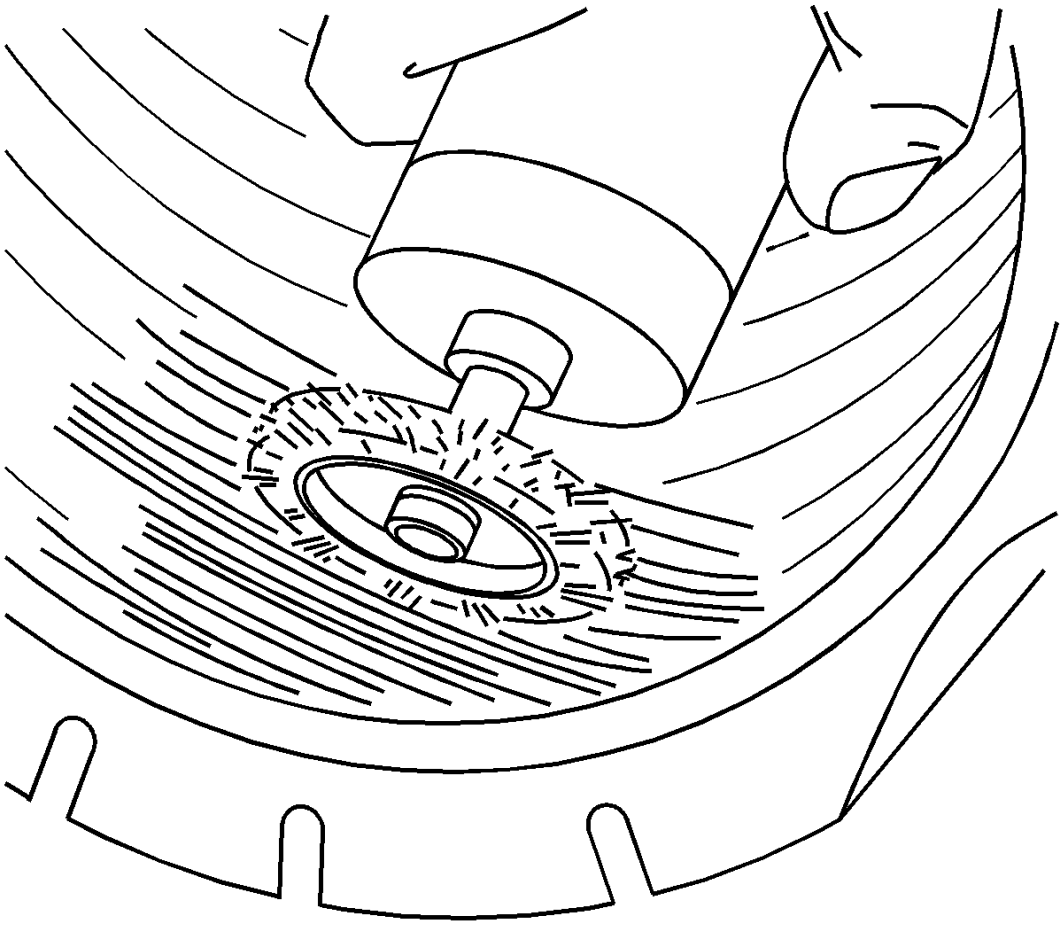

Fig. 20: Buffing Within Marked Area
Courtesy of GENERAL MOTORS COMPANY

1. To prevent contamination and preserve the outline, buff within the marked area thoroughly and evenly with a low speed buffing tool using a fine wire brush or gritted rasp.
2. Buff to a smooth velvet surface (RMA number 1 or number 2 buffed texture).
3. Use caution not to gouge the inner liner or expose casing fabric.
4. Remove any buffing dust with a vacuum cleaner.
5. Consult your repair material supplier for a proper buffing tool.

Cementing

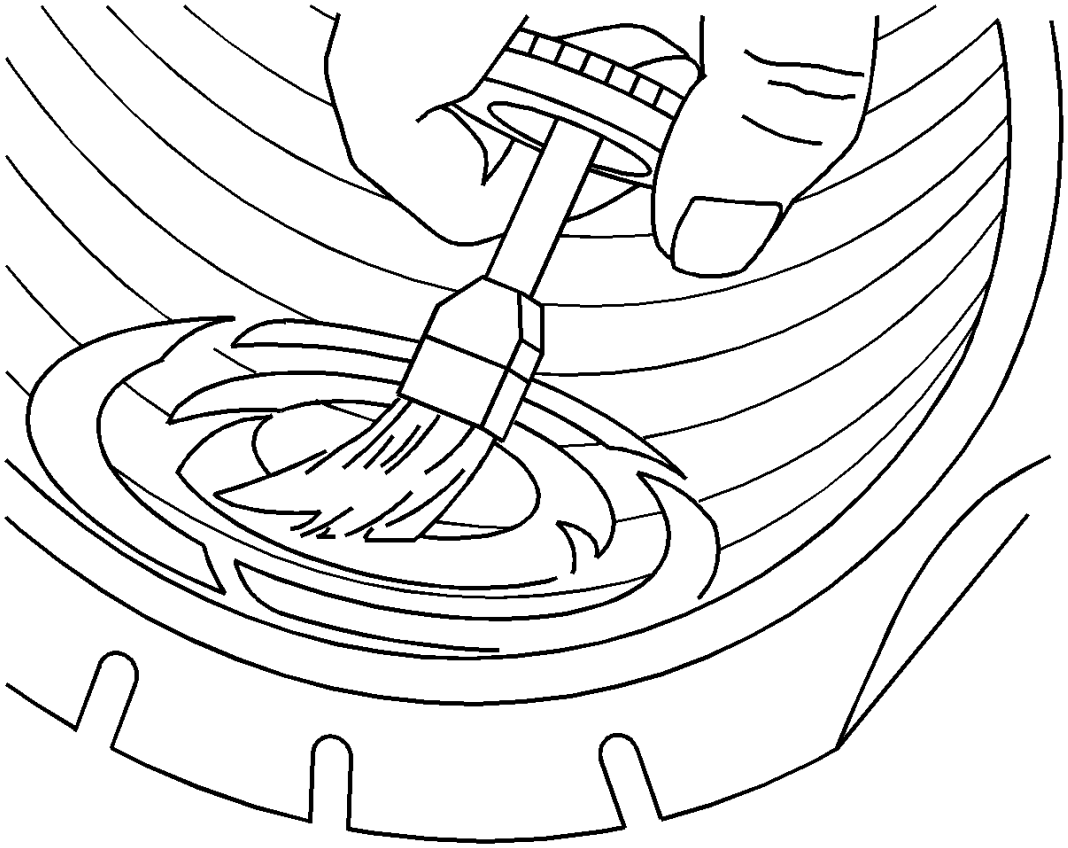

Fig. 21: Applying Chemical Cement
Courtesy of GENERAL MOTORS COMPANY

Apply chemical cement according to the repair material manufacturers procedures.

Repair Unit Application

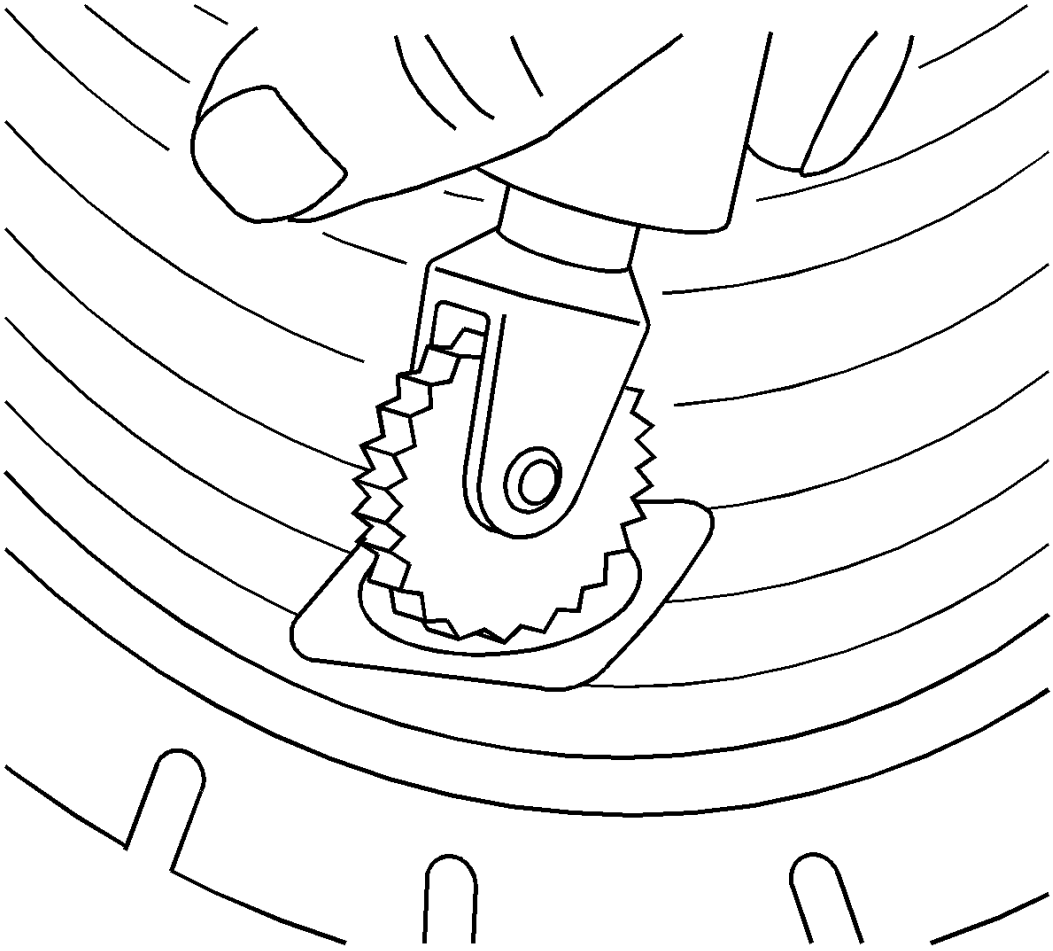

Fig. 22: Installing Repair Unit
Courtesy of GENERAL MOTORS COMPANY

The tire must be in the relaxed position when the repair unit is installed. Do not spread the beads excessively.

Two-Piece Plug and Repair Units

1. If applicable, install the repair unit so that the alignment is correct.
2. Center the repair unit over the injury and stitch down thoroughly with the stitching tool, working from the center out.

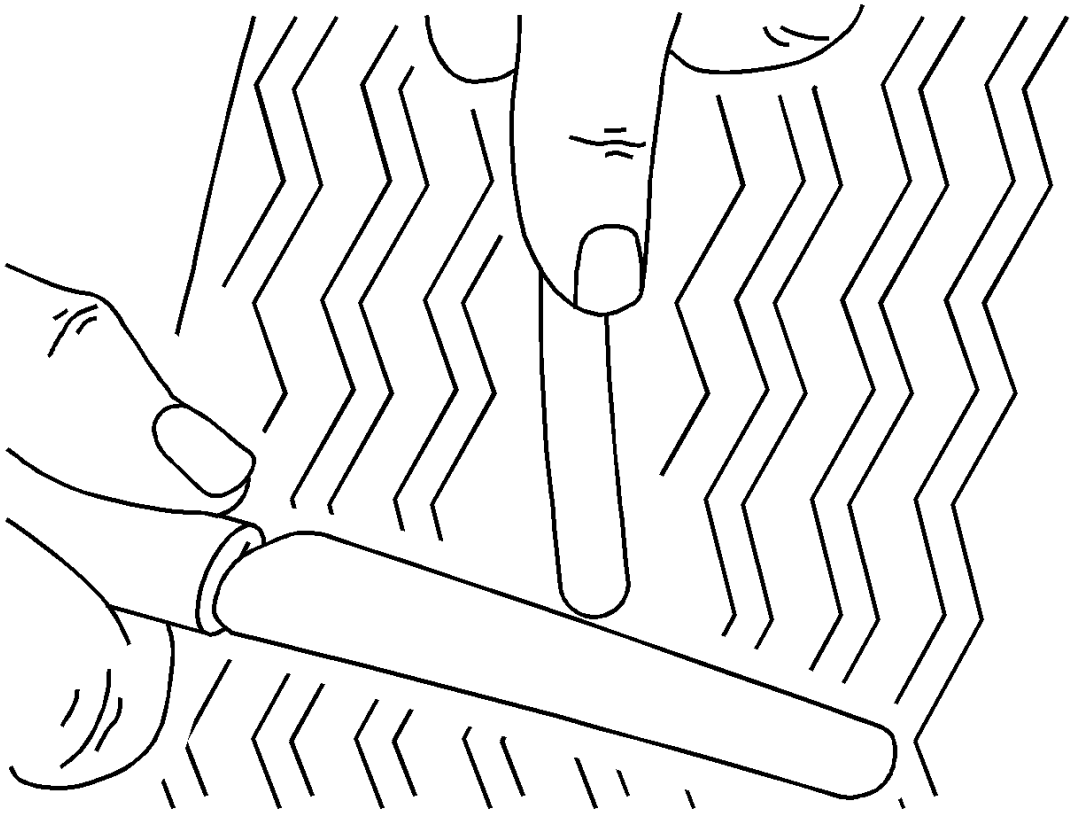

Fig. 23: Cutting Plug Material
Courtesy of GENERAL MOTORS COMPANY

3. Being careful not to stretch the plug material, cut the plug flush with the outer tread.

Combination Repair/Plug Units

1. Pull the plug through the injury until the repair just reaches the liner. Stitch down thoroughly.
2. Follow the repair material manufacturer's recommendations for further installation instructions.

   Consult your repair material supplier for the proper stitching tool.

Safety Cage

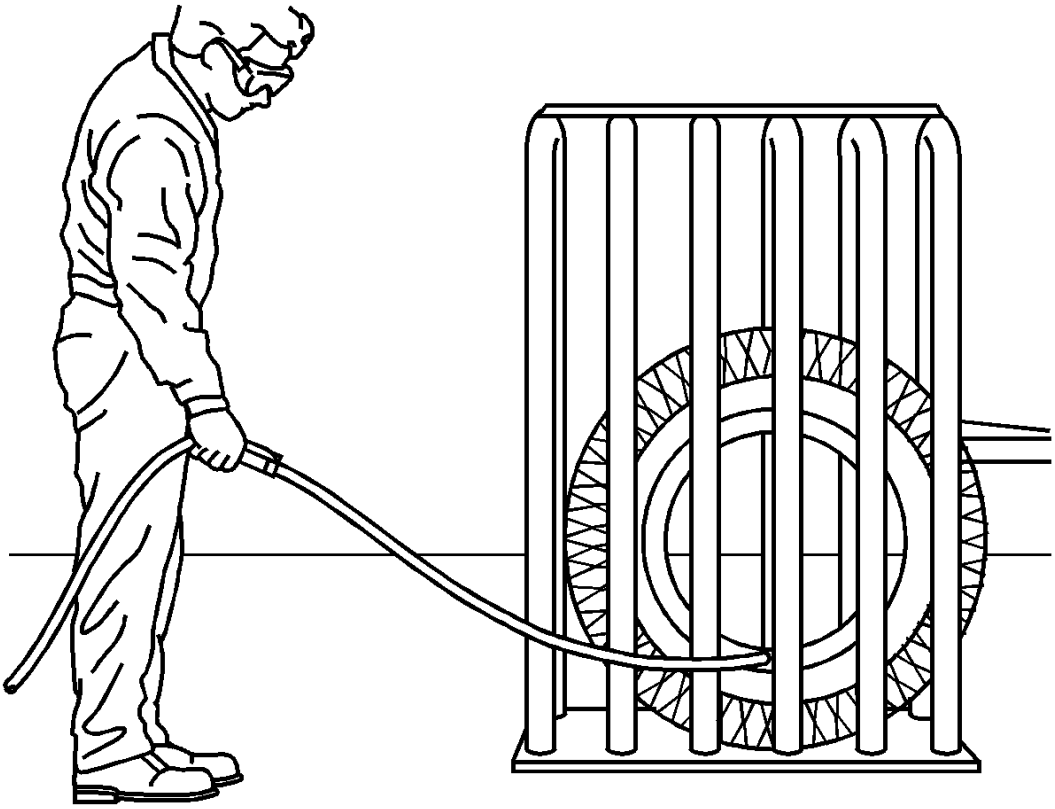

Fig. 24: Identifying Safety Cage
Courtesy of GENERAL MOTORS COMPANY

Some run flat tires may require more than 275 kPa (40 psi) to seat the bead. In such a case, a tire safety cage must be used. Consult the tire manufacturer for its individual repair policy.

Final Inspection

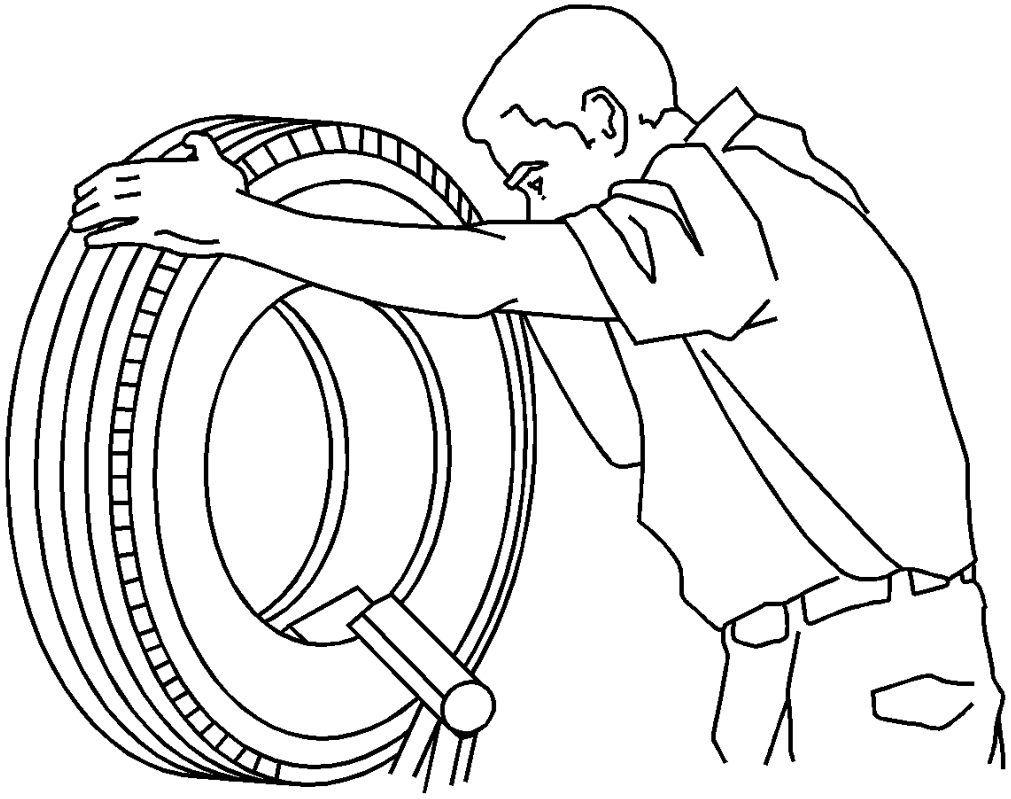

Fig. 25: Performing Final Inspection
Courtesy of GENERAL MOTORS COMPANY

1. After remounting and inflating the tire, check both beads, the repair and the valve with a water and soap solution in order to detect leaks.
2. If the tire continues to lose air, the tire must be demounted and reinspected.
3. Balance the tire and wheel assembly. Refer to **Tire and Wheel Assembly Balancing - Off Vehicle** .

TIRE DISMOUNTING AND MOUNTING

CAUTION: Use a tire changing machine in order to dismount tires. Do not use hand tools or tire irons alone in order to remove the tire from the wheel. Damage to the tire beads or the wheel rim could result.

CAUTION: Do not scratch or damage the clear coating on aluminum wheels with the tire changing equipment. Scratching the clear coating could cause the aluminum wheel to corrode and the clear coating to peel from the wheel.

CAUTION: Damage to either the tire bead or the wheel mounting holes can result from the use of improper wheel attachment or tire mounting procedures. It takes up to 70 seconds for all of the air to completely exhaust from a large tire. Failure to follow the proper procedures could cause the tire changer to put enough force on the tire to bend the wheel at the mounting surface. Such damage may result in vibration and/or shimmy, and under severe usage lead to wheel cracking.

1. Remove the valve core from the valve stem.
2. Deflate the tire completely.

NOTE: Rim-clamp European-type tire changers are recommended.

3. Use the tire changer in order to remove the tire from the wheel. Follow steps 4-7 to remove the tire from the wheel.

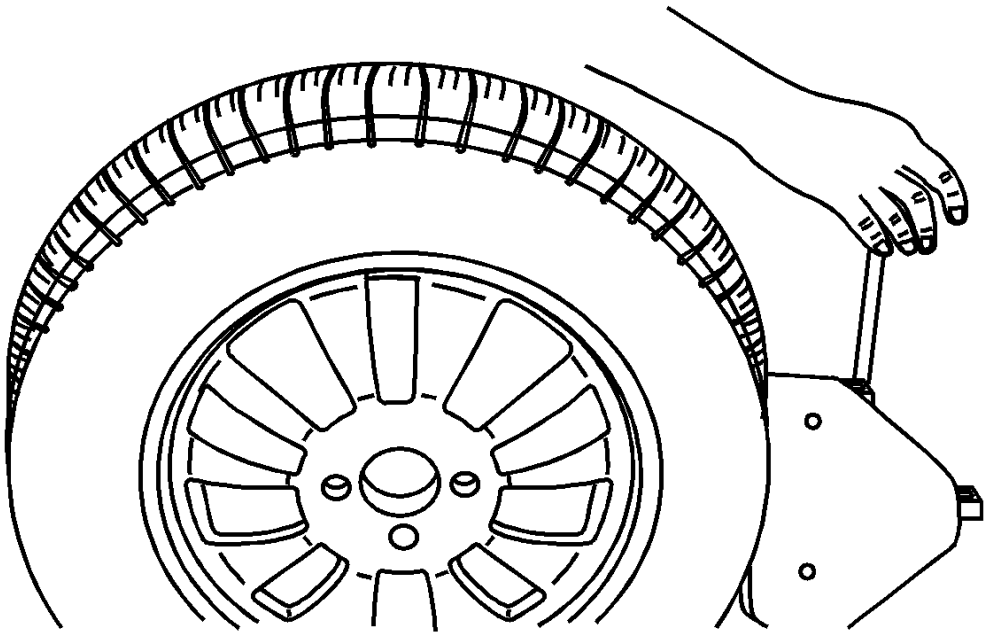

Fig. 26: Using Tire Changer to Remove Tire
Courtesy of GENERAL MOTORS COMPANY

4. When separating the tire bead from the wheel, position the bead breaking fixture 90, 180 and 270 degrees from the valve stem.

CAUTION: Failure to position valve stem in proper position while dismounting and mounting the tire may result in the TPM sensor to become damaged.

5. Position the wheel and tire so the valve stem is at the 7 o'clock position relative to the head. Apply tire bead lubricant to the pry bar to prevent damage to the tire bead. The tire iron or pry bar can be inserted when prying the outer tire bead up and over the mounting/dismounting head.

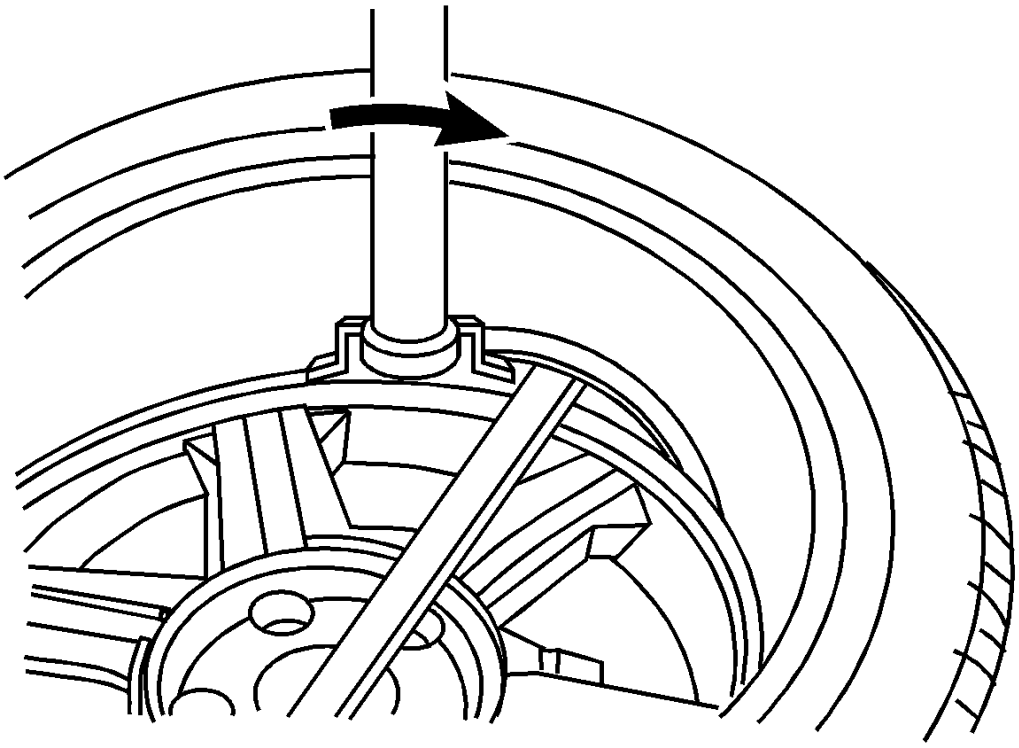

Fig. 27: Separating Tire Bead from Wheel
Courtesy of GENERAL MOTORS COMPANY

6. Position the wheel and tire so the valve stem is again at the 7 o'clock position relative to the head. The tire iron or pry bar can be inserted when prying the inner tire bead up and over the mounting/dismounting head.
7. Remove all residual liquid sealant from the inside of the tire and wheel surfaces. If any tire sealant is noted upon tire dismounting on vehicles equipped with TPM, replace the tire pressure sensor. Refer to **Tire Pressure Indicator Sensor Replacement** .
8. Use medium coarseness steel wool in order to remove any rubber, light rust or corrosion from the wheel bead seats.

CAUTION: When mounting the tires, use an approved tire mounting lubricant. DO NOT use silicon or corrosive base compounds to lubricate the tire bead and the wheel rim. A silicon base compound can cause the tire to slip on the rim. A corrosive type compound can cause tire or rim deterioration.

9. Apply mounting lubricant to the tire bead and the wheel rim. Refer to **Adhesives, Fluids, Lubricants, and Sealers**.

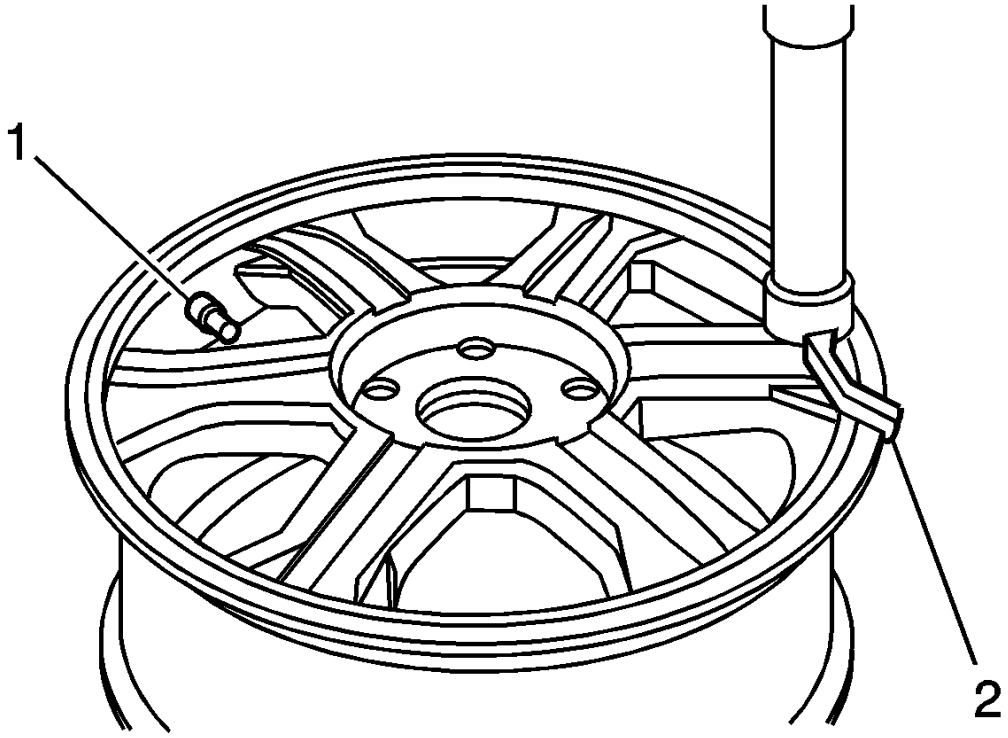

Fig. 28: Position Rim So Valve Stem Is At 7 O'clock Position Relative To Head
Courtesy of GENERAL MOTORS COMPANY

10. Position the rim so the valve stem (1) is at the 7 o'clock position relative to the head (2). This will protect the sensor when the bottom bead seats.

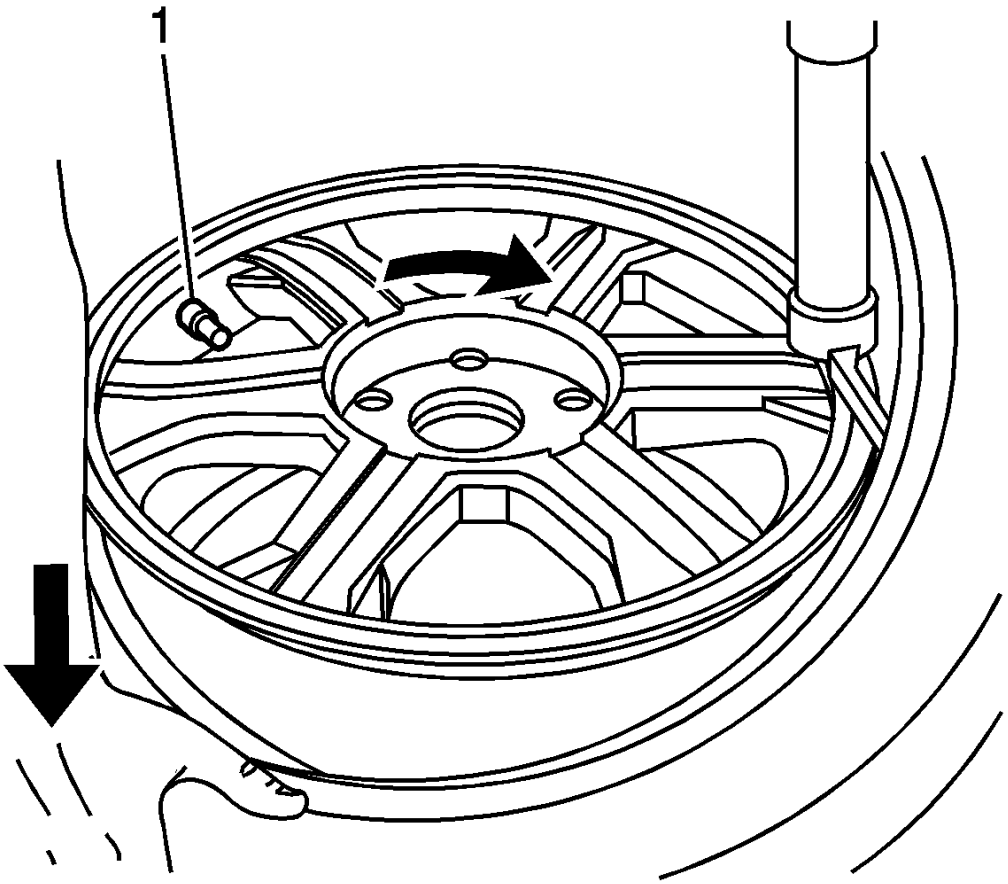

Fig. 29: Ensure Valve Stem Is At 7 O'clock Position
Courtesy of GENERAL MOTORS COMPANY

11. Using the tire machine, rotate the tire/wheel assembly clockwise when transferring the tire bead to the inside of the wheel rim. Ensure that the valve stem (1) is at the 7 o'clock position.

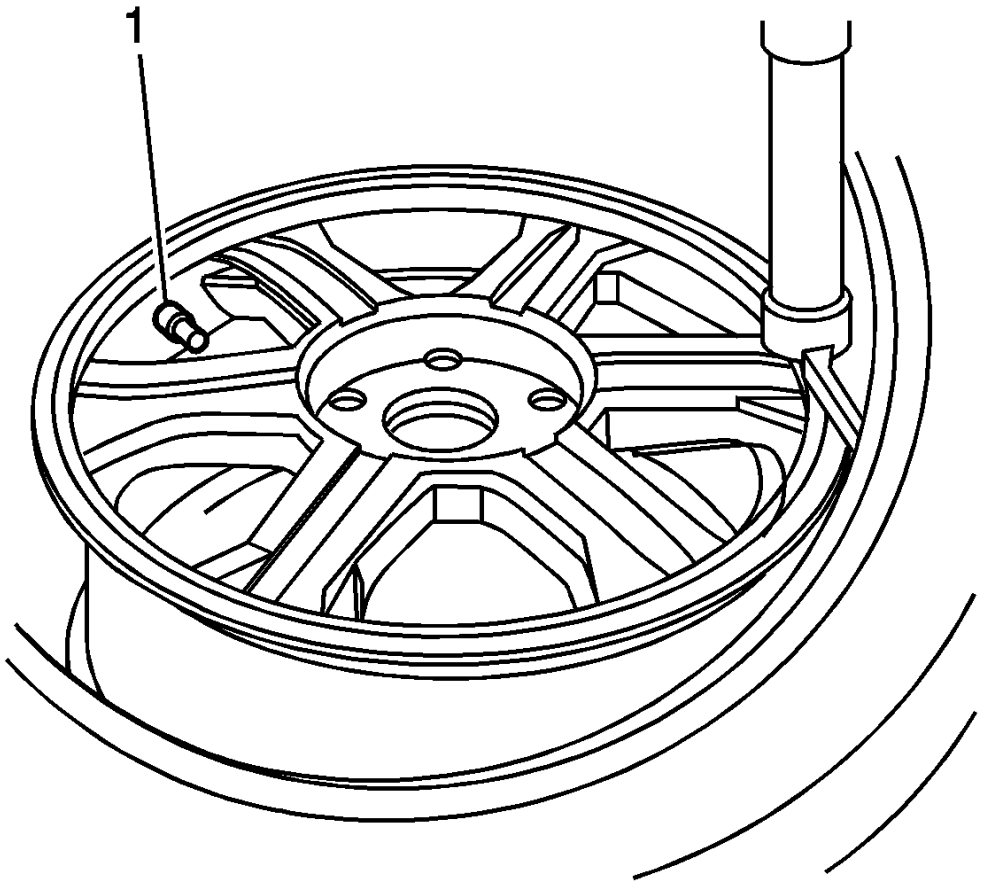

Fig. 30: Reposition Wheel And Tire So Valve Stem Is At 7 O'clock Position Relative To Head
Courtesy of GENERAL MOTORS COMPANY

12. After the bottom bead is on the wheel, reposition the wheel and tire so that the valve stem (1) is at the 7 o'clock position relative to the head. This will protect the sensor while mounting the tire bead to the outside of the wheel.

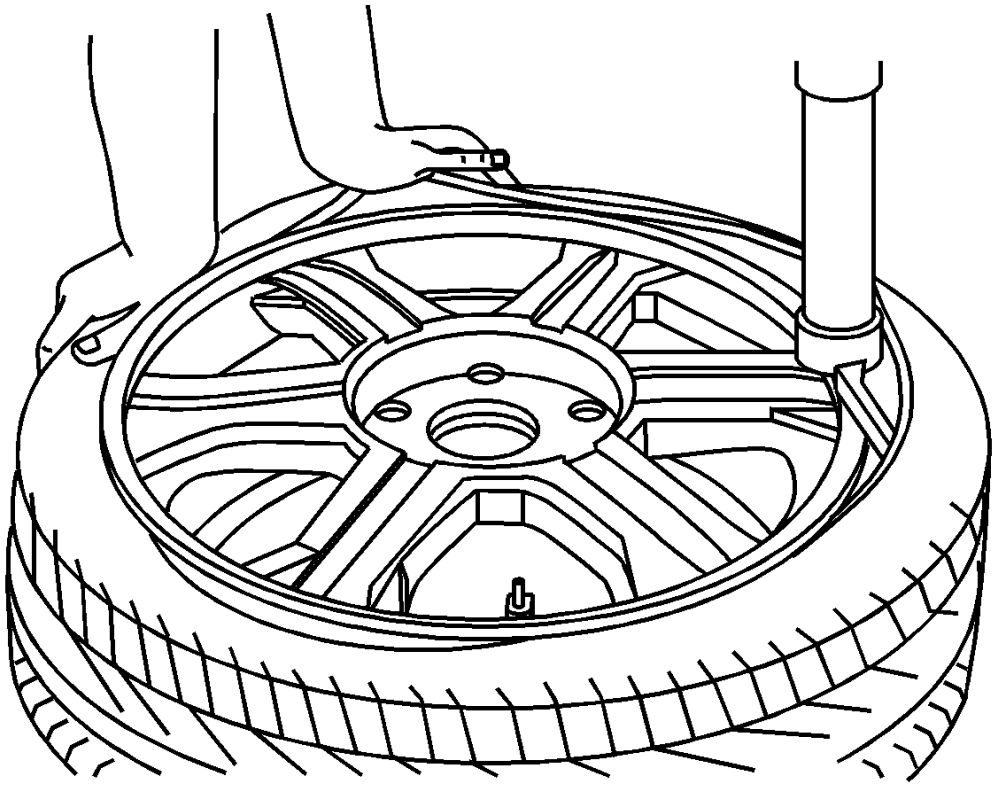

Fig. 31: Using Tire Changer
Courtesy of GENERAL MOTORS COMPANY

13. Use the tire changer in order to install the tire to the wheel.

WARNING: To avoid serious personal injury, do not stand over tire when inflating. The bead may break when the bead snaps over the safety hump. Do not exceed 275 kPa (40 psi) pressure when inflating any tire if beads are not seated. If 275 kPa (40 psi) pressure will not seat the beads, deflate, relubricate the beads and reinflate. Overinflation may cause the bead to break and cause serious personal injury.

14. Inflate the tire until it passes the bead humps. Be sure that the valve core is not installed at this time.
15. Install the valve core to the valve core stem.
16. Inflate the tire to the proper air pressure.
17. Ensure that the locating rings are visible on both sides of the tire in order to verify that the tire bead is fully seated on the wheel.

TIRE ROTATION

Rotate the tires and wheels at frequent intervals to equalize wear. Refer to tire rotation in Maintenance and Lubrication. In addition to scheduled rotation, rotate the tire and wheel whenever uneven tire wear is noticed.

Radial tires tend to wear faster in the shoulder area, particularly in front positions. Radial tires in non-drive locations may develop an irregular wear pattern that may increase tire noise. This makes regular rotation especially necessary.

Refer to **Tire and Wheel Removal and Installation** for tire removal.

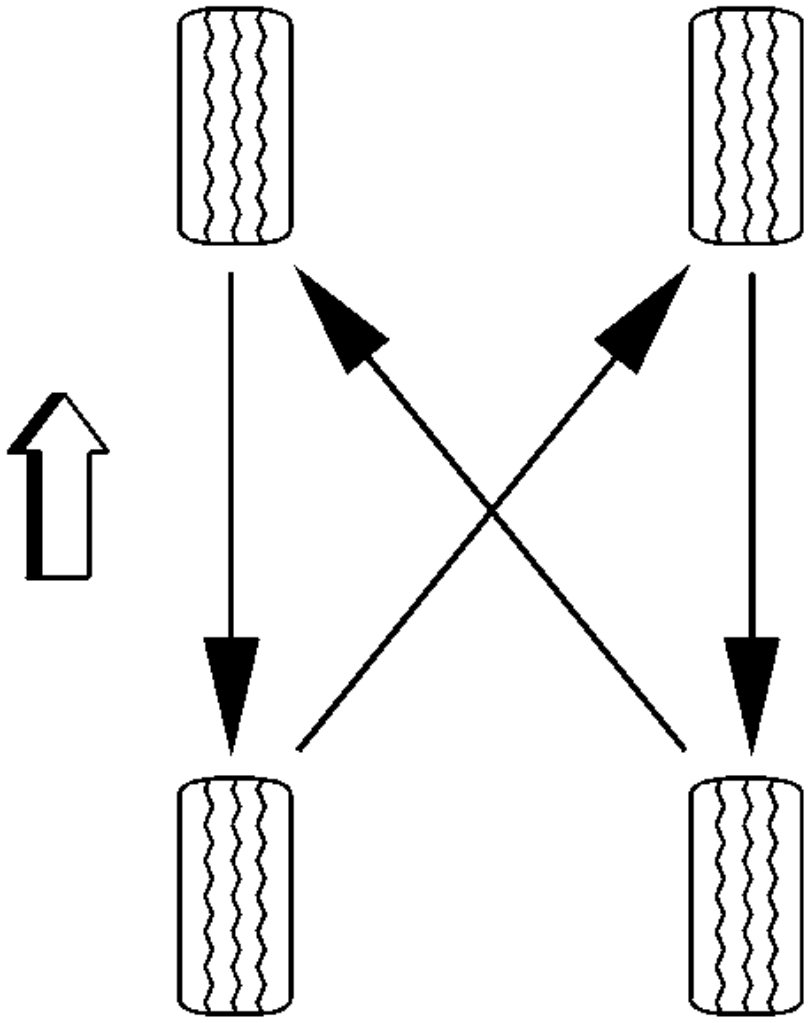

Fig. 32: Identifying Tire Rotation Pattern
Courtesy of GENERAL MOTORS COMPANY

Always use a 4-wheel rotation. After rotation, check the wheel nuts for specified torque. Then, set the tire pressure.

DESCRIPTION AND OPERATION

ALL SEASONS TIRES DESCRIPTION

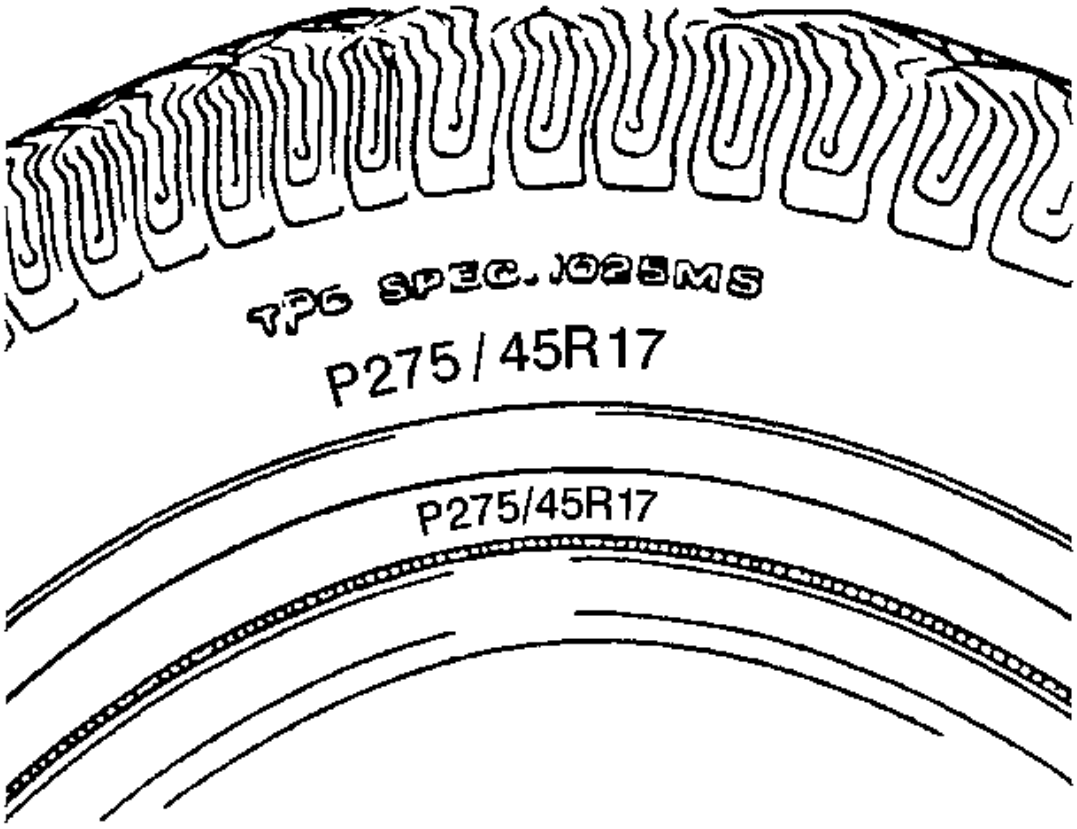

Fig. 33: Identifying All Seasons Tire Marking
Courtesy of GENERAL MOTORS COMPANY

Most GM vehicles are equipped with steel belted all-season radial tires as standard equipment. These tires qualify as snow tires, with a higher than average rating for snow traction than the non-all season radial tires previously used. Other performance areas, such as wet traction, rolling resistance, tread life, and air retention, are also improved. This is done by improvements in both tread design and tread compounds. These tires are identified by an M + S molded in the tire side wall after the tire size. The suffix MS is also molded in the tire side wall after the TPC specification number.

The optional handling tires used on some vehicles now also have the MS marking after the tire size and the TPC specification number.

GENERAL DESCRIPTION

The factory installed tires are designed to operate satisfactorily with loads up to and including the full rated load capacity when these tires are inflated to the recommended pressures.

The following factors have an important influence on tire life:

- Correct tire pressures
- Correct wheel alignment
- Proper driving techniques
- Tire rotation

The following factors increase tire wear:

- Heavy cornering
- Excessively rapid acceleration
- Heavy braking

METRIC WHEEL NUTS AND BOLTS DESCRIPTION

Metric wheel/nuts and bolts are identified in the following way:

- The wheel/nut has the word Metric stamped on the face.
- The letter M is stamped on the end of the wheel bolt.

The thread sizes of metric wheel/nuts and the bolts are indicated by the following example: M12 x 1.5.

- M = Metric
- 12 = Diameter in millimeters
- 1.5 = Millimeters gap per thread

P-METRIC SIZED TIRES DESCRIPTION

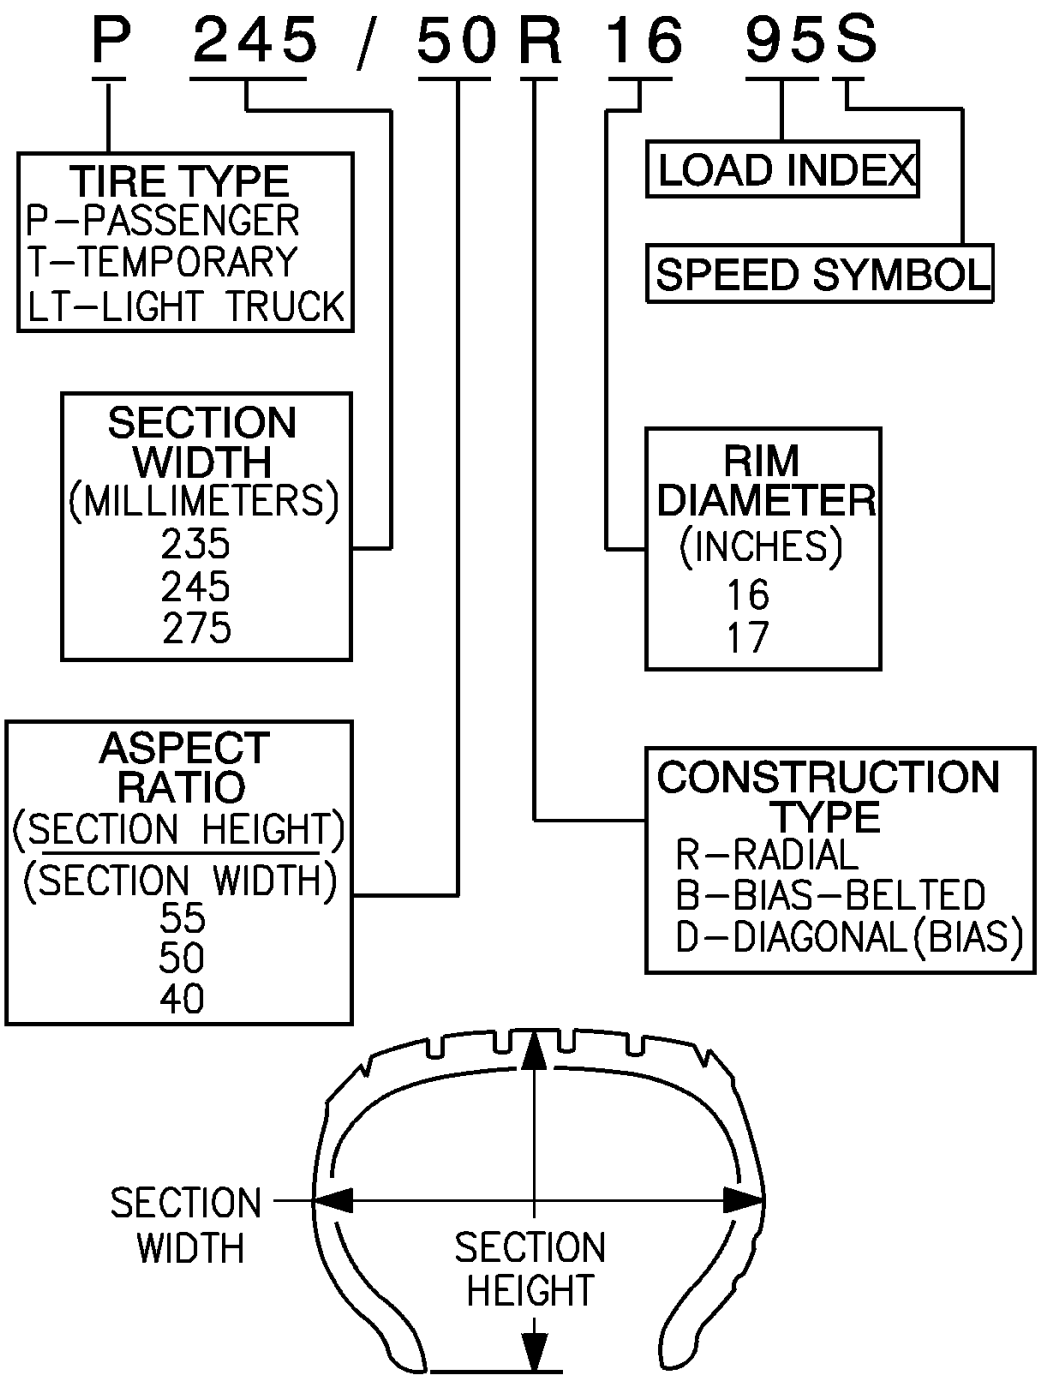

Fig. 34: Identifying P-Metric Sized Tire Marking
Courtesy of GENERAL MOTORS COMPANY

Replacement tires should be of the same tire performance criteria (TPC) specification number. This will ensure the same size, the same load range, and the same construction as those originally installed on the vehicle.

REPLACEMENT WHEELS DESCRIPTION

Replace the wheel if any of the following conditions exist:

- The wheel exhibits excessive runout.
- The wheel is bent.
- The wheel is cracked.
- The wheel is severely rusted.
- The wheel is severely corroded.

NOTE: **Air leaks caused by porosity on aluminum wheels are repairable.**

WARNING: **If you are replacing the wheel(s), the wheel stud(s), the wheel nut(s) or the wheel bolt(s), install only new GM original equipment parts. Installation of used parts or non-GM original equipment parts may cause the wheel to loosen, loss of tire air pressure, poor vehicle handling and loss of vehicle control resulting in personal injury.**

- The wheel leaks air.

CAUTION: **The use of non-GM original equipment wheels may cause:**

- **Damage to the wheel bearing, the wheel fasteners and the wheel**
- **Tire damage caused by the modified clearance to the adjacent vehicle components**
- **Adverse vehicle steering stability caused by the modified scrub radius**
- **Damage to the vehicle caused by the modified ground clearance**
- **Speedometer and odometer inaccuracy**

Replace the wheel, the wheel studs and the wheel/nuts, or the wheel bolts if applicable, if any of the following conditions exist:

- The wheel has elongated bolt holes.
- The wheel/nuts, or bolts if applicable, loosen repeatedly.

Steel wheel identification is stamped into the wheel near the valve stem.

Aluminum wheel identification is cast into the inboard side of the wheel.

STEEL WHEEL REPAIR DESCRIPTION

CAUTION: **Do not heat wheels in an attempt to soften them for straightening or repair damage from striking curbs, etc. Do not weld wheels. The alloy used in these wheels is heat-treated and uncontrolled heating from welding affects the properties of the material.**

CAUTION: **The use of tubes in tubeless tires is not a recommended repair due to the fact that speed ratings are greatly reduced.**

You can repair porosity in aluminum wheels. If leaks are found in a steel wheel, replace the wheel with a wheel of original equipment quality.

TIRE CHAIN USAGE DESCRIPTION

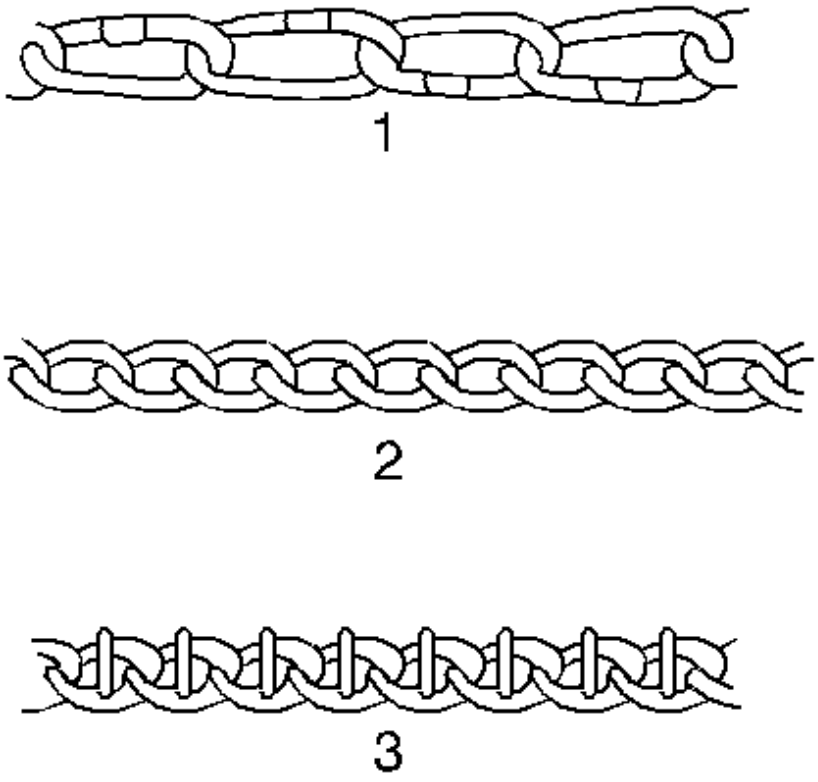

Fig. 35: Identifying Types Of Tire Chains
Courtesy of GENERAL MOTORS COMPANY

When you use tire chains, most current vehicles require the following chain types:

- SAE Class S or 1100 Series, Type PL tire chains (1)
- SAE Class U or 1200 Series, Type P tire chains (2)
- 1800 Series Lug Reinforced tire chains (3)

These chains are specially designed in order to limit the fly-off effect that occurs when the wheel rotates.

Manufacturers of tire chains have a specific chain size for each tire size. These ensure a proper fit when the

chains are installed. Purchase the correct chains for the tires on which the chains will be used. Do not use rubber adjusters to take up slack in chains that are loose due to incorrect size. Always follow the chain manufacturer's installation instructions.

The use of chains may adversely affect handling. When using chains, remember the following information:

- Ensure that the vehicle is designed for chain clearance.
- Adjust the speed to road conditions.
- Avoid sharp turns.
- Avoid locked-wheel braking in order to prevent chain damage to the vehicle.
- Install the chains as tightly as possible on the drive tires. Tighten the chains again after driving 0.4-0.8 km (0.25-0.5 mi). Do not use chains on the non-drive tires. These chains may contact and damage the vehicle. If you use chains on the non-drive tires, ensure that there is enough clearance.
- Do not exceed 70 km/h (45 mph). Do not exceed the chain manufacturer's speed limit, if lower.
- Drive in a restrained manner. Avoid large bumps, potholes, severe turns, and other maneuvers that cause the tires to bounce up and down.
- Follow any other instructions from the chain manufacturer that do not disagree with the above.

TIRE INFLATION DESCRIPTION

When you inflate the tires to the recommended inflation pressures, the factory-installed wheels and tires are designed in order to handle loads to the tire's rated load capacity. Incorrect tire pressures, or under-inflated tires, can cause the following conditions:

- Vehicle handling concerns
- Poor fuel economy
- Shortened tire life
- Tire overloading

Inspect the tire pressure when the following conditions apply:

- The vehicle has been sitting at least 3 hours.
- The vehicle has not been driven for more than 1.6 km (1 mi).
- The tires are cool.

Inspect the tires monthly or before any extended trip. Adjust the tire pressure to the specifications on the tire label. Install the valve caps or the extensions on the valves. The caps or the extensions keep out dust and water.

The kilopascal (kPa) is the metric term for pressure. The tire pressure may be printed in both kilopascal (kPa) and psi. One psi equals 6.9 kPa.

Inflation Pressure Conversion (Kilopascals to PSI)

kPa	psi	kPa	psi
140	20	215	31
145	21	220	32
155	22	230	33

kPa	psi	kPa	psi
160	23	235	34
165	24	240	35
170	25	250	36
180	26	275	40
185	27	310	45
190	28	345	50
200	29	380	55
205	30	415	60
Conversion: 6.9 kPa = 1 psi			

Tires with a higher than recommended pressure can cause the following conditions:

- A hard ride
- Tire bruising
- Rapid tread wear at the center of the tire

Tires with a lower than recommended pressure can cause the following conditions:

- A tire squeal on turns
- Hard steering
- Rapid wear and uneven wear on the edge of the tread
- Tire rim bruises and tire rim rupture
- Tire cord breakage
- High tire temperatures
- Reduced vehicle handling
- High fuel consumption
- Soft riding

Unequal pressure on the same axle can cause the following conditions:

- Uneven braking
- Steering lead
- Reduced vehicle handling

Refer to the Tire Placard for specific tire and wheel applications and tire pressures.

TREAD WEAR INDICATORS DESCRIPTION

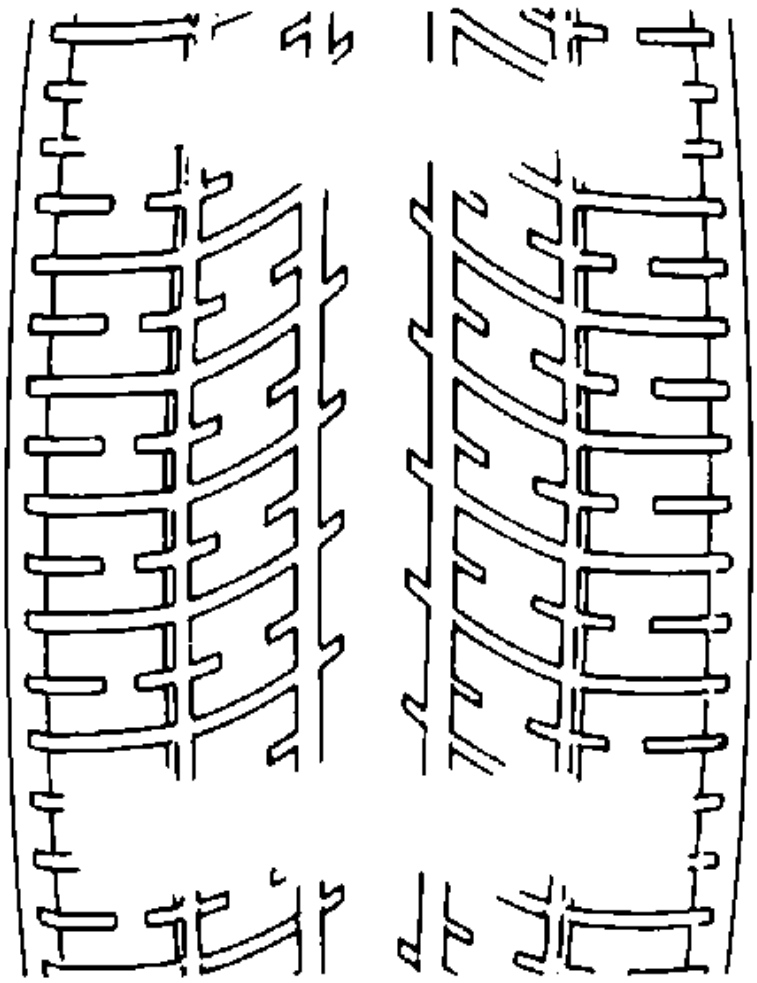

Fig. 36: View Of Tread Wear Indicators
Courtesy of GENERAL MOTORS COMPANY

The original equipment tires have tread wear indicators that show when you should replace the tires.

The location of these indicators are at 60 degree intervals around the outer diameter of the tire. The indicators appear as a 6 mm (0.25 in) wide band when the tire tread depth becomes 1.6 mm (2/32 in).

REPAIR INSTRUCTIONS

WHEEL ALIGNMENT MEASUREMENT

Steering and vibration complaints are not always the result of improper alignment. One possible cause is wheel and tire imbalance. Another possibility is tire lead due to worn or improperly manufactured tires. Lead/pull is defined as follows: At a constant highway speed on a typical straight road, lead/pull is the amount of effort required at the steering wheel to maintain the vehicle's straight path. Lead is the vehicle deviation from a straight path on a level road without pressure on the steering wheel. Refer to **Radial Tire Lead/Pull Correction** in order to determine if the vehicle has a tire lead problem.

Before performing any adjustment affecting wheel alignment, perform the following inspections in order to ensure correct alignment readings:

- Inspect for visible damage to the suspension components and replace as necessary.
- Inspect the tires for the proper inflation and irregular tire wear. Refer to **Vehicle Certification, Tire Placard, Anti-Theft, and Service Parts ID Label** , and **Tire Diagnosis - Irregular or Premature Wear** .
- Inspect the runout of the wheels and the tires. Refer to **Tire and Wheel Runout Specifications** .
- Inspect the wheel bearings for backlash and excessive play. Refer to **Wheel Bearings Diagnosis** .
- Inspect the ball joints for looseness or wear.
- Inspect the tie rod ends for looseness or wear.
- Inspect the control arms and stabilizer shaft for looseness or wear.
- Inspect the steering gear for looseness at the frame. Refer to **Fastener Specifications** .
- Inspect the struts/shock absorbers for wear, leaks, and any noticeable noises. Refer to **Suspension Strut and Shock Absorber Testing - On Vehicle** .
- Inspect the vehicle trim height. Refer to **Trim Height Inspection** .
- Inspect the steering wheel for excessive drag or poor return due to stiff or rusted linkage or suspension components.
- Inspect the fuel level. The fuel tank should be full or the vehicle should have a compensating load added.

Give consideration to excess loads, such as tool boxes, sample cases, etc. If normally carried in the vehicle, these items should remain in the vehicle during alignment adjustments. Give consideration also to the condition of the equipment being used for the alignment. Follow the equipment manufacturer's instructions.

Satisfactory vehicle operation may occur over a wide range of alignment settings. However, if the setting exceeds the service allowable specifications, correct the alignment to the service preferred specifications. Refer to **Wheel Alignment Specifications**.

Perform the following steps in order to measure the front and rear alignment angles:

1. Install the alignment equipment according to the manufacturer's instructions.
2. Jounce the front and the rear bumpers 3 times prior to checking the wheel alignment.
3. Measure the alignment angles and record the readings.

NOTE:

- **Record the "Before" and "After" alignment measurements.**
- **When performing adjustments to vehicles requiring a 4-wheel alignment, set the rear toe adjustment first in order to obtain proper front alignment angles.**

4. Adjust alignment angles to vehicle specification, if necessary. Refer to **Wheel Alignment Specifications**.

FRONT CAMBER ADJUSTMENT

Adjustment Procedure

1. Before performing any adjustment affecting the wheel alignment, refer to **Wheel Alignment Measurement**.
2. Loosen the strut to the knuckle bolts. Refer to **Strut Assembly Removal and Installation** .

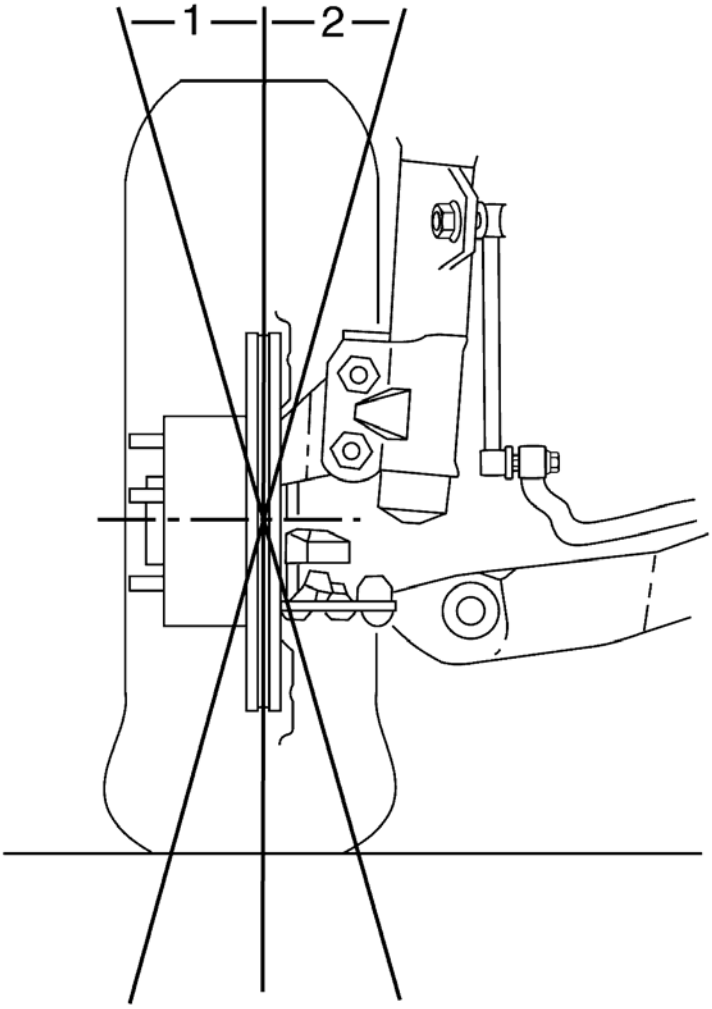

Fig. 1: View Of Positive Or Negative Camber
Courtesy of GENERAL MOTORS COMPANY

CAUTION: Refer to Fastener Caution .

3. Determine the actual camber, Positive (1) or Negative (2).

NOTE: For accurate readings, do not push or pull on the tire and wheel assembly during the alignment.

4. Adjust the front camber to specifications, refer to **Wheel Alignment Measurement**.

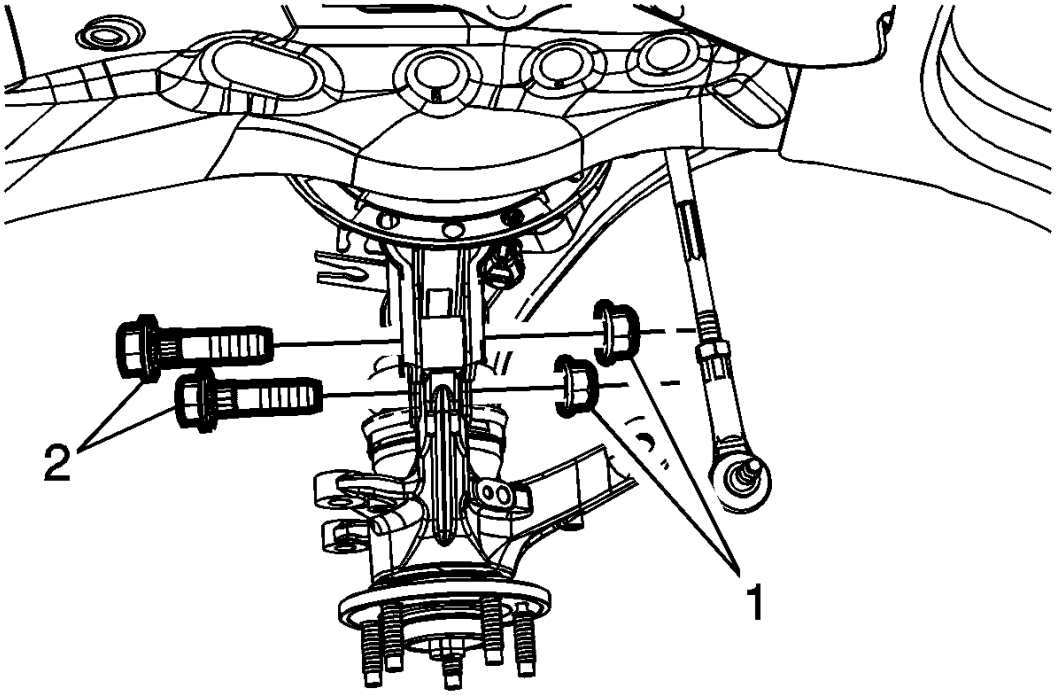

Fig. 2: Front Strut Components
Courtesy of GENERAL MOTORS COMPANY

5. Tighten the strut-to-knuckle nuts (1) to:
   - First Pass: 80 N.m (59 lb ft)
   - Final Pass: plus 180 degrees

NOTE: **After adjusting the front camber, it is necessary to adjust the front toe.**

6. Adjust the front toe. Refer to **Wheel Alignment - Steering Wheel Angle and/or Front Toe Adjustment**.

WHEEL ALIGNMENT - STEERING WHEEL ANGLE AND/OR FRONT TOE ADJUSTMENT

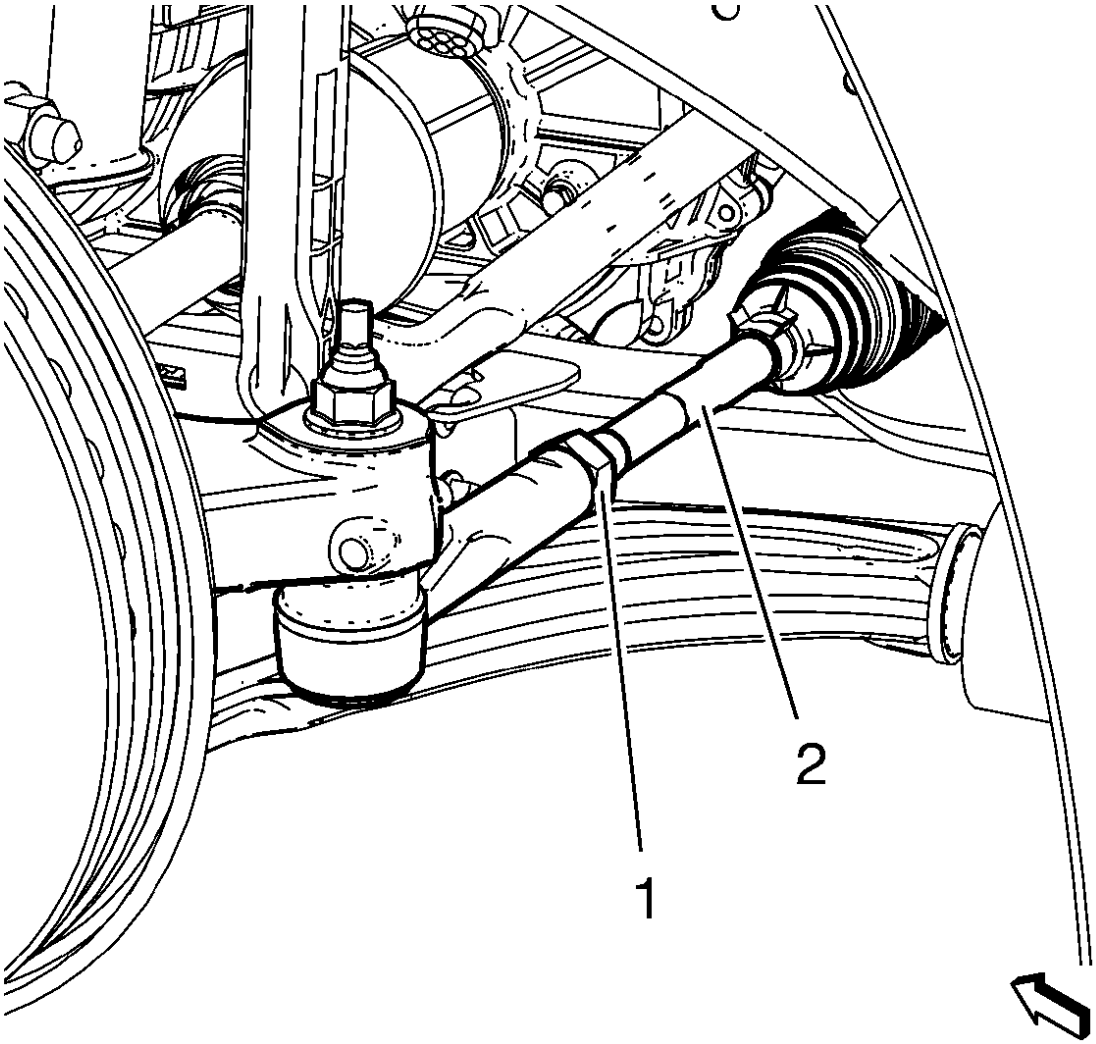

Fig. 3: Inner Tie Rod And Jam Nut
Courtesy of GENERAL MOTORS COMPANY

1. Ensure that the steering wheel is set in a straight ahead position.
2. Loosen the tie rod jam nut (1).
3. Adjust the toe to specification by turning the inner tie rod (2). Refer to **Wheel Alignment Specifications**.

CAUTION: Refer to Fastener Caution .

4. Tighten the tie rod jam nut (1) to 60 N.m (44 lb ft).
5. The steering angle sensor must be recentered, the steering stops must be relearned. Refer to **Steering Angle Sensor Centering** .

REAR TOE ADJUSTMENT

NOTE: Adjust the rear toe on each rear wheel separately.

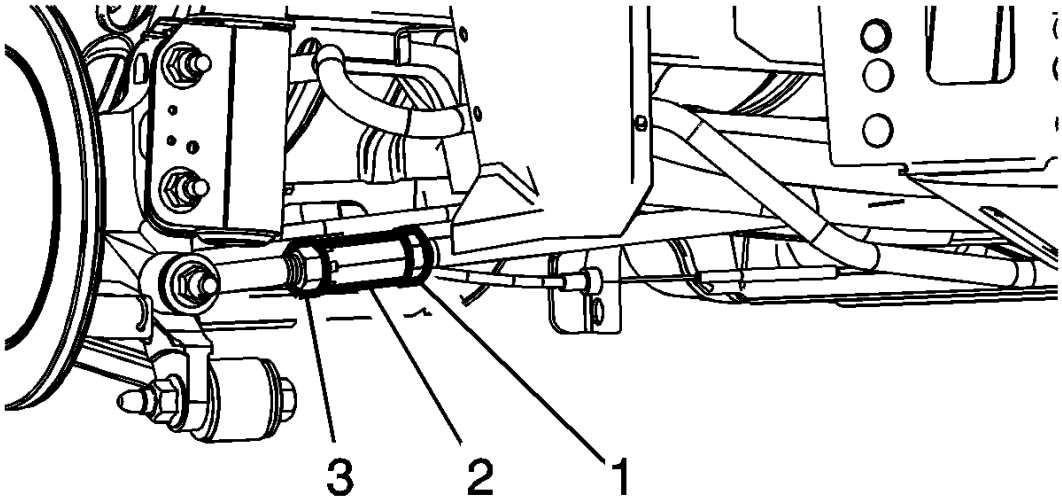

Fig. 4: Rear Suspension Adjust Link, Nuts And Bolts
Courtesy of GENERAL MOTORS COMPANY

1. Loosen the rear suspension adjust link nuts (1) and (3).
2. Adjust the toe by rotating the rear suspension adjust link (2) until the proper specification as been reached. Refer to **Wheel Alignment Specifications**.

CAUTION: Refer to Fastener Caution .

3. Using a backup wrench to hold the rear suspension adjust link (2), tighten the rear suspension adjust link nuts (1) and (3) to 75 N.m (55 lb ft).
4. Recheck the toe setting.
5. If necessary, readjust the toe specifications.

DESCRIPTION AND OPERATION

CAMBER DESCRIPTION

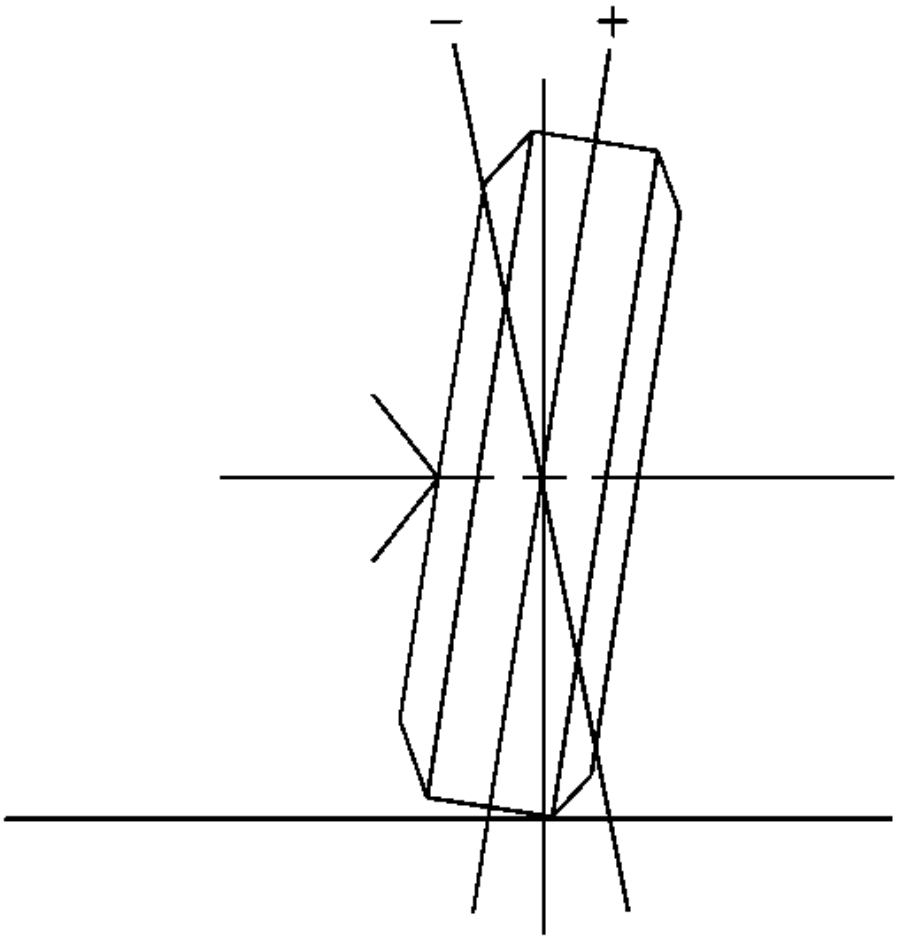

Fig. 5: Illustrating Camber Angle
Courtesy of GENERAL MOTORS COMPANY

Camber is the tilting of the wheels from the vertical when viewed from the front of the vehicle. When the wheels tilt outward at the top, the camber is positive (+). When the wheel tilts inward at the top, the camber is negative (-). The amount of tilt is measured in degrees from the vertical. Camber settings influence the directional control and the tire wear.

Too much positive camber will result in premature wear on the outside of the tire and cause excessive wear on the suspension parts.

Too much negative camber will result in premature wear on the inside of the tire and cause excessive wear on the suspension parts.

Unequal side-to-side camber of 1 degree or more will cause the vehicle to pull or lead to the side with the most positive camber.

Cross Camber is the difference between the left camber value and the right camber value.

Cross Camber = L camber - R camber

CASTER DESCRIPTION

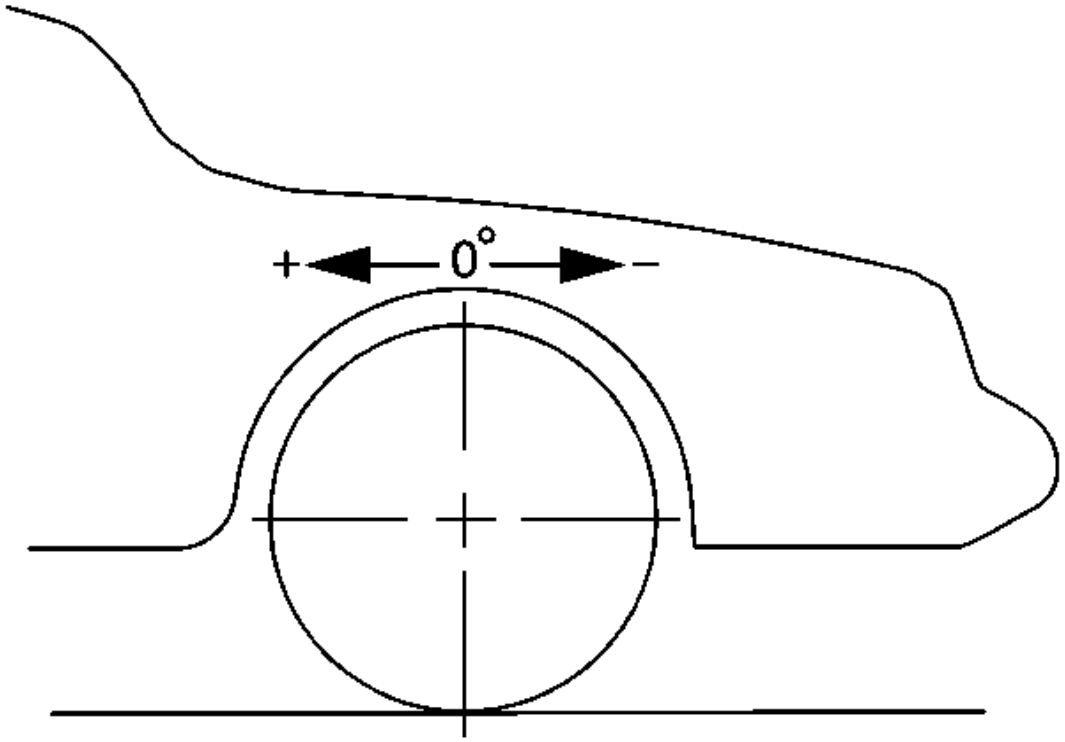

Fig. 6: Illustrating Caster Angle
Courtesy of GENERAL MOTORS COMPANY

Caster is the tilting of the uppermost point of the steering axis either forward or backward, when viewed from the side of the vehicle. A backward tilt is positive (+) and a forward tilt is negative (-). Caster influences directional control of the steering but does not affect the tire wear . Caster is affected by the vehicle height, therefore it is important to keep the body at its designed height. Overloading the vehicle or a weak or sagging rear spring will affect caster. When the rear of the vehicle is lower than its designated trim height, the front suspension moves to a more positive caster. If the rear of the vehicle is higher than its designated trim height, the front suspension moves to a less positive caster.

With too little positive caster, steering may be touchy at high speed and wheel returnability may be diminished when coming out of a turn. If one wheel has more positive caster than the other, that wheel will pull toward the center of the vehicle. This condition will cause the vehicle to pull or lead to the side with the least amount of positive caster.

Cross Caster is the difference between the left caster value and the right caster value.

Cross caster = L caster - R caster

LEAD/PULL DESCRIPTION

At a constant highway speed on a typical straight road, lead/pull is the amount of effort required at the steering wheel to maintain the vehicle's straight path.

IMPORTANT: Vehicles will tend to lead/pull in the direction of the road slope as part of normal operation.

Lead/pull is usually caused by the following factors:

- Road slope
- Variability in tire construction
- Wheel alignment (front cross caster and camber)
- Unbalanced steering gear
- Electronic Power Steering (EPS) steering position and torque sensors not calibrated correctly, if equipped.

MEMORY STEER DESCRIPTION

Memory steer is when the vehicle wants to lead or pull in the direction the driver previously turned the vehicle. Additionally, after turning in the opposite direction, the vehicle will want to lead or pull in that direction.

SCRUB RADIUS DESCRIPTION

Ideally, the scrub radius is as small as possible. Normally, the SAI angle and the centerline of the tire and the wheel intersect below the road surface, causing a positive scrub radius. With struts, the SAI angle is much larger than the long arm/short arm type of suspension. This allows the SAI angle to intersect the camber angle above the road surface, forming a negative scrub radius. The smaller the scrub radius, the better the directional stability. Installing aftermarket wheels that have additional offset will dramatically increase the scrub radius. The newly installed wheels may cause the centerline of the tires to move further away from the spindle. This will increase the scrub radius.

A large amount of scrub radius can cause severe shimmy after hitting a bump. Four-wheel drive vehicles with large tires use a steering damper to compensate for an increased scrub radius. Scrub radius is not directly measurable by the conventional methods. Scrub radius is projected geometrically by engineers during the design phase of the suspension.

SETBACK DESCRIPTION

Setback applies to both the front and the rear wheels. Setback is the amount that one wheel may be aligned behind the other wheel. Setback may be the result of a road hazard or a collision. The first clue is a caster difference from side-to-side of more than 1 degree.

THRUST ANGLES DESCRIPTION

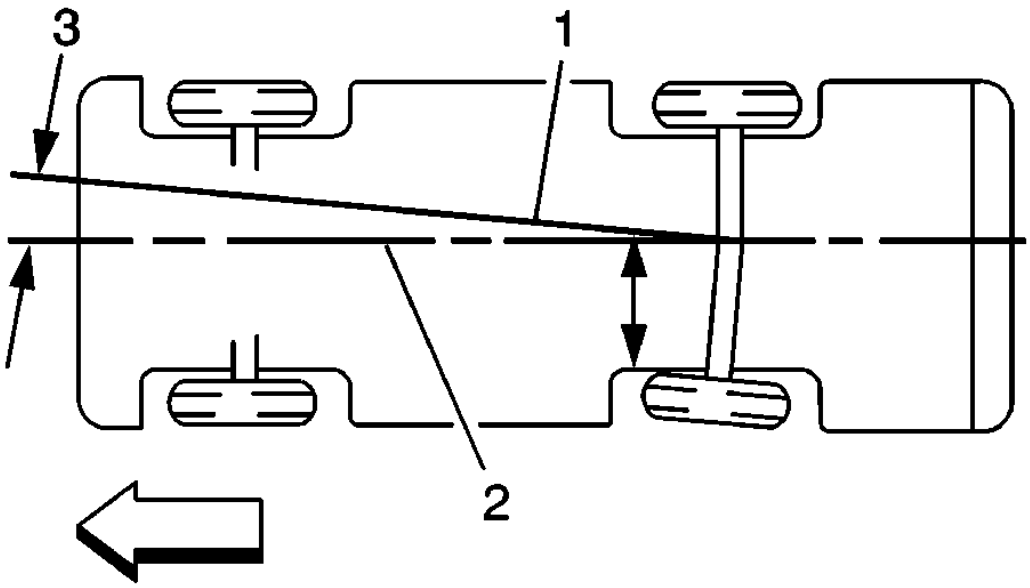

Fig. 7: Illustrating Thrust Angles
Courtesy of GENERAL MOTORS COMPANY

The front wheels aim or steer the vehicle. The rear wheels control tracking. This tracking action relates to the thrust angle (3). The thrust angle is the path that the rear wheels take. Ideally, the thrust angle is geometrically aligned with the body centerline (2).

In the illustration, toe-in is shown on the left rear wheel, moving the thrust line (1) off center. The resulting deviation from the centerline is the thrust angle.

If the thrust angle is not set properly the vehicle may "dog track", the steering wheel may not be centered or it could be perceived as a bent axle. Thrust angle can be checked during a wheel alignment.

Positive thrust angle means the thrust line is pointing to the right hand side (RHS) of the vehicle.

Negative thrust angle means the thrust line is pointing to the left hand side (LHS) of the vehicle.

If the thrust angle is out of specification, moving the axle to body relationship will change the thrust angle reading.

If the vehicle is out in the Positive (+) direction-moving the RHS forward and/or LHS rearward will move the thrust angle towards zero degrees.

If the vehicle is out in the Negative (-) direction-moving the RHS rearward and/or LHS forward will move the thrust angle towards zero degrees.

TOE DESCRIPTION

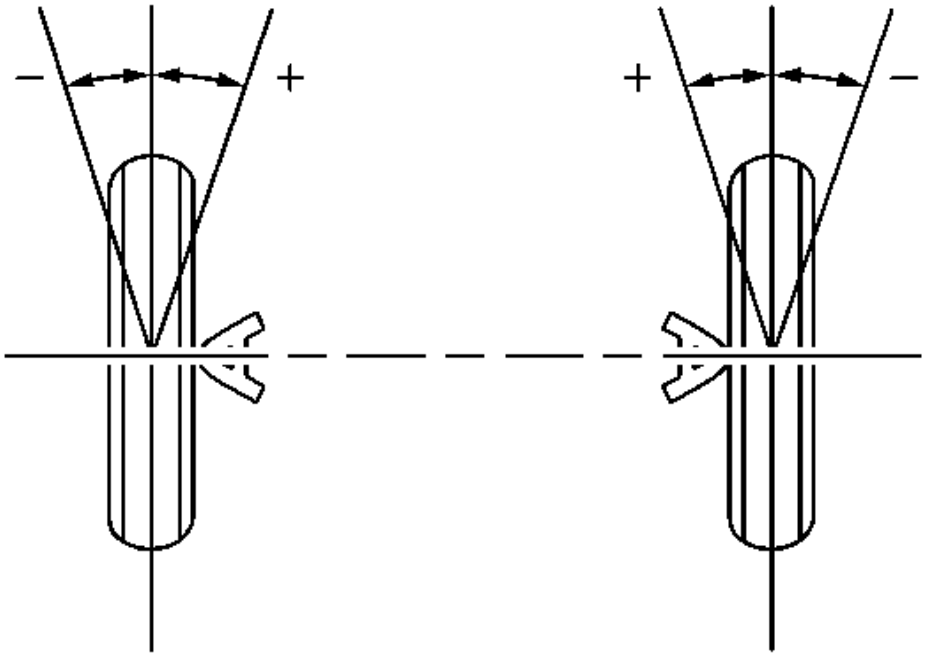

Fig. 8: Illustrating Toe Angle
Courtesy of GENERAL MOTORS COMPANY

Toe is a measurement of how much the front and/or rear wheels are turned in or out from a straight-ahead position. When the wheels are turned in, toe is positive (+). When the wheels are turned out, toe is negative (-). The actual amount of toe is normally only a fraction of a degree. The purpose of toe is to ensure that the wheels roll parallel.

Toe also offsets the small deflections of the wheel support system that occur when the vehicle is rolling forward. In other words, with the vehicle standing still and the wheels set with toe-in, the wheels tend to roll parallel on the road when the vehicle is moving.

Improper toe adjustment will cause premature tire wear and cause steering instability.

TORQUE STEER DESCRIPTION

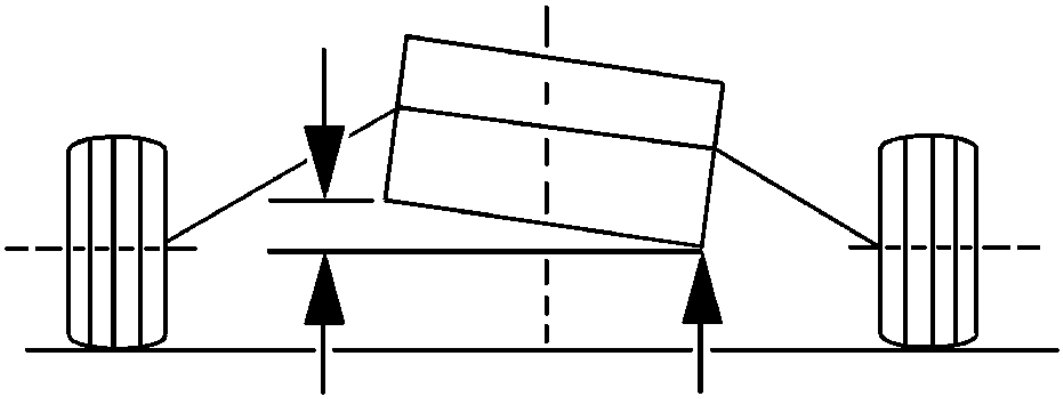

Fig. 9: Identifying Torque Steer
Courtesy of GENERAL MOTORS COMPANY

A vehicle pulls or leads in one direction during hard acceleration. A vehicle pulls or leads in the other direction during deceleration.

The following factors may cause torque steer to be more apparent on a particular vehicle:

- A slightly smaller diameter tire on the right front increases a right torque lead. Inspect the front tires for differences in the brand, the construction, or the size. If the tires appear to be similar, change the front tires from side-to-side and retest the vehicle. Tire and wheel assemblies have the most significant effect on torque steer correction.
- A large difference in the right and left front tire pressure
- Left-to-right differences in the front view axle angle may cause significant steering pull in a vehicle. The pull will be to the side with the most downward sloping axle from the differential to the wheels. Axles

typically slope downward from the differential. The slope of the transaxle pan to level ground may be used as an indication of bias axle angles. The side with the higher transaxle pan, shown on the left side of the illustration, has the most downward sloping axle angle.

WANDER DESCRIPTION

Wander is the undesired drifting or deviation of a vehicle to either side from a straight path with hand pressure on the steering wheel. Wander is a symptom of the vehicle's sensitivity to external disturbances, such as road crown and crosswind, and accentuated by poor on-center steering feel.

DESCRIPTION AND OPERATION

DEFINITIONS AND ABBREVIATIONS

Throttle Positions

Engine Braking

A condition where the engine is used to slow the vehicle by manually downshifting during a zero throttle coastdown.

Full Throttle Downshift

A quick apply of the accelerator pedal to its full travel, forcing a downshift.

Heavy Throttle

Approximately 3/4 of accelerator pedal travel, 75 percent throttle position.

Light Throttle

Approximately 1/4 of accelerator pedal travel, 25 percent throttle position.

Medium Throttle

Approximately 1/2 of accelerator pedal travel, 50 percent throttle position.

Minimum Throttle

The least amount of throttle opening required for an upshift.

Wide Open Throttle (WOT)

Full travel of the accelerator pedal, 100 percent throttle position.

Zero Throttle Coastdown

A full release of the accelerator pedal while the vehicle is in motion and in drive range.

Shift Condition Definitions

Bump

A sudden and forceful apply of a clutch or a band.

Chuggle

A bucking or jerking. This condition may be most noticeable when the converter clutch is engaged. It is

similar to the feel of towing a trailer.

Delayed

A condition where a shift is expected but does not occur for a period of time. This could be described as a clutch or band engagement that does not occur as quickly as expected during a part throttle or wide open throttle apply of the accelerator, or during manual downshifting to a lower range. This term is also defined as LATE or EXTENDED.

Double Bump - Double Feel

Two sudden and forceful applies of a clutch or a band.

Early

A condition where the shift occurs before the car has reached proper speed. This condition tends to labor the engine after the upshift.

End Bump

A firmer feel at the end of a shift than at the start of the shift. This is also defined as END FEEL or SLIP BUMP.

Firm

A noticeably quick apply of a clutch or band that is considered normal with a medium to heavy throttle. This apply should not be confused with HARSH or ROUGH.

Flare

A quick increase in engine RPM along with a momentary loss of torque. This most generally occurs during a shift. This condition is also defined as SLIPPING.

Harsh - Rough

A more noticeable apply of a clutch or band than FIRM. This condition is considered undesirable at any throttle position.

Hunting

A repeating quick series of upshifts and downshifts that causes a noticeable change in engine RPM, such as a 4-3-4 shift pattern. This condition is also defined as BUSYNESS.

Initial Feel

A distinctly firmer feel at the start of a shift than at the finish of the shift.

Late

A shift that occurs when the engine RPM is higher than normal for a given amount of throttle.

Shudder

A repeating jerking condition similar to CHUGGLE but more severe and rapid. This condition may be most noticeable during certain ranges of vehicle speed.

Slipping

A noticeable increase in engine RPM without a vehicle speed increase. A slip usually occurs during or after initial clutch or band apply.

Soft

A slow, almost unnoticeable clutch or band apply with very little shift feel.

Surge

A repeating engine related condition of acceleration and deceleration that is less intense than CHUGGLE.

Tie-Up

A condition where two opposing clutch and/or bands are attempting to apply at the same time causing the engine to labor with a noticeable loss of engine RPM.

Noise Conditions

Drive Link Noise

A whine or growl that increases or fades with vehicle speed, and is most noticeable under a light throttle acceleration. It may also be noticeable in PARK or NEUTRAL operating ranges with the vehicle stationary.

Final Drive Noise

A hum related to vehicle speed which is most noticeable under a light throttle acceleration.

Planetary Gear Noise

A whine related to vehicle speed, which is most noticeable in FIRST gear, SECOND gear, FOURTH gear or REVERSE. The condition may become less noticeable, or go away, after an upshift.

Pump Noise

A high pitched whine that increases in intensity with engine RPM. This condition may also be noticeable in all operating ranges with the vehicle stationary or moving.

Torque Converter Noise

A whine usually noticed when a vehicle is stopped, and the transmission is in DRIVE or REVERSE. The noise will increase with engine RPM.

Driver Shift Control

Driver shift control (DSC) allows the driver to change gears similar to a manual transmission. Refer to the vehicle owner's manual for specific DSC operating instructions.

TRANSMISSION GENERAL DESCRIPTION

The Hydra-matic 6T70/75 is a fully automatic, 6-speed, front-wheel drive, electronic-controlled transmission. It consists primarily of a 4-element torque converter, a compound planetary gear set, friction and mechanical clutch assemblies, and a hydraulic pressurization and control system. There are 2 variants of the transmission, based on torque capacity. Architecture is common between the variants, and component differences are primarily related to size.

The 4-element torque converter contains a pump, a turbine, a pressure plate splined to the turbine, and a stator assembly. The torque converter acts as a fluid coupling to smoothly transmit power from the engine to the transmission. It also hydraulically provides additional torque multiplication when required. The pressure plate, when applied, provides a mechanical direct drive coupling of the engine to the transmission.

The planetary gear sets provide the 6 forward gear ratios and reverse. Changing gear ratios is fully automatic and is accomplished through the use of a transmission control module (TCM) located inside the transmission. The TCM receives and monitors various electronic sensor inputs and uses this information to shift the transmission at the optimum time.

The TCM commands shift solenoids and variable bleed pressure control solenoids to control shift timing and feel. The TCM also controls the apply and release of the torque converter clutch which allows the engine to deliver the maximum fuel efficiency without sacrificing vehicle performance. All the solenoids, including the TCM, are packaged into a self-contained control solenoid valve assembly.

The hydraulic system primarily consists of a vane-type pump, 2 control valve body assemblies, transfer drive gear support assembly and case. The pump maintains the working pressures needed to stroke the clutch pistons that apply or release the friction components. These friction components, when applied or released, support the automatic shifting qualities of the transmission.

The friction components used in this transmission consist of 5 multiple disc clutches. The multiple disc clutches combine with one way clutch to deliver 7 different gear ratios, 6 forward and one reverse, through the gear sets. The gear sets then transfer torque through the transfer drive gear, transfer driven gear and differential assembly.

The transmission may be operated in any of the following gear ranges:

PARK (P)

This position locks the front wheels and prevents the vehicle from rolling either forward or backward. PARK is the best position to use when starting the vehicle. Because the transmission utilizes a shift lock control system, it is necessary to fully depress the brake pedal before shifting out of PARK. For safety reasons, use the parking brake in addition to the PARK position.

REVERSE (R)

This position allows the vehicle to be operated in a rearward direction.

NEUTRAL (N)

This position allows the engine to be started and operated while driving the vehicle. If necessary, you may select this position in order to restart the engine with the vehicle moving. This position should also be used when towing the vehicle.

DRIVE (D)

Drive range should be used for all normal driving conditions for maximum efficiency and fuel economy. Drive range allows the transmission to operate in each of the 6 forward gear ratios. Downshifts to a lower gear, or higher gear ratio, are available for safe passing by depressing the accelerator or by manually selecting a lower gear in the manual mode range.

Driver Shift Control (DSC) or Electronic Range Selection (ERS)

This position (M-Manual / L-Low) allows the driver to utilize the DSC/ERS system. When the shift selector lever is moved to this position, the driver may select upshifts or downshifts by using the paddle switches located on the steering wheel/shifter. An upshift is requested by pushing either + button. Refer to the vehicle owner's manual for more specific DSC/ERS information.

TRANSMISSION COMPONENT AND SYSTEM DESCRIPTION

The mechanical components of the 6T70/75 are as follows:

- A torque converter with an electronically controlled capacity clutch (ECCC)
- Off axis chain driven vane-type fluid pump assembly
- Input sun gear and carrier assembly
- 4-5-6 and 3-5 reverse clutch assembly with turbine shaft
- Low and reverse clutch (one way clutch) assembly
- Control valve body assembly
- Front differential transfer drive gear support assembly
- Front differential transfer drive gear assembly
- Front differential carrier assembly
- Case cover assembly

The electrical components of the 6T70/75 are as follows:

- Output speed sensor assembly
- Input speed sensor assembly
- Manual shift shaft with internal mode switch
- Control solenoid valve assembly, which contains the following components:
  - Transmission control module (TCM)
  - 5 variable bleed line pressure control (PC) solenoids
  - Transmission fluid pressure (TFP) switch assembly

- Torque converter clutch (TCC) pressure control solenoid
- 2 shift solenoids
- Transmission fluid temperature sensor

For more information, refer to **Electronic Component Description**.

TRANSMISSION ADAPTIVE FUNCTIONS

The 6T70/75 transmission utilizes a line pressure control system during upshifts to compensate for the normal wear of transmission components. As the apply components within the transmission wear or change over time, shift time (the time required to apply a clutch) increase or decreases. In order to compensate for these changes, the transmission control module (TCM) adjusts the pressure commands to the various PC solenoids, to maintain the originally calibrated shift timing. The automatic adjusting process is referred to as "adaptive learning" and it is used to ensure consistent shift feel plus increase transmission durability. The TCM monitors the A/T input speed sensor (ISS) and the A/T output speed sensor (OSS) during commanded shifts to determine if a shift is occurring too fast (harsh) or too slow (soft) and adjusts the corresponding pressure control (PC) solenoid signal to maintain the set shift feel.

The purpose of the adapt function is to automatically compensate the shift quality for the various vehicle shift control systems. The adapt function is a continuous process that will help to maintain optimal shift quality throughout the life of the vehicle.

TRANSMISSION INDICATORS AND MESSAGES

The following transmission-related indicators and messages may be displayed on the Instrument Panel Cluster (IPC). For a complete listing and description of all vehicle indicators and messages, refer to **Indicator/Warning Message Description and Operation** .

"TRANSMISSION HOT IDLE ENGINE"

This message is displayed when the TCM detects a transmission fluid temperature (TFT) equal to or greater than 132Â°C (270Â°F) for 5 seconds.

"SERVICE TRANSMISSION"

This message displays when there is a problem with the transmission.

ELECTRONIC COMPONENT DESCRIPTION

Control Solenoid (W/Body and TCM) Valve Assembly

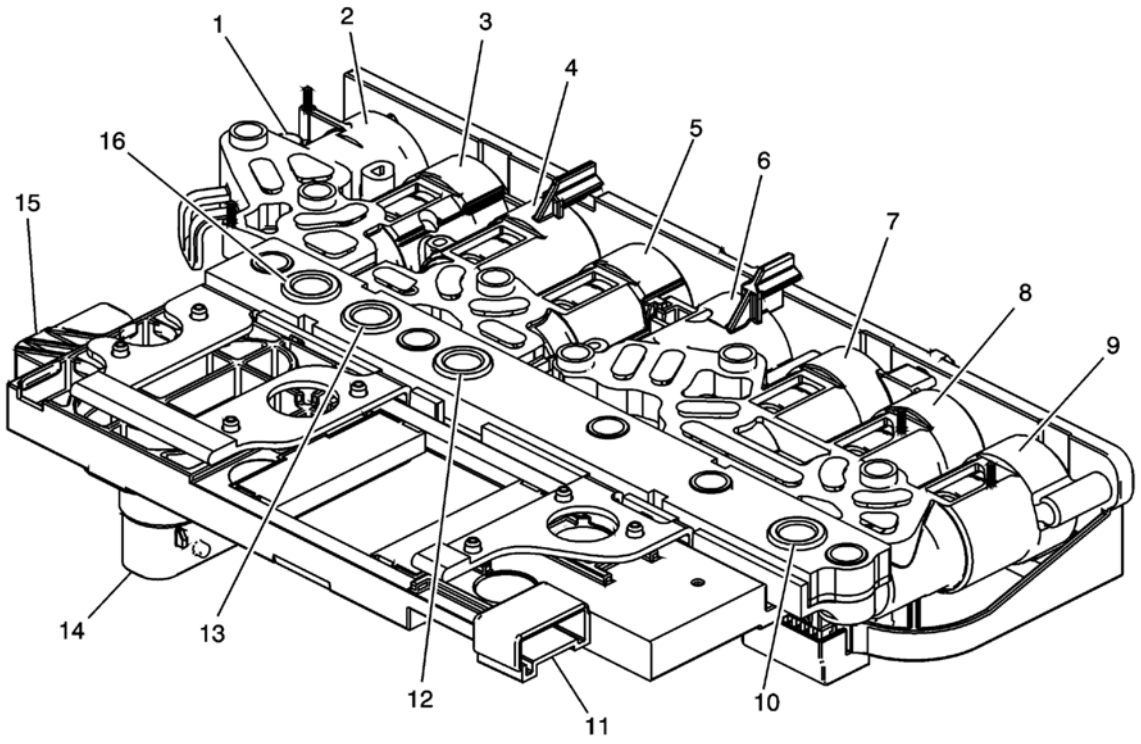

Fig. 2: Identifying Control Solenoid (W/Body & TCM) Valve Assembly Components
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Control Solenoid Valve Assembly X3 (ISS)
2	Shift Solenoid 1
3	Pressure Control Solenoid 3 (R1/456)
4	Pressure Control Solenoid 5 (1234)
5	Torque Converter Clutch (TCC) Pressure Control Solenoid
6	Shift Solenoid 2
7	Pressure Control Solenoid 2 (35R)
8	Pressure Control Solenoid 4 (26)
9	Line Pressure Control Solenoid
10	Transmission Fluid Pressure (TFP) Switch 5 (35R)
11	Control Solenoid Valve Assembly X2 (IMS)
12	Transmission Fluid Pressure (TFP) Switch 3 (26)
13	Transmission Fluid Pressure (TFP) Switch 4 (456/R1)
14	Control Solenoid Valve Assembly X1
15	Control Solenoid Valve Assembly X4 (OSS)
16	Transmission Fluid Pressure (TFP) Switch 5 (35R)

The control solenoid (w/body and TCM) valve assembly contains the following components:

- Transmission control module (TCM)
- Clutch pressure control solenoids (Clutch PC Sol)

- Shift solenoids (SS)
- Line pressure control solenoid (Line PC Sol)
- Torque converter clutch pressure control solenoid (TCC PC Sol)
- Transmission fluid temperature sensor (TFT Sensor)
- TCM temperature sensor
- Power-up temperature sensor
- Transmission fluid pressure switches (TFP Sw)

These components are not serviced separately. The control solenoid (w/body and TCM) valve assembly utilizes a lead-frame system to connect these components electrically to the TCM. No wires are used for these components. The control solenoid (w/body and TCM) valve assembly bolts directly to the lower and upper valve body assemblies inside the transmission. The control solenoid (w/body and TCM) valve assembly connects to the engine harness 20-way connector.

Manual Shift Detent Lever with Shaft Position Switch Assembly (IMS)

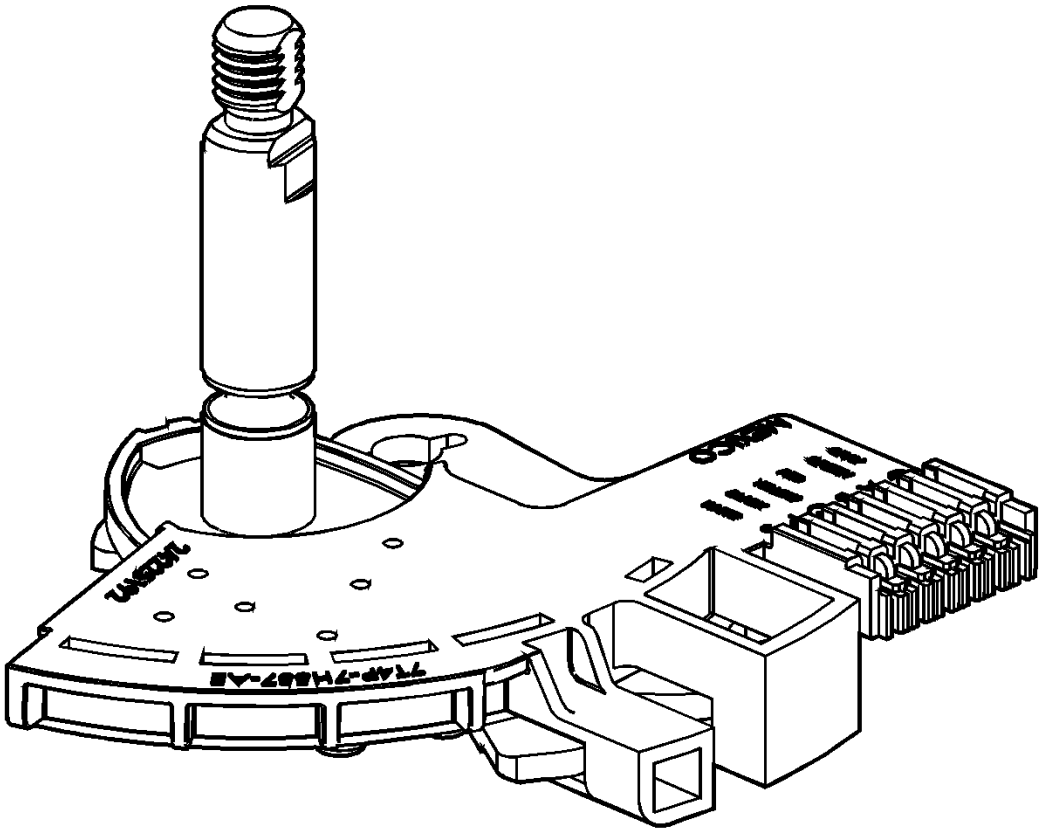

Fig. 3: Identifying Manual Shift Detent Lever with Shaft Position Switch
Courtesy of GENERAL MOTORS COMPANY

The transmission shaft position switch assembly is a sliding contact switch attached to the manual shaft detent lever assembly inside the transmission case. The five inputs to the TCM from the transmission manual shift shaft switch assembly indicate the transmission gear selector lever position. This information is used for engine controls as well as determining the transmission shift patterns. The state of each input is available for display on the scan tool. The five input parameters represented are Signal A, Signal B, Signal C, Signal P (Parity) and Signal N (P/N Start). The transmission shaft position switch assembly is connected to the Control Solenoid (W/Body and TCM) Valve Assembly via the Control Solenoid Valve Assembly X2 (IMS) connector.

Input Speed Sensor (ISS)

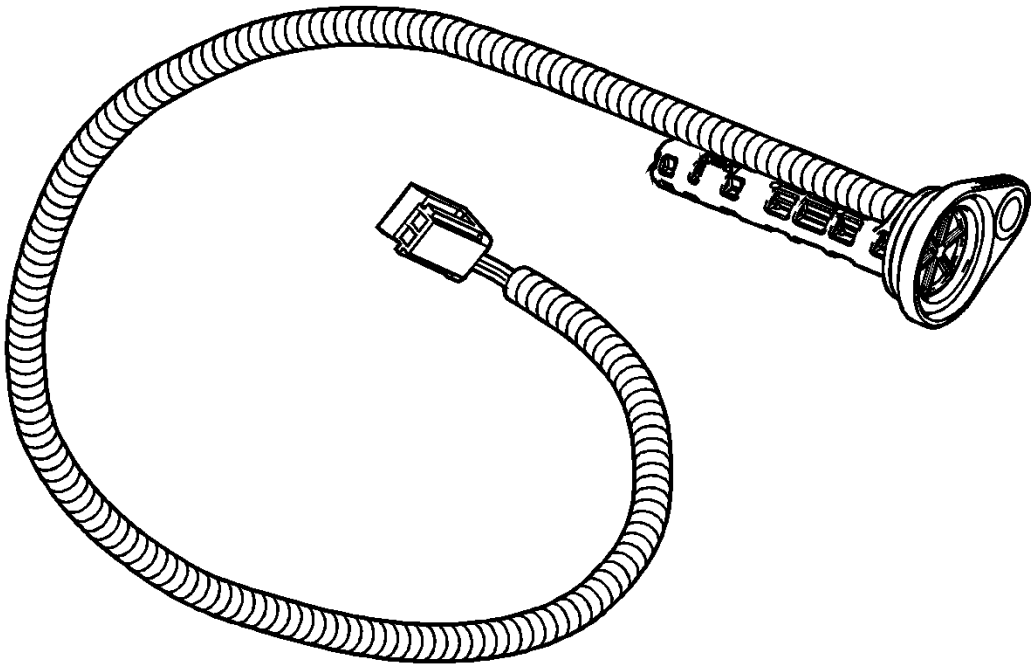

Fig. 4: Identifying Input Speed Sensor (ISS)
Courtesy of GENERAL MOTORS COMPANY

The input speed sensor (ISS) is a hall-effect type sensor. The ISS mounts to the transmission case cover assembly and connects to the control solenoid (w/body and TCM) valve assembly through a wire harness and connector. The sensor faces the 3-5-R clutch piston housing machined teeth surface. The sensor receives 8.3-9.3 volts on the ISS/OSS Supply Voltage circuit from the TCM. As the 3-5-R/4-5-6 clutch piston housing rotates, the sensor produces a signal frequency based on the machined surface of the 3-5-R/4-5-6 clutch piston housing. This signal is transmitted through the ISS signal circuit to the control solenoid (w/body and TCM) valve assembly. The TCM uses the ISS signal to determine line pressure, transmission shift patterns, torque converter

clutch (TCC) slip speed and gear ratio. The input speed sensor (ISS) is connected to the Control Solenoid (W/Body and TCM) Valve Assembly via the Control Solenoid Valve Assembly X3 (ISS) connector.

Output Speed Sensor (OSS)

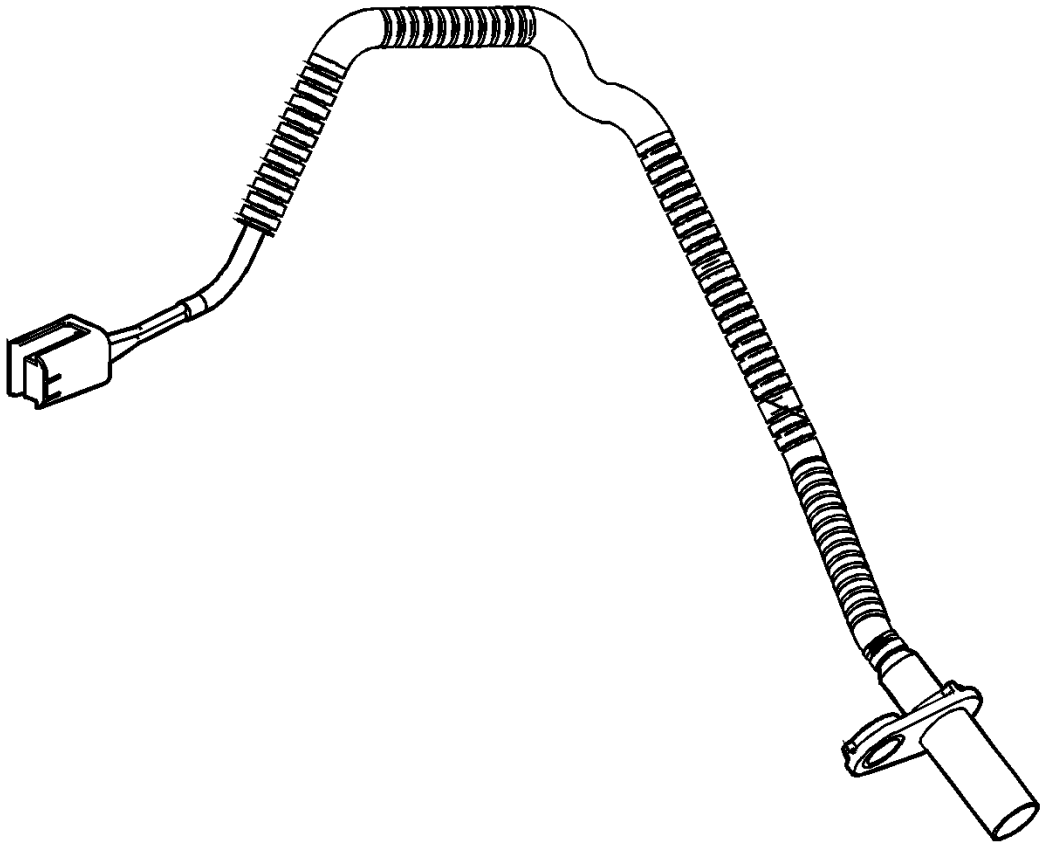

Fig. 5: Identifying Output Speed Sensor (OSS)
Courtesy of GENERAL MOTORS COMPANY

The output speed sensor (OSS) is a hall-effect type sensor. The OSS mounts to the transmission case below the control valve body assembly and connects to the control solenoid (w/body and TCM) valve assembly through a wire harness and connector. The sensor faces the Park gear machined teeth surface. The sensor receives 8.3-9.3 volts on the ISS/OSS supply voltage circuit from the TCM. As the front differential transfer drive gear assembly rotates, the sensor produces a signal frequency based on the machined surface of the Park gear. This signal is transmitted through the OSS signal circuit to the TCM. The TCM uses the OSS signal to determine line pressure, transmission shift patterns, torque converter clutch (TCC) slip speed and gear ratio. The output speed sensor (OSS) is connected to the Control Solenoid (W/Body and TCM) Valve Assembly via the Control Solenoid Valve Assembly X4 (OSS) connector.

AUTOMATIC TRANSMISSION INLINE 20-WAY CONNECTOR DESCRIPTION

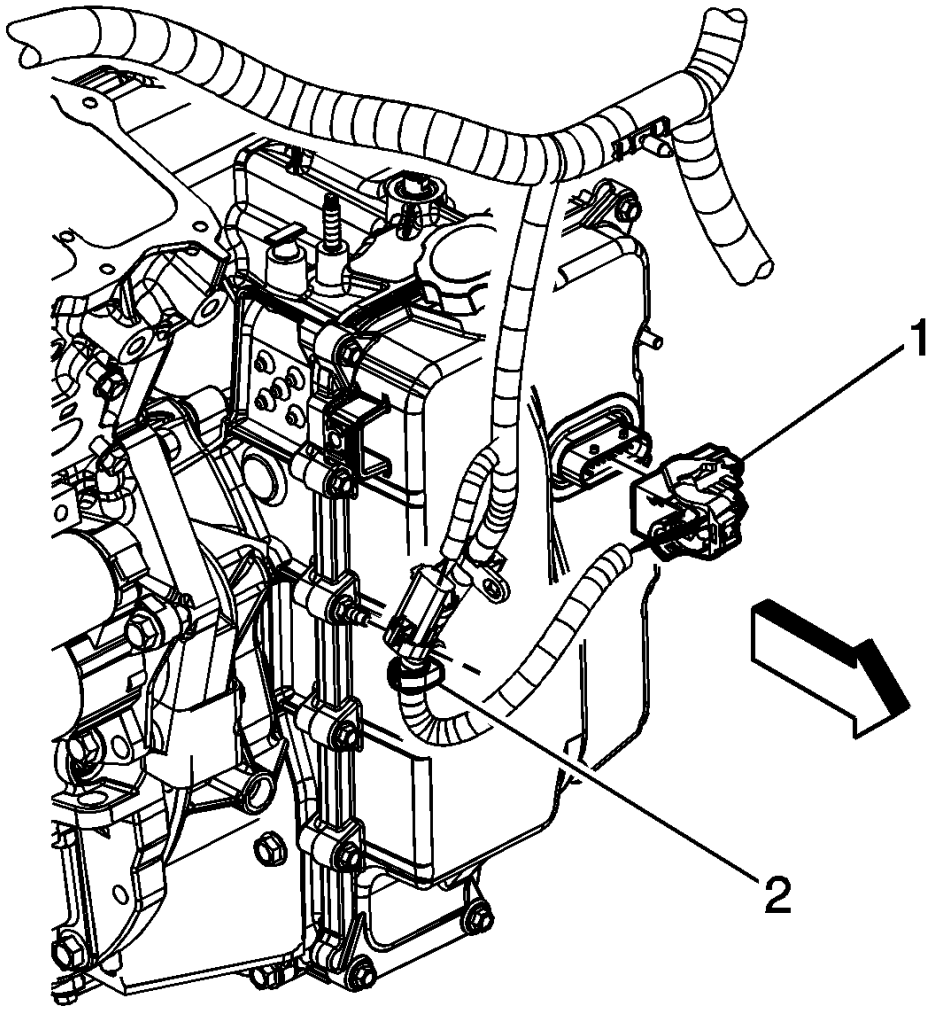

Fig. 6: Identifying Wire Harness Retainer & TCM Electrical Connector
Courtesy of GENERAL MOTORS COMPANY

The transmission electrical connector is an important part of the transmission operating system. Any interference with the electrical connection can cause the transmission to set diagnostic trouble codes or affect proper operation. The following items can affect the electrical connection:

- Bent pins in the connector from rough handling during connection and disconnection
- Wires backing away from the pins or coming uncrimped, in the external wiring harness
- Dirt contamination entering the connector when disconnected
- Transmission fluid leaking into the connector, wicking up into the external wiring harness and degrading the wire insulation
- Moisture intrusion in the connector
- Low pin retention in the external connector from excessive connection and disconnection of the wiring connector assembly
- Pin corrosion from contamination
- Damaged connector assembly

Remember the following points:

- Limit twisting or wiggling the connector during removal. Bent pins can occur.
- Do not pry the connector off with a screwdriver or other tool.
- Whenever the transmission external wiring connector is disconnected from the internal harness and the engine is operating, DTCs will set. Clear these DTCs after reconnecting the external connector.

CRUISE GRADE BRAKING DESCRIPTION

Purpose

- Cruise grade braking assists when driving on a downhill grade.
- It maintains vehicle speed by automatically implementing a shift schedule that uses the engine and the transmission to slow the vehicle.

Activation

- This feature is internal to the vehicle's software/calibration and requires no customer action to activate.
- Cruise grade braking is not available in Range Selection Mode.

Function

- Automatic downshifting to assist in speed control will activate when vehicle speed has increased from the set point by a certain amount. Multiple downshift may be commanded depending on the amount of deviation of vehicle speed to the set speed. As vehicle speed slows and approaches the original set speed, upshifts will be commanded to return to a normal operating condition.
- At some speeds and on some downhill grades, the transmission may not be able to command a gear low enough to slow the vehicle to the set point without overspeeding the engine.
- In this case the transmission will command all available downshifts, but if further engine braking is desired, the driver must press the brake pedal to slow the vehicle enough so additional downshift(s) can be commanded.
- Pressing the brake pedal has the normal effect of cancelling cruise control operation and in this case a transition to Normal - Powertrain Braking is completed.
- As always, if cruise control operation was cancelled through usage of the brake pedal, it must be reinitiated by tapping either the Set or Resume Cruise switches.

PARK - ENGINE RUNNING

When the gear selector lever is in the Park (P) position, fluid is drawn into the pump through the transmission fluid filter assembly. Line pressure is then directed to the following valves:

Fluid Pressure Directed in Preparation for a Shift

Manual Valve

Mechanically controlled by the gear selector lever, the manual valve is in the Park (P) position and prevents line pressure from the pressure regulator valve from entering the reverse and drive circuits.

R1/456 Pressure Control (PC) Solenoid 3

The R1/456 pressure control solenoid (PCS) is energized (HIGH) allowing actuator feed limit fluid to enter the

PCS R1/456 CL fluid circuit. PCS R1/456 CL fluid is then routed through orifice #22 to the 4-5-6 clutch boost valve and through orifice #21 to the R1/ 456 clutch regulator valve.

R1/456 Clutch Regulator Valve

PCS R1/456 CL fluid at the R1/4-5-6 clutch regulator valve moves the valve against R1/4-5-6 clutch regulator spring force and R1/FDBK fluid. This allows line pressure to pass through the valve and enter the R1/456CL FD circuit. R1/456CL FD is then routed to clutch select valve 2.

Shift Solenoid 1

Shift solenoid 1 is energized (ON) allowing actuator feed limit fluid to enter the solenoid 1 circuit. Solenoid 1 fluid is routed to the #2 ball check valve and through orifice #10 to the torque converter clutch (TCC) regulator valve and shuttle valve (SHTL).

TCC Regulator Valve and Shuttle Valve

Solenoid 1 fluid is routed to the TCC regulator valve and shuttle valve and moves the valve against TCC regulator valve spring force.

#2 Ball Check Valve

Solenoid 1 fluid seats the #2 ball check valve against the reverse fluid passage and fluid is forced through orifice #15 into the CSV2 enable fluid circuit.

Clutch Select Valve 2

CSV2 enable fluid is routed to the clutch select valve 2 and moves the valve against clutch select valve 2 spring force. This allows R1/456 CL FD fluid to pass through the valve and enter the R1 supply circuit. R1 Supply fluid is then routed into the R1 fluid circuit and, through orifice #18. R1 fluid is then routed to the low & reverse clutch assembly in preparation for a shift into low or reverse gear.

Shift Solenoid 2

Shift solenoid 2 is energized (ON) allowing actuator feed limit fluid to enter the solenoid 2 fluid circuit and is then routed to the #3 ball check valve and through orifice #13 to the clutch select valve #3.

3-5 Reverse Clutch Regulator Valve

Actuator feed limit fluid is routed through the valve and into the PS2 fluid passage. PS2 fluid is then sent to the normally closed #2 pressure switch and opens the switch.

#3 Ball Check Valve

Solenoid 2 fluid seats the #3 ball check valve against 456 CL fluid passage and fluid is forced through orifice #13 into the CSV3 enable fluid circuit. CSV3 enable fluid is then routed to the clutch select valve 3.

Clutch Select Valve #3

CSV3 enable fluid moves the clutch select valve 3 against clutch select valve 3 spring force.

Compensator Blow Off

Line pressure is routed through orifice #17 to the compensator feed circuit. Compensator feed fluid enters the compensator blow off circuit and fills the 4-5-6 dam piston area.

Park- Engine Running

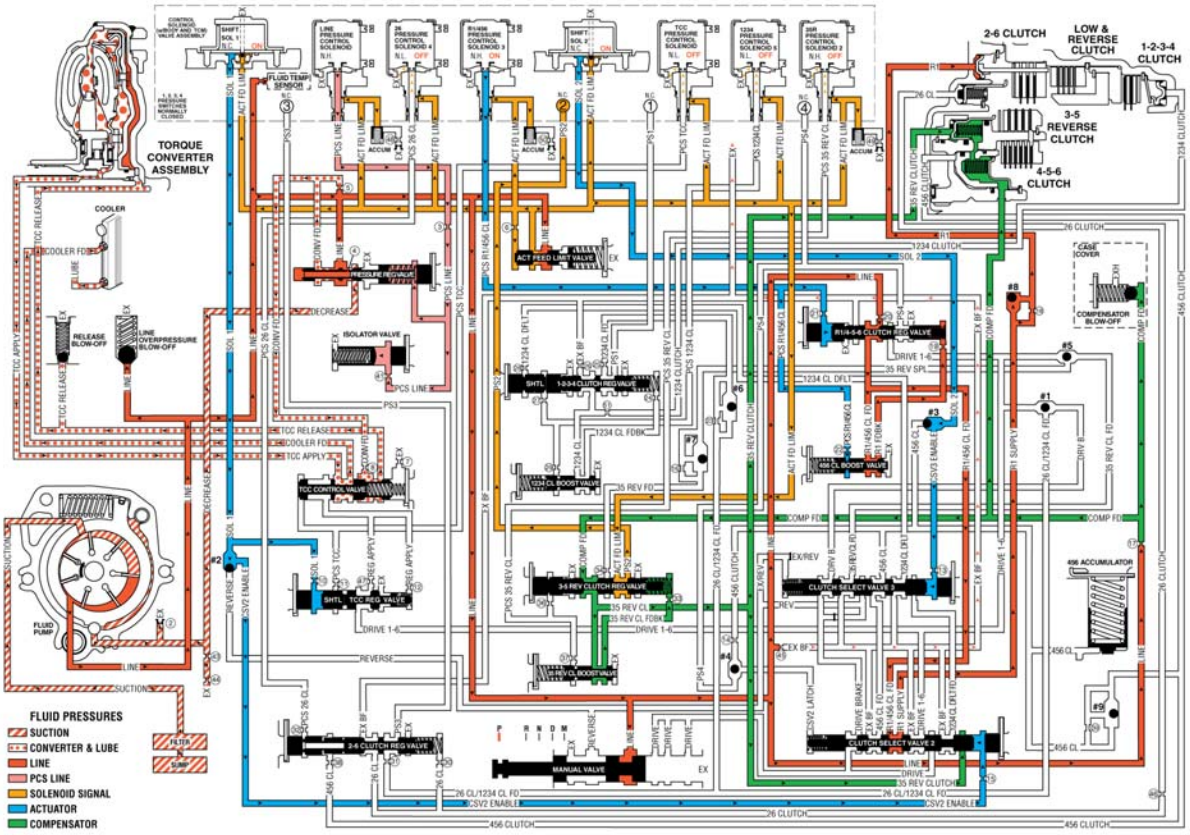

Fig. 7: Identifying Fluid Flow - Park - Engine Running
Courtesy of GENERAL MOTORS COMPANY

REVERSE

When the gear selector lever is moved to the Reverse (R) position (from the Park position) the normally high 35R pressure control solenoid 2 is commanded ON and the following changes occur in the transmission's hydraulic and electrical systems:

Fluid Pressure Directed in Preparation for a Shift

Manual Valve

With the manual valve in the reverse position, line pressure is directed into the reverse fluid circuit to the #2 ball check valve and clutch select valve 3.

#2 Ball Check Valve

Reverse fluid seats the #2 ball check valve against the solenoid 1 fluid passage and fluid is forced through orifice #15 into the CSV2 enable circuit.

Clutch Select Valve 2

CSV2 enable fluid, present at the valve from Park position, continues to hold the clutch select valve 2 against clutch select valve 2 spring force.

Low & Reverse Clutch Applies

Clutch Select Valve 3

Reverse fluid from the manual valve is routed to clutch select valve 3 to combine with clutch select valve 3 spring force to keep the valve in the off position. This allows reverse fluid to pass through the valve and enter the 3-5 clutch reverse feed circuit. The 3-5 clutch reverse feed fluid from the clutch select valve 3 is also routed to #5 ball check valve.

Low & Reverse Clutch

R1 supply fluid passes through orifice #18 and unseats check ball #8. R1 supply fluid enters the low & reverse clutch piston circuit and moves the piston against the spring force to apply the low & reverse clutch plates.

#5 Ball Check Valve

The 3-5 clutch reverse feed fluid seats #5 ball check valve against the drive 1-6 circuit allowing 3-5 clutch reverse feed fluid to enter the 3-5 reverse supply circuit. The 3-5 reverse supply fluid is then routed to #7 ball check valve and through orifice #16 where is enters the 3-5 reverse feed circuit. The 3-5 reverse feed passes through orifice #34 and then is routed to the 3-5 reverse clutch regulator valve.

3-5 Reverse Clutch Applies

35R Pressure Control Solenoid 2

The 35R pressure control solenoid 2 is energized (HIGH) allowing actuator feed limit fluid to enter the PCS 3-5 reverse clutch circuit. PCS 3-5 reverse clutch fluid is then routed through orifice #36 to the 3-5 reverse clutch regulator valve and through orifice #37 to the 3-5 reverse boost valve.

3-5 Reverse Clutch Regulator Valve

PCS 3-5 reverse clutch fluid moves the 3-5 reverse clutch regulator valve against 3-5 reverse clutch regulator valve spring force and 3-5 reverse clutch feedback fluid. This allows 3-5 reverse feed to pass through the valve and enter the 3-5 reverse clutch circuit. The 3-5 reverse clutch fluid is then routed to the 3-5 reverse clutch and the 3-5 reverse boost valve. PS2 fluid from pressure switch 2 exhausts through the valve allowing the switch to close.

3-5 Reverse Boost Valve

PCS 3-5 reverse clutch fluid pressure acts on a differential area moving the 3-5 reverse clutch boost valve against the 3-5 reverse clutch boost valve spring. The 3-5 reverse clutch fluid passes through the valve and enters the 3-5 reverse clutch feedback circuit. As PCS 3-5 reverse clutch fluid pressure is increased to a given value, the 3-5 reverse clutch boost valve opens the 3-5 reverse clutch feedback circuit to exhaust. This results in the 3-5 reverse clutch regulator valve moving to the full feed position sending full 3-5 clutch reverse feed pressure (full line pressure) to the clutch.

3-5 Reverse Clutch

The 3-5 reverse clutch fluid enters the 3-5R/456 clutch housing to move the piston against spring force and compensator feed fluid to apply the 3-5 reverse clutch plates.

Reverse

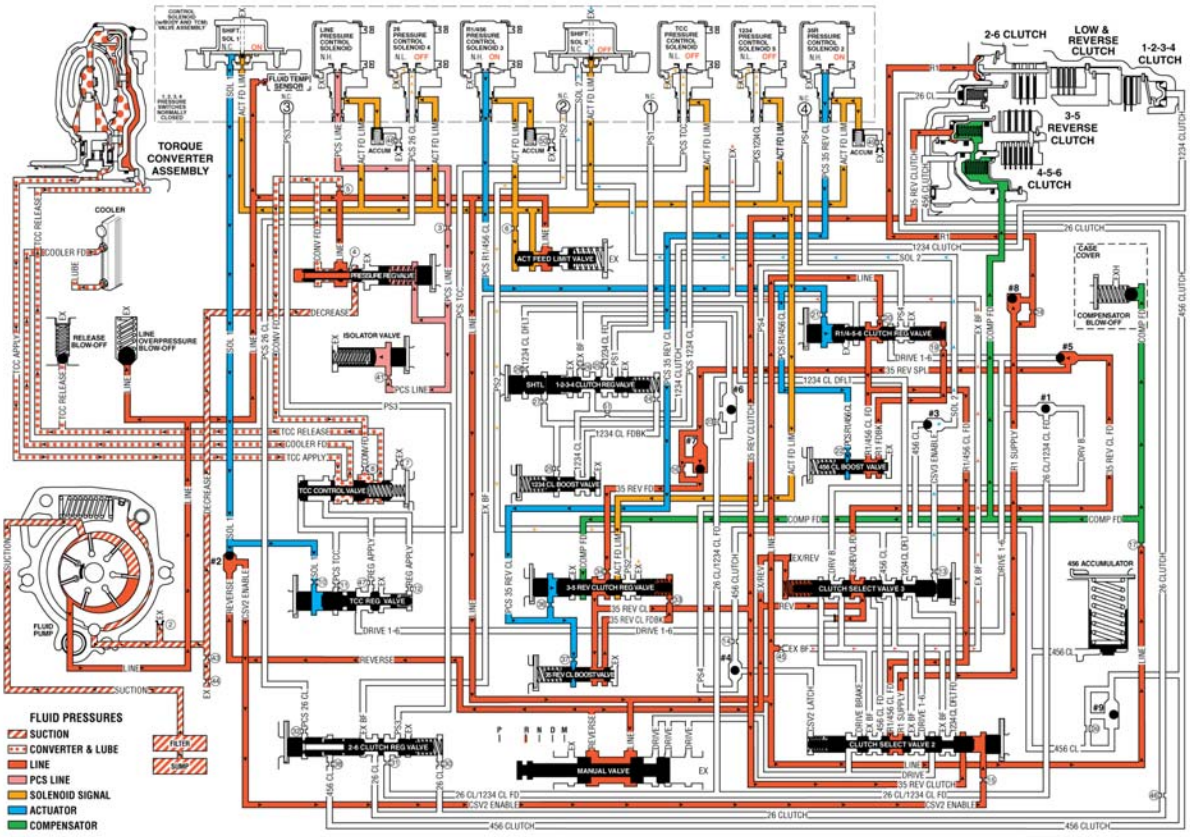

Fig. 8: Identifying Fluid Flow - Reverse
Courtesy of GENERAL MOTORS COMPANY

NEUTRAL - ENGINE RUNNING

When the gear selector is moved to the Neutral (N) position, the hydraulic and electrical system operation is identical to Park (P) range. However, if Neutral is selected after the vehicle was operating in Reverse (R), the normally high 35R pressure control solenoid 2 is commanded OFF and the following changes would occur in the hydraulic system:

3-5 Reverse Clutch Releases

Manual Valve

The manual valve is moved to the Neutral position and blocks line pressure from entering the reverse and drive fluid circuits. The reverse fluid from the #2 ball check valve and clutch select valve 3 is opened to an exhaust passage at the manual valve.

35R Pressure Control Solenoid 2

The 35R pressure control solenoid 2 is commanded OFF allowing PCS 3-5 reverse clutch fluid from the 3-5

reverse clutch boost valve and 3-5 reverse clutch regulator valve to exhaust.

3-5 Reverse Clutch Boost Valve

The 3-5 reverse boost valve spring force moves the valve to allow 3-5 reverse clutch feedback fluid from the 3-5 reverse clutch regulator valve to enter the 3-5 reverse clutch circuit and exhaust.

3-5 Reverse Clutch Regulator Valve

The 3-5 reverse clutch regulator valve spring force moves the valve to allow 3-5 reverse clutch fluid from the 3-5 reverse clutch and clutch select valve 2 to pass through the valve and enter the 35 reverse clutch feed circuit through orifice #16 past check ball #5 to clutch select valve 3 to exhaust back fill circuit to exhaust.

3-5 Reverse Clutch

The 3-5 reverse clutch spring force moves the 3-5 reverse clutch piston to release t h e 3-5 reverse clutch plates and force 3-5 reverse clutch fluid to exhaust from the 3-5/4-5-6 reverse clutch housing. The 3-5 reverse clutch fluid is then routed to the 3-5 reverse clutch regulator valve allowing the 3-5 reverse clutch to release.

Clutch Select Valve 3

When reverse fluid exhausts through the manual valve, CSV3 enable fluid moves the valve against clutch select valve 3 spring force. The 3-5 reverse feed fluid is routed into the exhaust back fill circuit and exhausts.

Neutral- Engine Running

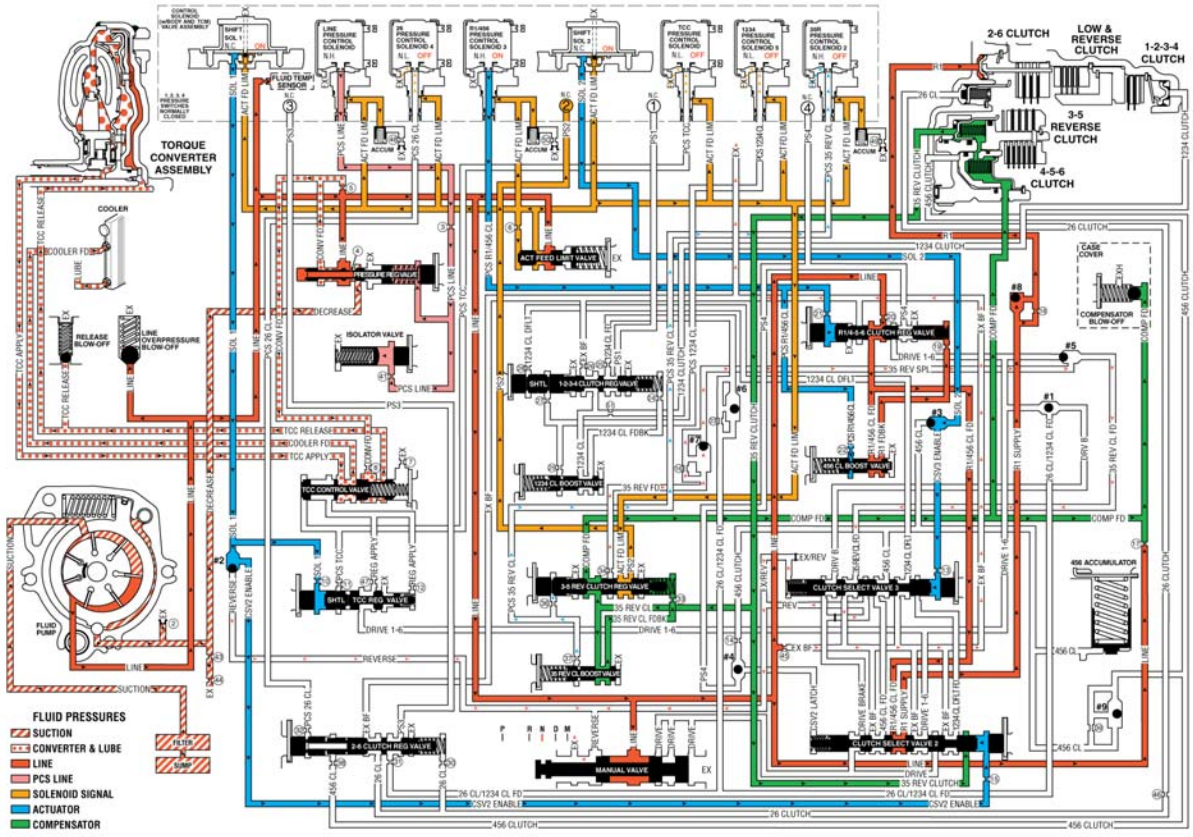

Fig. 9: Identifying Fluid Flow - Neutral - Engine Running
Courtesy of GENERAL MOTORS COMPANY

DRIVE RANGE, FIRST GEAR ENGINE BRAKING

When the gear selector lever is moved to the Drive (D) range from the Neutral (N) position, the transmission will provide engine braking. In this operating range, the normally-low 1234 pressure control solenoid 5 is commanded ON and in the engine braking mode the following changes occur within the hydraulic circuits:

Fluid Pressure is Directed to the 1-2-3-4 Clutch and the Low & Reverse Clutch to Provide Engine Braking

Manual Valve

The manual valve is moved to the Drive (D) position and allows line fluid pressure to enter the drive fluid circuit. Drive fluid is then routed to the clutch select valve 2.

Clutch Select Valve 2

Drive fluid at the clutch select valve 2 passes through the valve and enters the drive brake circuit. Drive brake fluid is then routed to the clutch select valve 3.

Clutch Select Valve 3

Drive brake fluid at the clutch select valve 3 passes through the valve and enters the Drive B fluid circuit. Drive B fluid is then routed to #1 ball check valve.

#1 Ball Check Valve

Drive B fluid seats the #1 ball check valve against drive 1-6 fluid to force drive B fluid into the 26/1234 feed passage. The 26/ 1234 feed fluid is routed through orifice #31 and, to the 2-6 clutch regulator valve. The 26/1234 feed fluid passes through the 2-6 clutch regulator valve and enters the pressure switch 3 (PS3) fluid circuit. PS3 fluid is then routed to the normally closed pressure switch 3 and opens the switch.

#6 Ball Check Valve

26/1234 feed fluid unseats the #6 ball check valve allowing 26/1234 feed fluid to enter the 1234 clutch feed circuit. The 1234 clutch feed fluid is routed through orifice #25 and then to the 1-2-3-4 clutch regulator valve.

1-2-3-4 Clutch Applies

1234 Pressure Control Solenoid 5

The 1234 pressure control solenoid 5 is commanded ON allowing actuator feed limit to enter the PCS 1234 clutch fluid circuit. PCS 1234 clutch fluid is then routed throught orifice #27 to the 1-2-3-4 clutch regulator valve. PCS1234 clutch fluid is also routed through orifice #29 and then to the 1-2-3-4 clutch boost valve.

1-2-3-4 Clutch Regulator Valve

PCS1234 clutch fluid moves the 1-2-3-4 clutch regulator valve against 1-2-3-4 clutch regulator valve spring force to allow 1234 clutch feed fluid to pass through the valve and enter the 1234 clutch fluid circuit. The 1234 clutch fluid is then routed to the 1234 clutch boost valve and the 1-2-3-4 clutch.

1-2-3-4 Clutch Boost Valve

PCS1234 clutch fluid pressure acts on a differential area moving the 1234 clutch boost valve against the 1234

clutch boost valve spring. The 1234 clutch fluid passes through the valve and enters the 1234 clutch feedback circuit. As PCS 1234 clutch fluid pressure is increased to a given value, the 1234 clutch boost valve opens the 1234 clutch feedback circuit to exhaust. This results in the 1234 clutch regulator valve moving to the full feed position sending full 26 CL/1234 CL feed pressure (full line pressure) to the clutch.

1-2-3-4 Clutch

The 1234 clutch fluid enters the 1234 clutch to move the piston against spring force to apply the 1-2-3-4 clutch plates.

Drive Range, First Gear Engine Braking

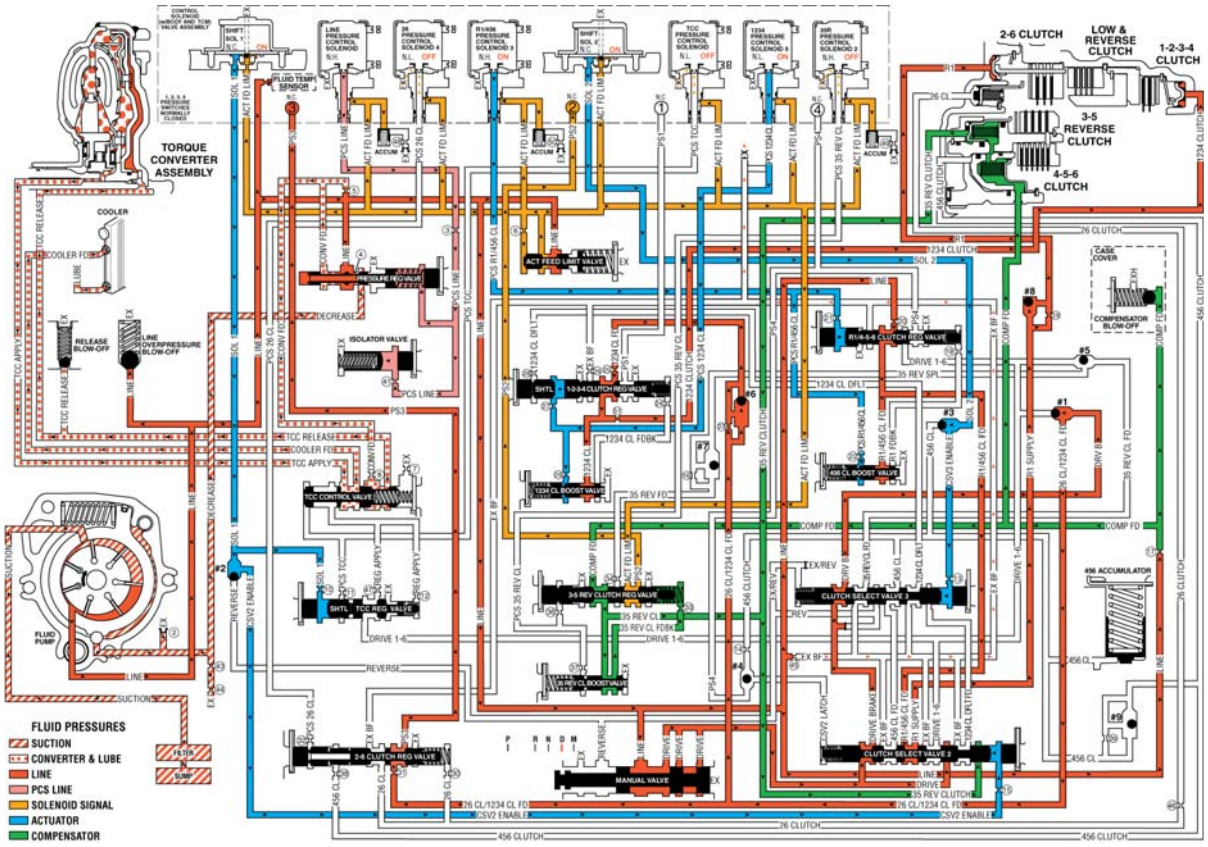

Fig. 10: Identifying Fluid Flow - Drive Range, First Gear Engine Braking
Courtesy of GENERAL MOTORS COMPANY

DRIVE RANGE, FIRST GEAR

As the vehicle speed increases, the transmission control module (TCM) receives input signals from the automatic transmission input and output speed sensors, throttle position sensor and other vehicle sensors to determine the precise moment to deenergize or "turn off" shift solenoid 1 and command OFF the normally-high R1/456 pressure control solenoid 3.

Low & Reverse Clutch Releases

Shift Solenoid 1

When shift solenoid 1 is "turned OFF", CSV2 enable fluid from the clutch select valve 2 passes by the #2 ball check valve and enters the solenoid 1 fluid circuit. Solenoid 1 fluid from the #2 ball check valve and TCC

regulator valve is then routed to the solenoid where it exhausts.

Clutch Select Valve 2

Clutch select valve 2 (CSV2) enable fluid is exhausted from the clutch select valve 2 and clutch select valve 2 spring force moves the valve to the released position. With clutch select valve 2 in the released position, drive fluid from the manual valve passes through the valve and enters the drive 1-6 fluid circuit. Drive 1-6 fluid then feeds the R1/456 and 35 reverse clutch regulator valves and the TCC regulator valve.

R1/456 Pressure Control Solenoid 3

The R1/456 pressure control solenoid 3 is commanded OFF allowing PCS R1/456 fluid from the R1/456 clutch regulator valve and 456 clutch boost valve to exhaust.

R1/456 Clutch Regulator Valve

R1/456 clutch regulator valve spring force moves the valve to exhaust the R1/456 clutch feed circuit and allow drive 1-6 fluid to enter the PS4 fluid circuit. PS4 fluid is then routed to the normally-closed pressure switch 4 and opens the switch. PS4 fluid is also routed to the #4 ball check valve and flows into the CSV2 latch fluid circuit.

#4 Ball Check Valve

PS4 fluid pressure seats the #4 ball check valve against the 456 clutch fluid circuit. PS4 fluid is then directed into the CSV2 latch fluid circuit and routed to the clutch select valve 2. CSV2 latch fluid combines with clutch select valve 2 spring force and holds the valve in this position during all 6 forward gear ranges.

#5 Ball Check Valve

Drive 1-6 fluid pressure seats the #5 ball check valve against the 35 reverse clutch feed fluid passage. Drive 1-6 fluid is then directed into the 35R supply fluid circuit which is routed to the #7 ball check valve and orifice #16.

#7 Ball Check Valve

The 35R supply fluid seats the #7 ball check valve against the 35R feed fluid passage to force 35R supply fluid through orifice #16 before entering the 35R feed circuit. The 35R feed fluid is then routed to the 3-5 reverse clutch regulator valve.

Low and Reverse Clutch

Low and reverse clutch spring force moves the low and reverse clutch piston which forces R1 fluid out. R1 fluid is routed to the clutch select valve 2 where it enters the exhaust backfill circuit. The low and reverse clutch is in the released position.

Drive Range, First Gear

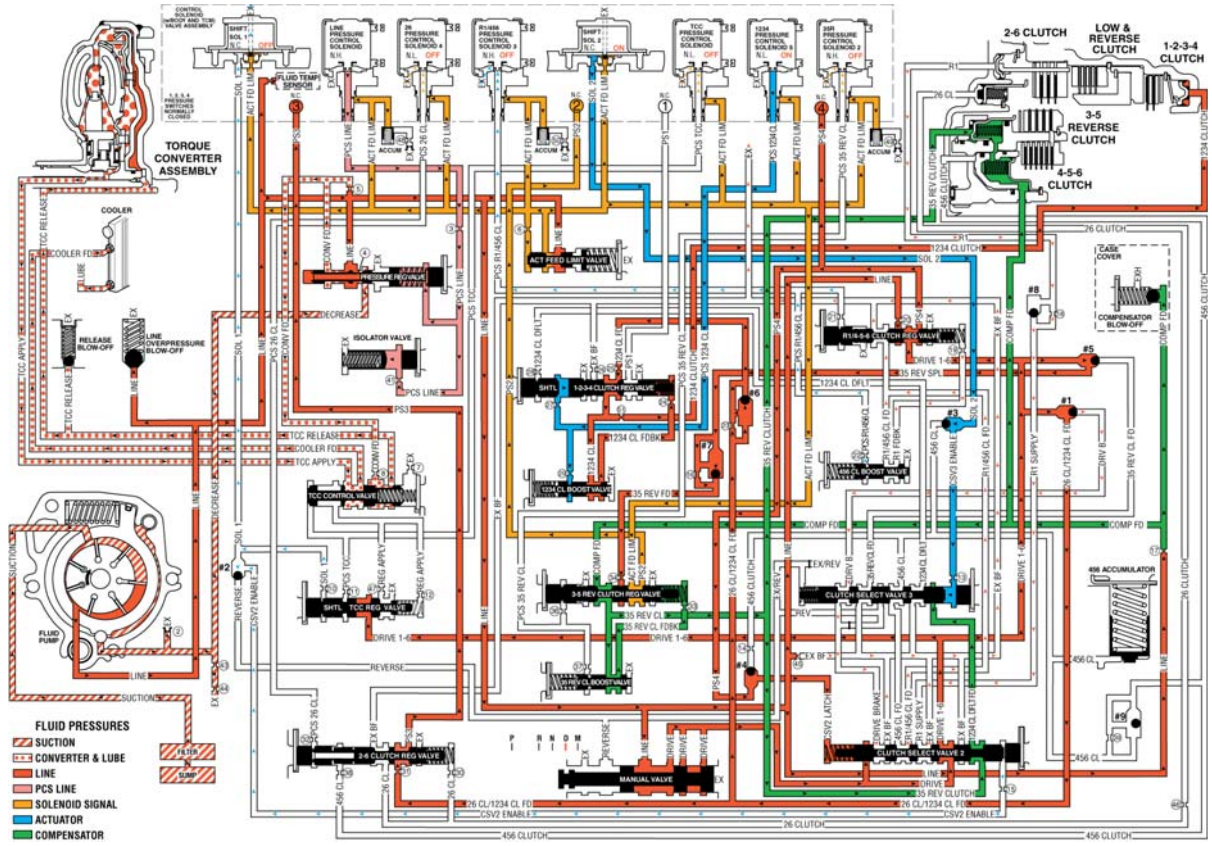

Fig. 11: Identifying Fluid Flow - Drive Range, First Gear
Courtesy of GENERAL MOTORS COMPANY

DRIVE RANGE, THIRD GEAR

As the vehicle speed increases, the transmission control module (TCM) receives input signals from the automatic transmission input and output speed sensors, the throttle position sensor and other vehicle sensors to determine the precise moment to command OFF the normally-low 26 pressure control solenoid 4. At the same time the 35R pressure control solenoid 2 is also commanded ON to regulate 3-5 clutch apply.

3-5 Reverse Clutch Applies

35R Pressure Control Solenoid 2

The 35R pressure control solenoid 2 is commanded ON allowing actuator feed fluid to enter the pressure control solenoid (PCS) 35 reverse clutch fluid circuit. PCS 35 reverse clutch fluid is routed through orifice #36 and then to the 3-5 reverse clutch regulator valve. PCS 35 reverse clutch fluid is also routed through orifice #37 and then to the 3-5 reverse clutch boost valve.

3-5 Reverse Clutch Boost Valve

PCS 35 reverse clutch fluid pressure acts on a differential area moving the 3-5 reverse clutch boost valve against the 3-5 reverse clutch boost valve spring. The 35 reverse clutch fluid passes through the valve and enters the 35 reverse clutch feedback circuit. As PCS 35 reverse clutch fluid pressure is increased to a given value, the 3-5 reverse clutch boost valve opens the 35 reverse clutch feedback circuit to exhaust. This results in the 3-5 reverse clutch regulator valve moving to the full feed position sending full 35 reverse clutch feed pressure (full line pressure) to the clutch.

3-5 Reverse Clutch Regulator Valve

PCS 35 reverse clutch fluid moves the 3-5 reverse clutch regulator valve against 3-5 reverse clutch regulator valve spring force and 35 reverse clutch feedback fluid. This allows 35 reverse feed to pass through the valve and enter the 35 reverse clutch circuit. The 35 reverse clutch fluid is then routed to the 3-5 reverse clutch, the 3-5 reverse boost valve and the clutch select valve 2. When the 3-5 reverse clutch regulator valve is in this position, PS2 fluid from the pressure switch 2 exhausts through the valve allowing the switch to close.

3-5 Reverse Clutch

The 35 reverse clutch fluid enters the 3-5 reverse/4-5-6 clutch housing to move the piston against spring force to apply the 3-5 reverse clutch plates.

2-6 Clutch Releases

26 Pressure Control Solenoid 4

The 26 pressure control solenoid 4 is commanded OFF allowing PCS 26 clutch fluid from the 2-6 clutch regulator valve to exhaust. The 26 clutch/1234 clutch feed fluid at the 2-6 clutch regulator valve passes through the valve and enters the PS3 fluid circuit. PS3 fluid is then routed to pressure switch 3 and opens the normally-closed switch.

2-6 Clutch Regulator Valve

The 2-6 clutch regulator valve spring force moves the valve to allow 26 clutch fluid from the 2-6 clutch to pass through the valve and enter the exhaust backfill fluid circuit.

2-6 Clutch

The 2-6 clutch spring force moves the 2-6 clutch piston to release the 2-6 clutch plates and forces 26 clutch fluid to exhaust. The 26 clutch fluid is routed through the 2-6 clutch regulator valve where it enters the exhaust backfill fluid circuit and is exhausted.

Drive Range, Third Gear

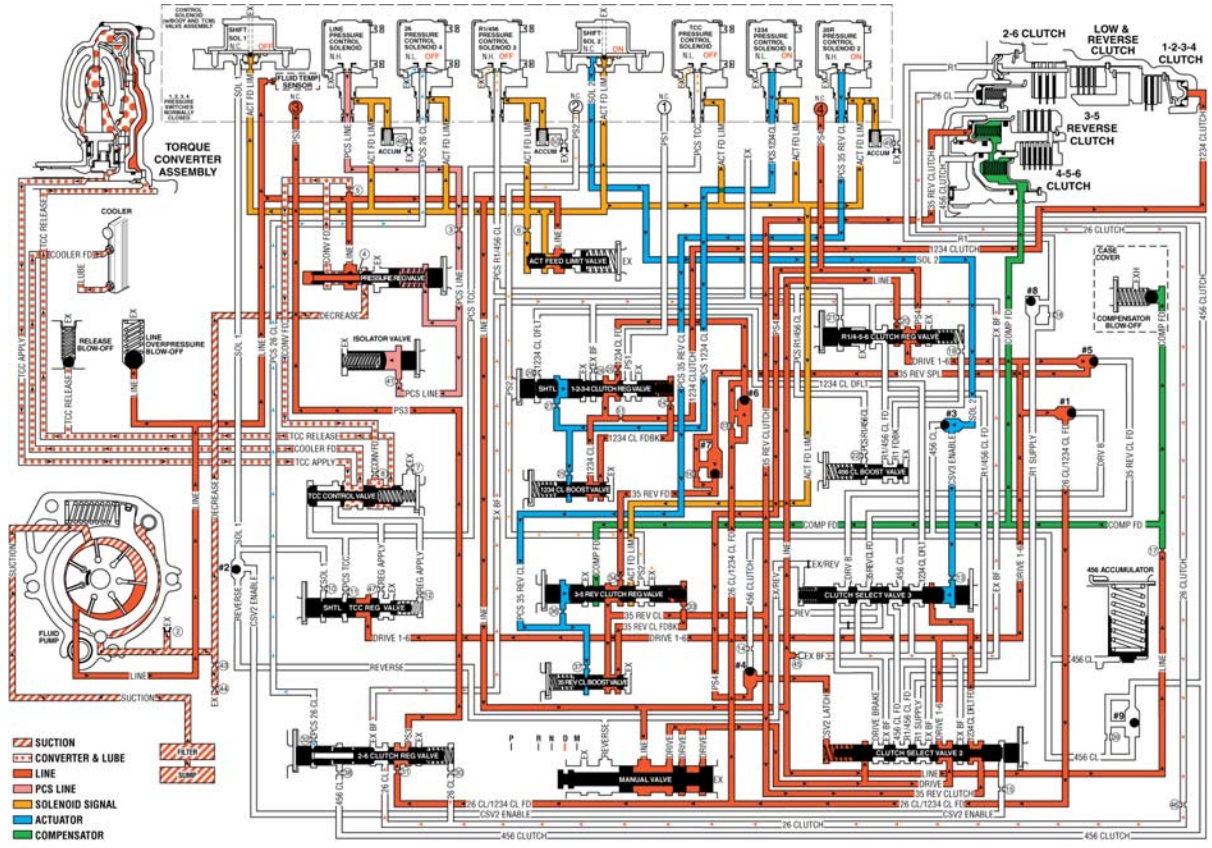

Fig. 12: Identifying Fluid Flow - Drive Range, Third Gear
Courtesy of GENERAL MOTORS COMPANY

DRIVE RANGE, THIRD GEAR DEFAULT

If the transmission is in 1st, 2nd or 3rd gear during a transmission electrical component failure, the transmission will default to 3rd gear. All solenoids will default to their normal state. If the torque converter clutch was applied, it will release. This default action will enable the vehicle to be safely driven to a service center.

1-2-3-4 Clutch Stays Applied

Shift Solenoid 2

Shift solenoid 2 defaults to it's normally-closed state (OFF), and SOL 2 fluid exhausts through the solenoid.

Clutch Select Valve 3

Solenoid 2 fluid pressure no longer holds the clutch select valve 3 open. When the valve moves back to the closed position, it opens the 1234 clutch default fluid circuit, and 1234 default fluid is routed to the 1-2-3-4 clutch regulator valve.

1-2-3-4 Clutch Regulator Valve

With the absence of PCS 1234 clutch fluid, due to the default state of the 1234 pressure control solenoid 5, the 1-2-3-4 regulator valve would close from spring force. However, the 1234 clutch default fluid enters behind the 1-2-3-4 regulator shuttle valve and keeps the valve in the open position.

1-2-3-4 Clutch

With the 1-2-3-4 clutch regulator valve still held in the open position, the 1-2-3-4 clutch will stay applied.

3-5 Reverse Clutch Applied or Applies

35R Pressure Control Solenoid 2

The normal state for the 35R pressure control solenoid 2 is ON, therefore PSC 35 reverse clutch fluid will still be routed to the 3-5 reverse clutch regulator valve and the 3-5 reverse clutch boost valve.

3-5 Reverse Clutch Regulator Valve

PCS 3-5 reverse clutch fluid moves the 3-5 reverse clutch regulator valve against 3-5 reverse clutch regulator valve spring force and 3-5 reverse clutch feedback fluid. This allows 3-5 reverse feed to pass through the valve and enter the 3-5 reverse clutch circuit. 3-5 reverse clutch fluid is then routed to the 3-5 reverse clutch, the 3-5 reverse boost valve and the clutch select valve 2. When the 3-5 reverse clutch regulator valve is in this position, PS2 fluid from the pressure switch 2 exhausts through the valve, allowing the switch to close.

3-5 Reverse Clutch Boost Valve

PCS 3-5 reverse clutch fluid pressure acts on a differential area moving the 3-5 reverse clutch boost valve against the 3-5 reverse clutch boost valve spring. The 3-5 reverse clutch fluid passes through the valve and enters the 3-5 reverse clutch feedback circuit. As PCS 3-5 reverse clutch fluid pressure is increased to a given value, the 3-5 reverse clutch boost valve opens the 3-5 reverse clutch feedback circuit to exhaust. This results in the 3-5 reverse clutch regulator valve moving to the full feed position sending full 3-5 reverse clutch feed pressure (full line pressure) to the clutch.

3-5 Reverse Clutch

The 3-5 reverse clutch fluid enters the 3-5 reverse/456 clutch housing to move the piston against spring force to apply the 3-5 reverse clutch plates.

Drive Range, Third Gear Default

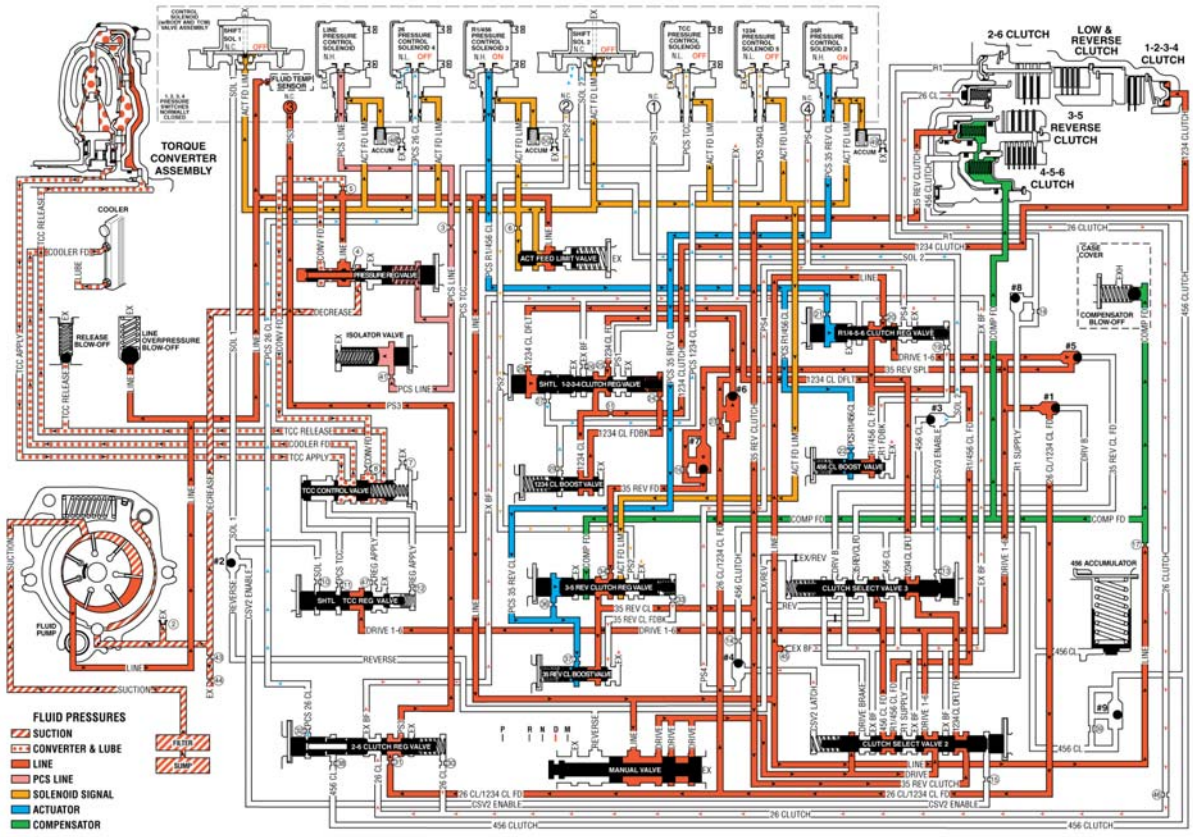

Fig. 13: Identifying Fluid Flow - Drive Range, Third Gear Default
Courtesy of GENERAL MOTORS COMPANY

DRIVE RANGE - FOURTH GEAR

As the vehicle speed increases, the transmission control module (TCM) receives input signals from the automatic transmission input and output speed sensors, the throttle position sensor and other vehicle sensors to determine the precise moment to command OFF the normally-high 35R pressure control solenoid 2. At the same time the normally-low R1/456 pressure control solenoid 3 is commanded ON to regulate 4-5-6 clutch apply.

4-5-6 Clutch Applies

R1/456 Pressure Control Solenoid 3

The R1/456 pressure control solenoid 3 (PCS) is commanded ON allowing actuator feed fluid to enter the PCS R1/456 clutch fluid circuit. PCS R1/456 clutch fluid is routed through orifice #21 to the R1/456 clutch regulator valve and, through orifice #22 to the R1/456 clutch boost valve.

R1/456 Clutch Regulator Valve

PCS R1/456 clutch fluid moves the R1/456 clutch regulator valve against R1/456 clutch regulator valve spring force to allow line fluid to pass through the valve an enter the R1/456 clutch feed circuit. R1/456 clutch feed is then routed to the 4-5-6 clutch boost valve and clutch select valve 2.

4-5-6 Clutch Boost Valve

PCS R1/456 clutch fluid pressure acts on a differential area moving the R1/456 clutch boost valve against the

R1/456 clutch boost valve spring. R1/456 clutch fluid passes through the valve and enters the R1/456 clutch feedback circuit. As PCS R1/456 clutch fluid pressure is increased to a given value, the R1/456 clutch boost valve opens the R1/456 clutch feedback circuit to exhaust. This results in the R1/456 clutch regulator valve moving to the full feed position, sending full line pressure to the clutch.

Clutch Select Valve 2

R1/456 clutch feed fluid passes through the clutch select valve 2 and enters the 456 clutch feed circuit. The 456 clutch feed fluid is routed to the clutch select valve 3 where it passes through the valve and enters the 456 clutch fluid circuit. The 456 clutch fluid is routed to the 4-5-6 clutch, the 4-5-6 accumulator, #9 ball check valve and to the #4 ball check valve. The 456 clutch fluid seats the #9 ball check valve and routes fluid through orifice #39. The 456 clutch fluid passes through orifice #14, seats #4 ball check valve against the PS4 fluid circuit and routes fluid to the CSV2 latch circuit.

4-5-6 Clutch

The 456 clutch fluid enters the 4-5-6 clutch housing to move the piston against spring force, combined with force from the compensator to apply the 4-5-6 clutch plates.

3-5 Reverse Clutch Releases

35R Pressure Control Solenoid 2

The 35R pressure control solenoid 2 is commanded OFF, allowing PCS 35 reverse clutch fluid from the 3-5 reverse clutch boost valve and the 3-5 reverse clutch regulator valve to exhaust through the solenoid.

3-5 Reverse Clutch Boost Valve

The 3-5 reverse boost valve spring force moves the valve to allow 35 reverse clutch feedback fluid from the 3-5 reverse clutch regulator valve to enter the 35 reverse clutch fluid circuit and exhaust.

#9 Ball Check Valve

The 456 clutch fluid pressure seats #9 ball check valve to force fluid through orifice #39 and applies the 456 clutch.

3-5 Reverse Clutch Regulator Valve

The 3-5 reverse clutch regulator valve spring force moves the valve to allow 35 reverse clutch fluid from the 3-5 reverse clutch to pass through the valve and enter the exhaust backfill fluid circuit. The 35 reverse clutch fluid then enters the exhaust backfill fluid circuit and is routed through orifice #30 to the exhaust backfill pressure relief valve where excess pressure is exhausted.

3-5 Reverse Clutch

The 3-5 reverse clutch spring force combined with force from the compensator move the 3-5 reverse clutch piston to release the 3-5 clutch plates and forces 35 reverse clutch fluid to exhaust from 3-5 reverse/456 clutch housing. The 35 reverse clutch fluid is then routed to the 3-5 reverse clutch regulator valve and exhausted.

#4 Ball Check Valve

The 456 clutch fluid pressure passes through orifice #14 to seat #4 ball check valve against PS4 fluid passage. The 456 clutch fluid is then directed into the CSV2 latch circuit.

456 Accumulator

The 456 clutch fluid enters the 456 accumulator to move the piston against spring force to cushion the 456 clutch piston apply.

Drive Range, Fourth Gear

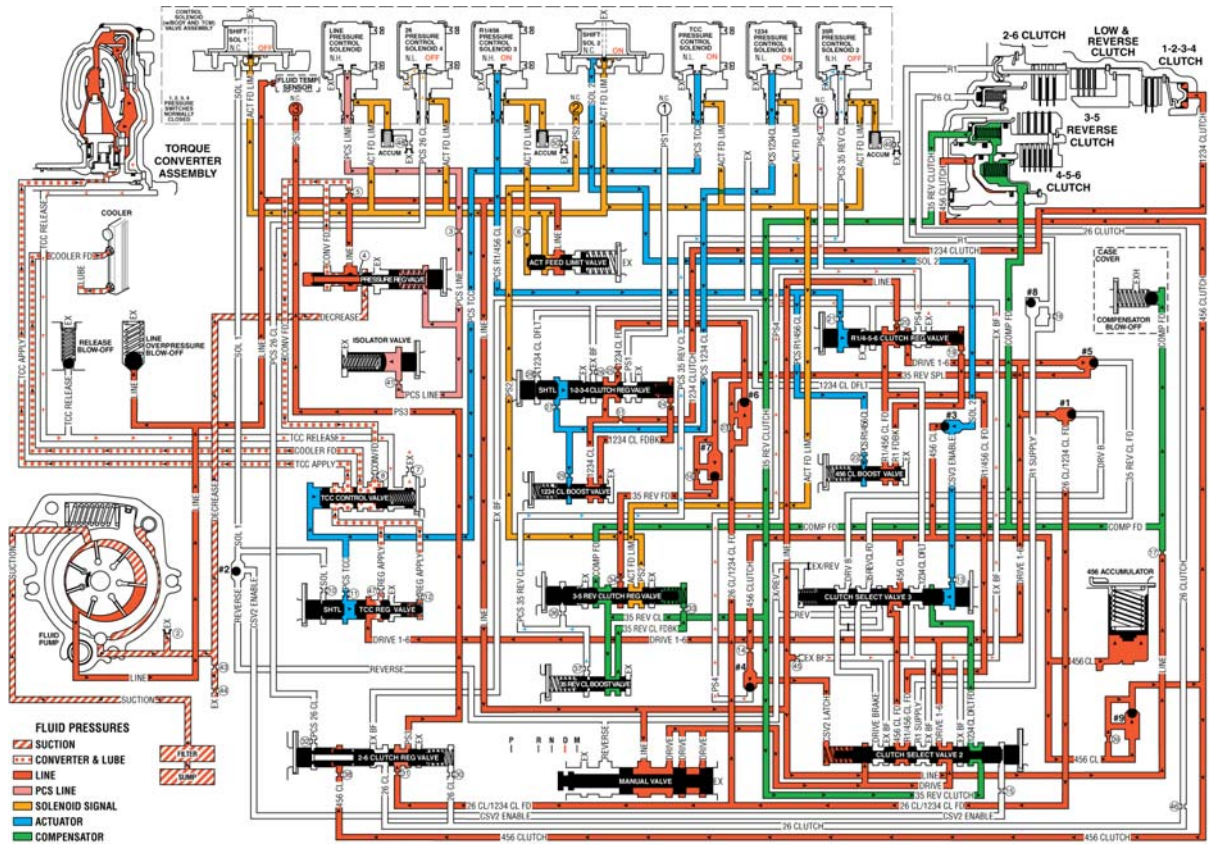

Fig. 14: Identifying Fluid Flow - Drive Range, Fourth Gear
Courtesy of GENERAL MOTORS COMPANY

DRIVE RANGE, FIFTH GEAR

As the vehicle speed increases, the transmission control module (TCM) receives input signals from the automatic transmission input and output speed sensors, the throttle position sensor and other vehicle sensors to determine the precise moment to command ON the normally-high 35R pressure control solenoid 2. At the same time the normally-low 1234 pressure control solenoid 5 is commanded OFF.

3-5 Reverse Clutch Applies

35R Pressure Control Solenoid 2

The 35R pressure control solenoid 2 is commanded ON, allowing actuator feed fluid to enter the PCS 35 reverse clutch fluid circuit. PCS 35 reverse clutch fluid is routed through orifice #36 and then to the 3-5 reverse clutch regulator valve. PCS 35 reverse clutch fluid is also routed through orifice #37 and then to the 3-5 reverse clutch boost valve.

3-5 Reverse Clutch Boost Valve

PCS 35 reverse clutch fluid pressure acts on a differential area moving the PCS 3-5 reverse clutch boost valve against the 3-5 reverse clutch boost valve spring. The 35 reverse clutch fluid passes through the valve and enters the 35 reverse clutch feedback circuit. As PCS 35 reverse clutch fluid pressure is increased to a given value, the 3-5 reverse clutch boost valve opens the 35 reverse clutch feedback circuit to exhaust. This results in the 3-5 reverse clutch regulator valve moving to the full feed position sending full 35 reverse clutch feed pressure (full line pressure) to the clutch.

3-5 Reverse Clutch Regulator Valve

PCS 35 reverse clutch fluid moves the 3-5 reverse clutch regulator valve against 3-5 reverse clutch regulator valve spring force and 35 reverse clutch feedback fluid. This allows 35 reverse feed to pass through the valve and enter the 35 reverse clutch circuit. The 35 reverse clutch fluid is then routed to the 3-5 reverse clutch, the 3-5 reverse boost valve and the clutch select valve 2. When the 3-5 reverse clutch regulator valve is in this position, PS2 fluid from the pressure switch 2 exhausts through the valve allowing the switch to close.

Clutch Select Valve 2

The 35 reverse clutch fluid passes through the clutch select valve 2 and enters the 1234 clutch default feed fluid circuit. The 1234 clutch default feed fluid is then routed to the clutch select valve 3.

3-5 Reverse Clutch

The 35 reverse clutch fluid enters the 3-5 reverse/456 clutch housing to move the piston against spring force combined with force from the compensator to apply the 3-5 reverse clutch plates.

1-2-3-4 Clutch Releases

1234 Pressure Control Solenoid 5

The 1234 pressure control solenoid 5 is commanded OFF, allowing PCS 1234 clutch fluid from the 1-2-3-4 clutch regulator valve and 1-2-3-4 clutch boost valve to exhaust.

1-2-3-4 Clutch Regulator Valve

The 1-2-3-4 clutch regulator valve spring force moves the valve to allow 1234 clutch feed fluid from the 1-2-3-4 clutch to pass through the valve and enter the exhaust backfill fluid circuit. The 1234 clutch fluid the enters the exhaust backfill fluid circuit and is routed through orifice #26 where excess pressure is exhausted. Also, 1234 clutch regulator valve spring force moves the valve to allow 1234 clutch feed fluid to pass through the valve and enter the PS1 fluid circuit. PS1 fluid is then routed to pressure switch 1 and opens the normally-closed switch.

1-2-3-4 Clutch Boost Valve

The 1-2-3-4 clutch boost valve spring force moves the valve to allow 1234 clutch feedback fluid from the 1-2-3-4 clutch regulator valve to enter the 1234 clutch circuit and exhaust.

1-2-3-4 Clutch

The 1-2-3-4 clutch spring force moves the 1-2-3-4 clutch piston to release the clutch plates and force 1234

clutch fluid from the 1-2-3-4 clutch. The 1234 clutch fluid is routed through the 1-2-3-4 clutch regulator valve where it enters the exhaust backfill fluid circuit.

Drive Range, Fifth Gear

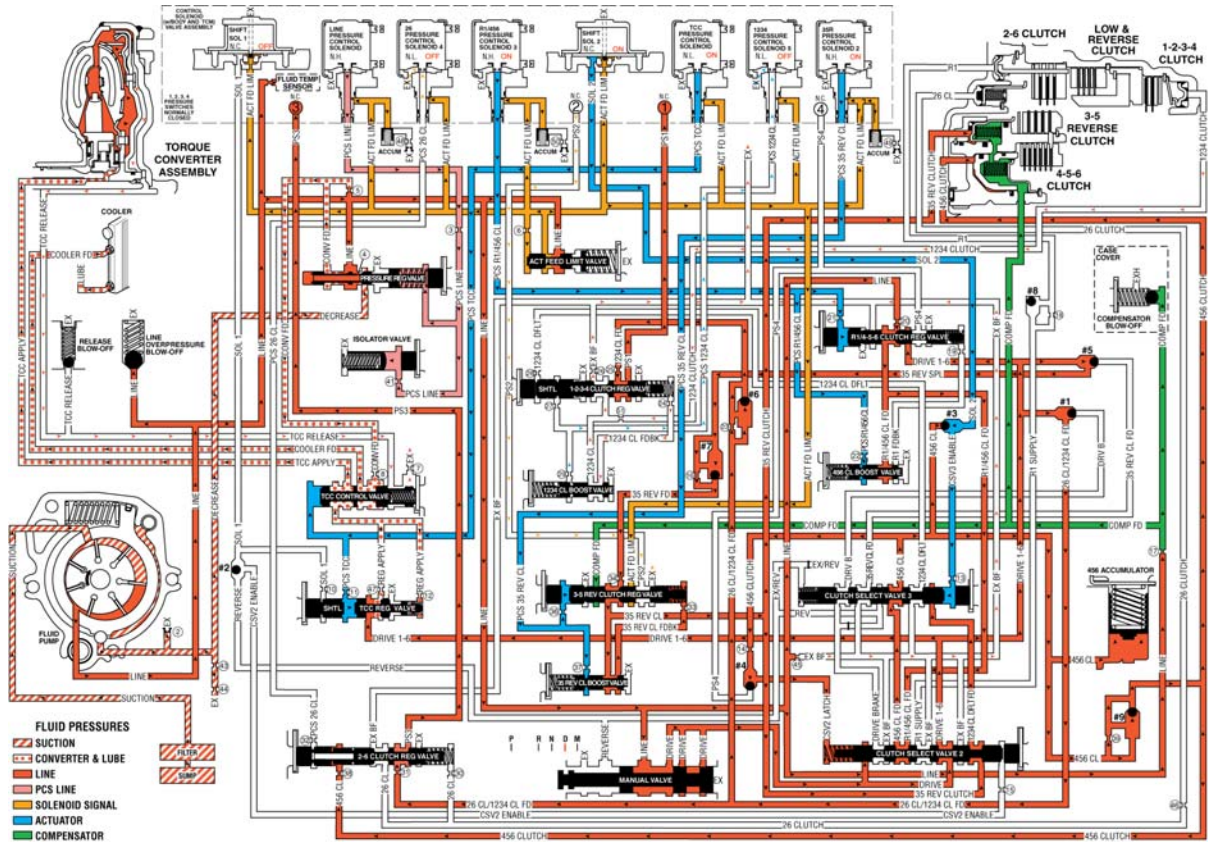

Fig. 15: Identifying Fluid Flow - Drive Range, Fifth Gear
Courtesy of GENERAL MOTORS COMPANY

DRIVE RANGE, FIFTH GEAR DEFAULT

If the transmission is in 4th, 5th or 6th gear during a transmission electrical component failure, the transmission will default to 5th gear. All solenoids will default to their normal state. If the torque converter clutch was applied, it will release. The transmission will stay in 5th gear default range until the ignition has been turned off or transmission shifted to reverse. When the vehicle is restarted, and shifted back into drive, the transmission will then operate in the 3rd gear default range. This default action will enable the vehicle to be safely driven to a service center.

3-5 Reverse Clutch Applies

35R Pressure Control Solenoid 2

The 35R pressure control solenoid 2 defaults to ON, allowing actuator feed fluid to enter the pressure control solenoid (PCS) 35 reverse clutch fluid circuit. PCS 35 reverse clutch fluid is routed through orifice #36 and then to the 3-5 reverse clutch regulator valve. PCS 35 reverse clutch fluid is also routed through orifice #37 and then to the 3-5 reverse clutch boost valve.

3-5 Reverse Clutch Boost Valve

PCS 3-5 reverse clutch fluid pressure acts on a differential area moving the PCS 3-5 reverse clutch boost valve against the 3-5 reverse clutch boost valve spring. The 3-5 reverse clutch fluid passes through the valve and enters the 3-5 reverse clutch feedback circuit. As PCS 3-5 reverse clutch fluid pressure is increased to a given value, the 3-5 reverse clutch boost valve opens the 3-5 reverse clutch feedback circuit to exhaust. This results in the 3-5 reverse clutch regulator valve moving to the full feed position sending full 3-5 reverse clutch feed pressure (full line pressure) to the clutch.

3-5 Reverse Clutch Regulator Valve

PCS 3-5 reverse clutch fluid moves the 3-5 reverse clutch regulator valve against 3-5 reverse clutch regulator valve spring force and 3-5 reverse clutch feedback fluid. This allows 3-5 reverse feed to pass through the valve and enter the 3-5 reverse clutch circuit. The 3-5 reverse clutch fluid is then routed to the 3-5 reverse clutch, the 3-5 reverse boost valve and the clutch select valve 2. When the 3-5 reverse clutch regulator valve is in this position, PS2 fluid from the pressure switch 2 exhausts through the valve, allowing the switch to close.

3-5 Reverse Clutch

The 3-5 reverse clutch fluid enters the 3-5 reverse/456 clutch housing to move the piston against spring force to apply the 3-5 reverse clutch plates.

Clutch Select Valve 3

Once the clutch select valve 3 is moved to the ON position in 4th gear, it will remain in this position throughout the 5th gear default range, until the ignition has been turned OFF. When the ignition is OFF, fluid will exhaust from the valve, thus when the vehicle is restarted, the transmission will then be in the 3rd gear default range.

1-2-3-4 Clutch Releases or 2-6 Clutch Releases

1234 Pressure Control Solenoid 5

If the transmission was in 4th gear when an electrical condition commands a protection mode, the 1234 pressure control solenoid 5 defaults to the OFF position, allowing PCS 1234 clutch fluid from the 1-2-3-4 clutch, the 1-2-3-4 clutch regulator valve and 1- 2-3-4 clutch boost valve to exhaust.

2-6 26 Pressure Control Solenoid 4

If the transmission was in 6th gear when an electrical condition commands a protection mode, the 26 pressure control solenoid 4 defaults to the OFF position, allowing PCS 26 clutch fluid from the 2-6 clutch regulator valve, and the 2-6 clutch to exhaust.

Torque Converter Clutch Releases

TCC Pressure Control Solenoid

The torque converter clutch (TCC) pressure control solenoid will default to it's normal state, OFF. PCS TCC fluid will exhaust from the TCC control valve, and spring force will shuttle the valve to the off position. TCC apply fluid will then be routed to the cooler, and TCC release fluid will be routed to the torque converter for complete TCC release.

1234 Clutch Regulator Valve

The 1234 clutch regulator valve spring force moves the valve to allow 1234 clutch feed fluid to enter the PS1 fluid circuit which opens PS1 switch. The 1234 clutch fluid passes through orifice #51 to the 1234 clutch regulator valve, through orifice #26 and enters the exhaust backfill circuit.

DIAGNOSTIC INFORMATION AND PROCEDURES

DTC P0601-P0604 OR P062F: CONTROL MODULE MEMORY

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptors

NOTE: **DTCs P0601, P0602, P0603, P0604 or P062F could set in other control modules. Verify the DTCs are set in the transmission control module (TCM).**

DTC P0601

Control Module Read Only Memory Performance

DTC P0602

Control Module Not Programmed

DTC P0603

Control Module Long Term Memory Reset

DTC P0604

Control Module Random Access Memory Performance

DTC P062F

Control Module Long Term Memory Performance

Circuit/System Description

This is an internal fault detection of the control solenoid valve assembly. This fault is handled inside the control solenoid valve assembly and no external circuits are involved.

Conditions for Running the DTC

Ignition voltage is between 8.6 volts and 18.0 volts.

Conditions for Setting the DTC

P0601

Read only memory (ROM) test has failed 5 or greater times.

P0602

TCM has not been programmed and is unable to detect the start program.

P0603

TCM has detected a memory checksum error.

P0604

TCM has detected a random access memory (RAM) test error 5 or greater times.

P062F

TCM has detected a non-volatile memory error during power-down.

Action Taken When the DTC Sets

P0601, P0603, P0604, or P062F

- DTCs P0601, P0603, P0604, and P062F are Type A DTCs.
- TCM limits the transmission to Reverse and 5th gear operation.
- TCM commands maximum line pressure.
- TCM forces the torque converter clutch (TCC) OFF.
- TCM freezes transmission adaptive functions.
- TCM commands the high side driver OFF.
- TCM inhibits Tap Up/Down function.
- TCM inhibits manual shifting of forward gears.

P0602

- DTC P0602 is a Type C DTC.
- TCM limits the transmission to Reverse and 5th gear operation.
- TCM commands maximum line pressure.
- TCM forces the torque converter clutch (TCC) OFF.
- TCM freezes transmission adaptive functions.
- TCM commands the high side driver OFF.
- TCM inhibits Tap Up/Down function.
- TCM inhibits manual shifting of forward gears.

Conditions for Clearing the DTC

P0601, P0603, P0604, or P062F

DTCs P0601, P0603, P0604, and P062F are Type A DTCs.

P0602

DTC P0602 is a Type C DTC.

Circuit/System Verification

CAUTION: Before programming a control module, the following must be observed, or control module damage may occur:

- **The TIS terminal, MDI, and/or scan tool must have the latest software.**
- **The vehicle battery must be fully charged. The battery voltage should be between 12-14 volts.**
- **The TIS terminal, MDI, and/or scan tool connections must be secure.**
- **A battery charger must NOT be connected to the battery when programming a control module.**

1. Ignition OFF for 1 minute.
2. Ignition ON.
3. Verify with a scan tool, that DTC P0602 is not set.
   - **If DTC P0602 is set**
   - Program the K71 transmission control module. Refer to **Control Solenoid Valve and Transmission Control Module Assembly Programming and Setup** , . If the DTC resets, replace the Q8 control solenoid valve assembly. Refer to **Control Solenoid Valve and Transmission Control Module Assembly Replacement** .
   - **If DTC P0602 is not set**
4. Verify with a scan tool that DTC P0601, P0603, P0604, or P062F is not set.
   - **If DTC P0601, P0603, P0604, or P062F is set**

     Replace the Q8 control solenoid valve assembly.

   - **If DTC P0601, P0603, P0604 or P062F is not set**
5. After performing the above steps, verify that the DTC does not reset by operating the vehicle within the

Conditions for Running the DTC. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/Failure Records data. If the vehicle passes the Circuit/System Verification procedure, refer to **Testing for Intermittent Conditions and Poor Connections** .

Repair Instructions

NOTE: Perform the Reset Transmission Adapts any time a transmission related component is serviced.

Perform the **Diagnostic Repair Verification** after completing the diagnostic procedure.

Control Module References for control solenoid valve assembly replacement, setup, and programming

DTC P0634: CONTROL MODULE OVERTEMPERATURE

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

DTC P0634

Control Module Overtemperature

Circuit/System Description

The transmission control module (TCM) temperature sensor is located inside of the control solenoid valve assembly which has no serviceable components. The TCM monitors the TCM temperature sensor for over temperature protection.

Conditions for Running the DTC

- Ignition voltage is 8.6-32 V.
- TCM temperature is between 0-170Â°C (32-338Â°F) for 0.25 s.

Conditions for Setting the DTC

Condition 1

TCM detects an internal temperature condition of 146Â°C (295Â°F) or greater for 5 s.

Condition 2

Ignition voltage is 18 V or greater and the TCM detects an internal temperature of 50Â°C (122Â°F) or greater for 2 s.

Action Taken When the DTC Sets

- P0634 is a Type A DTC.

- TCM limits the transmission to Reverse and 3rd or 5th gear operation.
- TCM inhibits Tap Up/Down function.
- TCM inhibits manual shifting of forward gears.
- TCM commands maximum line pressure.
- TCM shuts down.

Conditions for Clearing the DTC

P0634 is a Type A DTC.

Diagnostic Aids

During a road test, the TCM temperature should steadily increase to a normal operating temperature, and then stabilize.

Circuit/System Verification

1. Ignition ON.
2. Verify the scan tool Engine Coolant Temperature parameter was less than 125Â° C (257Â° F) when DTC set by reviewing the scan tool Freeze Frame/Failure Records.
    - **If 125Â° C (257Â° F) or greater**

      Refer to **Engine Overheating** .

    - **If less than 125Â° C (257Â° F)**
3. Verify transmission fluid level and condition is correct. Refer to **Transmission Fluid Level and Condition Check**.
    - **If the transmission fluid level and condition is not correct**

      Repair as necessary.

    - **If the transmission fluid level and condition is correct**
4. Clear the DTCs from the TCM with a scan tool.
5. Operate the vehicle until normal engine temperature is reached.
6. Verify the scan tool Transmission Fluid Temperature parameter is less than 140Â° C (284Â° F).
    - **If 140Â° C (284Â° F) or greater**
    1. Ignition OFF.
    2. Verify the conditions listed below do not exist:
        - Obstructions to the airflow to the radiator or transmission
        - Radiator damage
        - Transmission cooler damage
        - Transmission cooler pipe kinked or damaged
    - If conditions exist, repair or replace as necessary.
    - If conditions do not exist, refer to **Transmission Fluid Cooler Flushing and Flow Test** .
    - **If less than 140Â° C (284Â° F)**
7. Verify the DTC does not set.
    - **If DTC sets**

      Replace the Q8 Control Solenoid Valve Assembly.

    - **If DTC does not set**
8. Operate the vehicle within the conditions for Running the DTC. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/Failure Record data.
9. Verify the DTC does not set.
    - **If the DTC sets**

      Replace the Q8 Control Solenoid Valve Assembly.

    - **If the DTC does not set**
10. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repairs.

- Perform the **Reset Transmission Adapts** following all transmission repairs.
- **Transmission Fluid Auxiliary Cooler Replacement**
- **Transmission Fluid Auxiliary Cooler Inlet Hose Replacement**
- **Transmission Fluid Cooler Hose/Pipe Quick-Connect Fitting Disconnection and Connection**
- **Fluid Cooler Inlet Hose Replacement**
- **Fluid Cooler Outlet Hose Replacement**
- **Control Module References** for Control Solenoid Valve Assembly replacement, programming, and setup

DTC P0658 OR P0659: ACTUATOR HIGH CONTROL CIRCUIT GROUP 1

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptors

DTC P0658

Actuator High Control Circuit Group 1 Low Voltage

DTC P0659

Actuator High Control Circuit Group 1 High Voltage

Circuit/System Description

The transmission control module (TCM) high side driver 1 is located inside of the control solenoid valve assembly, which has no serviceable components. The high side driver 1 provides power to the pressure control solenoids and shift solenoids.

Conditions for Running the DTC

P0658

- DTC P0658 is not set.
- High side driver 1 is enabled.

P0659

- DTC P0659 is not set.
- Ignition transitions from OFF to ON

Conditions for Setting the DTC

P0658

TCM detects an internal open or short to ground in the high side driver 1 circuit for 1 s.

P0659

TCM detects an internal short to voltage on the high side driver 1 for 1 s.

Action Taken When the DTC Sets

P0658

- DTC P0658 is a Type A DTC.
- TCM turns the high side driver OFF.
- TCM turns OFF all solenoids.
- TCM commands maximum line pressure.
- TCM freezes transmission adaptive functions.
- TCM commands the torque converter clutch (TCC) OFF.
- TCM inhibits Tap Up/Down function.
- TCM inhibits manual shifting of forward gears.
- TCM limits the transmission to Reverse and 5th gear operation.
- TCM requests a reduced torque value based on input speed.

P0659

DTC P0659 is a Type C DTC.

Conditions for Clearing the DTC

- DTC P0658 is a Type A DTC.
- DTC P0659 is a Type C DTC.

Special Tools

DT-47825-20 Adapter Harness

For equivalent regional tools, refer to **Special Tools** .

Circuit/System Verification

1. Ignition ON.
2. Verify the scan tool High Side Driver 1 parameter displays ON.
    - **If ON is not displayed**

      Refer to Circuit/System Testing.

    - **If ON is displayed**
3. Engine Running, and transmission in Park.
4. Verify the scan tool parameters listed below do not display Malfunction:
    - High Side Driver 1 Circuit Low Voltage Test Status
    - High Side Driver 1 Circuit Open Test Status
    - High Side Driver 1 Circuit High Voltage Test Status
    - **If Malfunction is displayed**

      Refer to Circuit/System Testing.

    - **If Malfunction is not displayed**
5. Operate the vehicle within the Conditions for Running the DTC. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/Failure Records data.
6. Verify the DTC does not set.
    - **If the DTC sets**

      Refer to Circuit/System Testing.

- **If the DTC does not set**

7. All OK.

Circuit/System Testing

NOTE: **You must perform the Circuit/System Verification first.**

1. Ignition OFF, remove the Q8 Control Solenoid Valve Assembly.
2. Verify the Q8 Control Solenoid Valve Assembly is not contaminated with any debris. Refer to **Control Solenoid Valve and Transmission Control Module Assembly Inspection**
   - **If contaminated**

     Repair as necessary

   - **If not contaminated**
3. Verify the resistance is within the specified range for each solenoid listed in the **Control Solenoid Valve and Transmission Control Module Assembly Inspection**.
   - **If the resistance is not within range**

     Replace the Q8 Control Solenoid Valve Assembly.

   - **If the resistance is within range**
4. Place the Q8 Control Solenoid Valve Assembly on a clean work surface near the transmission assembly.
5. Connect the **DT 47825-20** adapter harness between the vehicle wire harness electrical connector and the Q8 Control Solenoid Valve Assembly electrical connector. Ignition ON.
6. Verify the scan tool parameters listed below do not display Malfunction:
   - High Side Driver 1 Circuit Low Voltage Test Status
   - High Side Driver 1 Circuit Open Test Status
   - High Side Driver 1 Circuit High Voltage Test Status
   - **If Malfunction is displayed**

     Replace the Q8 Control Solenoid Valve Assembly.

   - **If Malfunction is not displayed**
7. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repairs.

- Perform the **Reset Transmission Adapts** following all transmission repairs.
- **Control Module References** for Control Solenoid Valve Assembly replacement, programming, and setup.

DTC P0667, P0668, OR P0669: CONTROL MODULE TEMPERATURE SENSOR

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptors

DTC P0667

Control Module Temperature Sensor Performance

DTC P0668

Control Module Temperature Sensor Circuit Low Voltage

DTC P0669

Control Module Temperature Sensor Circuit High Voltage

Circuit/System Description

The transmission control module (TCM) temperature sensor is located inside of the control solenoid valve assembly, which has no serviceable components. The TCM temperature sensor provides the temperature of the TCM. This temperature reading is used in various shifting and diagnostic routines in the TCM software. This fault is handled inside the TCM and no external circuits are involved.

Conditions for Running the DTC

P0667

- DTC P0101, P0102, P0103, P0106, P0107, P0108, P0171, P0172, P0174, P0175, P0201, P0202, P0203, P0204, P0205, P0206, P0300, P0301, P0302, P0303, P0304, P0305, P0306, P0401, P042E, P0658, P0668, P0669, P06AD, P06AE, P0712, P0713, P0716, P0717, P0722, P0723, P0962, P0963, P0966, P0967, P0970, P0971, P215C, P2720, P2721, P2729, or P2730 is not set.
- Brake torque is not active.
- Engine speed is 400-7,500 RPM for 5 s.
- Ignition voltage is between 8.6-32 V.
- Engine torque signal is valid.
- Accelerator pedal position signal is valid.

P0668

- Engine speed is 400-7,500 RPM for 5 s.
- Ignition voltage is between 8.6-32 V.

P0669

- DTC P0716, P0717, P0722, or P0723 is not set.
- Engine speed is 400-7,500 RPM .
- Ignition voltage is between 8.6-32 V.

Conditions for Setting the DTC

P0667

- TCM detects a 20-50Â°C (36-90Â°F) or greater difference between the transmission fluid temperature and TCM substrate temperature, which depends on the average of the transmission fluid temperature, TCM substrate temperature, and TCM power up temperature.
- TCM detects an 8-10Â°C (14-18Â°F) or greater difference between the TCM power up temperature and TCM substrate temperature, which depends on the average of the transmission fluid temperature, TCM substrate temperature, and TCM power up temperature.
- Above conditions have to be met for 5 min within a 6 min period.

P0668

TCM temperature is -249Â°C (-416Â°F) or less for 1 min.

P0669

TCM temperature is 249Â°C (480Â°F) or greater for 1 min.

Action Taken When the DTC Sets

- DTCs P0667, P0668, and P0669 are Type B DTCs.
- TCM defaults the TCM substrate temperature to a calculated temperature based on the TCM power up temperature.

Conditions for Clearing the DTC

DTCs P0667, P0668, and P0669 are Type B DTCs.

Diagnostic Aids

The TCM temperature sensor is located inside of the control solenoid valve assembly and its output should resemble that of the transmission fluid temperature sensor output. During a road test, the TCM temperature should steadily increase to a normal operating temperature, and then stabilize.

DTC P06AC-P06AE: CONTROL MODULE POWER UP TEMPERATURE SENSOR

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptors

DTC P06AC

Control Module Power Up Temperature Sensor Performance

DTC P06AD

Control Module Power Up Temperature Sensor Circuit Low Voltage

DTC P06AE

Control Module Power Up Temperature Sensor Circuit High Voltage

Circuit/System Description

The transmission control module (TCM) power up temperature sensor is located inside of the control solenoid valve assembly, which has no serviceable components. The TCM power up temperature sensor provides the temperature of the TCM when the TCM power is ON. This temperature reading is used in various shifting and diagnostic routines and also to protect the control solenoid valve assembly and TCM. This fault is handled inside the TCM and no external circuits are involved.

Conditions for Running the DTC

P06AC

- DTC P0101, P0102, P0103, P0106, P0107, P0108, P0171, P0172, P0174, P0175, P0201, P0202, P0203, P0204, P0205, P0206, P0300, P0301, P0302, P0303, P0304, P0305, P0306, P0401, P042E, P0658, P0668, P0669, P06AD, P06AE, P0712, P0713, P0716, P0717, P0722, P0723, P0962, P0963, P0966, P0967, P0970, P0971, P215C, P2720, P2721, P2729, or P2730 is not set.
- Engine speed is 400-7,500 RPM for 5 s.
- Ignition voltage is between 8.6-32 V.
- Brake torque is not active.
- Engine torque signal is valid.
- Accelerator pedal position signal is valid.

P06AD

- DTC P0716, P0717, P0722, or P0723 is not set.

- Engine speed is 400-7,500 RPM for 5 s.
- Ignition voltage is between 8.6-32 V.

P06AE

- Engine speed is 400-7,500 RPM for 5 s.
- Ignition voltage is between 8.6-32 V.

Conditions for Setting the DTC

P06AC

- TCM detects a 20-50Â° C (36-90Â°F) or greater difference between the transmission fluid temperature and TCM power up temperature, which depends on the average of transmission fluid temperature, TCM substrate temperature, and TCM power up temperature.
- TCM detects an 8-10Â° C (14-18Â°F) or greater difference between the TCM substrate temperature and TCM power up temperature, which depends on the average of the transmission fluid temperature, TCM substrate temperature, and TCM power up temperature.
- Above conditions have to be met for 5 min. within a 6 min. period.

P06AD

TCM power up temperature is -59Â°C (-74Â°F) or less for 1 min.

P06AE

TCM power up temperature is 164Â°C (327Â°F) or greater for 1 min.

Action Taken When the DTC Sets

- DTC P06AC, P06AD, P06AE are Type B DTCs.
- TCM defaults the TCM power up temperature to a calculated temperature based on the TCM substrate temperature.

Conditions for Clearing the DTC

DTC P06AC, P06AD, P06AE are Type B DTCs.

DTC P0711-P0713: TRANSMISSION FLUID TEMPERATURE SENSOR

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptors

DTC P0711

Transmission Fluid Temperature Sensor Performance

DTC P0712

Transmission Fluid Temperature Sensor Circuit Low Voltage

DTC P0713

Transmission Fluid Temperature Sensor Circuit High Voltage

Circuit/System Description

The transmission fluid temperature sensor is located inside of the transmission control module (TCM) assembly which has no serviceable components. The transmission fluid temperature sensor provides transmission fluid temperature to the TCM. This fault is handled inside the TCM and no external circuits are involved.

Conditions for Running the DTC

P0711

- DTC P0101, P0102, P0103, P0106, P0107, P0108, P0171, P0172, P0174, P0175, P0201, P0202, P0203, P0204, P0205, P0206, P0300, P0301, P0302, P0303, P0304, P0305, P0306, P0401, P042E, P0658, P0668, P0669, P06AD, P06AE, P0712, P0713, P0716, P0717, P0722, P0723, P0962, P0963, P0966, P0967, P0970, P0971, P215C, P2720, P2721, P2729, or P2730 is not set.
- Engine speed is 400-7,500 RPM for 5 s.
- Ignition voltage is greater than 8.5 V.
- Brake torque is not active.
- Engine torque signal is valid.
- Throttle position signal is valid.

P0712 and P0713

- DTC P0716, P0717, P0722, or P0723 is not set.
- Engine speed is 400-7,500 RPM for 5 s.
- Ignition voltage is greater than 8.5 V.

Conditions for Setting the DTC

P0711

- TCM detects a 20-50Â° C (36-90Â° F) or greater difference between the transmission fluid temperature

and the TCM substrate temperature, which depends on the average of the transmission fluid temperature, TCM substrate temperature, and TCM power up temperature.

- TCM detects a 20-50Â° C (36-90Â° F) or greater difference between the transmission fluid temperature and the TCM power up temperature, which depends on the average of the transmission fluid temperature, TCM substrate temperature, and TCM power up temperature.
- Above conditions have to be met for 5 min within a 6 min period.

P0712

Transmission fluid temperature is -74Â°C (-101Â°F) or lower for 1 min.

P0713

Transmission fluid temperature is 174Â°C (345Â°F) or greater for 1 min.

Action Taken When the DTC Sets

- DTCs P0711, P0712, and P0713 are Type B DTCs.
- TCM defaults to a calculated transmission fluid temperature based on the TCM Temperature.

Conditions for Clearing the DTC

DTCs P0711, P0712, and P0713 are Type B DTCs.

Diagnostic Aids

The TCM temperature sensor is located inside of the control solenoid valve assembly and its output should resemble that of the transmission fluid temperature sensor's output. During a road test, the transmission fluid temperature should steadily increase to a normal operating temperature, and then stabilize.

Circuit/System Verification

1. Engine idling at the normal operating temperature.
2. Verify the scan tool Transmission Fluid Temperature parameter is between -74 and +174Â° C (-101 and +345Â° F).
   - **If not between -74 and +174Â° C (-101 and +345Â° F)**

     Replace the Q8 Control Solenoid Valve Assembly.

   - **If between -74 and +174Â° C (-101 and +345Â° F)**
3. Verify the scan tool Transmission Fluid Temperature parameter increases greater than 2Â° C (3.5Â° F) after operating the vehicle at 64 km/h (40 mph) for 10 min.
   - **If the temperature does not increase greater than 2Â° C (3.6Â° F)**

     Replace the Q8 Control Solenoid Valve Assembly.

   - **If the temperature increases greater than 2Â° C (3.6Â° F)**
4. Verify the scan tool Transmission Fluid Temperature and the TCM Temperature parameters are within 20Â° C (36Â° F).
   - **If the temperatures are not within 20Â° C (36Â° F)**
     1. Ignition OFF, remove the control valve body cover. Refer to **Control Valve Body Cover Replacement** .
     2. Verify the heat sink on the control valve channel upper plate and the control solenoid valve spring are in place and undamaged.
        - If the heat sink on the control valve channel upper plate or the control solenoid valve spring are damaged, replace as necessary
        - If the heat sink on the control valve channel upper plate and the control solenoid valve spring are in place and undamaged, replace the Q8 Control Solenoid Valve Assembly
   - **If the temperatures are within 20Â° C (36Â° F)**
5. Operate the vehicle within the Conditions for Running the DTC. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/Failure Records data.
6. Verify the DTC does not set.
   - **If the DTC sets**

Replace the Q8 Control Solenoid Valve Assembly.

- **If the DTC does not set**

7. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repairs.

- Perform the **Reset Transmission Adapts** following all transmission repairs.
- **Control Valve Lower Body and Upper Body Replacement** for control valve channel upper plate assembly and control solenoid valve spring replacement.
- **Control Module References** for Control Solenoid Valve Assembly replacement, programming, and setup.

DTC P0716 OR P0717: INPUT SPEED SENSOR

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

Circuit/System Description

The input shaft speed (ISS) sensor is a hall-effect type sensor. The ISS sensor mounts to the inside of the automatic transmission case assembly and connects to the control solenoid valve assembly through a 2-wire harness and connector. The sensor faces the reluctor wheel which is attached to the 4-5-6 clutch and 3-5-R clutch housing. The sensor receives 8.3-9.3 volts on the ISS supply voltage circuit from the transmission control module (TCM). As the 4-5-6 clutch and 3-5-R clutch housing rotates, the sensor produces a signal frequency based on the teeth of the reluctor wheel. This signal is transmitted through the ISS sensor signal circuit to the TCM. The TCM uses the ISS sensor signal to determine line pressure, transmission shift patterns, torque converter clutch (TCC) slip speed, and gear ratio.

Conditions for Running the DTC

P0716

- DTC P0101, P0102, P0103, P0121, P0122, P0123, P0717, P0752, P0973, or P0974 is not set.
- Engine speed is 400-7,500 RPM for 5 s.
- Ignition voltage is greater than 8.5 V.
- Engine torque signal is valid.
- Throttle position signal is valid.
- Vehicle speed is 10 km/h (6 mph) or greater.

P0717

- DTC P0101, P0102, P0103, P0722, or P0723 is not set.
- Engine speed is 400-7,500 RPM for 5 s.
- Ignition voltage is greater than 8.5 V.
- Vehicle speed is 16 km/h (10 mph) or greater.
- Engine torque is 50 N.m (37 lb ft) or greater.
- Engine torque signal is valid.

Conditions for Setting the DTC

P0716

TCM detects the transmission input shaft speed signal dropped greater than 1350 RPM for 1 s.

P0717 - Condition 1

TCM detects the transmission input shaft speed signal is less than 33 RPM for 5 s.

P0717 - Condition 2

The TCM detects that P0722 set and the Transmission input speed is less than 1000 RPM for 5 s.

Action Taken When the DTC Sets

- DTCs P0716 and P0717 are Type A DTCs.
- TCM freezes transmission adaptive functions.
- TCM commands the high side driver OFF.
- TCM commands TCC OFF.
- TCM commands maximum line pressure.
- TCM disables neutral idle.
- TCM inhibits Tap Up/Down function.
- TCM inhibits manual shifting of forward gears.
- Torque management is enabled.
- TCM limits the transmission to Reverse and 3rd or 5th gear operation.

Conditions for Clearing the DTC

DTCs P0716 and P0717 are Type A DTCs.

Diagnostic Aids

If the scan tool ISS/OSS supply voltage parameter is out of range, the fault could also be caused by the transmission output shaft speed sensor.

Damage or misalignment of the 4-5-6 clutch and 3-5-R clutch housing reluctor machined teeth surface may cause a speed sensor malfunction.

Circuit/System Verification

1. Ignition ON.
2. Verify the scan tool ISS/OSS Supply Voltage parameter displays OK.
   - **IF OK is not displayed**

     Refer to Circuit/System Testing.

   - **If OK is displayed**
3. Engine idling, transmission in Park, parking brake applied, and drive wheels chocked.
4. Verify the scan tool Transmission ISS parameter changes or does not drop out while varying the engine speed.
   - **If the Transmission ISS does not vary with engine speed or drops out**

     Refer to Circuit/System Testing.

   - **If the Transmission ISS varies with engine speed and does not drop out**
5. Operate the vehicle within the Conditions for Running the DTC. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/Failure Records data.
6. Verify the DTC does not set.
   - **If the DTC sets**

     Refer to Circuit/System Testing.

   - **If the DTC does not set**
7. All OK.

Circuit/System Testing

NOTE: **You must perform the Circuit/System Verification first.**

1. Ignition OFF, remove the control valve body cover.
2. Connect the vehicle wire harness electrical connector to the Q8 Control Solenoid Valve Assembly electrical connector.
3. Disconnect the B14C Transmission Input Shaft Speed Sensor wiring harness connector from the Q8

Control Solenoid Valve Assembly.

4. Ignition ON.
5. Test for 8.3-9.3 V between the ISS sensor supply voltage circuit terminal A at the Q8 Control Solenoid Valve Assembly, and ground at the transmission case.
    - **If not between 8.3-9.3 V**
    1. Ignition OFF, disconnect the B14A Transmission Output Shaft Speed Sensor wiring harness connector from the Q8 Control Solenoid Valve Assembly. Ignition ON.
    2. Test for 8.3-9.3 V between the OSS sensor supply voltage circuit terminal A X3 at the Q8 Control Solenoid Valve Assembly, and ground at the transmission case.
        - If not between 8.3-9.3 V, replace the Q8 Control Solenoid Valve Assembly.
        - If between 8.3-9.3 V, replace the B14A Transmission Output Shaft Speed Sensor.
    - **If between 8.3-9.3 V**
6. Verify the scan tool Transmission ISS parameter is between 495-505 RPM when performing the input shaft speed test. Refer to **Control Solenoid Valve and Transmission Control Module Assembly Input Shaft Speed/Output Shaft Speed Input Test**.
    - **If not between 495-505 RPM**

      Replace the Q8 Control Solenoid Valve Assembly.

    - **If between 495-505 RPM**
7. Verify there is no damage to the reluctor, which is attached to the 4-5-6 clutch and 3-5-R clutch housing assembly, or misalignment between the B14C Transmission Input Shaft Speed Sensor and reluctor.
    - **If the reluctor is damaged or misaligned**

      Repair or replace as necessary.

    - **If the reluctor is not damaged or misaligned**
8. Replace the B14C Transmission Input Shaft Speed Sensor.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repairs.

- Perform the **Reset Transmission Adapts** following all transmission repairs.
- **Input Speed Sensor Replacement**
- **Output Speed Sensor Replacement**
- **Control Valve Body Cover Replacement**
- **Control Module References** for Control Solenoid Valve Assembly replacement, programming, and setup.

DTC P0722 OR P0723: OUTPUT SPEED SENSOR

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.

- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

Circuit/System Description

The automatic transmission output shaft speed (OSS) sensor is a hall-effect type sensor. The sensor faces the front differential transfer drive gear. The sensor receives 8.3-9.3 volts on the OSS sensor supply voltage circuit from the transmission control module (TCM). As the output shaft rotates, the sensor produces a signal frequency based on the machined surface of the output shaft. This signal is transmitted through the OSS sensor signal circuit to the TCM. The TCM uses the OSS sensor signal to calculate output shaft speed to determine commanded line pressure, transmission shift patterns, torque converter clutch (TCC) slip speed and gear ratio.

Conditions for Running the DTC

P0722

- DTC P0101, P0102, P0103, P0121, P0122, P0123, P0716, P0717, or P0723 is not set.
- Selected range is not PARK or NEUTRAL.
- Transmission input speed is 1,000 RPM or greater.
- Engine speed is 3,200 RPM or greater.
- Throttle position is 5 % or greater.
- Throttle position signal is valid.
- Engine torque is 35 N.m (26 lb ft) or greater.
- Engine torque signal is valid.
- Transmission fluid temperature is -40Â°C (-40Â°F) or greater.
- Engine speed is 400-7,500 RPM for 5 s.
- Ignition voltage is greater than 8.5 V.

P0723

- DTC P0101, P0102, P0103, P0121, P0122, P0123, P0973, P0974, P0976, or P0977 is not set.
- Greater than 5 s since last transmission upshift or downshift.
- Engine speed is 400-7,500 RPM for 5 s.
- Ignition voltage is greater than 8.5 V.

Conditions for Setting the DTC

P0722

Transmission output speed is 35 RPM or less for 4.0 s.

P0723

- Transmission output speed is 105 RPM or greater for 0.2 s.
- TCM detects the transmission output shaft speed dropped greater than 650 RPM for 1.5 s.

Action Taken When the DTC Sets

- DTCs P0722 and P0723 are Type A DTCs.
- TCM freezes transmission adaptive functions.
- TCM turns the high side driver OFF.
- TCM commands maximum line pressure.
- TCM inhibits Tap Up/Down function.
- TCM inhibits manual shifting of forward gears.
- TCM limits the transmission to Reverse and 3rd or 5th gear operation.

Conditions for Clearing the DTC

DTCs P0722 and P0723 are Type A DTCs.

Diagnostic Aids

- Damage or misalignment of the front differential transfer drive gear teeth surface or metallic debris on the face of the sensor may cause a speed sensor malfunction.
- Proper torque of the OSS mounting bolt is critical to proper OSS operation.
- If the scan tool ISS/OSS Supply Voltage indicates out of range, the fault could also be caused by the transmission input shaft speed sensor.

Circuit/System Verification

1. Ignition ON.
2. Verify the scan tool ISS/OSS Supply Voltage parameter displays OK.
    - **If OK is not displayed**

      Refer to Circuit/System Testing.

    - **If OK is displayed**
3. Verify the scan tool Transmission OSS parameter changes with vehicle speed or does not drop out while

operating the vehicle at 16-32 km/h (10-20 mph).

- **If the Transmission OSS does not vary with vehicle speed or drops out**

  Refer to Circuit/System Testing.

- **If the Transmission OSS varies with vehicle speed and does not drop out**

4. Operate the vehicle within the Conditions for Running the DTC. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/Failure Records data.
5. Verify the DTC does not set
   - **If the DTC sets**

     Refer to Circuit/System Testing.

   - **If the DTC does not set**
6. All OK.

Circuit/System Testing

NOTE: **You must perform the Circuit/System Verification first.**

1. Ignition OFF, remove the control valve body cover.
2. Connect the vehicle wire harness electrical connector to the Q8 Control Solenoid Valve Assembly electrical connector.
3. Disconnect the B14A Transmission Output Shaft Speed Sensor wiring harness connector from the Q8 Control Solenoid Valve Assembly.
4. Ignition ON.
5. Test for 8.3-9.3 V between the OSS sensor supply voltage circuit terminal A at the Q8 Control Solenoid Valve Assembly, and ground at the transmission case.
   - **If not between 8.3-9.3 V**
   1. Ignition OFF, disconnect the B14C Transmission Input Shaft Speed Sensor wiring harness connector from the Q8 Control Solenoid Valve Assembly. Ignition ON.
   2. Test for 8.3-9.3 V between the OSS sensor supply voltage circuit terminal A X4 electrical connector at the Q8 Control Solenoid Valve Assembly, and ground at the transmission case.
      - If not between 8.3-9.3 V, replace the Q8 Control Solenoid Valve Assembly.
      - If between 8.3-9.3 V, replace the B14C Transmission Input Shaft Speed Sensor.
   - **If between 8.3-9.3 V**
6. Verify the scan tool Transmission OSS parameter is between 256-266 RPM when performing the output shaft speed test. Refer to **Control Solenoid Valve and Transmission Control Module Assembly Input Shaft Speed/Output Shaft Speed Input Test**.
   - **If not between 256-266 RPM**

     Replace the Q8 Control Solenoid Valve Assembly.

   - **If between 256-266 RPM**
7. Verify there is no damage to the front differential transfer drive gear teeth surface or misalignment with

the B14A Transmission Output Shaft Speed Sensor.

- **If the front differential transfer drive gear is damaged or is misaligned**

  Repair or replace as necessary.

- **If the front differential transfer drive gear is not damaged or misaligned.**

8. Replace the B14A Transmission Output Shaft Speed Sensor.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repairs.

- Perform the **Reset Transmission Adapts** following all transmission repairs.
- **Control Valve Body Cover Replacement** .

- **Control Module References** for Control Solenoid Valve Assembly replacement, programming, and setup

DTC P0741 OR P0742: TORQUE CONVERTER CLUTCH (TCC) SYSTEM STUCK

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptors

NOTE: **The DTCs listed below set due to a transmission hydraulic/mechanical condition. Perform the Circuit/System Verification and Circuit/System Testing to identify the cause.**

DTC P0741

Torque Converter Clutch (TCC) System Stuck Off - Transmission Hydraulic/Mechanical Performance

DTC P0742

Torque Converter Clutch (TCC) System Stuck On - Transmission Hydraulic/Mechanical Performance

Circuit/System Description

The torque converter clutch (TCC) pressure control solenoid is part of the control solenoid valve assembly which has no serviceable components. The TCC pressure control solenoid is a normally low pressure control solenoid. The TCC pressure control solenoid regulates transmission fluid to the TCC regulator valve in the lower valve body and the TCC control valve in the pump cover. When vehicle operating conditions are appropriate to apply the converter clutch, the transmission control module (TCM) will increase current flow to the TCC pressure control solenoid, thereby increasing pressure directed to the TCC control valve. The increase in fluid pressure moves the TCC control valve to the apply position, and moves the TCC regulator apply valve

to the regulating position. The TCC regulator valve regulates TCC apply fluid pressure proportional to TCC solenoid pressure. When the TCC is fully applied, the engine is coupled directly to the transmission. TCC release is accomplished by the TCM decreasing current flow to the TCC PC solenoid. This results in decreasing the apply pressure which allows the TCC control valve to move to the release position. The TCM calculates torque converter slip speed based on the speed signal from the input shaft speed sensor and the engine speed provided by the engine control module.

Conditions for Running the DTC

P0741

- DTC P0101, P0102, P0103, P0106, P0107, P0108, P0171, P0172, P0174, P0175, P0201, P0202, P0203, P0204, P0205, P0206, P0300, P0301, P0302, P0303, P0304, P0305, P0306, P0401, P042E, P0716, P0717, P0722, P0723, P0742, P2763, or P2764 is not set.
- Engine speed is 400-7,500 RPM for 5 s.
- Ignition voltage is greater than 8.5 V.
- Transmission fluid temperature is between -6.7 to +130Â°C (20-266Â°F).
- Throttle position is 8.5 % or greater.
- Engine torque is 50 N.m (36 lb ft) or greater.
- Engine torque signal is valid.
- Throttle position signal is valid.
- TCM detects the transmission gear ratios listed below for the commanded gear when TCC is commanded ON:
    - 2nd gear ratio is between 2.67-3.07.
    - 3rd gear ratio is between 1.71-1.97.
    - 4th gear ratio is between 1.32-1.51.
    - 5th gear is between 0.93-1.07.
    - 6th gear is between 0.69-0.79.

P0742

- DTC P0101, P0102, P0103, P0106, P0107, P0108, P0171, P0172, P0174, P0175, P0201, P0202, P0203, P0204, P0205, P0206, P0300, P0301, P0302, P0303, P0304, P0305, P0306, P0401, P042E, P0716, P0717, P0722, P0723, P0741, P2763, or P2764 is not set.
- Commanded range is 2nd gear or higher.
- Ignition voltage is 8.5 V or greater.
- Transmission fluid temperature is between 18-130Â°C (64-266Â°F).
- Throttle position is 5 % or greater.
- Engine torque is 80 N.m (59 lb ft) or greater.
- Engine speed is 400-7,500 RPM for 5 s.
- Vehicle speed is 1 km/h (0.6 mph) or greater.
- Engine speed is 500 RPM or greater
- Engine torque signal is valid.

- Throttle position signal is valid.
- TCC is commanded OFF.

Conditions for Setting the DTC

P0741

- TCC Pressure command is 800 kPa (116 psi) or greater for 2 s.
- TCM detects TCC slip of 50 RPM or greater for 5 s.
- The above conditions must occur 3 times.

P0742

TCM detects the TCC slip between -50 and +13 RPM for 2.5 s when the TCC is commanded OFF. This condition must occur 6 times.

Action Taken When the DTC Sets

P0741

- DTC P0741 is a Type B DTC.
- TCM inhibits 6th gear.
- TCM commands TCC OFF.
- TCM forces hot mode shift pattern.

P0742

- DTC P0742 is a Type A DTC.
- TCM freezes transmission adaptive functions.
- TCM forces hot mode shift pattern.
- TCM commands the TCC ON.

Conditions for Clearing the DTC

P0741

DTC P0741 is a Type B DTC.

P0742

DTC P0742 is a Type A DTC.

Circuit/System Verification

NOTE: **If other DTCs are set, diagnose those DTCs first.**

1. Engine idling, transmission in the Park, parking brake applied, and drive wheels chocked.
2. Verify the transmission fluid level and condition is correct. Refer to **Transmission Fluid Level and Condition Check**.
   - **If the transmission fluid level and condition is not correct**

     Repair as necessary.

   - **If the transmission fluid level and condition is correct**
3. Ignition ON, clear the TCM DTCs with a scan tool.
4. Verify DTC P0741 or P0742 does not set while performing a road test. Refer to **Road Test**.
   - **If DTC P0741 or P0742 sets**

     Refer to Circuit/System Testing.

   - **If DTC P0741 or P0742 did not set**
5. Operate the vehicle within the Conditions for Running the DTC. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/Failure Records data.
6. Verify the DTC does not set.
   - **If the DTC sets**

Refer to Circuit/System Testing.

- **If the DTC does not set**

7. All OK.

Circuit/System Testing

1. Engine idling at the normal operating temperature.
2. Verify the transmission line pressures are within the specified range. Refer to **Line Pressure Check**, and **Solenoid Valve Pressure** .
   - **If the pressures are not within range**

     Refer to **Fluid Pressure High or Low**.

   - **If the pressures are within range**
3. Ignition OFF, remove the Q8 Control Solenoid Valve Assembly.
4. Verify the pressure changes for all solenoids when performing the solenoid test. Refer to **Control Solenoid Valve and Transmission Control Module Assembly Solenoid Performance Test**.
   - **If the pressure does not change**

     Replace the Q8 Control Solenoid Valve Assembly.

   - **If the pressure changes**
5. Verify the mechanical conditions listed below do not exist. Repair or replace as necessary.

P0741 - Upper Valve Body

Release exhaust port/orifice plugged or blocked.

P0741 or P0742 - Upper Valve Body

Torque converter clutch regulator valve stuck/sticking - debris, binding, damaged valve, or scored bore.

P0741 - Channel Plate and Spacer Plate

Oil channels or orifices blocked by debris.

P0741 - Torque Converter

- Torque converter clutch delamination or material worn off.
- Converter bolts too long damaging the clutch apply surface.
- Damaged seal.

P0741 - Support

Damaged seal.

P0741 or P0742 - Transmission Case Cover

- Pressure release blow-off not seating/sealing.
- Damaged spring.

P0741 - Turbine Shaft

O-ring seal cut or damaged

P0741 or P0742 Q8 Control Solenoid Valve Assembly

- Torque converter clutch pressure control solenoid stuck OFF or leaking.
- Torque converter clutch pressure control solenoid stuck ON.
- Control signal fluid supply leak due to valve body filter plate assembly cracked, or damaged gasket seal.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repairs.

- Perform the **Reset Transmission Adapts** following all transmission repairs.
- **Torque Converter Removal**
- **Torque Converter and Differential Housing, Front Differential Transfer Drive Gear, and Front Differential Carrier Removal** , and **Torque Converter and Differential Housing Installation**
- **Torque Converter Installation**
- **Control Valve Lower Body and Upper Body Replacement**
- **Control Module References** for Control Solenoid Valve Assembly replacement, programming, and setup.

DTC P0751 OR P0752: SHIFT SOLENOID VALVE 1 PERFORMANCE - STUCK

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

NOTE: **The DTCs listed below set due to a transmission hydraulic/mechanical condition. Perform the Circuit/System Verification and Circuit/System Testing to identify the cause.**

DTC P0751

Shift Solenoid Valve 1 Performance - Stuck Off - Transmission Hydraulic/Mechanical Performance

DTC P0752

Shift Solenoid Valve 1 Performance - Stuck On - Transmission Hydraulic/Mechanical Performance

Circuit/System Description

Shift solenoid valve 1 is part of the control solenoid valve assembly, which has no serviceable components. The solenoid operates by the transmission control module (TCM) turning the low side driver ON or OFF. When the shift solenoid valve 1 is commanded OFF, the plunger forces the metering ball against the actuator feed limit seat, blocking the flow and any existing pressure is exhausted through the exhaust port. When the shift solenoid valve 1 is commanded ON, the internal plunger moves, allowing the metering valve to move away from the actuator feed limit seat and against the exhaust seat, creating signal fluid pressure. The signal fluid pressure acts against the clutch select valve 2 to overcome the valve spring force, moving the valve to the apply position. Fluid pressure from the R1/4-5-6 regulator valve flows through clutch select valve 2 and is directed to either the low and reverse clutch or the 4-5-6 clutch, depending on the position of clutch select valve 2.

Conditions for Running the DTC

- DTC P0101, P0102, P0103, P0106, P0107, P0108, P0171, P0172, P0174, P0175, P0201, P0202, P0203, P0204, P0205, P0206, P0300, P0301, P0302, P0303, P0304, P0305, P0306, P0401, P042E, P0716, P0717, P0722, P0723, or P182E is not set.
- Ignition voltage is greater than 8.5 V.
- Engine speed is 400-7,500 RPM for 5 s.
- Throttle position signal is valid.
- Engine torque signal is valid.
- High side driver is enabled.
- Output shaft speed is 36 RPM or greater, or the throttle position is 0.5 % or greater.
- Transmission fluid temperature is -6.6Â°C (20Â°F) or greater.

Conditions for Setting the DTC

P0751

- Commanded gear is 1st.
- TCM detects gear ratio 1.34-1.48.
- Gear slip is 400 RPM or greater for 2 s.
- Above conditions have to occur 8 times.

P0752

- Commanded gear is 3rd
- Transmission has achieved 1st or 2nd.
- Gear slip is 400 RPM or greater for 3 s.
- TCM commands 4th gear if above conditions exist and detects a gear ratio of 4.26-4.71 for 3 s.
- The conditions listed above have to occur 5 times.

Action Taken When the DTC Sets

P0751

- DTC P0751 is a Type B DTC.
- TCM inhibits 1st gear.

- TCM inhibits neutral idle.

P0752

- DTC P0752 is a Type A DTC.
- TCM freezes transmission adaptive functions.
- TCM commands maximum line pressure.
- TCM inhibits Tap Up/Down function.
- TCM inhibits manual shifting of forward gears.
- TCM commands second gear if output speed is less than 1,350 RPM, or neutral if output speed is 1,350 RPM or greater.
- TCM inhibits neutral idle.

Conditions for Clearing the DTC

- DTC P0751 is a Type B DTC.
- DTC P0752 is a Type A DTC.

Diagnostic Aids

Before performing a road test, configure and setup the scan tool for snapshot mode. This allows you to display, monitor, and verify multiple transmission data parameters at one time, after the road test.

Circuit/System Verification

NOTE: **If other DTCs are set, diagnose those DTCs first.**

1. Engine idling at the normal operating temperature, gear selector in the Park position, parking brake applied, and drive wheels chocked.
2. Verify the transmission fluid level and condition is correct. Refer to **Transmission Fluid Level and Condition Check**.
   - **If the transmission fluid level and condition is not correct**

     Repair as necessary

   - **If the transmission fluid level and condition is correct**
3. From a stop, accelerate to 72 km/h (45 mph) with the scan tool Calculated Throttle Position greater than 15 %. Perform this test 8 times.
4. Verify DTC P0751 or P0752 did not set.
   - **If DTC P0751 or P0752 set**

     Refer to Circuit/System Testing.

   - **If DTC P0751 or P0752 did not set**
5. Operate the vehicle within the Conditions for Running the DTC. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/Failure Records data.
6. Verify the DTC does not set.
   - **If the DTC sets**

     Refer to Circuit/System Testing.

   - **If the DTC does not set**
7. All OK.

Circuit/System Testing

1. Engine idling at the normal operating temperature.
2. Verify the transmission line pressures are within the specified range. Refer to **Line Pressure Check**, and **Solenoid Valve Pressure** .
   - **If the pressures are not within range**

Refer to **Fluid Pressure High or Low** .

- **If the pressures are within range**

3. Ignition OFF, remove the Q8 Control Solenoid Valve Assembly.
4. Verify the pressure changes for all solenoids when performing the solenoid test. Refer to **Control Solenoid Valve and Transmission Control Module Assembly Solenoid Performance Test**.
   - **If the pressure does not change**

     Replace the Q8 Control Solenoid Valve Assembly.

   - **If the pressure changes**
5. Verify the mechanical conditions listed below do not exist. Repair or replace as necessary.

P0751 - Upper Control Valve Body

- Clutch select valve 2 bore plug undersized causing a leak - plug should be a valve fit in the bore.
- Check ball #2 - missing, damaged or malformed, or damage to the seat causing leakage.

P0751 or P0752 - Upper Control Valve Body

Clutch select valve 2 stuck from debris, sediment, binding, or a scored bore.

P0751 or P0752 - Channel Plate and Spacer Plate

Oil channels or orifices blocked by debris.

P0751 - Lower Control Valve Body

- Shift solenoid 1 - not pressurizing, stuck OFF or leaking.
- Shift solenoid 1 - not exhausting, stuck ON.

P0751 or P0752 - Q8 Control Solenoid Valve Assembly

- Shift solenoid valve 1 stuck OFF or leaking.
- Shift solenoid valve 1 stuck ON.
- Valve body filter plate assembly cracked, blocked, or damaged gasket seal.
- Pressure control solenoid valve 3 stuck ON, stuck OFF, or leaking. Low and Reverse, and 4-5-6 regulator valve stuck or sticking from debris, sediment, binding or scored bore.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repairs.

- Perform the **Reset Transmission Adapts** following all transmission repairs.
- **Control Module References** for control solenoid valve assembly replacement, programming, and setup.

DTC P0756: SHIFT SOLENOID VALVE 2 PERFORMANCE - STUCK

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

NOTE: **The DTC listed below set due to a transmission hydraulic/mechanical condition. Perform the Circuit/System Verification and Circuit/System Testing to identify the cause.**

DTC P0756

Shift Solenoid Valve 2 Performance - Stuck Off - Transmission Hydraulic/Mechanical Performance

Circuit/System Description

Shift solenoid valve 2 is part of the control solenoid valve assembly, which has no serviceable components. Shift solenoid valve 2 is a normally closed solenoid valve and controls fluid to the clutch select valve 3. The transmission control module (TCM) operates the solenoid by turning the low side driver ON or OFF. When the shift solenoid valve 2 is commanded OFF, the plunger forces the metering ball against the actuator feed limit seat, blocking the flow and any existing pressure is exhausted through the exhaust port. When shift solenoid valve 2 is commanded ON, the internal plunger moves and allows the metering ball to move away from the feed seat and against the exhaust seat, creating signal fluid pressure. The signal fluid acts against the clutch select valve 3 to overcome the valve spring force, moving it to the apply position. Shift solenoid valve 2 is commanded OFF in Reverse, and commanded ON in Park, Neutral, Drive 1 Engine Braking, and Drive 1-6 gear ranges.

Conditions for Running the DTC

- DTC P0101, P0102, P0103, P0106, P0107, P0108, P0171, P0172, P0174, P0175, P0201, P0202, P0203, P0204, P0205, P0206, P0300, P0301, P0302, P0303, P0304, P0305, P0306, P0401, P042E, P0716, P0717, P0722, P0723, or P182E is not set.
- Engine speed is 400-7,500 RPM for 5 s.
- High side driver is enabled.
- Ignition voltage is greater than 8.5 V.
- Throttle position signal is valid.
- Transmission fluid temperature is -6.6Â°C (20Â°F) or greater.
- Output shaft speed is 36 RPM or greater, or the throttle position is 0.5 percent or greater

Conditions for Setting the DTC

- Commanded Gear is 1st locked.
- Gearbox Slip is 400 RPM or greater for 3 s.
- If above conditions exist, the TCM commands second gear. If the gear ratio is between 2.72-3.01 for 1 s, the counter will increment. DTC will set after 3 occurrences.

Action Taken When the DTC Sets

- DTC P0756 is a Type A DTC.
- TCM inhibits Tap Up/Down function.
- TCM inhibits manual shifting of forward gears.
- TCM commands maximum line pressure.
- TCM freezes transmission adaptive functions.
- TCM commands second gear if output speed is less than 1,350 RPM, or neutral if output speed is 1,350 RPM or greater.

Conditions for Clearing the DTC

DTC P0756 is a Type A DTC.

Circuit/System Verification

NOTE: **If other DTCs are set, diagnose those DTCs first.**

1. Engine idling, transmission in Park, with parking brake applied and drive wheels chocked.
2. Verify the transmission fluid level and condition is correct. Refer to **Transmission Fluid Level and Condition Check**.
    - **If the transmission fluid level and condition is not correct**

      Repair as necessary.

    - **If the transmission fluid level and condition is correct**
3. Ignition ON, clear the TCM DTCs with a scan tool.
4. Engine running, brakes applied, transmission gear shift selector in Reverse. Shift to Drive and accelerate to 56 km/h (35 mph) with the scan tool Calculated Throttle Position greater than 15 %. Perform this test 5 consecutive times.
5. Verify DTC P0756 did not set.
    - **If DTC P0756 sets**

      Refer to Circuit/System Testing.

    - **If DTC P0756 did not set**
6. Operate the vehicle within the Conditions for Running the DTC. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/Failure Records data.
7. Verify the DTC does not set.
    - **If the DTC sets**

      Refer to Circuit/System Testing.

    - **If the DTC does not set**
8. All OK.

Circuit/System Testing

1. Engine idling at the normal operating temperature.
2. Verify the transmission line pressures are within the specified range. Refer to **Line Pressure Check**, and **Solenoid Valve Pressure** .
    - **If the pressures are not within range**

      Refer to **Fluid Pressure High or Low**.

    - **If the pressures are within range**
3. Ignition OFF, remove the Q8 Control Solenoid Valve Assembly.
4. Verify the pressure changes for all solenoids when performing the solenoid test. Refer to **Control Solenoid Valve and Transmission Control Module Assembly Solenoid Performance Test**.
    - **If the pressure does not change**

      Replace the Q8 Control Solenoid Valve Assembly.

    - **If the pressure changes**

5. Verify the mechanical conditions listed below do not exist. Repair or replace as necessary.

Upper Control Valve Body

- Clutch select valve 3 stuck from debris, sediment, binding or scored bore
- Clutch select valve 3 bore plug undersized causing a leak - plug should be a valve fit in the bore.
- Check ball #3 - missing, damaged or malformed, or damage to the seat causing leakage.
- Check ball #1 - missing, damaged or malformed, or damage to the seat causing leakage.

Channel Plate and Spacer Plate

Oil channels or orifices blocked by debris.

Mechanical Diode

Broken or not capable of holding torque.

Pump Assembly

Fluid pump vanes or fluid pump rotor broken

Pump Seal

Seal is torn or cut, causing a small leak that is overcome with enough speed and pump capacity.

Q8 Control Solenoid Valve Assembly

- Shift solenoid 2 not pressurizing - stuck OFF or leaking.
- Valve body filter plate assembly cracked, blocked, or damaged gasket seal.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repairs.

- Perform the **Reset Transmission Adapts** following all transmission repairs.
- **Control Valve Upper Body Assembly Cleaning and Inspection**
- **Control Module References** for control solenoid valve assembly replacement, programming, and setup.

DTC P0776 OR P0777: PRESSURE CONTROL SOLENOID VALVE 2 STUCK

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptors

NOTE: **The DTCs listed below set due to a transmission hydraulic/mechanical condition. Perform the Circuit/System Verification and Circuit/System Testing to**

identify the cause.

DTC P0776

Pressure Control Solenoid Valve 2 Stuck Off - Transmission Hydraulic/Mechanical Performance

DTC P0777

Pressure Control Solenoid Valve 2 Stuck On - Transmission Hydraulic/Mechanical Performance

Circuit/System Description

The clutch pressure control (PC) solenoid 2 is part of the control solenoid valve assembly, which has no serviceable components. The PC solenoid 2 regulates transmission fluid pressure to the 3-5-Reverse clutch regulator valve which controls pressure to the 3-5-Reverse clutch. The transmission control module (TCM) calculates gear ratio based on the RPM signals from the input speed sensor (ISS) and the output speed sensor (OSS). The TCM compares the expected transmission gear ratio to the calculated gear ratio for each commanded gear.

Conditions for Running the DTC

P0776

- DTC P0101, P0102, P0103, P0106, P0107, P0108, P0171, P0172, P0174, P0175, P0201, P0202, P0203, P0204, P0205, P0206, P0300, P0301, P0302, P0303, P0304, P0305, P0306, P0401, P042E, P0716, P0717, P0722, P0723, or P182E is not set.
- Ignition voltage is 8.5 volts or greater.
- Engine speed is 400 RPM or greater for 5.0 seconds.
- Transmission fluid temperature (TFT) is -7Â°C (19Â°F) or greater.
- Transmission output speed is 36 RPM or greater, or the throttle position is 0.5 percent or greater.
- Throttle position signal is valid.
- High side driver is enabled.

P0777

- DTC P0101, P0102, P0103, P0106, P0107, P0108, P0171, P0172, P0174, P0175, P0201, P0202, P0203, P0204, P0205, P0206, P0300, P0301, P0302, P0303, P0304, P0305, P0306, P0401, P042E, P0716, P0717, P0722, P0723, or P182E is not set.
- Ignition voltage is 8.5 volts or greater.
- Engine speed is 400 RPM or greater for 5.0 seconds.
- TFT is -7Â°C (19Â°F) or greater.
- Engine torque is 20 N.m (15 lb ft) or greater.
- Transmission output speed is 36 RPM or greater, or the throttle position is 0.5 percent or greater.
- Throttle position signal is valid.
- High side driver is enabled.

Conditions for Setting the DTC

P0776

TCM has detected an incorrect gear ratio or neutral condition when the 3-5-Reverse clutch is commanded ON. This condition must occur 3 times.

P0777

TCM has detected an incorrect gear ratio change when the 3-5-Reverse clutch is commanded OFF during a shift or when 3rd gear ratio is detected in 1st gear. This condition must occur 3 times.

Action Taken When the DTC Sets

P0776

- DTC P0776 is a Type A DTC.
- TCM commands maximum line pressure.
- TCM inhibits Tap Up/Down function.
- TCM freezes transmission adaptive functions.
- TCM inhibits manual shifting of forward gears.
- TCM limits the transmission to Reverse, 2nd, and 4th gear operation.
- TCM inhibits auto grade braking.

P0777

- DTC P0777 is a Type A DTC.
- TCM commands maximum line pressure.
- TCM inhibits Tap Up/Down function.
- TCM inhibits manual shifting of forward gears.
- TCM freezes transmission adaptive functions.
- TCM limits the transmission to 3rd gear and Reverse operation.
- TCM inhibits auto grade braking.

Conditions for Clearing the DIC/DTC

DTCs P0776 and P0777 are Type A DTCs.

Diagnostic Aids

Before performing a road test, configure and setup the scan tool for snapshot mode. This will allow you to display, monitor, and verify multiple transmission data parameters at one time, after the road test.

Circuit/System Verification

WARNING: **Refer to Parking Brake and Drive Wheels Warning .**

NOTE: **If other DTCs are set, diagnose those DTCs first.**

1. Engine idling in Park, parking brake applied, and drive wheels chocked.
2. Verify correct transmission fluid level and condition. Refer to Transmission Fluid Level and Condition Check.
   - **If the transmission fluid level and condition is not the correct**

     Repair as necessary.

   - **If the transmission fluid level and condition is correct**
3. Verify with a scan tool the Transmission Fluid Pressure Switch 1 parameter values are correct for the Park, Reverse, and Neutral gear select lever positions. Refer to Transmission Fluid Pressure Switch Logic .
   - **If not the correct values for Transmission Fluid Pressure Switch 1**

     Refer to Circuit/System Testing below.

   - **If Transmission Fluid Pressure Switch 1 values are correct**
4. Gear select lever in Drive range. Verify the Transmission Fluid Pressure Switch 1 parameter states are correct for all forward ranges when commanded with a scan tool. Refer to Transmission Fluid Pressure Switch Logic .
   - **If not the correct values for Transmission Fluid Pressure Switch 1**

Refer to Circuit/System Testing below.

- **If Transmission Fluid Pressure Switch 1 values are correct**

5. Ignition ON, clear the TCM DTCs.
6. Perform the **Road Test**. Verify the transmission operation performs as indicated in the road test instructions and DTC P0776 or P0777 did not set.
   - **If DTC P0776 or P0777 sets**

     Refer to Circuit/System Testing below.

   - **If DTC P0776 or P0777 did not set**
7. After performing the above steps, verify that the DTC does not reset by operating the vehicle within the Conditions for Running the DTC. You may also operate the vehicle within the conditions you observe from the Freeze Frame/Failure Records data. If the vehicle passes the Circuit/System Verification procedure, then STOP. Do not perform the Circuit/System Testing or Component Testing as this may result in an unnecessary part replacement. Refer to **Testing for Intermittent Conditions and Poor Connections** .

Circuit/System Testing

NOTE: **You must perform the Circuit/System Verification first.**

1. Verify the transmission line pressures are within the ranges specified in the Line PC Solenoid Valve Pressure table. Refer to **Line Pressure Check**, and **Solenoid Valve Pressure** .
   - **If line pressures are not within the specified ranges**

     Refer to **Fluid Pressure High or Low**

   - **If line pressures are within the specified ranges**
2. Ignition OFF, remove the Q8 control solenoid valve assembly. Refer to **Control Solenoid Valve and Transmission Control Module Assembly Replacement** .
3. Perform the **Control Solenoid Valve and Transmission Control Module Assembly Solenoid Performance Test**. A pressure change should occur for each solenoid valve.
   - **If a pressure change does not occur for each solenoid**

     Replace the Q8 control solenoid valve assembly

   - **If a pressure change occurs for each solenoid**
4. Verify the mechanical conditions listed below do not exist. Repair or replace as necessary.

DTC P0776 or P0777 - Upper Control Valve Body Assembly

3-5-R regulator valve stuck/sticking - debris, binding, damaged valve, or scored bore.

DTC P0776 or P0777 - Lower Control Valve Body Assembly

- Actuator feed limit circuit supply fluid to solenoid restricted from debris, a stuck limit valve or sediment blockage.

- 3-5-R clutch boost valve - binding or scored bore - can cause harsh shifts.

DTC P0776 or P0777 - Q8 Control Solenoid Valve Assembly

- Clutch pressure control solenoid 2 stuck ON or stuck OFF.
- Control solenoid valve filter plate assembly, blocked or damaged gasket seal.

DTC P0776 - Channel Plate and Spacer Plate

Oil channels or orifices blocked by debris.

DTC P0776 or P0777 - Transmission Fluid Pump

- Fluid pump housing vanes/rotor/slide damaged/scored.
- Transmission pump fluid outlet seal assembly damaged/leaking.

DTC P0776 - Transmission Cooling/Lubrication

- Oil filter or filter seal loose, plugged, or damaged.
- Restriction/leak in oil to air cooler/radiator.
- Restricted/leaking/kinked/damaged transmission oil cooler lines.
- Restriction/leak in transmission fluid pump assembly.

DTC P0776 - Torque Converter Assembly

Torque converter overstressed due to high temperature, fluid boiled out.

DTC P0776 - 4-5-6 and 3-5-R Clutch Housing Assembly

- 3-5-R clutch backing plate retaining ring not seated or wave plate broken.
- 3-5-R piston seal torn, cut, or rolled.
- 4-5-6 and 3-5-R clutch housing assembly inner/outer seal damaged or dam pressure too high.

DTC P0776 or P0777 - Automatic Transmission Case Cover

Blow off regulator ball stuck.

DTC P0776 or P0777 - Input Shaft Support

3-5-R and 4-5-6 clutch fluid seal rings damaged, worn, or leaking.

Repair Instructions

NOTE:

- **Perform the Reset Transmission Adapts following all transmission related repairs.**
- **Before replacing the TCM, perform the Control Solenoid Valve and Transmission Control Module Assembly Inspection.**

Perform the **Diagnostic Repair Verification** after completing the diagnostic procedure.

- **Control Valve Lower Body and Upper Body Replacement**
- **Low and Reverse Clutch and 1-2-3-4 Clutch Plate Removal**
- **Control Module References** for control solenoid valve assembly replacement, setup, and programming

DTC P0796 OR P0797: PRESSURE CONTROL SOLENOID VALVE 3 STUCK

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptors

NOTE: **The DTCs listed below set due to a transmission hydraulic/mechanical condition. Perform the Circuit/System Verification and Circuit/System Testing to identify the cause.**

DTC P0796

Pressure Control Solenoid Valve 3 Stuck Off - Transmission Hydraulic/Mechanical Performance

DTC P0797

Pressure Control Solenoid Valve 3 Stuck On - Transmission Hydraulic/Mechanical Performance

Circuit/System Description

The clutch pressure control (PC) solenoid 3 is part of the control solenoid valve assembly, which has no serviceable components. The PC solenoid 3 regulates transmission fluid pressure (TFP) to the R1/4-5-6 clutch regulator valve which controls pressure to the low and reverse clutch and the 4-5-6 clutch. The transmission control module (TCM) calculates gear ratio based on the RPM signals from the input speed sensor (ISS) and the output speed sensor (OSS). The TCM compares the expected transmission gear ratio to the calculated gear ratio for each commanded gear.

Conditions for Running the DTC

P0796

- DTC P0101, P0102, P0103, P0106, P0107, P0108, P0171, P0172, P0174, P0175, P0201, P0202, P0203, P0204, P0205, P0206, P0207, P0208, P0300, P0301, P0302, P0303, P0304, P0305, P0306, P0307, P0308, P0401, P042E, P0716, P0717, P0722, P0723, or P182E is not set.
- Ignition voltage is 8.6 volts or greater.
- Engine speed is 400 RPM or greater for 5.0 seconds.
- Output speed is 36 RPM or greater, or the throttle position is 0.5 percent or greater.
- Throttle position signal is valid.
- High side driver is enabled.

- Transmission fluid temperature (TFT) is -7Â°C (19Â°F) or greater.

P0797

- DTC P0101, P0102, P0103, P0106, P0107, P0108, P0171, P0172, P0174, P0175, P0201, P0202, P0203, P0204, P0205, P0206, P0207, P0208, P0300, P0301, P0302, P0303, P0304, P0305, P0306, P0307, P0308, P0401, P042E, P0716, P0717, P0722, P0723, or P182E is not set.
- Ignition voltage is 8.6 volts or greater.
- Engine speed is 400 RPM or greater for 5.0 seconds.
- Output speed is 36 RPM or greater, or the throttle position is 0.5 percent or greater.
- Throttle position signal is valid.
- High side driver is enabled.
- TFT is -7Â°C (19Â°F) or greater.
- Engine torque is 20 N.m (15 lb ft) or greater when 1st gear is commanded.

Conditions for Setting the DTC

P0796

The TCM has detected an incorrect gear ratio or neutral condition when the low and reverse clutch or the 4-5-6 clutch is commanded ON. This condition must occur 3 times.

P0797

The TCM has detected an incorrect gear ratio change when the low and reverse clutch or the 4-5-6 clutch is commanded OFF during a shift or when 4th ratio is detected in 1st gear. This condition must occur 3 times.

Action Taken When the DTC Sets

P0796

- DTC P0796 is a Type A DTC.
- TCM commands maximum line pressure.
- TCM freezes transmission adaptive functions.
- TCM inhibits Tap Up/Down function.
- TCM inhibits manual shifting of forward gears.
- TCM limits the transmission to Reverse, 1st, and 3rd gear operation.
- TCM inhibits auto grade braking.

P0797

- DTC P0797 is a Type A DTC.
- TCM commands maximum line pressure.
- TCM freezes transmission adaptive functions.
- TCM inhibits Tap Up/Down function.
- TCM inhibits manual shifting of forward gears.

- TCM limits the transmission to Reverse and 4th gear operation.
- TCM inhibits neutral idle.
- TCM requests a reduced engine torque based on input speed.

Conditions for Clearing the DIC/DTC

DTCs P0796 and P0797 are Type A DTCs.

Circuit/System Verification

WARNING: Refer to Parking Brake and Drive Wheels Warning .

NOTE: If other DTCs are set, diagnose those DTCs first.

1. Engine idling in Park, with parking brake applied and drive wheels chocked.
2. Verify correct transmission fluid level and condition. Refer to **Transmission Fluid Level and Condition Check**.
3. Verify with a scan tool the Transmission Fluid Pressure Switch 5 parameter values are correct for the Park, Reverse, and Neutral range gear select lever positions. Refer to **Transmission Fluid Pressure Switch Logic** .
   - **If not the correct values for TFP switch 5**

     Refer to Circuit/System Testing below.

- **If TFP switch 5 values are correct**

4. Gear select lever in Drive range. Verify the Transmission Fluid Pressure Switch 5 parameter states are correct for all forward ranges when commanded with a scan tool. Refer to **Transmission Fluid Pressure Switch Logic** .
    - **If not the correct values for TFP switch 5**

      Refer to Circuit/System Testing below.

    - **If TFP switch 5 values are correct**
5. Ignition ON, clear the TCM DTCs.
6. Perform the **Road Test**. Verify the transmission operation performs as indicated in the road test instructions and DTC P0796 or P0797 did not set.
    - **If DTC P0796 or P0797 sets**

      Refer to Circuit/System Testing below.

    - **If DTC P0796 or P0797 did not set**
7. After performing the above steps, verify that the DTC does not reset by operating the vehicle within the Conditions for Running the DTC. You may also operate the vehicle within the conditions you observe from the Freeze Frame/Failure Records data. If the vehicle passes the Circuit/System Verification procedure, then STOP. Do not perform the Circuit/System Testing or Component Testing as this may result in an unnecessary part replacement. Refer to **Testing for Intermittent Conditions and Poor Connections** .

Circuit/System Testing

NOTE: **You must perform the Circuit/System Verification first.**

1. Verify the transmission line pressures are within the ranges specified in the Line PC Solenoid Valve Pressure table. Refer to **Line Pressure Check**, and **Solenoid Valve Pressure**
    - **If line pressures are not within the specified ranges**

      Refer to **Fluid Pressure High or Low**

    - **If line pressures are within the specified ranges**
2. Ignition OFF, remove the Q8 control solenoid valve assembly. Refer to **Control Solenoid Valve and Transmission Control Module Assembly Replacement** .
3. Perform the **Control Solenoid Valve and Transmission Control Module Assembly Solenoid Performance Test**. Test all solenoids on the Q8 control solenoid valve assembly. A pressure change should occur for each solenoid valve.
    - **If a pressure change does not occur for each solenoid**

      Replace the Q8 control solenoid valve assembly.

    - **If a pressure change occurs for each solenoid**
4. Verify the mechanical conditions listed below do not exist. Repair or replace as necessary.

P0796 or P0797 - Control Valve Upper Body Assembly

4-5-6 regulator valve stuck/sticking from debris, binding, damaged valve, or scored bore.

P0796 - Channel Plate and Spacer Plate

Channel Plate and spacer plate oil channels or orifices blocked by debris.

P0796 - Lower Control Valve Body Assembly

- Actuator feed limit circuit supply fluid to solenoid restricted or not available from debris, stuck limit valve, or sediment blockage.
- 4-5-6 clutch boost valve binding or a scored bore which can also cause harsh shifts.
- 4-5-6 clutch accumulator piston leaking, cracked, or broken.

P0796 or P0797 - Input Shaft Support

Input shaft support 3-5-R and 4-5-6 clutch fluid seal rings damaged, worn, or leaking.

P0796 or P0797 - Q8 Control Solenoid Valve Assembly

- Clutch pressure control solenoid valve 3 stuck ON or stuck OFF.
- Control solenoid filter plate assembly cracked, blocked, or damaged gasket seal.

P0796 - 4-5-6 Clutch Housing Assembly

- 4-5-6 clutch piston assembly damaged or leaking.
- 4-5-6 clutch inner/outer seal damaged.
- Dam pressure too high

P0796 - Automatic Transmission Case Cover

Blow off regulator ball stuck.

P0796 - Transmission Cooling/Lubrication

- Restriction/leak in oil to air cooler/radiator.
- Restricted/leaking/kinked/damaged transmission oil cooler lines.
- Restriction/leak in transmission fluid pump assembly.

P0796 - Torque Converter Assembly

Fluid pump or torque converter overstressed due to high temperature of fluid boiled out.

P0796 - 4-5-6 Reaction Carrier Hub Assembly

4-5-6 reaction carrier hub/shaft - broken hub weld.

P0796 - Automatic Transmission Fluid Filter Assembly

Oil filter or filter seal loose or damaged

P0796 - Automatic Transmission Fluid Pump

Pump fluid outlet seal assembly damaged/leaking.

Repair Instructions

NOTE:

- **Perform the Reset Transmission Adapts following all transmission related repairs.**
- **Before replacing the TCM, perform the Control Solenoid Valve and Transmission Control Module Assembly Inspection.**

Perform the Diagnostic Repair Verification after completing the diagnostic procedure.

- Control Valve Lower Body and Upper Body Replacement
- Low and Reverse Clutch and 1-2-3-4 Clutch Plate Removal , and 3-5-Reverse and 4-5-6 Clutch Housing Disassemble
- Control Module References for control solenoid valve assembly replacement, setup, and programming

DTC P0815, P0816, OR P0826: UPSHIFT/DOWNSHIFT SWITCH

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Diagnostic Procedure Instructions provides an overview of each diagnostic category.

DTC Descriptors

DTC P0815

Upshift Switch Circuit

DTC P0816

DTC P0826

Up and Down Shift Switch Circuit

Diagnostic Fault Information

Driver Shift Request

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Tap Upshift Switch	P0826	P0826	P0815	-
Tap Downshift Switch	P0826	P0826	P0816	-

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Up and Down Shift Switch	P0826	P0826	P0826	-

Circuit/System Description

When the shift lever is placed in manual mode (M), electronic range select (ERS), which allows for the selection of the range of gears available, is activated. The ERS allows the vehicle operator to increase the highest range by pressing the plus (+) button or decrease the highest range by pressing the minus (-) button. The body control module (BCM) provides ignition voltage and a signal circuit to the resistor network embedded in the cruise control and tap shift switch assembly. When a plus or minus button is pressed, a corresponding voltage drop occurs across the resistor network. This voltage drop is monitored by the BCM. The BCM sends the request to the transmission control module (TCM) to increase or decrease the available gear ranges.

Conditions for Running the DTC

P0815 or P0816

- DTC P0815, P0816, P0826, P1761, P182E, P1876, P1877, or P1915 is not set.
- Time since the range change is greater than 1 second.
- Engine speed is 400 RPM or greater for 5 seconds.
- Ignition voltage is 8.6 volts or greater.

P0826

- Engine speed is greater than 400 RPM for at least 5 seconds.
- Ignition voltage is 8.6 volts or greater.
- DTC P0826 or 1761 is not set.

Conditions for Setting the DTC

P0815 - Condition 1

TCM detects an upshift request for 1 second in PARK or neutral.

P0815 - Condition 2

TCM detects an upshift request for 10 minutes in any forward range.

P0816 - Condition 1

TCM detects a downshift request for 1 second in PARK or neutral.

P0816 - Condition 2

TCM detects a downshift request for 10 minutes in any forward range.

P0826

TCM detects an invalid voltage on the Tap Up/Down signal circuit for 1 minute.

Action Taken When the DTC Sets

- DTCs P0815, P0816, and P0826 are Type C DTCs.
- TCM disables TAP shift operation.

Conditions for Clearing the DTC

DTCs P0815, P0816, and P0826 are Type C DTCs.

Circuit/System Verification

WARNING: Refer to Parking Brake and Drive Wheels Warning .

1. Ignition ON, engine OFF, transmission shift lever in Park, parking brake ON.
2. Verify with a scan tool no internal mode switch (IMS) DTCs set.
   - **If IMS DTCs were set**

     Refer to **Diagnostic Trouble Code (DTC) List - Vehicle**

   - **If IMS DTCs were not set**

3. Transmission shift lever in manual mode (M).
4. Verify the scan the scan tool Driver Shift Request parameter displays None. Press and release the Tap Up (+) switch, and the Tap Down (-) switch. Verify the Driver Shift Request parameter changes from None to Upshift when the Tap Up switch is pressed, and from None to Downshift when the Tap Down switch is pressed.
    - **If parameter does not display the correct values**

      Refer to Circuit/System testing below.

    - **If parameter displays the correct values**
5. Operate the vehicle within the conditions for running the DTC to verify the DTC does not set. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/Failure Records.
    - **If the DTC sets**

      Refer to Circuit/System Testing.

    - **If the DTC does not set**
6. All OK.

Circuit/System Testing

1. Ignition OFF, parking brake ON, disconnect the S70L Steering Wheel Control Switch - Left connector, ignition ON.
2. Verify that a test lamp illuminates between the ignition circuit terminal 1 and ground.
    - **If the test lamp does not illuminate**
    1. Ignition OFF, remove the harness connector from the K9 Body Control Module.
    2. Test for infinite resistance between the S70L Steering Wheel Control Switch - Left harness connector ignition circuit terminal 1 and ground.
        - If less than infinite resistance, repair the short to ground in the circuit
        - If infinite resistance
    3. Test for less than 5 Ω in the ignition circuit end to end.
        - If 5 Ω or greater, repair the open/high resistance in the circuit
        - If less than 5 Ω, replace the K9 body control module.
    - **If the test lamp illuminates**
3. Ignition OFF.
4. Test for 6.5-7.1 k ohms between the steering wheel control switch - left connector terminals 1 and 5. Verify the resistance changes to 1.7-2.1 k ohms when the Tap Up button is pressed and 3.8-4.2 k ohms when the Tap Down button is pressed.
    - **If not the correct values**

      Replace the S70L Steering Wheel Control Switch - Left.

    - **If values are correct**
5. Remove the harness connector at the K9 Body Control Module.

6. Test for infinite resistance between the S70L Steering Wheel Control Switch - Left harness connector signal circuit terminal 5 and ground.
    - **If less than infinite resistance**

      Repair the short to ground in the circuit

    - **If infinite resistance**
7. Test for less than 5 Ω in the signal circuit end to end.
    - **If 5 Ω or greater**

      Repair the open/high resistance in the circuit.

    - **If less than 5 Ω**
8. Replace the K9 Body Control Module.

Repair Instructions

NOTE:

- **Perform the Reset Transmission Adapts following all transmission related repairs.**
- **Before replacing the TCM, perform the Control Solenoid Valve and Transmission Control Module Assembly Inspection.**

Perform the **Diagnostic Repair Verification** after completing the diagnostic procedure.

- **Control Module References** for BCM or control solenoid valve assembly replacement, setup and programming
- **Steering Wheel Control Switch Assembly Replacement**

DTC P0842 OR P0843: TRANSMISSION FLUID PRESSURE SWITCH 1

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptors

DTC P0842

Transmission Fluid Pressure Switch 1 Signal	P0842	P0843	P0843	-
Transmission Fluid Pressure Switch 3 Signal	P0872	P0873	P0873	-
Transmission Fluid Pressure Switch 4 Signal	P0877	P0878	P0878	-
Transmission Fluid Pressure Switch 5 Signal	P0989	P0990	P0990	-

Typical Scan Tool Data

Transmission Fluid Pressure Switch 1

Circuit	Short to Ground	Open/High Resistance	Short to Voltage
Operating Conditions: Engine running, normal operating temperature **Parameter Normal Range:** 12 volts = High, 0 volts = Low			
Transmission Fluid Pressure Switch 1 Signal	Low	High	High

Transmission Fluid Pressure Switch 3

Circuit	Short to Ground	Open/High Resistance	Short to Voltage
Operating Conditions: Engine running, normal operating temperature **Parameter Normal Range:** 12 volts = High, 0 volts = Low			
Transmission Fluid Pressure Switch 3 Signal	Low	High	High

Transmission Fluid Pressure Switch 4

Circuit	Short to Ground	Open/High Resistance	Short to Voltage
Operating Conditions: Engine running, normal operating temperature **Parameter Normal Range:** 12 volts = High, 0 volts = Low			
Transmission Fluid Pressure Switch 4 Signal	Low	High	High

Transmission Fluid Pressure Switch 5

Circuit	Short to Ground	Open/High Resistance	Short to Voltage
Operating Conditions: Engine running, normal operating temperature **Parameter Normal Range:** 12 volts = High, 0 volts = Low			
Transmission Fluid Pressure Switch 5 Signal	Low	High	High

Circuit/System Description

The transmission fluid pressure (TFP) switch 1 is part of the control solenoid valve assembly, which has no serviceable components. The transmission control module (TCM) supplies a signal circuit to the TFP Switch 1. The TFP Switch 1 has an internal case ground. TFP Switch 1 is normally closed or LOW. When oil pressure is present at the TFP Switch 1, the switch is open or HIGH. The normally high clutch pressure control (PC) solenoid 2 controls pressure to the 3-5 reverse clutch regulator valve. The TCM monitors the TFP switch 1 to determine the position of the 3-5 reverse clutch regulator valve. When the 3-5 reverse clutch is commanded OFF, pressure is present on the TFP switch 1. When the 3-5 reverse clutch is commanded ON, the 3-5 reverse clutch regulator valve moves and pressure to the TFP switch 1 is exhausted through the 3-5 reverse clutch regulator valve.

Conditions for Running the DTC

P0842 or P0843

- DTC P0711, P0712, P0713, P0716, P0717, P0722, P0723, P0742, P0751, P0756, P0757, P0973, P0974, P0976, P0977, P1915, or P182E is not set.
- High side driver is enabled.
- Engine speed is 400 RPM or greater for 5.0 seconds.
- Engine speed is 550 RPM or greater.
- Ignition voltage is 8.6 volts or greater.
- Transmission fluid temperature (TFT) is between -7 to +120Â°C (19-248Â°F).

Conditions for Setting the DTC

P0842

The TCM detects that the TFP switch 1 signal voltage remains LOW after the 3-5-Reverse clutch transitions from a HIGH pressure state to a LOW pressure state. The TCM counts each incident. The DTC sets when 25 counts are accumulated.

P0843

The TCM detects that the TFP switch 1 signal voltage remains HIGH after the 3-5-Reverse clutch transitions from a LOW pressure state to a HIGH pressure state. The TCM counts each incident. The DTC sets when 35 counts are accumulated.

Action Taken When the DTC Sets

- DTCs P0842 and P0843 are Type C DTCs.
- TCM freezes transmission adaptive functions for the 3-5-Reverse clutch.

Conditions for Clearing the DTC

DTCs P0842 and P0843 are Type C DTCs.

Diagnostic Aids

A TFP switch may malfunction due to normal debris in the transmission fluid causing a TFP Switch DTC to intermittently set. This type of failure should not be immediately noticeable to a customer, as the switch outputs are used for shift adaptives and do not cause transmission symptoms unless the switch malfunctions

continuously for an extended period of time.

For equivalent regional tools, refer to **Special Tools** .

Circuit/System Verification

WARNING: Refer to Parking Brake and Drive Wheels Warning .

1. Engine idling in Park with parking brake applied, and drive wheels chocked.
2. Verify with a scan tool the Transmission Fluid Pressure Switch 1, Transmission Fluid Pressure Switch 3, Transmission Fluid Pressure Switch 4, and Transmission Fluid Pressure Switch 5 parameter states are correct for the Park, Reverse, and Neutral gear select lever positions. Refer to **Transmission Fluid Pressure Switch Logic** .
    - **If any parameter value is not correct for a given gear range**

Refer to Circuit/System Testing below.

- **If the parameter values are correct for all gear ranges**

3. Verify the Transmission Fluid Pressure Switch 1, Transmission Fluid Pressure Switch 3, Transmission Fluid Pressure Switch 4, and Transmission Fluid Pressure Switch 5 parameter states are correct for each forward range with the gear select lever in Drive, using the scan tool to command all forward ranges. Refer to **Transmission Fluid Pressure Switch Logic** .
   - **If any parameter value is not correct for a given gear range**

     Refer to Circuit/System Testing below.

   - **If the parameter values are correct for all gear ranges**
4. After performing the above steps, verify that the DTC does not reset by operating the vehicle within the Conditions for Running the DTC. You may also operate the vehicle within the conditions you observe from the Freeze Frame/Failure Records data. If the vehicle passes the Circuit/System Verification procedure, then STOP. Do not perform the Circuit/System Testing or Component Testing as this may result in an unnecessary part replacement. Refer to **Testing for Intermittent Conditions and Poor Connections** .

Circuit/System Testing

NOTE: **You must perform the Circuit/System Verification first.**

1. Ignition OFF. Remove the Q8 control solenoid valve assembly. Refer to **Control Solenoid Valve and Transmission Control Module Assembly Replacement** .
2. Place the Q8 control solenoid valve assembly on a clean work surface near the transmission assembly.
3. Connect the **DT-47825-20** harness between the vehicle wire harness X1 20-way transmission electrical connector, and the Q8 control solenoid valve assembly electrical connector.
4. Ignition ON, verify with a scan tool that the Transmission Fluid Pressure Switch 1, Transmission Fluid Pressure Switch 3, Transmission Fluid Pressure Switch 4, and Transmission Fluid Pressure Switch 5 parameters change states when gently pushing on each TFP switch with the eraser end of a pencil.
   - **If any TFP Switch parameter does not change states**

     Replace the Q8 control solenoid valve assembly.

   - **If all TFP Switch parameters change states**
5. Inspect the channel plate, spacer plate, and filter plate for debris and blocked orifices.

Repair Instructions

NOTE:

- **Perform the Reset Transmission Adapts following all transmission related repairs.**
- **Before replacing the TCM, perform the Control Solenoid Valve and Transmission Control Module Assembly Inspection.**

Perform the **Diagnostic Repair Verification** after completing the diagnostic procedure.

Control Module References for control solenoid valve assembly replacement, setup, or programming

DTC P0851: PARK/NEUTRAL POSITION SWITCH

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Diagnostic Procedure Instructions provides an overview of each diagnostic category.

DTC Descriptors

DTC P0851

Park/Neutral Position Switch Circuit Low Voltage

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Signal	P0851	-	-	-
Ground	-	-	-	-

Typical Scan Tool Data

Park/Neutral Position Switch

Circuit	Short to Ground	Open/High Resistance	Short to Voltage
Operating Conditions: Engine running, normal operating temperature **Parameter Normal Range:** 12 Volts = In-Gear, 0 Volts = Park/Neutral			
Signal	Park/Neutral	In-Gear	In-Gear
Ground	-	In-Gear	-

Circuit/System Description

The transmission manual shift shaft switch assembly, also known as the transmission internal mode switch, is a sliding contact switch attached to the manual shift shaft inside the transmission case. The park/neutral position switch is integrated into the transmission internal mode switch and connects to the transmission control module (TCM) lead-frame through a short wire harness. The circuit uses the TCM as a pass-through connector only. The park/neutral signal is sent from the park/neutral switch directly to the engine control module (ECM) and is used for engine start enable.

Conditions for Running the DTC

- DTC P182E is not set.
- Ignition voltage is 8-32 V.
- Engine speed is running. Vehicle speed is 10 km/h (6 mph) or greater.
- Throttle position is 8 % or greater.

Conditions for Setting the DTC

ECM detects the park/neutral switch signal equals 0 V for 4 s.

Action Taken When the DTC Sets

- DTC P0851 is a Type C DTC.
- ECM uses the indicated transmission range from the TCM to prevent engine start-up with the transmission in reverse or a forward range.

Conditions for Clearing the DTC

DTC P0851 is a Type C DTC.

DT-47825-20 Adapter Harness

For equivalent regional tools, refer to **Special Tools** .

Circuit/System Verification

1. Ignition ON.
2. Verify that DTC P182E or P1915 is not set.
   - **If any of the DTCs are set**

     Refer to **DTC P182E or P1915**.

   - **If none of the DTCs are set**
3. Verify the gear shift lever position matches the scan tool TCM Internal Mode Switch parameter while slowly moving the gear shift lever from Park through all ranges.
   - **If the gear shift lever position does not match the Internal Mode Switch parameter**

     Adjust or replace the range selector lever cable as necessary.

   - **If the gear shift lever position matches the Internal Mode Switch parameter**
4. Verify the scan tool engine control module Park/Neutral Position Switch parameter displays Park/Neutral when in Park or Neutral and In-Gear when in Reverse or Drive.
   - **If the Park/Neutral Position Switch parameter is not as specified**

     Refer to Circuit/System Testing.

   - **If the Park/Neutral Position Switch parameter is as specified**
5. Operate the vehicle within the Conditions for Running the DTC. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/Failure Records data.
6. Verify the DTC does not set.
   - **If the DTC sets**

     Refer to Circuit/System Testing.

   - **If the DTC does not set**
7. All OK.

Circuit/System Testing

NOTE: **You must perform the Circuit/System Verification first.**

1. Ignition OFF, disconnect the X1 harness connector at the Q8 Control Solenoid Valve Assembly harness connector at the automatic transmission.
2. Install the **DT-47825-20** Adapter Harness to the vehicle harness connector.

NOTE: **All testing in steps 3 through 5 will be performed at the DT-47825-20 Adapter Harness connector.**

3. Test for less than 5 Ω between the ground circuit terminal 18 and ground.
   - **If 5 Ω or greater**
   1. Ignition OFF.

2. Test for less than 2 Ω in the ground circuit end to end.
- If 2 Ω or greater, repair the open/high resistance in the circuit.
- If less than 2 Ω, repair the open/high resistance in the ground connection.
- **If less than 5 Ω**

4. Ignition ON.
5. Test for 11-13 V between signal circuit terminal 20 and ground.
- **If not between 11-13 V**

1. Ignition OFF, remove the harness connector at the K20 Engine Control Module.
2. Test for infinite resistance between signal circuit terminal 20 and ground.
- If less than infinite resistance, repair the short to ground in the circuit.
- If infinite resistance.

1. Test for less than 2 Ω in the signal circuit end to end.
- If 2 Ω or greater, repair the open/high resistance in the circuit.
- If less than 2 Ω, replace the K20 Engine Control Module.
- **If between 11-13 V**

6. Ignition OFF, transmission in Park, disconnect the **DT-47825-20** Adapter Harness from the vehicle wire harness.
7. Connect the **DT-47825-20** Adapter Harness to the Q8 Control Solenoid Valve Assembly X1 connector.

NOTE: **The ignition will need to be ON momentarily to shift from Park.**

8. Test for less than 10 Ω between the Park/Neutral signal circuit terminal 20 and ground circuit terminal 18 with the transmission in Park and Neutral.
- **If 10 Ω or greater**

1. Disconnect the **DT-47825-20** Adapter Harness and remove the transmission control valve body cover.
2. Install the **DT-47825-20** Adapter Harness to the Q8 Control Solenoid Valve Assembly X1 connector.
3. Disconnect the B15 Transmission Internal Mode Switch electrical connector from the Q8 Control Solenoid Valve Assembly.
4. Test for less than 10 Ω between Park/Neutral signal circuit terminal 20 and terminal A at the Q8 Control Solenoid Valve Assembly X2 connector.
    - If 10 Ω or greater, replace the Q8 Control Solenoid Valve Assembly.
    - If less than 10 Ω, replace the B15 Transmission Internal Mode Switch.

- **If less than 10 Ω**

9. Test for infinite resistance between the Park/Neutral signal circuit terminal 20 and ground circuit terminal 18 with the transmission in Reverse and Drive.
- **If less than infinite resistance**

1. Disconnect the **DT-47825-20** Adapter Harness and remove the transmission control valve body cover.
2. Install the **DT-47825-20** Adapter Harness to the Q8 Control Solenoid Valve Assembly X1

connector.

3. Disconnect the B15 Transmission Internal Mode Switch electrical connector from the Q8 Control Solenoid Valve Assembly.
4. Test for infinite resistance between the Park/Neutral signal circuit terminal 20 and ground circuit terminal 18.
    - If less than infinite resistance, replace the Q8 Control Solenoid Valve Assembly.
    - If infinite resistance, replace the B15 Transmission Internal Mode Switch.

- **If infinite resistance**

10. Replace the K20 Engine Control Module.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repairs.

- Perform the **Reset Transmission Adapts** following all transmission repairs.
- **Manual Shift Detent Lever with Shaft Position Switch Assembly Replacement**
- **Range Selector Lever Cable Adjustment**
- **Control Valve Body Cover Replacement**
- **Control Module References** for ECM or control solenoid valve assembly replacement, programming, or setup.

DTC P0872 OR P0873: TRANSMISSION FLUID PRESSURE SWITCH

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptors

DTC P0872

Transmission Fluid Pressure Switch 5 Signal	P0989	P0990	P0990	-

Typical Scan Tool Data

Transmission Fluid Pressure Switch 1

Circuit	Short to Ground	Open/High Resistance	Short to Voltage
Operating Conditions: Engine running, normal operating temperature **Parameter Normal Range:** 12 volts = High, 0 volts = Low			
Transmission Fluid Pressure Switch 1 Signal	Low	High	High

Transmission Fluid Pressure Switch 3

Circuit	Short to Ground	Open/High Resistance	Short to Voltage
Operating Conditions: Engine running, normal operating temperature **Parameter Normal Range:** 12 volts = High, 0 volts = Low			
Transmission Fluid Pressure Switch 3 Signal	Low	High	High

Transmission Fluid Pressure Switch 4

Circuit	Short to Ground	Open/High Resistance	Short to Voltage
Operating Conditions: Engine running, normal operating temperature **Parameter Normal Range:** 12 volts = High, 0 volts = Low			
Transmission Fluid Pressure Switch 4 Signal	Low	High	High

Transmission Fluid Pressure Switch 5

Circuit	Short to Ground	Open/High Resistance	Short to Voltage
Operating Conditions: Engine running, normal operating temperature **Parameter Normal Range:** 12 volts = High, 0 volts = Low			
Transmission Fluid Pressure Switch 5 Signal	Low	High	High

Circuit/System Description

The transmission fluid pressure (TFP) switch 3 is part of the control solenoid valve assembly, which has no serviceable components. The transmission control module (TCM) supplies a signal circuit to the TFP switch 3. The TFP switch 3 has an internal case ground. The TFP switch 3 is normally closed or LOW. When oil pressure is present at the TFP switch 3, the switch is open or HIGH. The normally low clutch pressure control (PC)

solenoid 4 controls pressure to the 2-6 clutch regulator valve. The TCM monitors the TFP switch 3 to determine the position of the 2-6 clutch regulator valve. When the 2-6 clutch is commanded OFF, pressure is present on the TFP switch 3. When the 2-6 clutch is commanded ON, the 2-6 clutch regulator valve moves and pressure to the TFP switch 3 is exhausted through the 2-6 clutch regulator valve.

Conditions for Running the DTC

P0872 or P0873

- DTC P0711, P0712, P0713, P0716, P0717, P0722, P0723, P0742, P0751, P0756, P0757, P0973, P0974, P0976, P0977, P1915, or P182E is not set.
- High side driver is enabled.
- Engine speed is 400 RPM or greater for 5 seconds.
- Engine speed is 550 RPM or greater.
- Ignition voltage is 8.6 volts or greater.
- Transmission fluid temperature (TFT) is -7 to +120Â°C (19-248Â°F).

Conditions for Setting the DTC

P0872

The TCM detects that the TFP switch 3 signal voltage remains LOW after the 2-6 clutch transitions from a HIGH pressure state to a LOW pressure state. The TCM counts each incident. The DTC sets when 18 counts are accumulated.

P0873

The TCM detects that the TFP switch 3 signal voltage remains HIGH after the 2-6 clutch transitions from a LOW pressure state to a HIGH pressure state. The TCM counts each incident. The DTC sets when 20 counts are accumulated.

Action Taken When the DTC Sets

- DTCs P0872 and P0873 are Type C DTCs.
- TCM freezes transmission adaptive functions for the 2-6 clutch.

Conditions for Clearing the DTC

DTCs P0872 and P0873 are Type C DTCs.

Diagnostic Aids

A TFP switch may malfunction due to normal debris in the transmission fluid causing a TFP Switch DTC to intermittently set. This type of failure should not be immediately noticeable to a customer, as the switch outputs are used for shift adaptives and do not cause transmission symptoms unless the switch malfunctions continuously for an extended period of time.

Circuit/System Verification

WARNING: Refer to Parking Brake and Drive Wheels Warning .

1. Engine idling in Park with parking brake applied, and drive wheels chocked.
2. Verify with a scan tool the Transmission Fluid Pressure Switch 1, Transmission Fluid Pressure Switch 3, Transmission Fluid Pressure Switch 4, and Transmission Fluid Pressure Switch 5 parameter states are correct for the Park, Reverse, and Neutral gear select lever positions. Refer to **Transmission Fluid Pressure Switch Logic** .
   - **If any parameter value is not correct for a given gear range**

     Refer to Circuit/System Testing below.

   - **If parameter values are correct for all gear ranges**
3. Verify the Transmission Fluid Pressure Switch 1, Transmission Fluid Pressure Switch 3, Transmission Fluid Pressure Switch 4, and Transmission Fluid Pressure Switch 5 parameter states are correct for each

forward range with the gear select lever in Drive, using the scan tool to command all forward ranges. Refer to **Transmission Fluid Pressure Switch Logic** .

- **If any parameter value is not correct for a given gear range**

  Refer to Circuit/System Testing below.

- **If parameter values are correct for all gear ranges**

4. After performing the above steps, verify that the DTC does not reset by operating the vehicle within the Conditions for Running the DTC. You may also operate the vehicle within the conditions you observe from the Freeze Frame/Failure Records data. If the vehicle passes the Circuit/System Verification procedure, then STOP. Do not perform the Circuit/System Testing or Component Testing as this may result in an unnecessary part replacement. Refer to **Testing for Intermittent Conditions and Poor Connections** .

Circuit/System Testing

NOTE: **You must perform the Circuit/System Verification first.**

1. Ignition OFF. Remove the Q8 control solenoid valve assembly. Refer to **Control Solenoid Valve and Transmission Control Module Assembly Replacement** .
2. Place the Q8 control solenoid valve assembly on a clean work surface near the transmission assembly.
3. Connect the **DT-47825-20** harness between the vehicle wire harness X1 20-way transmission electrical connector, and the Q8 control solenoid valve assembly electrical connector.
4. Ignition ON, verify with a scan tool that the Transmission Fluid Pressure Switch 1, Transmission Fluid Pressure Switch 3, Transmission Fluid Pressure Switch 4, and Transmission Fluid Pressure Switch 5 parameters change states when gently pushing on each TFP switch with the eraser end of a pencil.
   - **If any TFP Switch parameter does not change states**

     Replace the Q8 control solenoid valve assembly.

   - **If all TFP Switch parameters change states**
5. Inspect the channel plate, spacer plate, and filter plate for debris and blocked orifices.

Repair Instructions

NOTE:

- **Perform the Reset Transmission Adapts following all transmission related repairs.**
- **Before replacing the TCM, perform the Control Solenoid Valve and Transmission Control Module Assembly Inspection.**

Perform the **Diagnostic Repair Verification** after completing the diagnostic procedure.

Control Module References for control solenoid valve assembly replacement, setup, or programming

DTC P0877 OR P0878: TRANSMISSION FLUID PRESSURE SWITCH 4

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.

Circuit	Short to Ground	Open/High Resistance	Short to Voltage
Operating Conditions: Engine running, normal operating temperature **Parameter Normal Range:** 12 volts = High, 0 volts = Low			
Transmission Fluid Pressure Switch 5 Signal	Low	High	High

Circuit/System Description

The transmission fluid pressure (TFP) switch 4 is part of the control solenoid valve assembly which has no serviceable components. The transmission control module (TCM) supplies a signal circuit to the TFP switch 4. The TFP switch 4 has an internal case ground. TFP switch 4 is normally closed or LOW. When oil pressure is present at the TFP switch 4, the switch is open or HIGH. The normally LOW pressure control solenoid 5 controls pressure to the 1-2-3-4 clutch regulator valve. The TCM monitors the TFP switch 4 to determine the position of the 1-2-3-4 clutch regulator valve. When the 1-2-3-4 clutch is commanded OFF, pressure is present on the TFP switch 4. When the 1-2-3-4 clutch is commanded ON, the 1-2-3-4 clutch regulator valve moves and pressure to the TFP switch 4 is exhausted through the 1-2-3-4 clutch regulator valve.

Conditions for Running the DTC

P0877 or P0878

- DTC P0711, P0712, P0713, P0716, P0717, P0722, P0723, P0742, P0751, P0756, P0757, P0973, P0974, P0976, P0977, P1915, or P182E is not set.
- High side driver is enabled.
- Engine speed is 400 RPM or greater for 5.0 seconds.
- Engine speed is 550 RPM or greater.
- Ignition voltage is 8.6 volts or greater.
- Transmission fluid temperature (TFT) is -7 to +120Â°C (19-248Â°F).

Conditions for Setting the DTC

P0877

The TCM detects that the TFP switch 4 signal voltage remains LOW after the 1-2-3-4 clutch transitions from a HIGH pressure state to a LOW pressure state. The TCM counts each incident. The DTC sets when 5 counts are accumulated.

P0878

The TCM detects that the TFP switch 4 signal voltage remains HIGH after the 1-2-3-4 clutch transitions from a LOW pressure state to a HIGH pressure state. The TCM counts each incident. The DTC sets when 8 counts are accumulated.

Action Taken When the DTC Sets

- DTCs P0877 and P0878 are Type C DTCs.
- TCM freezes transmission adaptive functions for the 1-2-3-4 clutch.

Conditions for Clearing the DTC

DTCs P0877 and P0878 are Type C DTCs.

Diagnostic Aids

A TFP switch may malfunction due to normal debris in the transmission fluid causing a TFP Switch DTC to intermittently set. This type of failure should not be immediately noticeable to a customer, as the switch outputs are used for shift adaptives and do not cause transmission symptoms unless the switch malfunctions continuously for an extended period of time.

Circuit/System Verification

WARNING: Refer to Parking Brake and Drive Wheels Warning .

1. Engine idling in Park with parking brake applied, and drive wheels chocked.
2. Verify with a scan tool the Transmission Fluid Pressure Switch 1, Transmission Fluid Pressure Switch 3, Transmission Fluid Pressure Switch 4, and Transmission Fluid Pressure Switch 5 parameter states are correct for the Park, Reverse, and Neutral gear select lever positions. Refer to **Transmission Fluid Pressure Switch Logic** .
   - **If any parameter value is not correct for a given gear range**

     Refer to Circuit/System Testing below.

   - **If the parameter values are correct for all gear ranges**
3. Verify the Transmission Fluid Pressure Switch 1, Transmission Fluid Pressure Switch 3, Transmission Fluid Pressure Switch 4, and Transmission Fluid Pressure Switch 5 parameter states are correct for each forward range with the gear select lever in Drive, using the scan tool to command all forward ranges. Refer to **Transmission Fluid Pressure Switch Logic**
   - **If any parameter value is not correct for a given gear range**

     Refer to Circuit/System Testing below.

   - **If the parameter values are correct for all gear ranges**
4. After performing the above steps, verify that the DTC does not reset by operating the vehicle within the Conditions for Running the DTC. You may also operate the vehicle within the conditions you observe from the Freeze Frame/Failure Records data. If the vehicle passes the Circuit/System Verification procedure, then STOP. Do not perform the Circuit/System Testing or Component Testing as this may result in an unnecessary part replacement. Refer to **Testing for Intermittent Conditions and Poor Connections** .

Circuit/System Testing

NOTE: You must perform the Circuit/System Verification first.

1. Ignition OFF. Remove the Q8 control solenoid valve assembly. Refer to **Control Solenoid Valve and Transmission Control Module Assembly Replacement** .
2. Place the Q8 control solenoid valve assembly on a clean work surface near the transmission assembly.
3. Connect the **DT-47825-20** harness between the vehicle wire harness X1 20-way transmission electrical connector, and the Q8 control solenoid valve assembly electrical connector.
4. Ignition ON, verify with a scan tool that the Transmission Fluid Pressure Switch 1, Transmission Fluid Pressure Switch 3, Transmission Fluid Pressure Switch 4, and Transmission Fluid Pressure Switch 5 parameters change states when gently pushing on each TFP switch with the eraser end of a pencil.

- **If any TFP Switch parameter does not change states**

  Replace the Q8 control solenoid valve assembly.

- **If all TFP Switch parameters change states**

5. Inspect the channel plate, spacer plate, and filter plate for debris and blocked orifices.

Repair Instructions

NOTE:

- **Perform the Reset Transmission Adapts following all transmission related repairs.**
- **Before replacing the TCM, perform the Control Solenoid Valve and Transmission Control Module Assembly Inspection.**

Perform the **Diagnostic Repair Verification** after completing the diagnostic procedure.

DTC P0961-P0963: LINE PRESSURE CONTROL SOLENOID VALVE

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptors

DTC P0961

Line Pressure Control Solenoid Valve Performance

DTC P0962

Line Pressure Control Solenoid Valve Control Circuit Low Voltage

DTC P0963

Line Pressure Control Solenoid Valve Control Circuit High Voltage

Circuit/System Description

The line pressure control solenoid is part of the control solenoid valve assembly which has no serviceable components. The normally high line pressure control solenoid regulates and directs the line pressure control solenoid oil pressure to the pressure regulator valve. Increasing line pressure control solenoid pressure increases transmission line pressure. The transmission control module (TCM) varies the current to the line pressure control solenoid by controlling the amount of time the low side driver is ON and OFF. Decreasing the ON time, decreases the current to the line pressure control solenoid, which increases line pressure control solenoid oil pressure by closing OFF the solenoid exhaust port. Increasing the current to the line pressure control solenoid decreases line pressure control oil pressure by opening the solenoid exhaust port. Line pressure control solenoid

power is supplied by the TCM through a high side driver. The high side driver protects the circuit and components from excessive current flow. If excessive current flow is detected, the high side driver will turn OFF. When the fault is corrected, the high side driver will reset.

Conditions for Running the DTC

- Engine speed is 400-7,500 RPM for 5 s.
- Ignition voltage is 8.6-32 V.

Conditions for Setting the DTC

P0961

TCM detects an internal electrical malfunction of the line pressure control solenoid where the measured line pressure control solenoid current does not equal the commanded line pressure control solenoid current for 5 s.

P0962

TCM detects a short to ground on the line pressure control solenoid control circuit for 2 s.

P0963

TCM detects an open or a short to voltage on the line pressure control solenoid control circuit for 5 s.

Action Taken When the DTC Sets

P0961 or P0963

- DTCs P0961 and P0963 are Type B DTCs.
- TCM freezes transmission adaptive functions.
- TCM commands maximum line pressure.

P0962

- DTC P0962 is a Type A DTC.
- TCM limits the transmission to Reverse and 3rd or 5th gear operation.
- TCM inhibits the torque converter clutch (TCC).
- TCM commands maximum line pressure.
- TCM freezes transmission adaptive functions.
- TCM turns the high side driver OFF.
- TCM inhibits Tap Up/Down function.
- TCM inhibits manual shifting of forward gears.
- TCM enables torque management.

Conditions for Clearing the DTC

- DTCs P0961 and P0963 are Type B DTCs.
- DTC P0962 is a Type A DTC.

Circuit/System Verification

WARNING: Refer to Parking Brake and Drive Wheels Warning .

1. Engine running, transmission in Park. Move the gear shift lever into each gear position and back into Park position.
2. Verify the scan tool parameters listed below do not display Malfunction:
    - Line Pressure Control Solenoid Valve Performance Test Status
    - Line Pressure Control Solenoid Valve Control Circuit Low Voltage Test Status
    - Line Pressure Control Solenoid Valve Control Circuit High Voltage Test Status

- **If Malfunction is displayed**

  Refer to Circuit/System Testing.

- **If Malfunction is not displayed**

3. Operate the vehicle within the Conditions for Running the DTC. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/Failure Records data.
4. Verify the DTC does not set.
   - **If the DTC sets**

     Refer to Circuit/System Testing.

   - **If the DTC does not set**
5. All OK.

Circuit/System Testing

NOTE: **You must perform the Circuit/System Verification first.**

1. Ignition OFF, remove the Q8 Control Solenoid Valve Assembly.
2. Verify the Q8 Control Solenoid Valve Assembly is not contaminated with any debris and clean as necessary. Refer to **Control Solenoid Valve and Transmission Control Module Assembly Inspection**.
   - **If contaminated**

     Repair as necessary.

   - **If not contaminated**
3. Verify the resistance of each solenoid is within the specified range for listed in the **Control Solenoid Valve and Transmission Control Module Assembly Inspection**.
   - **If the resistance is not within range**

     Replace the Q8 Control Solenoid Valve Assembly.

   - **If the resistance is within range**
4. Place the Q8 Control Solenoid Valve Assembly on a clean work surface near the transmission assembly.
5. Connect the **DT-47825-20** adapter harness between the vehicle harness connector and the Q8 Control Solenoid Valve Assembly connector. Ignition ON.
6. Verify the scan tool parameters listed below do not display Malfunction:
   - Line Pressure Control Solenoid Valve Performance Test Status
   - Line Pressure Control Solenoid Valve Control Circuit Low Voltage Test Status
   - Line Pressure Control Solenoid Valve Control Circuit High Voltage Test Status
   - **If Malfunction is displayed**

     Replace the Q8 Control Solenoid Valve Assembly.

   - **If Malfunction is not displayed**

7. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repairs.

- Perform the **Reset Transmission Adapts** following all transmission repairs.
- **Control Module References** for control solenoid valve assembly replacement, programming, and setup.

DTC P0965-P0967: PRESSURE CONTROL SOLENOID VALVE 2

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.

- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptors

DTC P0965

Pressure Control Solenoid Valve 2 Performance

DTC P0966

Pressure Control Solenoid Valve 2 Control Circuit Low Voltage

DTC P0967

Pressure Control Solenoid Valve 2 Control Circuit High Voltage

Circuit/System Description

Pressure control solenoid 2 is part of the control solenoid valve assembly which has no serviceable components. The normally high pressure control solenoid 2 regulates and directs oil pressure to the 3-5 reverse clutch regulator valve. Increasing pressure to the 3-5 reverse clutch regulator valve increases pressure to the 3-5 reverse clutch. The transmission control module (TCM) varies the current to the pressure control solenoid 2 by controlling the amount of time the low side driver is ON and OFF. Decreasing the current to the pressure control solenoid 2 increases pressure control solenoid 2 oil pressure by closing OFF the solenoid exhaust port. Increasing the current to the pressure control solenoid 2 decreases pressure control solenoid 2 oil pressure by opening the solenoid exhaust port. Power to pressure control solenoid 2 is supplied by the TCM through a high side driver. The high side driver protects the circuit and components from excessive current flow. If excessive current flow is detected, the high side driver will turn OFF. When the fault is corrected, the high side driver will reset.

Conditions for Running the DTC

- Engine speed is 400-7,500 RPM for 5 s.
- Ignition voltage is 8.6-32 V.

Conditions for Setting the DTC

P0965

TCM detects an internal electrical performance malfunction of the pressure control solenoid 2 control circuit where the measured pressure control solenoid 2 current does not equal the commanded pressure control solenoid 2 current for 5 s.

P0966

TCM detects a short to ground on the pressure control solenoid 2 control circuit for 1 s.

P0967

TCM detects an open or short to voltage on the pressure control solenoid 2 control circuit for 1 s.

Action Taken When the DTC Sets

P0965

- DTC P0965 is a Type C DTC.
- TCM freezes transmission adaptive functions on the 3-5-Reverse clutch.

P0966

- DTC P0966 is a Type A DTC.
- TCM limits the transmission to Reverse and 3rd or 5th gear operation.
- TCM commands maximum line pressure.
- TCM freezes transmission adaptive functions.
- TCM turns the high side driver OFF.
- TCM forces the torque converter clutch (TCC) OFF.
- TCM inhibits Tap Up/Down function.
- TCM inhibits manual shifting of forward gears.
- TCM enables torque management.

P0967

- DTC P0967 is a Type A DTC.
- TCM limits the transmission to Reverse and 3rd gear operation.
- TCM commands maximum line pressure.
- TCM freezes transmission adaptive functions.
- TCM inhibits Tap Up/Down function.
- TCM inhibits manual shifting of forward gears.

Conditions for Clearing the DTC

- DTC P0965 is a Type C DTC.
- DTCs P0966 and P0967 are Type A DTCs.

DTC Descriptors

DTC P0969

Pressure Control Solenoid Valve 3 Performance

DTC P0970

Pressure Control Solenoid Valve 3 Control Circuit Low Voltage

DTC P0971

Pressure Control Solenoid Valve 3 Control Circuit High Voltage

Circuit/System Description

Pressure control solenoid 3 is part of the control solenoid valve assembly which has no serviceable components. The normally high pressure control solenoid 3 regulates and directs oil pressure to the R1/4-5-6 regulator valve. Increasing pressure control solenoid 3 pressure increases pressure to the low and reverse clutch or 4-5-6 clutch, depending on the position of the clutch select valve 2. The transmission control module (TCM) varies current to pressure control Solenoid 3 by controlling the time the low side driver is ON and OFF. Decreasing the current to pressure control solenoid 3 increases oil pressure by closing off the solenoid exhaust port. Increasing the current to the pressure control solenoid 3 decreases oil pressure by opening the exhaust port. Power is supplied to the pressure control solenoid 3 by the TCM through a high side driver. The high side driver protects the circuit and components from excessive current flow. If excessive current flow is detected, the high side driver will turn OFF. When the fault is corrected, the high side driver will reset.

Conditions for Running the DTC

- Engine speed is 400-7,500 RPM for 5 s.
- Ignition voltage is 8.6-32 V.

Conditions for Setting the DTC

P0969

TCM detects an internal electrical performance malfunction of the clutch pressure control solenoid 3 control circuit where the measured clutch pressure control solenoid 3 currents does not equal the commanded clutch pressure control solenoid 3 current for 5 s.

P0970

TCM detects a short to ground on the clutch pressure control solenoid 3 control circuit for 1 s.

P0971

TCM detects an open or short to voltage on the clutch pressure control solenoid 3 control circuit for 1 s.

Action Taken When the DTC Sets

P0969

- DTC P0969 is a Type C DTC.
- TCM freezes transmission adaptive functions to the low and reverse clutch and 4-5-6 clutch.

P0970 or P0971

- DTCs P0970 and P0971 are Type A DTCs.
- TCM limits the transmission to Reverse and 3rd or 5th gear operation.
- TCM inhibits the torque converter clutch (TCC).
- TCM commands maximum line pressure.
- TCM freezes transmission adaptive functions.
- TCM turns the high side driver OFF.
- TCM enables torque management.
- TCM inhibits Tap Up/Down function.
- TCM inhibits manual shifting of forward gears.

Conditions for Clearing the DTC

- DTC P0969 is a Type C DTC.
- DTCs P0970 and P0971 are Type A DTCs.

Circuit/System Verification

1. Operate the vehicle in second gear long enough to ensure at least a 3Â°C (5Â°F) rise in TCM temperature, then operate the vehicle with transmission in Park for 5 s.
2. Operate the vehicle in Drive range. Allow the transmission to shift through all forward gear ranges.
3. Verify the scan tool parameters listed below do not display Malfunction:
    - Pressure Control Solenoid Valve 3 Performance Test Status
    - Pressure Control Solenoid Valve 3 Control Circuit Low Voltage Test Status
    - Pressure Control Solenoid Valve 3 Control Circuit High Voltage Test Status
    - **If Malfunction is displayed**

      Refer to Circuit/System Testing.

    - **If Malfunction is not displayed**
4. Operate the vehicle within the Conditions for Running the DTC. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/Failure Records data.
5. Verify the DTC does not set.
    - **If the DTC sets**

      Refer to Circuit/System Testing.

    - **If the DTC does not set**

6. All OK.

Circuit/System Testing

NOTE: **You must perform the Circuit/System Verification first.**

1. Ignition OFF, remove the Q8 Control Solenoid Valve Assembly.
2. Verify the Q8 Control Solenoid Valve Assembly is not contaminated with any debris and clean as necessary. Refer to **Control Solenoid Valve and Transmission Control Module Assembly Inspection**.
   - **If contaminated**

     Repair as necessary.

   - **If not contaminated**
3. Verify the resistance is within the specified range for each solenoid listed in the **Control Solenoid Valve and Transmission Control Module Assembly Inspection**.
   - **If the resistance is not within range**

     Replace the Q8 Control Solenoid Valve Assembly.

   - **If the resistance is within range**
4. Place the Q8 Control Solenoid Valve Assembly on a clean work surface near the transmission assembly.
5. Connect the **DT-47825-20** adapter harness between the vehicle harness connector and the Q8 Control Solenoid Valve Assembly connector. Ignition ON.
6. Verify the scan tool parameters listed below do not display Malfunction:
   - Pressure Control Solenoid Valve 3 Performance Test Status
   - Pressure Control Solenoid Valve 3 Control Circuit Low Voltage Test Status
   - Pressure Control Solenoid Valve 3 Control Circuit High Voltage Test Status
   - **If Malfunction is displayed**

     Replace the Q8 Control Solenoid Valve Assembly.

   - **If Malfunction is not displayed**
7. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repairs.

- Perform the **Reset Transmission Adapts** following all transmission repairs.
- **Control Module References** for control solenoid valve assembly replacement, programming, and setup.

DTC P0973 OR P0974: SHIFT SOLENOID VALVE 1

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.

- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptors

DTC P0973

Shift Solenoid Valve 1 Control Circuit Low Voltage

DTC P0974

Shift Solenoid Valve 1 Control Circuit High Voltage

Circuit/System Description

Shift solenoid 1 is part of the control solenoid valve assembly, which has no serviceable components. Shift Solenoid 1 is a normally closed (NC) ON/OFF solenoid and is controlled by the transmission control module (TCM) through a low side driver. When the shift solenoid 1 is energized (ON), shift solenoid 1 fluid pressure is directed to the clutch select valve 2, which allows the valve to overcome the spring pressure and move to the applied position. Power to the shift solenoid 1 is supplied by the TCM through a high side driver. The high side driver protects the circuit and components from excessive current flow. If excessive current flow is detected, the high side driver will turn OFF. When the fault is corrected, the high side driver will reset.

Conditions for Running the DTC

- Engine speed is 400-7,500 RPM for 5 s.
- Ignition voltage is 8.6-32 V.

Conditions for Setting the DTC

P0973

TCM detects a short to ground on the shift solenoid 1 control circuit for 2 s.

P0974

TCM detects an open or a short to power on the shift solenoid 1 control circuit for 2 s.

Action Taken When the DTC Sets

P0973

- DTC P0973 is a Type A DTC.
- TCM limits the transmission to Reverse and 3rd gear operation.
- TCM commands maximum line pressure.
- TCM freezes transmission adaptive functions.
- TCM inhibits Tap Up/Down function.
- TCM inhibits manual shifting of forward gears.
- TCM inhibits auto grade braking

P0974

- DTC P0974 is a Type B DTC.
- TCM inhibits 1st gear.

Conditions for Clearing the DTC

- DTC P0973 is a Type A DTC.
- DTC P0974 is a Type B DTC.

Circuit/System Verification

1. Operate the vehicle in second gear long enough to ensure at least a 3Â°C (5Â°F) rise in TCM temperature, then operate the vehicle in Park for 5 s.
2. Place the gear selector in Reverse for 5 s and then idle the engine with the gear selector in Park for 5 s.
3. Verify the scan tool parameters listed below do not display Malfunction.
    - Shift Solenoid Valve 1 Control Circuit Low Voltage Test Status
    - Shift Solenoid Valve 1 Control Circuit Open Test Status
    - Shift Solenoid Valve 1 Control Circuit High Voltage Test Status
    - **If Malfunction is displayed**

      Refer to Circuit/System Testing.

    - **If Malfunction is not displayed**
4. Operate the vehicle within the Conditions for Running the DTC. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/Failure Records data.
5. Verify the DTC does not set.
    - **If the DTC sets**

      Refer to Circuit/System Testing.

    - **If the DTC does not set**
6. All OK.

Circuit/System Testing

NOTE: **You must perform the Circuit/System Verification first.**

1. Ignition OFF, remove the Q8 Control Solenoid Valve Assembly.
2. Verify the Q8 Control Solenoid Valve Assembly is not contaminated with any debris and clean as necessary. Refer to **Control Solenoid Valve and Transmission Control Module Assembly Inspection**.
    - **If contaminated**

      Repair as necessary.

    - **If not contaminated**
3. Verify the resistance is within the specified range for each solenoid listed in the **Control Solenoid Valve and Transmission Control Module Assembly Inspection**.
    - **If the resistance is not within range**

      Replace the Q8 Control Solenoid Valve Assembly.

    - **If the resistance is within range**
4. Place the Q8 Control Solenoid Valve Assembly on a clean work surface near the transmission assembly.
5. Connect the **DT-47825-20** adapter harness between the vehicle harness connector and the Q8 Control Solenoid Valve Assembly connector. Ignition ON.
6. Verify the scan tool parameters listed below do not display Malfunction:

- Shift Solenoid Valve 1 Control Circuit Low Voltage Test Status
- Shift Solenoid Valve 1 Control Circuit Open Test Status
- Shift Solenoid Valve 1 Control Circuit High Voltage Test Status
- **If Malfunction is displayed**

  Replace the Q8 Control Solenoid Valve Assembly.

- **If Malfunction is not displayed**

7. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repairs.

- Perform the **Reset Transmission Adapts** following all transmission repairs.
- **Control Module References** for control solenoid valve assembly replacement, programming, and setup.

DTC P0976 OR P0977: SHIFT SOLENOID VALVE 2

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptors

DTC P0976

Shift Solenoid Valve 2 Control Circuit Low Voltage

DTC P0977

Shift Solenoid Valve 2 Control Circuit High Voltage

Circuit/System Description

Shift solenoid 2 is part of the control solenoid valve assembly, which has no serviceable components. Shift solenoid 2 is a normally closed ON/OFF solenoid and is controlled by the transmission control module (TCM) through a low side driver. When the shift solenoid 2 is energized, fluid pressure is directed to the clutch select valve 3, which allows the valve to overcome the spring pressure and move to the applied position. Power to the shift solenoid 2 is supplied by the TCM through a high side driver. The high side driver protects the circuit and components from excessive current flow. If excessive current flow is detected, the high side driver will turn OFF. When the fault is corrected, the high side driver will reset.

Conditions for Running the DTC

- Engine speed is 400-7,500 RPM for 5 s.
- Ignition voltage is 8.6-32 V.

Conditions for Setting the DTC

P0976

TCM detects a short to ground on the shift solenoid 2 control circuit for 2 s.

P0977

TCM detects an open or short to power on the shift solenoid 2 control circuit for 2 s.

Action Taken When the DTC Sets

P0976

- DTC P0976 is a Type C DTC.
- TCM freezes transmission adaptive functions.

P0977

- DTC P0977 is a Type A DTC.
- TCM limits the transmission to Reverse and 3rd gear operation.
- TCM commands maximum line pressure.
- TCM freezes transmission adaptive functions.
- TCM inhibits Tap Up/Down function
- TCM inhibits manual shifting of forward gears

Conditions for Clearing the DTC

- DTC P0976 is a Type C DTC.
- DTC P0977 is a Type A DTC.

- **Control Module References** for control solenoid valve assembly replacement, programming, and setup.

DTC P0989 OR P0990: TRANSMISSION FLUID PRESSURE SWITCH 5

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptors

DTC P0989

Transmission Fluid Pressure Switch 5 Circuit Low Voltage

DTC P0990

Transmission Fluid Pressure Switch 5 Circuit High Voltage

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
TFP Switch 1 Signal	P0842	P0843	P0843	-
TFP Switch 3 Signal	P0872	P0873	P0873	-
TFP Switch 4 Signal	P0877	P0878	P0878	-
TFP Switch 5 Signal	P0989	P0990	P0990	-

Typical Scan Tool Data

Transmission Fluid Pressure Switch 1

Circuit	Short to Ground	Open/High Resistance	Short to Voltage
Operating Conditions: Engine running, normal operating temperature **Parameter Normal Range:** 12 volts = High, 0 volts = Low			
Transmission Fluid Pressure Switch 1 Signal	Low	High	High

Transmission Fluid Pressure Switch 3

Circuit	Short to Ground	Open/High Resistance	Short to Voltage
Operating Conditions: Engine running, normal operating temperature **Parameter Normal Range:** 12 volts = High, 0 volts = Low			
Transmission Fluid Pressure Switch 3 Signal	Low	High	High

Transmission Fluid Pressure Switch 4

Circuit	Short to Ground	Open/High Resistance	Short to Voltage
Operating Conditions: Engine running, normal operating temperature **Parameter Normal Range:** 12 volts = High, 0 volts = Low			
Transmission Fluid Pressure Switch 4 Signal	Low	High	High

Transmission Fluid Pressure Switch 5

Circuit	Short to Ground	Open/High Resistance	Short to Voltage
Operating Conditions: Engine running, normal operating temperature **Parameter Normal Range:** 12 volts = High, 0 volts = Low			
Transmission Fluid Pressure Switch 5 Signal	Low	High	High

Circuit/System Description

The transmission fluid pressure (TFP) switch 5 is part of the control solenoid valve assembly, which has no serviceable components. The transmission control module (TCM) supplies a signal circuit to the TFP switch 5. The TFP switch 5 has an internal case ground. TFP switch 5 is normally closed or LOW. When oil pressure is present at the TFP switch 5, the switch is open or HIGH. The normally high pressure control (PC) solenoid 3 controls pressure to the R1/4-5-6 clutch regular valve. The TCM monitors the TFP switch 5 signal circuit to determine the position of the R1/4-5-6 clutch regulator valve. When the low and reverse clutch and 4-5-6 clutch are commanded OFF, pressure is present on the TFP switch 5. When the low and reverse clutch or the 4-5-6 clutch is commanded ON, the R1/4-5-6 clutch regulator valve moves and pressure to the TFP switch 5 is exhausted through the R1/4-5-6 clutch regulator valve.

Conditions for Running the DTC

DTC P0989 or P0990

- DTC P0711, P0712, P0713, P0716, P0717, P0722, P0723, P0742, P0751, P0756, P0757, P0973, P0974, P0976, P0977, P182E, or P1915 is not set.
- Engine speed is 400 RPM or greater for 5 seconds.
- Engine speed is 550 RPM or greater.
- Ignition voltage is 8.6 volts or greater.
- Transmission fluid temperature (TFT) is -7 to +120Â°C (19-248Â°F).
- High side driver (HSD) is enabled.
- Gear Selector is in a forward range.

Conditions for Setting the DTC

P0989

The TCM detects that the TFP switch 5 signal voltage remains LOW after the low and reverse clutch or the 4-5-6 clutch transitions from a HIGH pressure state to a LOW pressure state. The TCM counts each incident. The DTC sets when 18 counts are accumulated.

P0990

The TCM detects that the TFP switch 5 signal voltage remains HIGH after the low and reverse clutch or the 4-5-6 clutch transitions from a LOW pressure state to a HIGH pressure state. The TCM counts each incident. The DTC sets when 15 counts are accumulated.

Action Taken When the DTC Sets

- DTCs P0989 and P0990 are Type C DTCs.
- TCM freezes transmission adaptive functions for the reverse and low clutch and the 4-5-6 clutch.

Conditions for Clearing the DTC

DTCs P0989 and P0990 are Type C DTCs.

Diagnostic Aids

A TFP switch may malfunction due to normal debris in the transmission fluid causing a TFP Switch DTC to intermittently set. This type of failure should not be immediately noticeable to a customer, as the switch outputs are used for shift adaptives and do not cause transmission symptoms unless the switch malfunctions continuously for an extended period of time.

Special Tools

DT-47825-20 Adapter Harness

For equivalent regional tools, refer to **Special Tools** .

Circuit/System Verification

WARNING: Refer to Parking Brake and Drive Wheels Warning .

1. Engine idling in Park with parking brake applied, and drive wheels chocked.
2. Verify with a scan tool the Transmission Fluid Pressure Switch 1, Transmission Fluid Pressure Switch 3, Transmission Fluid Pressure Switch 4, and Transmission Fluid Pressure Switch 5 parameter states are correct for the Park, Reverse, and Neutral gear select lever positions. Refer to **Transmission Fluid Pressure Switch Logic** .
   - **If any parameter value is not correct for a given gear range**

     Refer to Circuit/System Testing below.

   - **If the parameter values are correct for all gear ranges**
3. Verify the Transmission Fluid Pressure Switch 1, Transmission Fluid Pressure Switch 3, Transmission Fluid Pressure Switch 4, and Transmission Fluid Pressure Switch 5 parameter states are correct for each forward range with the gear select lever in Drive, using the scan tool to command all forward ranges. Refer to **Transmission Fluid Pressure Switch Logic**
   - **If any parameter value is not correct for a given gear range**

Refer to Circuit/System Testing below.

- **If the parameter values are correct for all gear ranges**

4. After performing the above steps, verify that the DTC does not reset by operating the vehicle within the Conditions for Running the DTC. You may also operate the vehicle within the conditions you observe from the Freeze Frame/Failure Records data. If the vehicle passes the Circuit/System Verification procedure, then STOP. Do not perform the Circuit/System Testing or Component Testing as this may result in an unnecessary part replacement. Refer to **Testing for Intermittent Conditions and Poor Connections** .

Circuit/System Testing

NOTE: **You must perform the Circuit/System Verification first.**

1. Ignition OFF. Remove the Q8 control solenoid valve assembly. Refer to **Control Solenoid Valve and Transmission Control Module Assembly Replacement** .
2. Place the Q8 control solenoid valve assembly on a clean work surface near the transmission assembly.
3. Connect the **DT-47825-20** harness between the vehicle wire harness X1 20-way transmission electrical connector, and the Q8 control solenoid valve assembly electrical connector.
4. Ignition ON, verify with a scan tool that the Transmission Fluid Pressure Switch 1, Transmission Fluid Pressure Switch 3, Transmission Fluid Pressure Switch 4, and Transmission Fluid Pressure Switch 5 parameters change states when gently pushing on each TFP switch with the eraser end of a pencil.
   - **If any TFP Switch parameter does not change states**

     Replace the Q8 control solenoid valve assembly.

   - **If all TFP Switch parameters change states**
5. Inspect channel plate, spacer plate, and filter plate for debris and blocked orifices.

Repair Instructions

NOTE:

- **Perform the Reset Transmission Adapts following all transmission related repairs.**
- **Before replacing the TCM, perform the Control Solenoid Valve and Transmission Control Module Assembly Inspection.**

Perform the **Diagnostic Repair Verification** after completing the diagnostic procedure.

Control Module References for control solenoid valve assembly replacement, setup, or programming

DTC P1761: UP AND DOWN SHIFT SWITCH

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

DTC P1761

Up and Down Shift Switch Signal Circuit

Circuit/System Description

A signal circuit is provided by the body control module (BCM) to the resistor network embedded in the plus or minus buttons. When a plus or minus button is pressed, a corresponding voltage drop occurs across the resistor network. This voltage drop is monitored by the BCM. The BCM will send the request to the transmission control module (TCM) to perform the upshift or downshift. The TCM is constantly monitoring the serial data sent from the BCM for the correct number and sequence of counts for Tap Up and Tap Down function.

Conditions for Running the DTC

- The TCM rolling counter diagnostic is enabled.
- The Tap Up and Tap Down message health is received from the BCM.
- The engine speed is 400 RPM or greater for 5 s.

Conditions for Setting the DTC

The TCM detects an error in the rolling count value that does not match with the BCM count, 3 times within 10 s.

Action Taken When the DTC Sets

- DTC P1761 is a Type C DTC.
- The TCM inhibits Tap Up/Down function.
- The TCM inhibits manual shifting of forward gears.

Conditions for Clearing the DTC

DTC P1761 is a Type C DTC.

Circuit/System Verification

1. DTC P1761 is an informational DTC. Diagnose all other body control module DTCs prior to DTC P1761. Refer to **Diagnostic Trouble Code (DTC) List - Vehicle** .
2. If there are no other body control DTCs, diagnosis is accomplished by looking for an intermittent CAN circuit fault. Refer to **Scan Tool Does Not Communicate with High Speed GMLAN Device** .
3. After performing the above steps, verify that the DTC does not reset by operating the vehicle within the Conditions for Running the DTC. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/Failure Records data. If the vehicle passes the Circuit/System Verification procedure, refer to **Testing for Intermittent Conditions and Poor Connections** .

Repair Instructions

- Perform the **Reset Transmission Adapts** following all transmission related repairs
- Perform the **Diagnostic Repair Verification** after completing the diagnostic procedure

DTC P182E OR P1915: INTERNAL MODE SWITCH

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptors

DTC P182E

Internal Mode Switch Indicates Invalid Range

DTC P1915

Internal Mode Switch Does Not Indicate Park/Neutral During Start

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance

Ground	-	P182E	P182E	P182E, P1915

Typical Scan Tool Data

Internal Mode Switch A/B/C/P

Circuit	Short to Ground	Open	Short to Voltage
Operating Conditions: Ignition ON, range selector in Park **Parameter Normal Range:** Low High High Low			
Signal A	Low	High	High
Signal B	Low	High	High
Signal C	Low	High	High
Signal P	Low	High	High

Circuit/System Description

The manual shift detent lever with shaft position switch assembly, or internal mode switch assembly, is a sliding contact switch attached to the manual shift detent lever within the transmission. The 4 inputs to the transmission control module (TCM), from the switch, indicate the position selected by the transmission manual shaft. The input voltage at the TCM is high when the switch is open and low when the switch is closed to ground. The state of each input is displayed on the scan tool as the internal mode switch A/B/C/P parameter. The internal mode switch input parameters represented are transmission range Signal A, Signal B, Signal C, and Signal P.

The park/neutral position switch is integrated into the transmission internal mode switch. The circuit uses the TCM as a pass-through connector only.

The park/neutral signal is sent from the park/neutral switch directly to the engine control module (ECM) and is used for engine start enable.

Conditions for Running the DTC

P182E

- DTC P0101, P0102, P0103, P0106, P0107, P0108, P0171, P0172, P0174, P0175, P0201, P0202, P0203, P0204, P0205, P0206, P0207, P0208, P0300, P0301, P0302, P0303, P0304, P0305, P0306, P0307, P0308, P0401, P042E, P0716, P0717, P0722, or P0723 is not set.
- Engine speed is 400-7500 RPM for 5 s.
- Ignition voltage is 8.6-32 V.
- Engine torque signal is valid.

P1915

- DTC P0722, P0723, or P1915 is not set.

- Transmission output shaft speed is 90 RPM or less.
- Ignition voltage was 5 V or greater, and has not dropped below 2 V.

Conditions for Setting the DTC

P182E

Internal mode switch does not indicate a valid Park, Reverse, Neutral or Drive Range gear position for 7 s.

P1915

Internal mode switch does not indicate Park or Neutral during the following sequence:

- Engine speed is 50 RPM or less for 0.25 s or greater.
- Engine speed is 50-480 RPM for 0.07 s or greater.
- Engine speed is 525 RPM or greater and the transmission input speed is 200 RPM or greater for 1.25 s.

Action Taken When the DTC Sets

- DTCs P182E and P1915 are Type A DTCs.
- TCM commands maximum line pressure.
- TCM forces the torque converter clutch (TCC) OFF.
- TCM turns all the solenoids OFF.
- TCM freezes transmission adaptive functions.
- TCM limits the transmission to Reverse and 5th gear operation.
- Torque management is enabled.
- TCM turns the high side driver OFF.
- TCM inhibits Tap Up/Down function.
- TCM inhibits manual shifting of forward gears.

Conditions for Clearing the DTC

DTCs P182E and P1915 are Type A DTCs.

Diagnostic Aids

Under certain driving conditions, DTC P182E could set due to an intermittent low voltage fault on the park/neutral signal circuit, before conditions for setting DTC P0851 are met. Reference Information

Circuit/System Verification

1. Verify the range selector lever cable is adjusted correctly. Refer to **Range Selector Lever Cable Adjustment** .
    - **If cable adjustment is not correct**

      Repair as necessary.

    - **If cable adjustment is correct**
2. Ignition ON.
3. Verify the scan tool transmission control module Internal Mode Switch A/B/C/P parameter matches the **Transmission Internal Mode Switch Logic** table for each gear shift lever position.
    - **If the parameter does not match**

      Refer to Circuit/System Testing.

    - **If the parameter matches**
4. Verify the scan tool engine control module Park/Neutral Position Switch parameter displays Park/Neutral with the gear shift lever in Park or Neutral and In Gear when in Reverser or Drive.

- **If Park/Neutral or In Gear is not displayed**

  Refer to Circuit/System Testing.

- **If Park/Neutral and In Gear is displayed**

5. Operate the vehicle within the Conditions for Running the DTC. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/Failure Records data.
6. Verify the DTC does not set.
   - **If the DTC sets**

     Refer to Circuit/System Testing.

   - **If the DTC does not set**
7. All OK.

Circuit/System Testing

NOTE:

- **You must perform Circuit/System Verification first.**

1. Ignition OFF, remove the control valve body cover.
2. Connect the vehicle harness connector to the Q8 Control Solenoid Valve Assembly.
3. Disconnect the B15 Transmission Internal Mode Switch connector at the Q8 Control Solenoid Valve Assembly.
4. Ignition ON.
5. Verify the scan tool transmission control module Internal Mode Switch A/B/C/P parameter displays High High High High.
   - **If High High High High is not displayed**

     Replace the Q8 control solenoid valve assembly.

   - **If High High High High is displayed**
6. Verify the scan tool engine control module Park/Neutral Position Switch parameter displays In Gear.
   - **If In Gear is not displayed**
   1. Ignition OFF, disconnect the harness connector at the K20 Engine Control Module.
   2. Test for infinite resistance between the neutral start signal circuit and ground at the vehicle harness K20 Engine Control Module connector.
   - If less than infinite resistance, repair the short to ground on the circuit
   - If infinite resistance, replace the K20 Engine Control Module
   - **If In Gear is displayed**
7. Install a 3 A fused jumper wire between the low reference circuit terminal A and each signal circuit listed below one at a time at the Q8 Control Solenoid Valve Assembly.
   - Signal A - terminal E
   - Signal B - terminal D
   - Signal C - terminal C

- Signal P - terminal B

8. Verify the scan tool TCM A/B/C/P displays 1 Low and 3 High when a signal circuit is grounded.
   - **If 1 Low and 3 High is not displayed**

     Replace the Q8 control solenoid valve assembly.

   - **If 1 Low and 3 High is displayed**
9. Connect a 3 A fused jumper wire between park/neutral switch signal circuit terminal F and low reference circuit terminal A at the Q8 Control Solenoid Valve Assembly.
10. Verify the scan tool engine control module Park/Neutral Position Switch parameter displays Park/Neutral.
    - **If Park/Neutral is not displayed**
    1. Ignition OFF, disconnect the connector at the K20 Engine Control Module.
    2. Test for less than 2 Ω in the signal circuit end to end
    - If 2 Ω or greater, repair the open/high resistance in the circuit
    - If less than 2 Ω, replace the K20 Engine Control Module
    - **If Park/Neutral is displayed**
11. Replace the B15 Transmission Internal Mode Switch.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repairs.

- Perform the **Reset Transmission Adapts** following all transmission repairs.
- **Control Valve Body Cover Replacement**
- **Control Solenoid Valve and Transmission Control Module Assembly Replacement**
- **Manual Shift Detent Lever with Shaft Position Switch Assembly Replacement**
- **Range Selector Lever Cable Adjustment**
- **Control Module References** for ECM or control solenoid valve assembly replacement, programming, and setup.

DTC P2714 OR P2715: PRESSURE CONTROL SOLENOID VALVE 4 STUCK

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptors

NOTE: **The DTCs listed below set due to a transmission hydraulic/mechanical condition. Perform the Circuit/System Verification and Circuit/System Testing to identify the cause.**

DTC P2714

Pressure Control Solenoid Valve 4 Stuck Off - Transmission Hydraulic/Mechanical Performance

DTC P2715

Pressure Control Solenoid Valve 4 Stuck On - Transmission Hydraulic/Mechanical Performance

Circuit/System Description

The clutch pressure control (PC) solenoid 4 is part of the control solenoid valve assembly which has no serviceable components. The PC solenoid 4 regulates transmission fluid pressure to the 2-6 clutch regulator valve which controls pressure to the 2-6 clutch. The transmission control module (TCM) calculates gear ratio based on the RPM signals from the input speed sensor (ISS) and the output speed sensor (OSS). The TCM compares the expected transmission gear ratio to the calculated gear ratio for each commanded gear.

Conditions for Running the DTC

P2714

- DTC P0101, P0102, P0103, P0106, P0107, P0108, P0171, P0172, P0174, P0175, P0201, P0202, P0203, P0204, P0205, P0206, P0207, P0208, P0300, P0301, P0302, P0303, P0304, P0305, P0306, P0307, P0308, P0401, P042E, P0716, P0717, P0722, P0723, or P182E is not set.
- Ignition voltage is 8.6 volts or greater.
- Output speed is 36 RPM or greater, or throttle position is 0.5 percent or greater.
- Throttle position signal is valid.
- Engine speed is 400 RPM or greater for 5 seconds.
- Transmission fluid temperature is -7Â°C (19Â°F) or greater.
- High side driver (HSD) is enabled.

P2715

- DTC P0101, P0102, P0103, P0106, P0107, P0108, P0171, P0172, P0174, P0175, P0201, P0202, P0203, P0204, P0205, P0206, P0207, P0208, P0300, P0301, P0302, P0303, P0304, P0305, P0306, P0307, P0308, P0401, P042E, P0716, P0717, P0722, P0723, or P182E is not set.
- Ignition voltage is 8.6 volts or greater.
- HSD is enabled.
- Transmission fluid temperature is -7Â°C (19Â°F) or greater.
- Engine speed is 400 RPM or greater for 5 seconds.
- Transmission output shaft speed is 36 RPM or greater, or the throttle position is 0.5 percent or greater.
- Commanded and attained range is not 1st gear.

Conditions for Setting the DTC

P2714

TCM has detected an incorrect gear ratio or neutral condition when the 2-6 clutch is commanded ON. This condition must occur 3 times.

P2715

TCM has detected an incorrect gear ratio change when the 2-6 clutch is commanded OFF during a shift or, when 2nd gear ratio is detected in 1st gear. This condition must occur 3 times.

Action Taken When the DTC Sets

P2714

- DTC P2714 is a Type A DTC.
- TCM commands maximum line pressure.
- TCM inhibits Tap Up/Down function.
- TCM inhibits manual shifting of forward gears.
- TCM freezes transmission adaptive functions.
- TCM limits the transmission to Reverse and 3rd gear operation.

P2715

- DTC P2715 is a Type A DTC.
- TCM commands maximum line pressure.
- TCM inhibits Tap Up/Down function.
- TCM inhibits manual shifting of forward gears.
- TCM freezes transmission adaptive functions.
- TCM limits the transmission to Reverse and 2nd gear operation.

Conditions for Clearing the DIC/DTC

DTCs P2714 and P2715 are Type A DTCs.

Circuit/System Verification

WARNING: Refer to Parking Brake and Drive Wheels Warning .

NOTE: If other DTCs are set, diagnose those DTCs first.

1. Engine idling in Park, with parking brake applied and drive wheels chocked.
2. Verify correct transmission fluid level and condition. Refer to **Transmission Fluid Level and Condition Check**.
3. Verify with a scan tool the Transmission Fluid Pressure Switch 3 parameter values are correct for the Park, Reverse, and Neutral gear selector positions. Refer to **Transmission Fluid Pressure Switch Logic** .
   - **If not the correct values for TFP switch 3**

     Refer to Circuit/System Testing below.

   - **If TFP switch 3 values are correct**
4. Place the gear select lever in Drive range. Verify the Transmission Fluid Pressure Switch 3 parameter states are correct for all forward ranges when commanded with a scan tool. Refer to **Transmission Fluid Pressure Switch Logic** .
   - **If not the correct values for TFP switch 3**

     Refer to Circuit/System Testing below.

   - **If TFP switch 3 values are correct**
5. Ignition ON, clear the TCM DTCs
6. Perform the **Road Test**. Verify the transmission operation performs as indicated in the road test instructions and DTC P2714 or P2715 did not set.
   - **If DTC P2714 or P2715 sets**

     Refer to Circuit/System Testing below.

   - **If DTC P2714 or P2715 did not set**
7. After performing the above steps, verify that the DTC does not reset by operating the vehicle within the Conditions for Running the DTC. You may also operate the vehicle within the conditions you observe from the Freeze Frame/Failure Records data. If the vehicle passes the Circuit/System Verification procedure, then STOP. Do not perform the Circuit/System Testing or Component Testing as this may result in an unnecessary part replacement. Refer to **Testing for Intermittent Conditions and Poor Connections** .

Circuit/System Testing

NOTE: You must perform the Circuit/System Verification first.

1. Verify the transmission line pressures are within the ranges specified in the Line PC Solenoid Valve

Pressure table. Refer to **Line Pressure Check**, and **Solenoid Valve Pressure** .

- **If line pressures are not within the specified ranges**

  Refer to **Fluid Pressure High or Low**.

- **If line pressures are within the specified ranges**

2. Ignition OFF, remove the Q8 control solenoid valve assembly. Refer to **Control Solenoid Valve and Transmission Control Module Assembly Replacement** .
3. Perform the **Control Solenoid Valve and Transmission Control Module Assembly Solenoid Performance Test**. Test all solenoids on the Q8 control solenoid valve assembly. A pressure change should occur for each solenoid valve.
   - **If a pressure change does not occur for each solenoid**

     Replace the Q8 control solenoid valve assembly.

   - **If a pressure change occurs for each solenoid**
4. Verify the conditions listed below do not exist. Repair or replace as necessary.

P2714 or P2715 Control Valve Upper Body Assembly

2-6 clutch regulator valve stuck/sticking - debris, binding, damaged valve, or scored bore.

P2714 Lower Control Valve Body Assembly

Actuator feed limit circuit supply fluid to solenoid restricted or not available - debris or sediment blockage.

P2714 or P2715 Channel Plate and Spacer Plate

Oil channels or orifices blocked by debris.

P2714 or P2715 Control Solenoid Valve Assembly

- Clutch pressure control solenoid 4 stuck ON or stuck OFF.
- Control signal fluid supply leak - valve body filter plate assembly cracked or damaged gasket seal.
- Clutch pressure control solenoid 2 stuck OFF.

P2714 or P2715 Automatic Transmission Case Cover

- 2-6 clutch return spring retaining ring not seated in groove.
- 2-6 clutch piston assembly seal damaged or leaking.
- 2-6 clutch plates worn or damaged.

P2714 1-2-3-4 Clutch Plate Assembly

- 1-2-3-4 clutch backing plate retaining ring not seated/oriented correctly.
- 1-2-3-4 clutch piston seals damaged or leaking.
- 1-2-3-4 clutch piston cracked or damaged.

P2714 Automatic Transmission Fluid Pump Assembly

- Fluid pump housing/vanes/rotor/slide damaged/scored.
- A/Trans pump fluid outlet seal assembly damaged/leaking.

P2714 Automatic Transmission Fluid Filter Assembly

Oil filter or filter seal loose or damaged.

Repair Instructions

NOTE:

- **Perform the Reset Transmission Adapts following all transmission related repairs.**
- **Before replacing the TCM, perform the Control Solenoid Valve and Transmission Control Module Assembly Inspection.**

Perform the **Diagnostic Repair Verification** after completing the diagnostic procedure.

- **Control Valve Lower Body and Upper Body Replacement**
- **Low and Reverse Clutch and 1-2-3-4 Clutch Plate Removal**
- **Control Module References** for control solenoid valve assembly replacement, setup, and programming

DTC P2719-P2721: PRESSURE CONTROL SOLENOID VALVE 4

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptors

DTC P2719

Pressure Control Solenoid Valve 4 Performance

DTC P2720

Pressure Control Solenoid Valve 4 Control Circuit Low Voltage

DTC P2721

Pressure Control Solenoid Valve 4 Control Circuit High Voltage

Circuit/System Description

Pressure control solenoid 4 is part of the control solenoid valve assembly which has no serviceable components. The normally low pressure control solenoid 4 regulates and directs oil pressure to the 2-6 clutch regulator valve. Increasing pressure control solenoid 4 pressure increases pressure to the 2-6 clutch. The transmission control

module (TCM) varies current to the pressure control solenoid 4 by controlling the amount of time the low side driver is ON and OFF. Increasing the ON time increases current to the clutch pressure control solenoid 4. Increasing current to pressure control solenoid 4 increases oil pressure by closing off the solenoid exhaust port. Decreasing the current to the pressure control solenoid 4 decreases oil pressure by opening the exhaust port. Pressure control solenoid 4 power is supplied by the TCM through a high side driver. The high side driver protects the circuit and components from excessive current flow. If excessive current flow is detected, the high side driver will turn OFF. When the fault is corrected, the high side driver will reset.

Conditions for Running the DTC

- Engine speed is 400-7,500 RPM for 5 s.
- Ignition voltage is 8.6-32 V.

Conditions for Setting the DTC

P2719

TCM detects an internal electrical performance malfunction on the clutch pressure control 4 control circuit where the measured pressure control solenoid 4 current does not equal the commanded clutch pressure control solenoid 4 current for 5 s.

P2720

TCM detects a short to ground on the clutch pressure control solenoid 4 control circuit for 1 s.

P2721

TCM detects an open or short to voltage on the clutch pressure control solenoid 4 control circuit for 1 s.

Action Taken When the DTC Sets

P2719

- DTC P2719 is a Type C DTC.
- TCM freezes transmission adaptive functions on the 2-6 clutch.

P2720

- DTC P2720 is a Type A DTC.
- TCM commands maximum line pressure.
- TCM freezes transmission adaptive functions.
- TCM inhibits Tap Up/Down function.
- TCM inhibits manual shifting of forward gears.
- TCM commands 2nd gear if the transmission is in a forward gear and the output speed is less than 1350 RPM, or neutral if the output speed is 1,350 RPM or greater.

P2721

- DTC P2721 is a Type A DTC.

- TCM commands maximum line pressure.
- TCM freezes transmission adaptive functions.
- TCM inhibits Tap Up/Down function.
- TCM inhibits manual shifting of forward gears.
- TCM limits the transmission to Reverse and 3rd gear operation.

Conditions for Clearing the DTC

- DTC P2719 is a Type C DTC.
- DTCs P2720 and P2721 are Type A DTCs.

Special Tools

DT-47825-20 Adapter Harness

For equivalent regional tools, refer to **Special Tools** .

Circuit/System Verification

1. Operate the vehicle in second gear long enough to ensure at least a 3Â°C (5Â°F) rise in TCM temperature, then operate the vehicle in Park for 5 s.
2. Operate the vehicle in Drive range. Allow the transmission to shift through all forward gear ranges.
3. Verify the scan tool parameters listed below do not display Malfunction:
   - Pressure Control Solenoid Valve 4 Performance Test Status
   - Pressure Control Solenoid Valve 4 Control Circuit Low Voltage Test Status
   - Pressure Control Solenoid Valve 4 Control Circuit High Voltage Test Status
   - **If Malfunction is displayed**

     Refer to Circuit/System Testing.

   - **If Malfunction is displayed**
4. Operate the vehicle within the Conditions for Running the DTC. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/Failure Records data.
5. Verify the DTC does not set.
   - **If the DTC sets**

     Refer to Circuit/System Testing

   - **If the DTC does not set**
6. All OK.

Circuit/System Testing

NOTE: **You must perform the Circuit/System Verification first.**

1. Ignition OFF, remove the Q8 Control Solenoid Valve Assembly.
2. Verify the Q8 Control Solenoid Valve Assembly is not contaminated with any debris and clean as necessary. Refer to **Control Solenoid Valve and Transmission Control Module Assembly Inspection**.
   - **If contaminated**

     Repair as necessary.

   - **If not contaminated**
3. Verify the resistance is within the specified range for each solenoid listed in the **Control Solenoid Valve and Transmission Control Module Assembly Inspection**.
   - **If the resistance is not within range**

     Replace the Q8 Control Solenoid Valve Assembly

   - **If the resistance is within range.**
4. Place the Q8 Control Solenoid Valve Assembly on a clean work surface near the transmission assembly.
5. Connect the **DT-47825-20** adapter harness between the vehicle harness connector, and the Q8 Control Solenoid Valve Assembly connector. Ignition ON.

6. Verify the scan tool parameters listed below do not display Malfunction:
    - Pressure Control Solenoid Valve 4 Performance Test Status
    - Pressure Control Solenoid Valve 4 Control Circuit Low Voltage Test Status
    - Pressure Control Solenoid Valve 4 Control Circuit High Voltage Test Status
    - **If Malfunction is displayed**

      Replace the Q8 Control Solenoid Valve Assembly.

    - **If Malfunction is not displayed**
7. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repairs.

- Perform the **Reset Transmission Adapts** following all transmission repairs.
- **Control Module References** for control solenoid valve assembly replacement, programming, and setup.

DTC P2723 OR P2724: PRESSURE CONTROL SOLENOID VALVE 5 STUCK

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptors

NOTE: **The DTCs listed below set due to a transmission hydraulic/mechanical condition. Perform the Circuit/System Verification and Circuit/System Testing to identify the cause.**

DTC P2723

Pressure Control Solenoid Valve 5 Stuck Off - Transmission Hydraulic/Mechanical Performance

DTC P2724

Pressure Control Solenoid Valve 5 Stuck On - Transmission Hydraulic/Mechanical Performance

Circuit/System Description

The clutch pressure control (PC) solenoid 5 is part of the control solenoid valve assembly which has no serviceable components. The clutch PC solenoid 5 regulates the transmission fluid pressure (TFP) to the 1-2-3-4 clutch regulator valve, which controls pressure to the 1-2-3-4 clutch. The transmission control module (TCM) calculates gear ratio based on the RPM signals from the input speed sensor (ISS) and the output speed sensor (OSS). The TCM compares the expected transmission gear ratio to the calculated gear ratio for each commanded gear.

Conditions for Running the DTC

P2723

- DTC P0101, P0102, P0103, P0106, P0107, P0108, P0171, P0172, P0174, P0175, P0201, P0202, P0203, P0204, P0205, P0206, P0207, P0208, P0300, P0301, P0302, P0303, P0304, P0305, P0306, P0307, P0308, P0401, P042E, P0716, P0717, P0722, P0723, or P182E is not set.
- Ignition voltage is 8.6 volts or greater.
- High side driver (HSD) is enabled.
- Output speed is 36 RPM or greater, or the throttle position is 0.5 percent or greater.
- Throttle position signal is valid.
- Engine speed is 400 RPM or greater for 5 seconds.
- Transmission fluid temperature (TFT) is -7Â°C (19Â°F) or greater.

P2724

- DTC P0101, P0102, P0103, P0106, P0107, P0108, P0171, P0172, P0174, P0175, P0201, P0202, P0203, P0204, P0205, P0206, P0207, P0208, P0300, P0301, P0302, P0303, P0304, P0305, P0306, P0307, P0308, P0401, P042E, P0716, P0717, P0722, P0723, or P182E is not set.
- Ignition voltage is 8.6 volts or greater.
- HSD is enabled.
- TFT is -7Â°C (19Â°F) or greater.
- Output speed is 36 RPM or greater, or the throttle position is 0.5 percent or greater.
- Engine speed is 400 RPM or greater for 5 seconds.

Conditions for Setting the DTC

P2723

TCM has detected an incorrect gear ratio or neutral condition when the 1-2-3-4 clutch is commanded ON. This condition must occur 3 times.

P2724

TCM has detected an incorrect gear ratio change when the 1-2-3-4 clutch is commanded OFF during a shift. This condition must occur 3 times.

Action Taken When the DTC Sets

P2723

- DTC P2723 is a Type A DTC.
- TCM freezes transmission adaptive functions.
- TCM commands maximum line pressure.
- TCM inhibits Tap Up/Down function.
- TCM inhibits manual shifting of forward gears.
- Torque management is enabled.
- TCM limits the transmission to Reverse and fifth gear operation.

P2724

- DTC P2724 is a Type A DTC.
- TCM freezes transmission adaptive functions.
- TCM commands maximum line pressure.
- TCM inhibits Tap Up/Down function.
- TCM inhibits manual shifting of forward gears.
- TCM limits the transmission to Reverse, first, or third gear operation.

Conditions for Clearing the DIC/DTC

DTCs P2723 and P2724 are Type A DTCs.

Diagnostic Aids

Before performing a road test, configure and setup the scan tool for snapshot mode. This will allow you to display, monitor, and verify multiple transmission data parameters at one time, after the road test.

Circuit/System Verification

WARNING: **Refer to Parking Brake and Drive Wheels Warning .**

NOTE: **If other DTCs are set, diagnose those DTCs first.**

1. Engine idling in Park, with parking brake applied and drive wheels chocked.
2. Verify correct transmission fluid level and condition. Refer to **Transmission Fluid Level and Condition Check**.
3. Verify with a scan tool the Transmission Fluid Pressure Switch 4 parameter values are correct for the Park, Reverse, and Neutral gear selector positions. Refer to **Transmission Fluid Pressure Switch Logic** .
    - **If not the correct values for TFP switch 4**

      Refer to Circuit/System below.

    - **If TFP switch 4 values are correct**
4. Gear select lever in Drive range. Verify the Transmission Fluid Pressure Switch 4 parameter states are correct for all forward ranges when commanded with a scan too. Refer to **Transmission Fluid Pressure Switch Logic** .
    - **If not the correct values for TFP switch 4**

      Refer to Circuit/system below.

    - **If TFP switch 4 values are correct**
5. Ignition ON, clear the DTCs from the TCM
6. Perform the **Road Test**. Verify the transmission operation performs as indicated in the road test instructions and DTC P2723 or P2724 did not set.
    - **If DTC P2723 or P2724 sets**

      Refer to Circuit/System below.

    - **If DTC P2723 or P2724 did not set**
7. After performing the above steps, verify that the DTC does not reset by operating the vehicle within the Conditions for Running the DTC. You may also operate the vehicle within the conditions you observe from the Freeze Frame/Failure Records data. If the vehicle passes the Circuit/System Verification procedure, then STOP. Do not perform the Circuit/System Testing or Component Testing as this may result in an unnecessary part replacement. Refer to **Testing for Intermittent Conditions and Poor Connections** .

Circuit/System Testing

1. Verify the transmission line pressures are within the ranges specified in the Line PC Solenoid Valve Pressure table. Refer to **Line Pressure Check**, and **Solenoid Valve Pressure** .
    - **If line pressures are not within the specified ranges**

      Refer to **Fluid Pressure High or Low**.

    - **If line pressures are within the specified ranges**
2. Ignition OFF, remove the Q8 control solenoid valve assembly. Refer to **Control Solenoid Valve and Transmission Control Module Assembly Replacement** .
3. Perform the **Control Solenoid Valve and Transmission Control Module Assembly Solenoid Performance Test**. Test all solenoids on the Q8 control solenoid valve assembly. A pressure change should occur for each solenoid valve.

- **If a pressure change does not occur for each solenoid**

  Replace the Q8 control solenoid valve assembly.

- **If a pressure change occurs for each solenoid**

4. Verify the conditions listed below do not exist. Repair or replace as necessary.

DTC P2723 Control Valve Upper Body Assembly

Manual shift detent (w/shaft position switch) lever assembly not engaged with manual shaft.

DTC P2723 Control Valve Upper Body Assembly

Clutch select valve 3 stuck OFF from debris, binding, damaged valve, or scored bore.

DTC P2723 or P2724 Lower Control Valve Body Assembly

- Actuator feed limit circuit supply fluid to solenoid restricted or not available from debris or sediment blockage.
- 1-2-3-4 clutch boost valve binding or scored bore which can also cause harsh shifts.
- 1-2-3-4 clutch regulator valve stuck/sticking from debris, binding, damaged valve, or scored bore.

DTC P2723 or P2724 Control Solenoid Valve Assembly

- Clutch pressure control solenoid 5 stuck ON or stuck OFF.
- Clutch pressure control solenoid 2 stuck OFF.
- Control solenoid filter plate assembly blocked, or damaged gasket seal.

DTC P2723 Channel Plate and Spacer Plate

Channel plate and spacer plate oil channels or orifices blocked by debris.

DTC P2723 1-2-3-4 Clutch Assembly

- 1-2-3-4 clutch piston cracked/damaged/leaking.
- 1-2-3-4 clutch backing plate retaining ring not seated/oriented, causing clutch pack/piston over travel.

DTC P2723 Low and Reverse Clutch Assembly

- Low and reverse clutch assembly will not hold torque.
- Low and reverse clutch assembly friction plate support face cracked/damaged.

DTC P2723 Automatic Transmission Case

Transmission case 1-2-3-4 clutch fluid passage seal damaged/leaking.

DTC P2723 Automatic Transmission Fluid Pump

- Fluid pump housing vanes/rotor/slide damaged/scored.
- Fluid pump outlet seal assembly damaged/leaking.

DTC P2723 Torque Converter Assembly

Fluid pump or torque converter overstressed due to high temperatures.

DTC P2723 Automatic Transmission Fluid Filter Assembly

Oil filter or filter seal loose or damaged.

DTC P2723 Reaction Sun Gear Assembly

- Reaction sun gear broke away from shell.
- Input sun gear missing or broken.

Repair Instructions

NOTE:

- **Perform the Reset Transmission Adapts following all transmission related repairs.**
- **Before replacing the TCM, perform the Control Solenoid Valve and Transmission Control Module Assembly Inspection.**

Perform the **Diagnostic Repair Verification** after completing the diagnostic procedure.

- **Control Valve Lower Body and Upper Body Replacement**
- **Low and Reverse Clutch and 1-2-3-4 Clutch Plate Removal**
- **Control Module References** for control solenoid valve assembly replacement, setup, and programming

DTC P2728-P2730: PRESSURE CONTROL SOLENOID VALVE 5

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

Pressure Control Solenoid Valve 5 Performance

DTC P2729

Pressure Control Solenoid Valve 5 Control Circuit Low Voltage

DTC P2730

Pressure Control Solenoid Valve 5 Control Circuit High Voltage

Circuit/System Description

Pressure solenoid 5 is part of the control solenoid valve assembly which has no serviceable components. The normally low pressure control solenoid 5 regulates and directs oil pressure to the 1-2-3-4 clutch regulator valve. Increasing pressure control solenoid 5 pressure increases pressure to the 1-2-3-4 clutch. The transmission control module (TCM) varies the current to the pressure control solenoid 5 by controlling the amount of time the low side driver is ON and OFF. Decreasing the current to pressure control solenoid 5 decreases pressure control solenoid 5 oil pressure by opening the solenoid exhaust port. Increasing the current to pressure control solenoid 5 increases pressure control solenoid 5 oil pressure by closing OFF the solenoid exhaust port. Pressure control solenoid 5 power is supplied by the TCM through a high side driver. The high side driver protects the circuit and components from excessive current flow. If excessive current flow is detected, the high side driver will turn OFF. When the fault is corrected, the high side driver will reset.

Conditions for Running the DTC

- Engine speed is 400-7,500 RPM for 5 s.
- Ignition voltage is 8.6-32 V.

Conditions for Setting the DTC

P2728

TCM detects an internal electrical performance malfunction of the pressure control solenoid 5 control circuit where the measured pressure control solenoid 5 current does not equal the commanded pressure control solenoid 5 current for 5 s.

P2729

TCM detects a short to ground on the pressure control solenoid 5 control circuit for 1 s.

P2730

TCM detects an open or short to voltage on the pressure control solenoid 5 control circuit for 1 s.

Action Taken When the DTC Sets

P2728

- DTC P2728 is a Type C DTC.
- TCM freezes transmission adaptive functions on the 1-2-3-4 clutch.

P2729

- DTC P2729 is a Type A DTC.
- TCM commands maximum line pressure.
- TCM freezes transmission adaptive functions.
- TCM inhibits Tap Up/Down function.
- TCM inhibits manual shifting of forward gears.
- TCM limits the transmission to Reverse, 1st and 3rd gear operation.

P2730

- DTC P2730 is a Type A DTC.
- TCM inhibits the TCC.
- TCM forces the high side driver OFF.
- TCM commands maximum line pressure.
- TCM freezes transmission adaptive functions.
- TCM inhibits Tap Up/Down function.
- TCM inhibits manual shifting of forward gears.
- Torque management in enabled.
- TCM limits the transmission to Reverse and 3rd or 5th gear operation.

Conditions for Clearing the DTC

- DTC P2728 is a Type C DTC.
- DTCs P2729 and P2730 are Type A DTCs.

Circuit/System Verification

1. Operate the vehicle in second gear long enough to ensure at least a 3Â°C (5Â°F) rise in TCM temperature.
2. Operate the vehicle in Drive range. Allow the transmission to shift through all forward gear ranges.
3. Verify the scan tool parameters listed below do not display Malfunction:
   - Pressure Control Solenoid Valve 5 Performance Test Status
   - Pressure Control Solenoid Valve 5 Control Circuit Low Voltage Test Status
   - Pressure Control Solenoid Valve 5 Control Circuit High Voltage Test Status
   - **If Malfunction is displayed**

     Refer to Circuit/System Testing.

   - **If Malfunction is not displayed**
4. Operate the vehicle within the Conditions for Running the DTC. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/Failure Records data.
5. Verify the DTC does not set.
   - **If the DTC sets**

     Refer to Circuit/System Testing.

   - **If the DTC does not set**
6. All OK.

Circuit/System Testing

NOTE: **You must perform the Circuit/System Verification first.**

1. Ignition OFF, remove the Q8 Control Solenoid Valve Assembly.
2. Verify the Q8 Control Solenoid Valve Assembly is not contaminated with any debris and clean as necessary. Refer to **Control Solenoid Valve and Transmission Control Module Assembly Inspection**.
   - **If contaminated**

     Repair as necessary.

   - **If not contaminated**
3. Verify the resistance is within the specified range for each solenoid listed in the **Control Solenoid Valve and Transmission Control Module Assembly Inspection**.
   - **If the resistance is not within range**

     Replace the Q8 Control Solenoid Valve Assembly.

- **If the resistance is within range**

4. Place the Q8 Control Solenoid Valve Assembly on a clean work surface near the transmission assembly.
5. Connect the **DT-47825-20** adapter harness between the vehicle harness connector, and the Q8 Control Solenoid Valve Assembly connector. Ignition ON.
6. Verify the scan tool parameters listed below do not display Malfunction:
    - Pressure Control Solenoid Valve 5 Performance Test Status
    - Pressure Control Solenoid Valve 5 Control Circuit High Voltage Test Status
    - Pressure Control Solenoid Valve 5 Control Circuit Low Voltage Test Status
    - **If Malfunction is displayed**

      Replace the Q8 Control Solenoid Valve Assembly.

    - **If Malfunction is not displayed**
7. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repairs.

- Perform the **Reset Transmission Adapts** following all transmission repairs.
- **Control Module References** for control solenoid valve assembly replacement, programming, and setup.

DTC P2762, P2763, OR P2764: TORQUE CONVERTER CLUTCH (TCC) PRESSURE CONTROL SOLENOID VALVE

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptors

DTC P2762

Torque Converter Clutch (TCC) Pressure Control Solenoid Valve Performance

DTC P2763

Torque Converter Clutch (TCC) Pressure Control Solenoid Valve Control Circuit High Voltage

DTC P2764

Torque Converter Clutch (TCC) Pressure Control Solenoid Valve Control Circuit Low Voltage

Circuit/System Description

The torque converter clutch (TCC) pressure control solenoid is part of the control solenoid valve assembly which has no serviceable components. The normally low TCC pressure control solenoid regulates oil pressure

to the TCC regulator valve and TCC control valve. Increasing TCC pressure control solenoid oil pressure increases oil pressure to the torque converter to apply the clutch. The transmission control module (TCM) varies the current to the TCC pressure control solenoid by controlling the amount of time the low side driver is ON and OFF. Increasing current to the TCC pressure control solenoid increases oil pressure by closing OFF the solenoid exhaust port. Decreasing current to the TCC pressure control solenoid decreases oil pressure by opening up the solenoid exhaust port. TCC pressure control solenoid power is supplied by the TCM through a high side driver. The high side driver protects the circuit and components from excessive current flow. If excessive current flow is detected, the high side driver will turn OFF. When the fault is corrected, the high side driver will reset.

Conditions for Running the DTC

P2762

- Engine speed is 400-7,500 RPM for 5 s.
- Ignition voltage is 8.6-32 V.

P2763 and P2764

- DTC P0658 or P0659 is not set.
- Engine speed is 400-7,500 RPM for 5 s.
- Ignition voltage is 8.6-32 V.
- High side driver is enabled.

Conditions for Setting the DTC

P2762

TCM detects an internal electrical performance malfunction of the TCC pressure control solenoid control circuit where the measured TCC pressure control solenoid current does not equal the commanded TCC pressure control solenoid for 5 s.

P2763

TCM detects an open/high resistance or short to voltage on the TCC pressure control solenoid control circuit for 5 s.

P2764

TCM detects a short to ground on the TCC pressure control solenoid control circuit for 5 s.

Action Taken When the DTC Sets

P2762

DTC P2762 is a Type C DTC.

P2763

- DTC P2763 is a Type B DTC.

- TCM inhibits 6th gear.
- TCM forces TCC OFF.
- TCM commands the hot mode shift pattern.

P2764

- DTC P2764 is a Type A DTC.
- TCM inhibits TCC.
- TCM freezes transmission adaptive functions.
- TCM commands maximum line pressure.
- TCM inhibits Tap Up/Down function.
- TCM inhibits manual shifting of forward gears.
- TCM limits the transmission to Reverse and 5th gear operation.
- Torque management is enabled.
- TCM commands the high side driver OFF.

Conditions for Clearing the DTC

- DTC P2762 is a Type C DTC.
- DTC P2763 is a Type B DTC.
- DTC P2764 is a Type A DTC.

Circuit/System Verification

1. Operate the vehicle in second gear long enough to ensure at least a 3Â°C (5Â°F) rise in TCM temperature.
2. Operate the vehicle in Drive range and ensure TCC is commanded ON for 1 min.
3. Verify the scan tool parameters listed below do not display Malfunction:
   - TCC Pressure Control Solenoid Valve Control Circuit Status
   - TCC Pressure Control Solenoid Valve Control Circuit Low Voltage Test Status
   - TCC Pressure Control Solenoid Valve Control Circuit High Voltage Test Status
   - **If Malfunction is displayed**

     Refer to Circuit/System Testing.

   - **If Malfunction is not displayed**
4. Operate the vehicle within the Conditions for Running the DTC. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/Failure Records data.
5. Verify the DTC does not set.
   - **If the DTC sets**

     Refer to Circuit/System Testing.

   - **If the DTC does not set**
6. All OK.

Circuit/System Testing

NOTE: **You must perform the Circuit/System Verification first.**

1. Ignition OFF, remove the Q8 Control Solenoid Valve Assembly.
2. Verify the Q8 Control Solenoid Valve Assembly is not contaminated with any debris and clean as necessary. Refer to **Control Solenoid Valve and Transmission Control Module Assembly Inspection**.
   - **If contaminated**

     Repair as necessary.

- **If not contaminated.**

3. Verify the resistance is within the specified range for each solenoid listed in the **Control Solenoid Valve and Transmission Control Module Assembly Inspection**.
    - **If the resistance is not within range**

      Replace the Q8 Control Solenoid Valve Assembly.

    - **If the resistance is within range**
4. Place the Q8 Control Solenoid Valve Assembly on a clean work surface near the transmission assembly.
5. Connect the **DT-47825-20** adapter harness between the vehicle harness connector, and the Q8 Control Solenoid Valve Assembly connector. Ignition ON.
6. Verify the scan tool parameters listed below do not display Malfunction:
    - TCC Pressure Control Solenoid Valve Control Circuit Status
    - TCC Pressure Control Solenoid Valve Control Circuit Low Voltage Test Status
    - TCC Pressure Control Solenoid Valve Control Circuit High Voltage Test Status
    - **If Malfunction is displayed**

      Replace the Q8 Control Solenoid Valve Assembly.

    - **If Malfunction is not displayed**
7. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repairs.

- Perform the **Reset Transmission Adapts** following all transmission repairs.
- **Control Module References** for control solenoid valve assembly replacement, programming, and setup.

SYMPTOMS - AUTOMATIC TRANSMISSION

NOTE: **Use the symptom tables only if the following conditions are met:**

- **Refer to Diagnostic Starting Point - Vehicle .**
- **There are no DTCs set.**
- **The control modules can communicate via the serial data link.**
- **Review the system operation in order to familiarize yourself with the system functions. Refer to Transmission General Description , and Transmission Component and System Description .**

Visual/Physical Inspection

Inspect the easily accessible or visible system components for obvious damage or conditions which could cause the symptom.

Intermittent

Faulty electrical connections or wiring may be the cause of intermittent conditions. Refer to **Testing for Intermittent Conditions and Poor Connections** .

Symptom List

Refer to a symptom diagnostic procedure from the following list in order to diagnose the symptom:

- Fluid Diagnosis
  - **Transmission Fluid Level and Condition Check**
  - **Fluid Pressure High or Low**
  - **Automatic Transmission Fluid Leaks**
  - **Fluid Leak Diagnosis**
- Noise and Vibration Diagnosis
  - **Whine/Growl Noise**
  - **Noise and Vibration Analysis**
  - **Torque Converter Diagnosis**
- Range Performance Diagnosis
  - **No Park**
  - **No Drive in All Ranges**
  - **No Reverse Gear**
- Shift Quality Feel Diagnosis
  - **Harsh Garage Shift**
  - **Harsh or Late First, Second, Third, and Fourth Shift**
  - **Harsh First and Reverse Shift**
  - **Harsh or Late Second and Sixth Shift**
  - **Harsh or Late Third, Fifth, and Reverse Shift**
  - **Harsh Fourth, Fifth, and Sixth Shift**
- Shift Pattern
  - **No First and Reverse Gears**
  - **No First, Second, Third, and Fourth Gear**
  - **No Second and Sixth Gear**
  - **No Fourth, Fifth, and Sixth Gear**
  - **No Third, Fifth, and Reverse Gear**
- Torque Converter Diagnosis
  - **Torque Converter Diagnosis**
  - **No Torque Converter Clutch Apply**
  - **No Torque Converter Clutch Release**
- Symptom Not Found or No Symptom Detected
  - **Transmission Fluid Level and Condition Check**
  - **Road Test**

- Line Pressure Check

CONTROL SOLENOID VALVE AND TRANSMISSION CONTROL MODULE ASSEMBLY INSPECTION

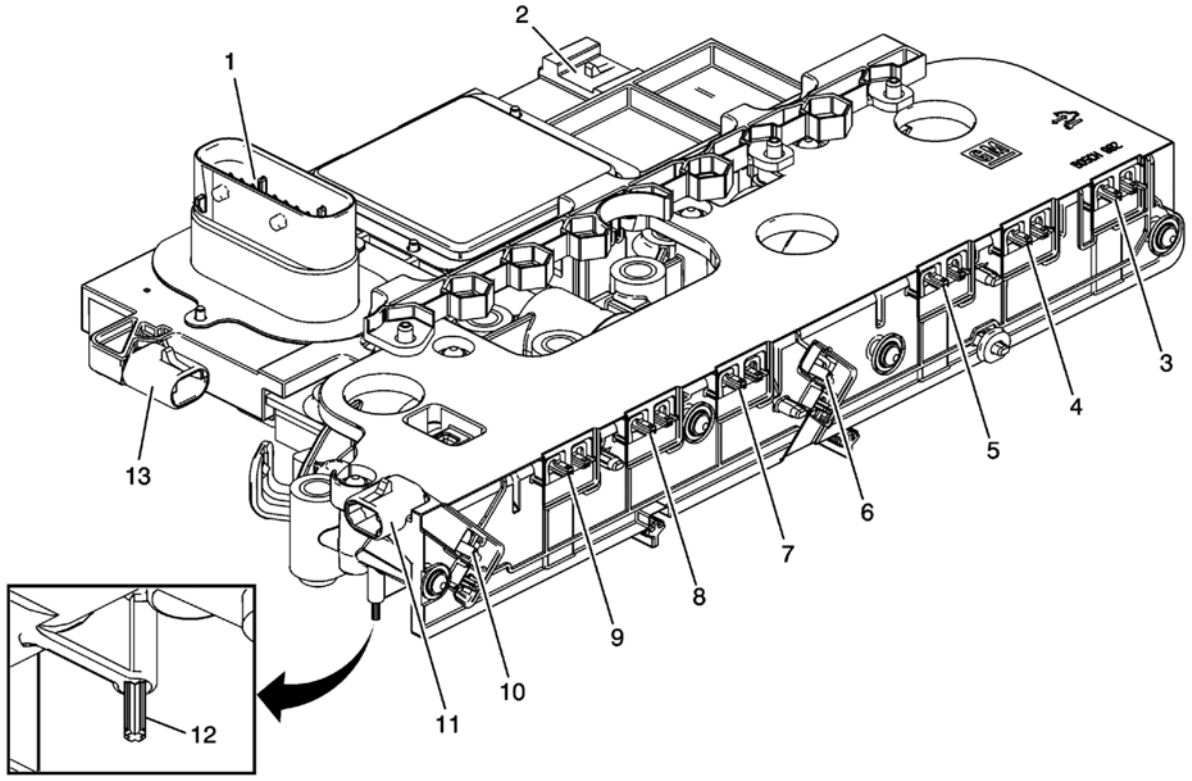

Fig. 1: Identifying Control Solenoid Valve & Transmission Control Module Assembly
Courtesy of GENERAL MOTORS COMPANY

1. Inspect the control solenoid valve assembly connectors and pins (1, 2, 11, 13) for the following conditions:
   - Damage
   - Bent pins
   - Debris
   - Broken retaining tab
   - Contamination
2. Ensure no metallic debris is inside the connectors near the terminal pins.
3. Inspect the control solenoid valve assembly solenoid leads (3) for contamination or metallic debris.
4. Inspect the 4 control solenoid valve assembly filter plate retaining tabs (12) for cracks and ensure proper tension when filter plate is attached.

Solenoid Resistance

Solenoid Name	Illustration Number of Solenoid Lead	Expected Resistance (Ohms)
Line Pressure Control Solenoid	3	4.5-5.2 Ω

Solenoid Name	Illustration Number of Solenoid Lead	Expected Resistance (Ohms)
Pressure Control Solenoid 2 (PCS2)	5	4.5-5.2 Ω
Pressure Control Solenoid 3 (PCS3)	9	4.5-5.2 Ω
Pressure Control Solenoid 4 (PCS4)	4	4.5-5.2 Ω
Pressure Control Solenoid 5 (PCS5)	8	4.5-5.2 Ω
Shift Solenoid 1 (SS1)	10	22-25 Ω
Shift Solenoid 2 (SS2)	6	22-25 Ω
Torque Converter Clutch (TCC) Pressure Control Solenoid	7	4.5-5.2 Ω

CONTROL SOLENOID VALVE AND TRANSMISSION CONTROL MODULE ASSEMBLY INPUT SHAFT SPEED/OUTPUT SHAFT SPEED INPUT TEST

Special Tools

- **EL 35616** GM-Approved Terminal Test Kit
- **EL 38522** Variable Signal Generator

For equivalent regional tools, refer to **Special Tools** .

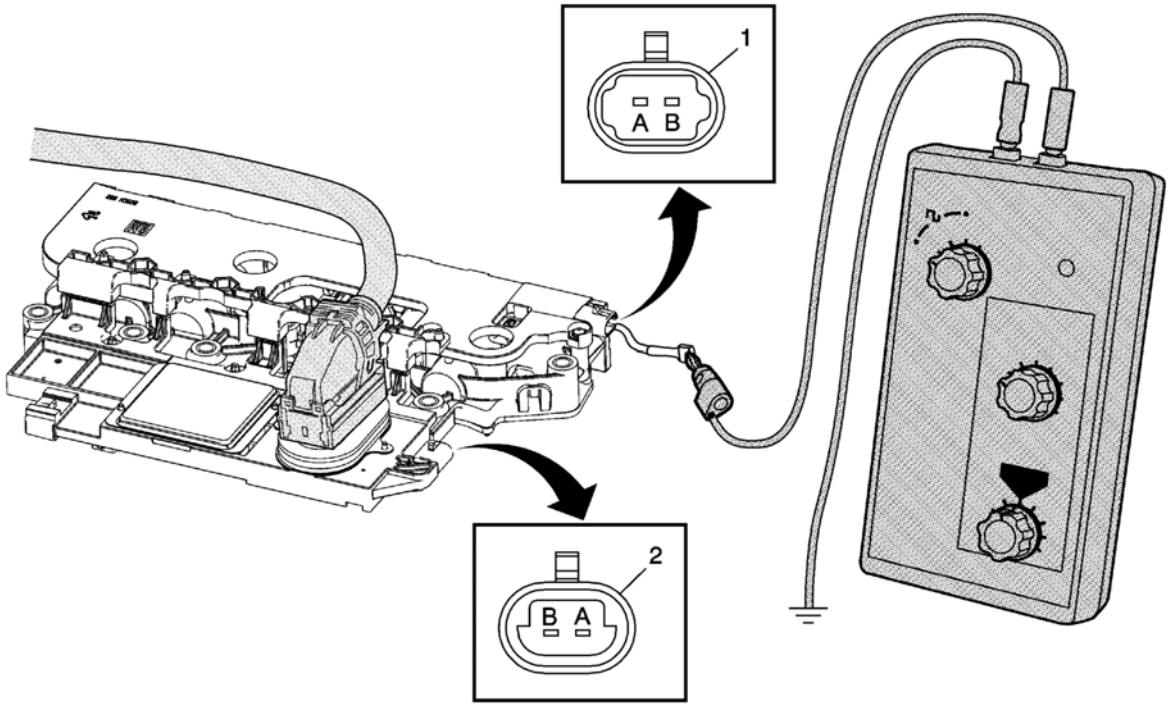

Fig. 2: Identifying Special Tools - J 38522 And J 35616
Courtesy of GENERAL MOTORS COMPANY

The purpose of this test is to provide a simulated input/output speed sensor (ISS/OSS) signal to the control solenoid valve assembly ISS/OSS input circuits.

Transmission Input Speed Sensor

1. Ignition OFF, disconnect the ISS wiring harness connector X3 (1) from the control solenoid valve assembly.
2. Ignition ON, test for 8.3-9.3 volts at terminal A.
    - If not within the specified range, replace the control solenoid valve assembly. Refer to **Control Solenoid Valve and Transmission Control Module Assembly Replacement** .
3. Ignition OFF, using the **EL 35616** terminal test kit , connect the **EL38522** variable signal generator red lead to the ISS signal circuit terminal B on the TCM.
4. Connect the black lead from the **EL 38522** variable signal generator to ground.
5. Set the **EL 38522** variable signal generator to 5 volts, the frequency to 300 Hz, and the percent duty cycle to 50 or the normal position.
6. Ignition ON, verify with a scan tool the Transmission ISS parameter is between 495-505 RPM.

- If not within the specified range, replace the control solenoid valve assembly. Refer to **Control Solenoid Valve and Transmission Control Module Assembly Replacement** .

Transmission Output Speed Sensor

1. Ignition OFF, disconnect the OSS wiring harness connector X4 (2) from the control solenoid valve assembly.
2. Ignition ON, test for 8.3-9.3 volts at terminal A.
    - If not within the specified range, replace the control solenoid valve assembly. Refer to **Control Solenoid Valve and Transmission Control Module Assembly Replacement** .
3. Ignition OFF, using the **EL 35616** terminal test kit , connect the **EL 38522** variable signal generator red lead to the OSS signal circuit terminal B on the TCM.
4. Connect the black lead from the **EL 38522** variable signal generator to ground.
5. Set the **EL 38522** variable signal generator to 5 volts, the frequency to 300 Hz, and the percent duty cycle to 50 or the normal position.
6. Ignition ON, verify with a scan tool the Transmission OSS parameter is between 256-266 RPM.
    - If not within the specified range, replace the control solenoid valve assembly. Refer to **Control Solenoid Valve and Transmission Control Module Assembly Replacement** .

CONTROL SOLENOID VALVE AND TRANSMISSION CONTROL MODULE ASSEMBLY SOLENOID PERFORMANCE TEST

Special Tools

- **DT-47825-100** Solenoid Test Plate
- **DT-47825-20** Adapter Harness

For equivalent regional tools, refer to **Special Tools** .

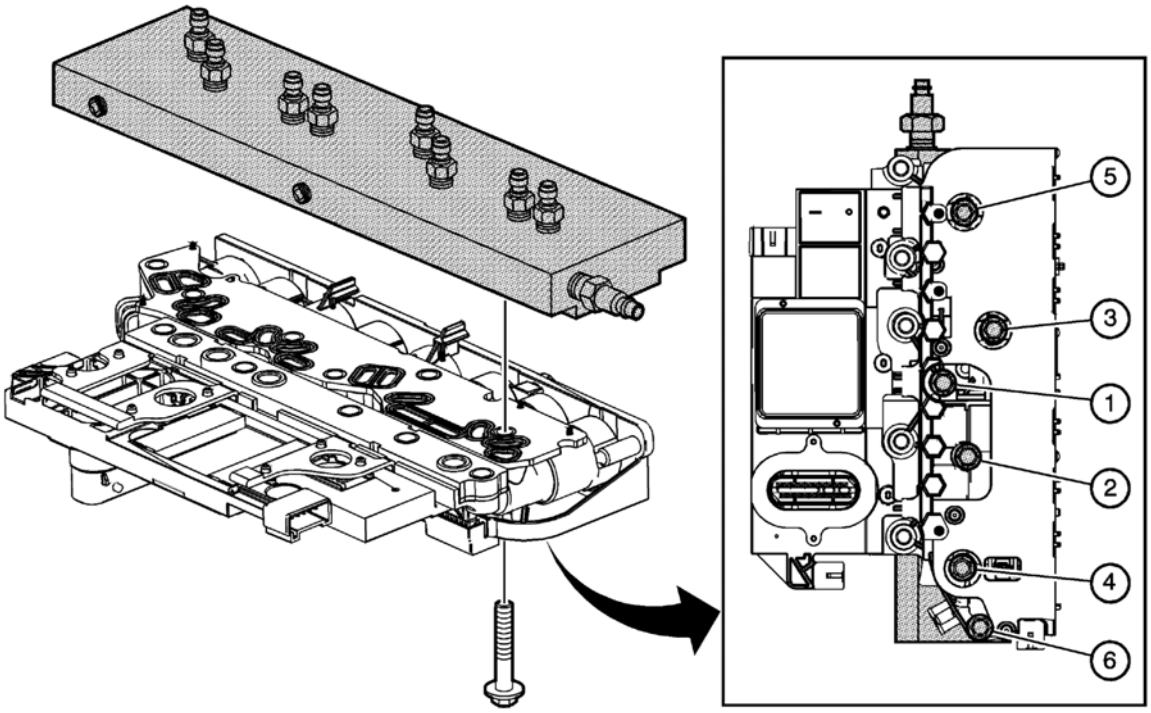

Fig. 3: Identifying Special Tool Bolt Tightening Sequence
Courtesy of GENERAL MOTORS COMPANY

The purpose of this procedure is to test the functionality of the control solenoid valve assembly solenoids for a gross stuck open or stuck closed condition. The **DT-47825-100** test plate is bolted to the control solenoid valve assembly on the valve body mounting surface. Pressurized air is passed into the aluminum test plate, through the control solenoid valve assembly solenoid passage and back to a pressure gauge on the test plate. The pressure gauge indicates open if air pressure is passed through the solenoid, or closed if the solenoid is unable to pass air through. A scan tool is used to command the solenoids ON and OFF. While watching the pressure gauge, one can determine the valve functionality. The recommended shop air pressure for this test is 90-100 psi.

1. Remove the control solenoid valve assembly from the transmission.
2. Bolt the **DT-47825-100** test plate to the control solenoid valve assembly on the valve body mounting surface. Use the bolts and washers supplied with the tool to attach the test plate. Tighten the bolts to 5 N.m (44 lb in) using a center out alternating torque sequence.
3. Install the pressure gauge to the affected solenoid air port. Reference component to air port table.
4. Connect the shop air pressure line to the **DT-47825-100** test plate test plate air psi inlet port.
5. Connect the **DT-47825-20** harness to the vehicle and control solenoid valve assembly.

CAUTION: Do not energize the solenoids for more than two minutes or the solenoids could be damaged.

6. Ignition ON, with a scan tool command the solenoid in question ON and OFF. Watch the air pressure gauge and look for the change in pressure as you command the valve ON and OFF. The valve should allow air pressure to flow through the valve port to the gauge with a result of pressure reading on the gauge. If the valve is stuck closed, no pressure change will occur. Command the solenoid valve ON and OFF several times to determine the state of the solenoid valve in question. Release the air pressure in the

gauge between pressurization tests.

Control Solenoid Valve Assembly Solenoid Performance Test Plate to Component Identification

Component	Port On Test Plate	Commanded State	
		ON	OFF
PC Solenoid 2, 35R	C	Full pressure to gauge	No pressure to gauge
PC Solenoid 3, R1/456	G	Full pressure to gauge	No pressure to gauge
PC Solenoid 4, 2-6	B	Full pressure to gauge	No pressure to gauge
PC Solenoid 5, 1234	F	Full pressure to gauge	No pressure to gauge
Shift Solenoid 1	H	Full pressure to gauge	No pressure to gauge
Shift Solenoid 2	D	Full pressure to gauge	No pressure to gauge
Line Pressure Control Solenoid	A	Command to highest setting, full pressure to gauge	Command to lowest setting, below 620.5 kPa (90 psi) to gauge
TCC PC Solenoid	E	Full pressure to gauge	No pressure to gauge

NOTE: **With the key ON, engine OFF (KOEO), the transmission control module (TCM) will normally cycle some of the transmission solenoids On and Off to facilitate keeping the ports and solenoids clean and free of debris. This dither function is a normal activity and will cause the valves to cycle open and closed quickly when the TCM is powered up. This can cause the psi gauge to flicker high and low as the valves open and close. This may cause some air to exit the ports where the psi gauge is not connected as those solenoids cycle on and off.**

Drain the TCM of excess transmission fluid before attaching to test plate and use caution when attaching air to test plate air inlet.

RESET TRANSMISSION ADAPTS

The Reset Transmission Adapts is a procedure for automatic transmissions in which the shift pressure learn values of each individual clutch is reset to zero or a base calibrated value, in the transmission control module (TCM).

Once the transmission adapts are set to zero or a calibrated value, the vehicle is then road test under various drive cycle events for the TCM to relearn shift pressure values for the best possible shift feel in all gear ranges.

The Reset Transmission Adapts procedure must be performed when one of the following repairs have been made to the transmission. Failure to perform the procedure after one of the following repairs may result in poor transmission performance, DTCs being set, or customer dissatisfaction.

- Transmission internal service, repair or overhaul
- Valve body repair or replacement
- Control solenoid valve assembly replacement
- Any service/repair in response to a shift quality concern

1. Install any components or connectors that have been removed or replaced during diagnosis.
2. Perform any adjustments, programming or setup procedures that are required when a component or

module is removed or replaced.

3. Clear the DTCs.
4. Ignition OFF, all vehicle systems OFF, this may take up to 2 minutes.

NOTE: **Do not cycle or turn the ignition switch OFF until directed to do so below.**

5. Ignition ON, engine running, with a scan tool Reset Transmission Adapts.
6. Perform the **Road Test**.
7. Ignition OFF for 2 minutes.

TRANSMISSION FLUID LEVEL AND CONDITION CHECK

This procedure checks both the transmission fluid level, as well as the condition of the fluid itself.

CAUTION: **Use DexronÂ® VI transmission fluid only. Failure to use the proper fluid may result in transmission internal damage.**

NOTE: **Ensure the transmission has enough fluid in it to safely start the vehicle without damaging the transmission. With the vehicle off there must be at least enough fluid to wet the end of the dipstick bullet. This will ensure that there is enough fluid in the sump to fill the components once the vehicle is started.**

Level Checking Procedure

1. Park the vehicle on a level surface, apply the parking brake and place the shift lever in PARK (P).
2. Start the engine.
3. Depress the brake pedal and move the shift lever through each gear range, pausing for about 3 seconds in each range. Then move the shift lever back to PARK (P).
4. Allow the engine to idle 500-800 rpm for at least 1 minute. Release the brake pedal.
5. Keep the engine running and observe the transmission fluid temperature (TFT) using the Driver Information Center or a scan tool.

NOTE: **If the fluid temperature is below the specified range, perform the following procedure to raise the fluid temperature to the specified range.**

6. If the TFT reading is not within the required temperature ranges, allow the vehicle to cool, or operate the vehicle until the appropriate TFT is reached.

   Drive the vehicle in second gear until the fluid temperature is within the specified range.

NOTE: **Check the transmission fluid level when the TFT is between 180Â°F and 200Â°F (82Â°C and 93Â°C). The fluid level rises as fluid temperature increases, so it is important to ensure the transmission fluid temperature is within range.**

7. Remove the dipstick and wipe it with a clean rag or paper towel.
8. Inspect the fluid color. The fluid should be red or dark brown.

- If the fluid color is very dark or black and has a burnt odor, inspect the fluid for excessive metal particles or other debris. A small amount of "friction" material is a "normal" condition. If large pieces and/or metal particles are noted in the fluid, flush the oil cooler and cooler lines and overhaul the transmission. If there are no signs of transmission internal damage noted, replace the fluid, repair the oil cooler, and flush the cooler lines.
- Fluid that is cloudy or milky or appears to be contaminated with water indicates engine coolant or water contamination. Refer to **Engine Coolant/Water in Transmission**.

9. Install the dipstick and tighten. Wait three seconds and then remove it again.

NOTE: **Always check the fluid level at least twice. Consistent readings are important to maintaining proper fluid level. If inconsistent readings are noted, inspect the transmission vent assembly to ensure it is clean and unclogged.**

NOTE: **It is not necessary to get the fluid level all the way up to the MAX mark. Anywhere within the crosshatch band is acceptable.**

10. Check both sides of the dipstick and read the lower level.
11. Install and remove the dipstick again to verify the reading.
12. If the fluid level is not within the crosshatch band, and the transmission temperature is between 180Â°F and 200Â°F (82Â°C and 93Â°C), add or drain fluid as necessary to bring the level into the crosshatch band. If the fluid level is low, add only enough fluid to bring the level into the crosshatch band.

NOTE: **Do not add more than one pint (0.5L) at a time without rechecking the level. Once the oil is on the dipstick bullet, it will not take much more fluid to raise the fluid level into the crosshatch band. Do not overfill. Also, if the fluid level is low, inspect the transmission for leaks. Refer to Fluid Leak Diagnosis.**

13. If the fluid level is in the acceptable range, install the dipstick.
14. If the fluid was changed, reset the transmission oil life monitor if applicable.

Fluid Condition Inspection

- Inspect the fluid color. The fluid should be red in color. The fluid may also turn brown form normal use, and does not always indicate contamination.

NOTE: **Fluid that is very dark or black and has a burnt odor usually indicates contamination or overheating.**

- If the fluid color is very dark or black and has a burnt odor, inspect the fluid for excessive metal particles or other debris which may indicate transmission damage. Refer to **Road Test** to verify transmission operation. Change the transmission fluid if no other conditions are found.
- Fluid that is cloudy or milky or appears to be contaminated with water indicates engine coolant or water contamination. Refer to **Engine Coolant/Water in Transmission**.

LINE PRESSURE CHECK

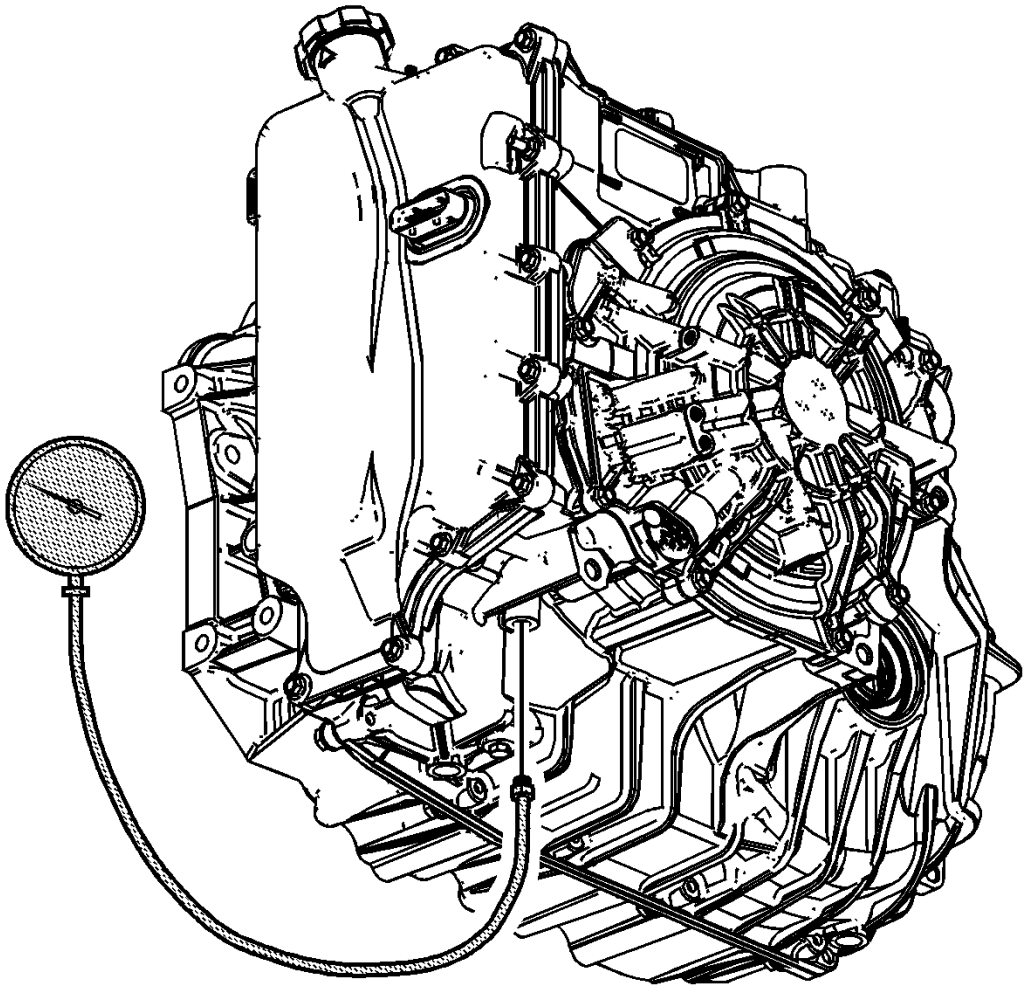

Fig. 4: Identifying Special Tool - J 21867
Courtesy of GENERAL MOTORS COMPANY

Special Tools

DT 21867-A Pressure Gauge

For equivalent regional tools, refer to **Special Tools** .

WARNING: Keep the brakes applied at all times in order to prevent unexpected vehicle motion. Personal injury may result if the vehicle moves unexpectedly.

1. Install a scan tool.
2. Start the engine.
3. Inspect the transmission for the proper fluid level. Refer to **Transmission Fluid Level and Condition Check**.
4. Use the scan tool to inspect for any active or stored diagnostic trouble codes.
5. Inspect the manual linkage at the transmission for proper function.
6. Turn the engine OFF.

7. Remove the line pressure test hole plug.
8. Install the **DT 21867-A** pressure gauge.
9. Access the Scan Tool Transmission Output Controls for the Line PC Solenoid.
10. Start the engine.

NOTE: **In order to achieve accurate line pressure readings, the following procedure must be performed at least 3 times in order to gather uniform pressure readings.**

The scan tool is only able to control the line PC solenoid in PARK and NEUTRAL with engine speeds below 1500 RPM. This protects the clutches from extreme high or low line pressures.

11. Use the scan tool to increase and decrease the Line PC Solenoid in increments of approximately 200 KPa (29 psi). The scan tool commands the increment values automatically.
12. Allow the pressure to stabilize between increments.
13. Compare the pressure readings on the **DT 21867-A** pressure gauge to the actual pressure values in the solenoid valve pressure chart. Refer to **Solenoid Valve Pressure** .
14. If the pressure readings vary greatly, refer to **Fluid Pressure High or Low**.
15. Turn the engine OFF.
16. Remove the **DT 21867-A** pressure gauge.

CAUTION: **Refer to Fastener Caution .**

17. Install the line pressure test hole plug and tighten to 12 N.m (106 lb in).

ROAD TEST

The following test provides a method of evaluating the condition of the automatic transmission. The test is structured so that most driving conditions would be achieved. The test is divided into the following parts:

- Electrical Function Check
- Upshift Control and Torque Converter Clutch (TCC) Apply
- Part Throttle Step-In Downshifts
- Manual Downshifts
- Coasting Downshifts
- Manual Gear Range Selection
  - REVERSE
  - Driver Shift Control

NOTE: **Complete the test in the sequence given. Incomplete testing cannot guarantee an accurate evaluation.**

Before the road test, ensure the following:

- The engine is performing properly.
- Transmission fluid level is correct. Refer to **Transmission Fluid Level and Condition Check**.
- Tire pressure is correct.

During the road test:

- Perform the test only when traffic conditions permit.
- Operate the vehicle in a controlled, safe manner.
- Observe all traffic regulations.
- View the scan tool data while conducting this test.

  Take along qualified help in order to operate the vehicle safely.

- Observe any unusual sounds or smells.

After the road test, check the following:

- Inspect for proper transmission fluid level. Refer to **Transmission Fluid Level and Condition Check**.
- Inspect for any diagnostic trouble codes (DTCs) that may have set during the testing. Refer to the applicable DTC.
- Monitor the scan tool data for any abnormal readings or data.
- Inspect for fluid leaks. Refer to **Fluid Leak Diagnosis**.

Electrical Function Check

Perform this procedure first in order to ensure the electronic transmission components are functioning properly. If these components are not checked, a simple electrical condition could be misdiagnosed.

1. Connect the scan tool.
2. Ensure the gear selector is in PARK and set the parking brake.
3. Start the engine.
4. Verify that the following scan tool data can be obtained and is functioning properly.

   Refer to **Control Module References** for typical data values. Data that is questionable may indicate a concern.

   - Engine Speed
   - Transmission ISS
   - Transmission OSS
   - Vehicle Speed
   - IMS
   - Commanded Gear
   - Gear Ratio
   - Line PC Sol. Pressure Cmd.
   - Brake Switch

- ECT, Engine Data List
- Trans. Fluid Temp.
- TCM Temperature
- Calc. Throttle Position
- Ignition Voltage
- TFP Switch 1
- TFP Switch 3
- TFP Switch 4
- TFP Switch 5
- PC Sol. 2 Pressure Cmd.
- PC Sol. 3 Pressure Cmd.
- PC Sol. 4 Pressure Cmd.
- PC Sol. 5 Pressure Cmd.
- Shift Solenoid 1
- Shift Solenoid 2
- TCC PC Sol. Duty Cycle
- TCC Slip Speed

5. Check the garage shifts.
    1. Apply the brake pedal and ensure the parking brake is set.
    2. Move the gear selector through the following ranges:
        1. PARK to REVERSE
        2. REVERSE to NEUTRAL
        3. NEUTRAL to DRIVE
        4. DRIVE to REVERSE
        5. REVERSE to DRIVE
    3. Pause 2 to 3 seconds in each gear position.
    4. Verify the gear engagements are immediate (less than 2 seconds to complete if trans fluid temperature is above 20Â°C) and not harsh. Note that these shifts may be almost imperceptible in some applications. Using the scan tool to monitor Transmission ISS achieving 0 RPM can be used to check delay in these cases.

NOTE: **Harsh engagement may be caused by any of the following conditions:**

- **High engine idle speed-Compare engine idle speed to desired idle speed.**
- **Incorrect line pressure-Investigate Line PC Sol. Pressure Cmd. kPa (psi), also perform Line Pressure Check.**
- **A default condition caused by certain DTCs that result in maximum line pressure to prevent clutch slippage.**
- **Incomplete adapting or incorrect adapting-Repeat maneuver multiple times to see if shift quality improves. If it does not, refer to the**

service procedures for Harsh Garage Shift, and for Harsh First and Reverse Shift.

NOTE: **Delayed engagement may be caused by any of the following conditions:**

- **Low idle speed-Compare engine idle speed to desired idle speed.**
- **Low fluid level**
- **Incorrect line pressure-Investigate Line PC Sol. Pressure Cmd. kPa (psi), also perform Line Pressure Check.**
- **Cold transmission fluid temperature (TFT)-Use the scan tool to determine TFT.**
- **Selector linkage-Inspect and adjust as necessary.**
- **Incomplete adapting or incorrect adapting-Repeat maneuver multiple times to see if delay improves. If it does not, refer to the service procedures for Harsh First and Reverse Shift.**

6. Monitor transmission range on the scan tool, transmission data list.
    1. Apply the brake pedal and ensure the parking brake is set.
    2. Move the gear selector through all ranges.
    3. Pause 2 to 3 seconds in each range.
    4. Return gear selector to PARK.
    5. Verify that all selector positions match the scan tool display.
7. Check throttle position input.
    1. Apply the brake pedal and ensure the parking brake is set.
    2. Ensure the gear selector is in PARK.
    3. Monitor the scan tool Calc. Throttle Position while increasing and decreasing engine speed with the throttle pedal. The scan tool Calc. Throttle Position percentage should increase and decrease with engine speed.

If any of the above checks do not perform properly, record the result for reference after completion of the road test.

Upshift Control and Torque Converter Clutch (TCC) Apply

The TCM calculates the upshift points based primarily on 2 inputs: throttle position and vehicle speed. When the TCM determines that conditions are met for a shift to occur, the TCM commands the shift by varying current to the appropriate PC solenoids to control oncoming and offgoing clutch pressures.

Perform the following steps:

1. Monitor the following scan tool parameters:
    - Calc. Throttle Position
    - Vehicle Speed
    - Engine Speed

- Transmission ISS
- Transmission OSS
- Commanded Gear
- TCC PC Sol. Pressure Cmd.
- TCC Slip Speed
- TFP Switch 1
- TFP Switch 3
- TFP Switch 4
- TFP Switch 5
- PC Sol. 2 Pressure Cmd.
- PC Sol. 3 Pressure Cmd.
- PC Sol. 4 Pressure Cmd.
- PC Sol. 5 Pressure Cmd.
- Shift Solenoid 1 and 2

2. Place the gear selector in the DRIVE position.
3. Accelerate the vehicle using a steady throttle position between 15 and 20 percent. Hold the throttle steady.
4. As the transmission upshifts, there should be a noticeable shift feel or engine speed change within 1 to 2 seconds of the commanded gear change. The PC solenoid pressure command should change to "YES" for the oncoming clutch and the PC solenoid pressure command should change to "NO" for the offgoing clutch.
5. Note any harsh, soft or delayed shifts or slipping. Note any noise or vibration.
6. The TCC feel may not be noticeable. In many applications the TCC will apply after the 1-2 shift and TCC events will not be easily detected using engine speed.

NOTE: **This transmission is equipped with an electronically controlled capacity clutch (ECCC), which allows operation of the clutch without fully locking to the torque converter cover. The clutch maintains a small amount of slippage, approximately 20 RPM, in 2nd, 3rd, 4th, 5th, and 6th gears, depending on the vehicle application. ECCC was developed to reduce the possibility of noise, vibration or chuggle caused by TCC apply. Full lockup is available at highway speeds on some applications.**

7. Monitor TCC PC solenoid pressure command while driving and check TCC slip speed when the pressure command indicates that the TCC is commanded to apply:

   When the TCC applies, slip speed should be controlled to below 100 RPM when the transmission is not shifting and the throttle is held steady. If the TCC slip exceeds this value for more than 6 seconds after the TCC PC Sol. Pressure Command indicates that the TCC is commanded ON:

   - Check for DTCs.
   - Refer to **Torque Converter Diagnosis**.

Part Throttle Step-In Downshifts

1. Place the gear selector in the DRIVE position.
2. Accelerate the vehicle at light throttle (5-15 percent) until 3rd gear is just achieved.
3. Quickly increase throttle angle until commanded gear indicates that a downshift to 2nd gear is commanded.
4. Verify that the transmission downshifts within 2 seconds of the throttle movement.
5. Repeat steps 2 to 4 at higher speed to achieve 4th gear and then step in to command a 4th gear to 3rd gear downshift.
6. Repeat steps 2 to 4 at higher speed to achieve 5th gear and then step in to command a 5th gear to 4th gear downshift.
7. Repeat steps 2 to 4 at higher speed to achieve 6th gear and then step in to command a 6th gear to 5th gear downshift.
8. Note any harsh, soft or delayed shifts or slipping. Note any noise or vibration.

Manual Downshifts

Manual downshift testing is not required since all vehicles equipped are also equipped with some form of Driver Shift Control (DSC). The TCM will automatically override DSC downshifts to protect the transmission from damage.

Coasting Downshifts

1. Place the gear selector in the DRIVE position.
2. Accelerate the vehicle to 6th gear with the TCC applied.
3. Release the throttle and apply the brakes
4. Verify that the downshifts occur as commanded by monitoring gear ratio, which should change after commanded gear changes.

Manual Gear Range Selection

This application does not utilize manual forward gear ranges.

Reverse

Perform the following test using a 10-15 percent throttle position.

1. With the vehicle stopped, move the gear selector to REVERSE.
2. Slowly accelerate the vehicle.
3. Verify that there is no noticeable slip, noise or vibration.

Driver Shift Control (DSC)

Refer to the owner's manual for specific instructions on the type of DSC available in this application. Utilize the DSC to ensure that the transmission responds appropriately to driver's commands. The TCM will upshift automatically when maximum engine speed is achieved and will protect from any downshift which may cause excessive engine RPM.

TORQUE CONVERTER DIAGNOSIS

Torque Converter Stator

The torque converter stator roller clutch can have 2 different malfunctions.

- The stator assembly freewheels in both directions.
- The stator assembly remains locked up in both directions.

Poor Acceleration at Low Speed - Stator Roller Clutch Freewheels at All Times

If the stator is freewheeling at all times, the vehicle tends to have poor acceleration from a standstill and at speeds below 48-55 km/h (30-34 mph). At speeds above 48-55 km/h (30-34 mph), the vehicle may act normally.

For poor acceleration at low speeds, you should first determine that the exhaust system is not blocked, and the transmission is in First gear when starting out. If the engine freely accelerates to high RPM in NEUTRAL, you can assume that the engine and the exhaust system are normal. Check for poor performance in DRIVE and REVERSE to help determine if the stator is freewheeling at all times.

Poor Acceleration at High Speed - Stator Roller Clutch is Locked Up at All Times

If the stator is locked up at all times, performance is normal when accelerating from a standstill. Engine RPM and vehicle speed are limited or restricted at speeds above 48-55 km/h (30-34 mph). Visual examination of the converter may reveal a blue color from overheating.

Torque Converter Bearing Noise

NOTE: **Do not confuse this noise with pump whine noise, which is usually noticeable in all gear ranges. Pump whine will vary with line pressure.**

Torque converter whine is noticed when the vehicle is stopped and the transmission is in DRIVE or REVERSE. This noise will increase as you increase the engine RPM. The noise will stop when the vehicle is moving or when you apply the torque converter clutch, because there is no slip speed across the bearings.

Perform a stall test to verify that the noise is actually coming from the torque converter:

1. Place your foot on the brake.
2. Put the gear selector in DRIVE.

CAUTION: **You may damage the transmission if you depress the accelerator for more than 6 seconds.**

3. Depress the accelerator to approximately 1,200 RPM for no more than six seconds.

A torque converter noise will increase under this load.

Torque Converter Clutch

The torque converter clutch (TCC) is applied by fluid pressure, which is controlled by a TCC pressure control (PC) solenoid. This solenoid is part of the control solenoid valve assembly, which is located inside the automatic transmission assembly. The solenoid is controlled through a combination of computer controlled switches and sensors. Electronically controlled capacity clutch (ECCC) is controlled slip across the TCC.

Torque Converter Clutch Shudder

The key to diagnosing torque converter clutch (TCC) shudder is to note when it happens and under what conditions. TCC shudder should only occur during the apply, release, or ECCC conditions of the converter clutch. Shudder should never occur after the TCC is fully locked (approximately 0 RPM slip).

If Shudder Occurs During TCC Apply, Release, and ECCC

If the shudder occurs while the TCC is applying, the problem can be within the transmission or the torque converter. Something is causing one of the following conditions to occur:

- The clutch is not engaging completely.
- The clutch is not releasing completely.
- The clutch is releasing and applying rapidly and continuously.

One of the following conditions may be causing the TCC Shudder to occur:

- Leaking turbine shaft/TCC seals
- A restricted release orifice
- A distorted clutch or converter cover due to long flexplate to converter bolts
- Defective friction material on the TCC plate

If Shudder Occurs After TCC has Locked

Engine problems may go unnoticed under light throttle and load, but they become noticeable after the TCC has locked when going up a hill or accelerating.

Refer to **Symptoms - Engine Controls** in order to avoid misdiagnosis of TCC shudder and the unnecessary disassembly of a transmission or the unnecessary replacement of a torque converter.

Torque Converter Vibration Test

NOTE: **The Noise and Vibration Analysis procedure should be performed prior to performing this test.**

Indexing Torque Converter

To determine and correct a torque converter vibration, the following procedure may have to be performed several times to achieve the best possible torque converter to flexplate balance.

1. Remove the torque converter bolts.
2. Rotate the torque converter one bolt position from the original marked position.

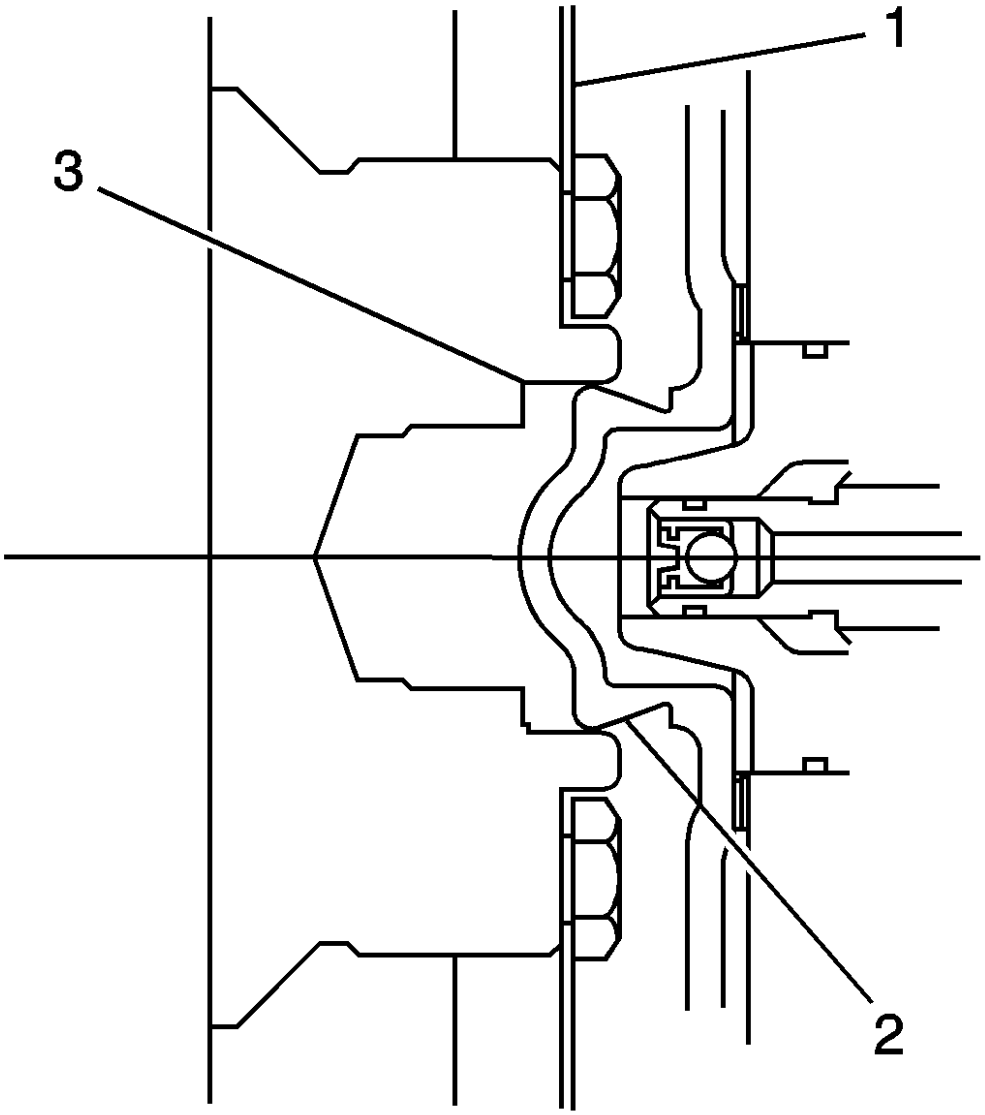

Fig. 5: View Of Torque Converter Hub In Engine Crankshaft
Courtesy of GENERAL MOTORS COMPANY

CAUTION: When installing the torque converter to the flexplate, make sure to use specified bolts. DO NOT use longer bolts. Using longer bolts will result in deformation of the torque converter cover and cause internal damage.

CAUTION: Refer to Fastener Caution .

3. Align the torque converter pilot (2) in the engine crankshaft (3). Install the torque converter to flexplate bolts, and tighten according to **Fastener Specifications (Off Vehicle)** .
4. Lower the vehicle.
5. With the engine at idle speed and the transmission in PARK or NEUTRAL, observe the vibration.

   Repeat this procedure until the best possible balance is obtained.

6. Install the torque converter access cover and bolts (if equipped) and tighten according to **Fastener Specifications (Off Vehicle)** .

Torque Converter Replacement Guide

Condition	Action
• Transmission Fluid Oxidized/Discolored • Clutch Fiber Material	Do not replace the torque converter. Refer to **Transmission Fluid Level and Condition Check**.
Transmission Fluid Contaminated with Metal Particles	**NOTE:** **Do not replace the torque converter for clutch system or gearset component damage. Fine metallic debris or clutch plate material that is suspended in the fluid will not cause damage to the internal torque converter components nor any internal transmission components.**
Harsh Gear Shifts	Do not replace the torque converter. Refer to **Symptoms - Automatic Transmission**.
Noise-Whine	• Refer to **Symptoms - Automatic Transmission**. • Do not replace the torque converter if noise is present in Neutral/Park. Refer to **Symptoms - Engine Mechanical** .
Vibration-Out of Balance	Refer to Torque Converter Vibration Test in this procedure.
No Drive/Slips in Drive	Do not replace the torque converter until completing all engine and transmission diagnostics.

Condition	Action
Idle Surge/Rough Idle	Do not replace the torque converter. Refer to **Symptoms - Engine Controls**
TCC Apply/Release Shudder	Do not replace the torque converter. Refer to Torque Converter Clutch Shudder in this procedure.
TCC Chuggle	Do not replace the torque converter. Refer to **Symptoms - Engine Controls** .
DTC P0741-TCC Stuck OFF/High Slip-Intermittent Only	Do not replace the torque converter. Refer to **DTC P0741 or P0742** diagnostic table.
DTC P0741-TCC Stuck OFF/High Slip	Do not replace the torque converter. Refer to **DTC P0741 or P0742** diagnostic table.
DTC P0742-TCC Stuck ON	Do not replace the torque converter. Refer to **DTC P0741 or P0742** diagnostic table.
Transmission Fluid Contaminated with Sludge/Metal Particles as a result of: • Engine Coolant/Oil • Pump damage • Drive sprocket support damage • Turbine/stator shaft damage • Internal converter damage with no damage found in the transmission	Replace the torque converter.
Poor Acceleration above 48 km/h (30 mph) - Good Launch	Do not replace the torque converter until completing all engine and transmission diagnostics. • Refer to Torque Converter Stator in this procedure. • Refer to **Symptoms - Engine Controls** .
Poor Launch - Good Acceleration above 48 km/h (30 mph)	Do not replace the torque converter until completing all engine and transmission diagnostics. • Refer to Torque Converter Stator in this procedure. • Refer to **Symptoms - Engine Controls** .
Stripped Converter Bolt Holes	• Replace the torque converter. • Inspect flexplate and refer to **Lower Engine Noise, Regardless of Engine Speed** .
Torque Converter Pilot Damaged	Replace the torque converter.

Condition	Action
Torque Converter Hub surface is damaged - scored, raised/transferred metal.	Replace the torque converter.
External Leaks in the weld areas - hub, lug or closure weld.	Replace the torque converter.
Broken/Cracked Flexplate	Replace the torque converter.
Torque Converter Discolored/Overheated	Replace the torque converter.

CLUTCH PLATE DIAGNOSIS

Composition Plates

Dry the plates and inspect the plates for the following conditions:

- Pitting
- Flaking
- Delamination-splitting or separation of bonded clutch material
- Wear
- Glazing
- Cracking
- Charring
- Chips or metal particles embedded in the lining

Replace a composition plate which shows any of these conditions.

Steel Plates

Wipe the plates dry and check the plates for heat discoloration. If the surfaces are smooth, even if color smear is indicated, you can reuse the plate. If the plate is discolored with heat spots or if the surface is scuffed, replace the plate.

Causes of Burned Clutch Plates

The following conditions can result in a burned clutch plate:

- Incorrect usage of clutch or apply plates
- Engine coolant or water in the transmission fluid
- A cracked clutch piston
- Damaged or missing seals
- Low line pressure
- Valve body conditions
    - The valve body face is not flat.
    - Porosity in between channels.
    - The valve train retainers are improperly installed.
    - The checkballs are misplaced.

- The TeflonÂ® seal rings are worn or damaged.

ENGINE COOLANT/WATER IN TRANSMISSION

CAUTION: The antifreeze or water will deteriorate the seals, gaskets and the glue that bonds the clutch material to the pressure plate. Both conditions may cause damage to the transmission.

If antifreeze or water has entered the transmission, perform the following:

1. Disassemble the transmission.
2. Replace all of the rubber type seals. The coolant will attack the seal material which will cause leakage.
3. Replace the composition-faced clutch plate assemblies. The facing material may separate from the steel center portion.
4. Replace all of the nylon parts - washers.
5. Replace the torque converter.
6. Thoroughly clean and rebuild the transmission, using new gaskets and oil filter.
7. Flush the cooler lines after the transmission cooler has been properly repaired or replaced.
8. Inspect the rubber hose portion of the oil cooler lines for damage, if applicable. Refer to **Transmission Fluid Cooler Flushing and Flow Test** .

FLUID LEAK DIAGNOSIS

General Method

1. Verify that the leak is transmission fluid.

   CAUTION: Do not clean using brake cleaner or other reactive solvents as these solvents can damage rubber gaskets, seals and bushings.

2. Thoroughly clean the suspected leak area using a rag.

   NOTE: Do not idle vehicle, this will not actuate transmission systems, and do not drive the vehicle on the freeway as this will splatter oil inhibiting leak diagnosis.

3. Operate the vehicle for 15-20 minutes under city driving conditions until normal operating temperatures are reached.
4. Park the vehicle over clean paper or cardboard.
5. Shut OFF the engine.
6. Look for fluid spots on the paper.
7. Make the necessary repairs.

Powder Method

CAUTION: Do not clean using brake cleaner or other reactive solvents as these solvents can damage rubber gaskets, seals and bushings.

1. Thoroughly clean the suspected leak area using a rag.
2. Apply an aerosol type leak tracing powder to the suspected leak area.

NOTE: **Do not idle vehicle, this will not actuate transmission systems, and do not drive the vehicle on the freeway as this will splatter oil inhibiting leak diagnosis.**

3. Operate the vehicle for 15-20 minutes under city driving conditions until normal operating temperatures are reached.
4. Shut OFF the engine.
5. Inspect the suspected leak area.
6. Trace the leak path through the powder in order to find the source of the leak.
7. Make the necessary repairs.

Dye and Black Light Method

A fluid dye and black light kit is available from various tool manufacturers.

1. Follow the manufacturer's instructions in order to determine the amount of dye to use.
2. Operate the vehicle for 24 km (15 mi) or until normal operating temperatures are reached.
3. Detect the leak with the black light.
4. Make the necessary repairs.

Find the Cause of the Leak

Pinpoint the leak and trace the leak back to the source. You must determine the cause of the leak in order to repair the leak properly. For example, if you replace a gasket, but the sealing flange is bent, the new gasket will not repair the leak. You must also repair the bent flange. Before you attempt to repair a leak, check for the following conditions, and make repairs as necessary:

Gaskets

- Fluid level/pressure is too high
- Plugged vent or drain-back holes
- Improperly tightened fasteners
- Dirty or damaged threads
- Warped flanges or sealing surface
- Scratches, burrs, or other damage to the sealing surface
- Damaged or worn gasket
- Cracking or porosity of the component
- Improper sealant used, where applicable
- Incorrect gasket

Seals

- Fluid level/pressure is too high

- Plugged vent or drain-back holes
- Damaged seal bore
- Damaged or worn seal
- Improper installation
- Cracks in component
- Manual shaft or output shaft surface is scratched, nicked, or damaged
- Loose or worn bearing causing excess seal wear

Possible Points of Fluid Leaks

Transmission Case Cover and/or Valve Body Cover

- Incorrectly tightened bolts
- Improperly installed or damaged gasket/seal
- Damaged mounting face
- Incorrect gasket seal

Case Leak

- Damaged input speed sensor seal
- Damaged manual shaft seal
- Loose or damaged oil cooler lines/seals
- Worn or damaged axle shaft oil seal
- Loose line pressure pipe plug or fluid level pipe plug
- Porous casting
- Warped torque converter housing
- Damaged converter housing to case seal

Leak at the Torque Converter End

- Converter leak in the weld area
- Converter seal lip cut. Check the converter hub for damage
- Converter seal bushing moved forward and damaged
- Converter seal garter spring missing from the seal
- Porous casting of the torque converter housing

Leak at the Vent

- Overfilled system
- Water or coolant in the fluid; The fluid will appear milky
- Transmission case porous
- Incorrect fluid level indicator causing an overfilled system
- Plugged vent

Leak Inspection Points

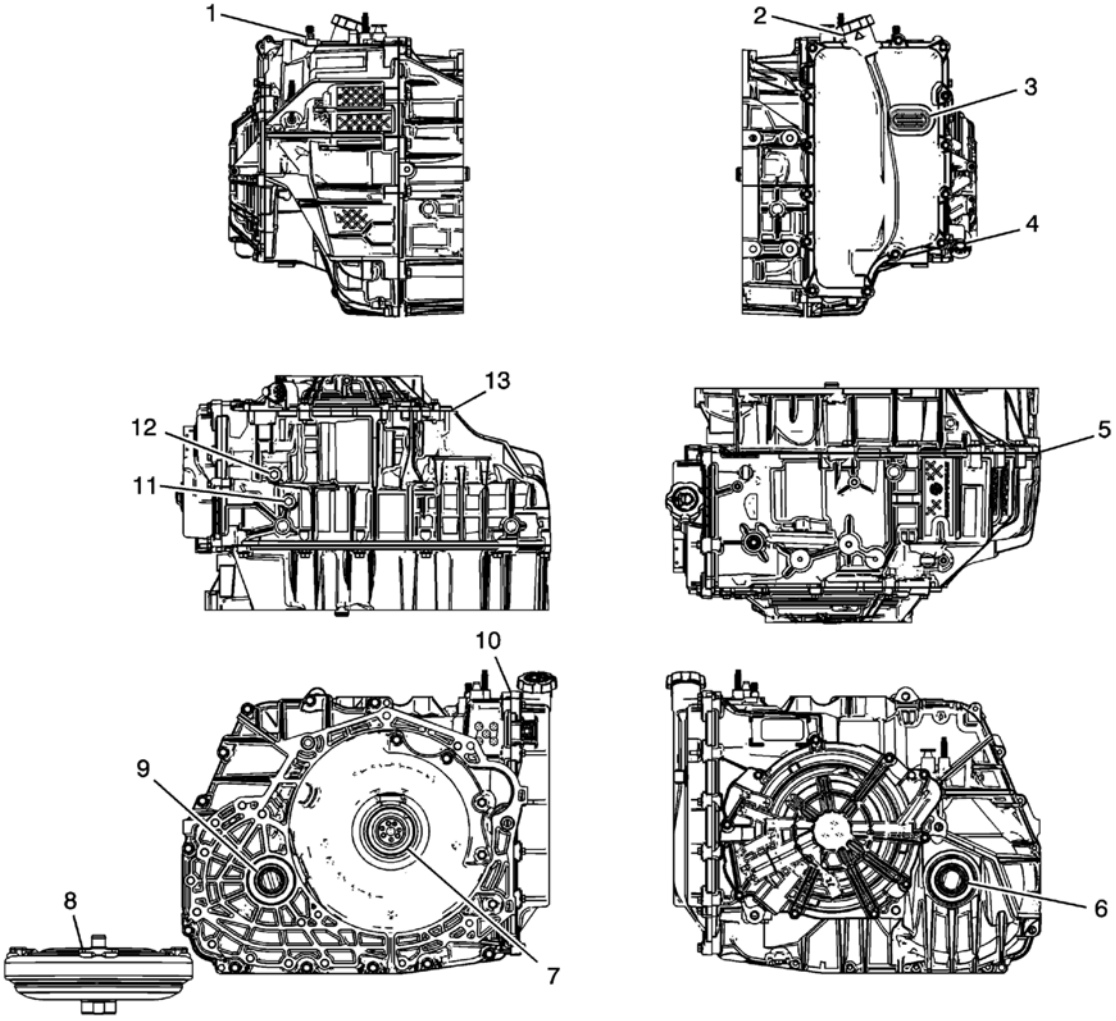

Fig. 6: Identifying Leak Inspection Points
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Manual Shift Shaft Seal
2	Automatic Transmission Vent
3	Control Valve Body Cover Wiring Connector Hole Seal
4	Input Speed Sensor Seal
5	Converter Housing to Case Joint
6	Front Wheel Drive Shaft Oil Seal Assembly - Case
7	Torque Converter Fluid Seal Assembly
8	Torque Converter Assembly
9	Front Wheel Drive Shaft Oil Seal Assembly - Torque Converter Housing
10	Control Valve Body Cover Assembly Gasket
11	Fluid Level Hole Plug
12	Fluid Pressure Hole Plug
13	Case Cover Gasket

CASE POROSITY REPAIR

Some external leaks are caused by case porosity in non-pressurized areas.

1. Thoroughly clean the area to be repaired with a cleaning solvent. Air dry the area.

   WARNING: Epoxy adhesive may cause skin irritations and eye damage. Read and follow all information on the container label as provided by the manufacturer.

2. Using instructions from the manufacturer, mix a sufficient amount of an epoxy to make the repair.
3. Apply the epoxy. A clean, dry soldering acid brush can be used to clean the area and also to apply the epoxy cement. Make certain that the area to be repaired is fully covered.
4. Allow the epoxy cement to cure for three hours before assembling the components.
5. Repeat the fluid leak diagnosis procedures.

BUSHING AND MATING SHAFT INSPECTION

NOTE: Proper bushing and corresponding mating shaft inspection should be performed before replacing the bushing, shaft, and in some cases, the component which houses the bushing. Thoroughly clean and dry the bushing and shaft surfaces before inspecting for damage.

Any of the following bushing conditions require replacement of the bushing and/or housing:

- Discoloration due to heat distress
- Misalignment or displacement of bushing as a result of spinning in housing
- Medium to heavy scoring that can be easily detected with fingernail. Light scoring is a normal condition.
- Debris embedded into the bushing lining material
- Obvious damage, including excessive and uneven wear
- Excessive polishing. Minor polishing of the bushing is an indication of normal wear and does not require replacement.

Any of the following conditions require replacement of the bushing's mating shaft:

- Discoloration due to heat distress
- Rough surface finish that can be easily detected with finger
- Obvious shaft abnormalities, including warping or uneven surfaces
- Obvious damage or cracking

NOISE AND VIBRATION ANALYSIS

A noise or vibration that is noticeable when the vehicle is in motion MAY NOT be the result of the transmission.

If noise or vibration is noticeable in PARK and NEUTRAL with the engine at idle, but is less noticeable as RPM increases, the vibration may be a result of poor engine performance.

- Vibration may also be caused by a small amount of water inside the converter.
- Inspect the engine and transmission mounts for damage and loose bolts.
- Inspect the transmission case mounting holes for the following conditions:
  - Missing bolts, nuts, and studs
  - Stripped threads
  - Cracks
- Inspect the flywheel for the following conditions:
  - Missing or loose bolts
  - Cracks
  - Imbalance
- Inspect the torque converter for the following conditions:
  - Missing or loose bolts or lugs
  - Missing or loose balance weights
  - Imbalance caused by heat distortion or fluid contamination
- If the noise or vibration is noticeable in PARK and NEUTRAL with the engine at idle, but is more noticeable as RPM increases, the vibration may be an engine imbalance or a transmission imbalance. Refer to **Torque Converter Diagnosis**.

WHINE/GROWL NOISE

Checks	Causes
Front Differential Drive Pinion Gear Assembly (23)	• Inspect for worn wheel bearings or axles. • Inspect for proper Taper Roller Bearing Pre-load • Inspect for loose or worn transfer Driven Gear
Differential Assembly (486)	• Inspect for worn wheel bearings or axles. • Inspect for proper Taper Roller Bearing Pre-load • Inspect for worn or damaged Side Gear Thrust Washer (492) or Pinion Gear Thrust Washer (488) • Inspect for loose or worn Side Gear Axle Splines
Input Carrier Assembly (470)	• Inspect for worn or damaged Pinion Gear Thrust Washers and Bushings • Inspect for worn or damaged Pinion Gears, Pins or Needle Bearings • Inspect for loose Hub and Ring Gear
Output Carrier Assembly (474)	• Inspect for worn or damaged Pinion Gear Thrust Washers and Bushings • Inspect for worn or damaged Pinion Gears, Pins or Needle Bearings

Checks	Causes
	• Inspect for loose Hub and Ring Gear
Reaction Carrier Assembly (467)	• Inspect for worn or damaged Pinion Gear Thrust Washers and Bushings • Inspect for worn or damaged Pinion Gears, Pins or Needle Bearings • Inspect for loose hub and Ring Gear
Fluid Pump Assembly (203)	• Inspect for proper fluid level • Inspect for loose or worn Drive Link Assembly (218) • Inspect for worn Driven Sprocket Thrust Washer (214) or Drive Sprocket Thrust Washers (219, 220) • Inspect for leaking Transfer Drive Gear Support Seal (213), Pump Fluid Outlet Seal Assembly (57) or Filter Seal (202) • Inspect for worn or damaged Fluid Pump Shaft Splines
3-5-Reverse Clutch Assembly	• Inspect for inadequate Clutch Plate Clearance • Inspect for loose or worn Clutch Plate Splines (423-425) • Inspect for loose or worn Clutch Spring Retainer (427) • Inspect for loose Speed Sensor Reluctor Wheel (416) or Retainer (415)
4-5-6 Clutch Assembly	• Inspect for inadequate Clutch Plate Clearance • Inspect for loose or worn Clutch Plate Splines (449, 440) • Inspect for loose or worn Clutch Spring Retainer (442) • Inspect for loose or worn 3-5-Reverse/4-5-6 Clutch Housing Bushing
1-2-3-4 Clutch Assembly	• Inspect for inadequate Clutch Plate Clearance • Inspect for loose or worn Clutch Plate Splines (456-458) • Inspect for loose or worn Clutch Spring Retainer (459)
Low and Reverse Clutch Assembly (OWC) (455)	• Inspect for loose or worn Splines (455) • Inspect for loose or worn Retainer (454)
Low and Reverse Clutch	• Inspect for inadequate Clutch Plate Clearance • Inspect for loose or worn Clutch Plate Splines (449-452) • Inspect for loose or worn Clutch Spring Retainer (410)

Checks	Causes
2-6 Clutch Assembly	• Inspect for inadequate Clutch Plate Clearance • Inspect for loose or worn Clutch Plate Splines (445-447) • Inspect for loose or worn Clutch Spring Retainer (407)
Case Assembly (51)	• Inspect for loose or broken Transmission Mount Bolts • Inspect for loose Torque Converter and Differential Housing Bolts (26) • Inspect for loose or broken Fluid Trough Bolts (56)

AUTOMATIC TRANSMISSION FLUID LEAKS

Checks	Causes
Torque Converter (27)	Inspect for damage.
Case Assembly (21)	• Inspect for porosity or damage on the sealing surfaces • Inspect for loose Oil Cooler Line Bolts or damaged Oil Cooler Line Seals • Inspect for damaged Manual Shift Shaft Seal (58) • Inspect for damaged or worn Axle Seal (61) or Axle Seal Slinger on the axle shafts • Inspect for loose Pressure Test Plug (62) and Fluid Level Plug (63)
Torque Converter Housing Assembly (221)	• Inspect for damaged Torque Converter Housing Assembly (25) • Inspect for porosity or damage on the sealing surfaces • Inspect for damaged Torque Converter Housing Seal (22) • Inspect for damaged or worn Torque Converter Fluid Seal (225) • Inspect for loose Torque Converter and Differential Housing Bolts (26) • Inspect for damaged or worn Axle Seal (226) or Axle Seal Slingers on the axle shafts
Case Cover assembly (34)	• Inspect for porosity or damage on the sealing surface • Inspect for damaged Case Cover Gasket (33) • Inpsect for loose Case Cover Assembly Bolts (35) • Inspect for loose Input Speed Sensor (ISS) Bolt (401) • Inspect for damaged Input Speed Sensor (ISS) Seal (402) • Inspect for loose, damaged or leaking Case Cover Assembly bore plugs

SHIFT INDICATOR INDICATES WRONG GEAR SELECTION

Checks	Causes
Shift Cable	• Inspect for damage. • Verify proper attachment to shifter. • Verify cable is locked into shifter bracket. • Verify cable is properly attached to the transmission. • Verify that the cable is locked into the transmission bracket.
Manual Shaft	• Verify shift lever is properly attached to the manual shaft. • Verify manual shaft is not twisted or damaged.
Manual Shift Detent Lever with Shaft Position Switch Assembly, IMS	Verify proper operation. Refer to **Transmission Internal Mode Switch Logic** .

NO PARK

Checks	Causes
Front Differential Drive Pinion (w/Transfer Gear) Gear Assembly (481)	• Inspect for broken or stripped Park Gear splines • Inspect for broken or worn Park Gear
Front Differential Carrier Assembly (486)	Inspect for damaged, broken or loose Front Differential Ring Gear
Output Carrier Transfer Drive Gear Hub Assembly (477)	• Inspect for worn, stripped or broken splines • Inspect for disengaged hub to Transfer Drive Gear
Reaction Carrier Assembly (467)	• Inspect for worn, stripped or broken splines • Inspect for disengaged to the Output Sun Gear (475)
Case Assembly (507)	• Inspect for broken or damaged Case • Inspect for loose or stripped Park Pawl Actuator Bracket Bolts (500) • Inspect for broken or bent Park Pawl Actuator Bracket (501) • Inspect for broken or missing Park Pawl Actuator Guide Pin (505) or Manual Shaft Pin (510) • Inspect for broken, loose or misaligned Park Pawl Guide (506) • Inspect for binding or broken Park Pawl (503) or Actuator Assembly (509)
Manual Shift Detent Lever Assembly (511)	Inspect for broken or disengaged Manual Valve Link Pin

HARSH GARAGE SHIFT

Checks	Causes
Input Carrier Assembly (470)	Inspect for worn or stripped ring gear splines
Case Assembly (51)	• Check the engine for diagnostic codes. If the engine controller signals the transmission that engine torque is inaccurate, the transmission will command high line pressure. • Check line pressure at idle is below 800 kPa. • Inspect for stuck valves in the lower valve body, particularly the boost valves. • Inspect for damaged or fatigued 1-2-3-4 clutch wave plate (458) and low and reverse clutch wave plate (450). • Inspect for stripped or worn splines on 1-2-3-4 clutch plate (456). • Inspect for improperly positioned or plugged low reverse piston (408) air bleed. • Inspect for correct fluid level.
Low and Reverse Clutch Assembly (OWC) (455)	Inspect for stripped or sheared internal and external splines on the low and reverse clutch assembly (455).

NO DRIVE IN ALL RANGES

Checks	Causes
For an explanation of which clutches are applied during the transmission gear ranges, refer to **Range Reference** .	
Case Assembly (51)	• Inspect for cracked or broken Case (51) • Inspect for stripped or sheared splines • Inspect for binding Manual Shift Detent Lever Assembly (511) • Inspect for missing Manual Shift Shaft Pin (510) • Inspect for interference or binding Park Pawl Actuator Assembly (509) • Inspect for disengaged or broken 1-2-3-4 Clutch Piston Spring Retainer (459) • Inspect for loose or damaged case bushing. • Inspect for missing Lube Orifice Plug
Torque Converter (29)	• Inspect for stripped or sheared splines on Turbine Shaft • Inspect for missing Torque Converter to Flywheel bolts.

Checks	Causes
Torque Converter Housing (221)	• Inspect for loose, missing or broken Torque Converter and Differential Housing bolts (26). • Inspect for loose, missing or broken Fluid Pump bolts (204).
35R/456 Housing Assembly (422)	• Inspect for damaged or broken Input Shaft Thrust Bearing Assembly (32) • Inspect for stripped, sheared or loose splines on the Input Shaft to the 3-5 Reverse/4-5-6 Clutch Housing (422)
Oil Pump Assembly (203)	• Inspect for fluid leaks / improper fluid level • Inspect for disengaged, worn, binding or failed Drive Sprocket (216), Driven Sprocket (215) or Drive Link (217) • Inspect for leaking Fluid Outlet Seal Assembly (57) • Inspect for damaged or worn Drive (219, 220) and Driven Sprocket Thrust Washers (214) • Inspect for loose or missing Oil Pump Bolts (204) • Inspect for stripped or sheared splines on the Oil Pump Shaft or Driven Sprocket (215) • Inspect for damaged, clogged or improperly installed Oil Filter Assembly (201) • Inspect for damaged or leaking Oil Filter Neck Seal (202)
Low & Reverse Clutch Assembly (455)	Inspect for stripped or sheared splines to the Reaction Carrier (467)
Input Carrier Assembly (470)	• Inspect for stripped or sheared splines to ring gear • Inspect for improperly installed carrier pinion gear pins • Inspect for damaged or broken Pinion Gears. • Inspect for stripped or sheared splines on the Input Sun Gear (471). • Inspect for damaged or broken Output Internal Gear. • Inspect for broken or disengaged Output Internal Gear Retainer Ring. • Inspect for damaged or broken Input Carrier Thrust Bearing Assembly (468) and Output Carrier Thrust Bearing Assembly (473). • Inspect for damaged or broken Input Carrier Thrust Bearings (469, 472).
Reaction Carrier Assembly (467)	• Inspect for stripped or sheared Reaction Carrier Assembly (467) splines. • Inspect for damaged or broken Input Carrier Thrust Bearings

Checks	Causes
	(468). • Inspect for damaged or broken Pinion Gear teeth. • Inspect for damaged or broken Reaction Internal Gear teeth. • Inpsect for disengaged or broken Reaction Internal Gear retainer ring.
Reaction Sun Gear Assembly (466)	• Inspect for damaged or broken weld at Sun Gear. • Inspect for loose or worn Reaction Sun Gear Assembly bushing.
Output Carrier Assembly (474)	• Inspect for stripped or sheared splines to reaction internal ring gear. • Inspect for damaged or broken Input Sun Gear Thrust Bearings (472). • Inspect for damaged or broken Pinion Gear teeth. • Inspect for damaged or broken Input Carrier Thrust Bearings (473). • Inspect for broken or damaged Output Internal Gear.
Output Sun Gear Assembly (475)	• Inspect for stripped or sheared Output Sun Gear Assembly (475) splines. • Inspect for broken Output Sun Gear Assembly (4755) hub or weld.
Low and Reverse Clutch Assembly (455)	Inspect for disengaged or broken Low and Reverse Clutch Assembly (455).
Differential Carrier Assembly (486)	• Inspect for stripped or sheared splines on Differential Side Gear. • Inspect for stripped or sheared splines Differential Carrier to PTU (AWD only). • Inspect for damaged or broken Pinion Gear teeth. • Inspect for broken, worn or damaged Final Drive Inner and Outer Thrust Washers (492).
Control Solenoid (w/Body and TCM) Valve Assembly	• Check that the Manual Valve (348) is engaged with Manual Shift Detent Lever Assembly (511). • Inspect the Control Solenoid (w/Body and TCM) Valve Assembly (15) and verify that it is functioning properly. Refer to **Control Solenoid Valve and Transmission Control Module Assembly Inspection**.

NO FIRST AND REVERSE GEARS

Checks	Causes
Low and Reverse Clutch Assembly (455)	• Inspect for disengaged or broken low and reverse clutch retainer (454). • Inspect for stripped or sheared splines on low and reverse clutch (455).
Low and Reverse Clutch	• Inspect for stripped or sheared splines on low and reverse clutch plates (449-453). • Inspect for damaged, deformed or improper surface finish on the low and reverse clutch plates (449-453).
Case Cover Assembly (403)	• Inspect for disengaged or broken low and reverse clutch piston spring retainer (410). • Inspect for worn, damaged or debonding low and reverse clutch piston seals (408). • Inspect for broken or deformed low and reverse clutch piston (408). • Inspect for improperly position or too large bleed hole in low and reverse piston (408). • Inspect for porosity or improper finish on the case cover. • Inspect for broken or fatigued low and reverse clutch piston return spring (409).

NO FIRST, SECOND, THIRD, AND FOURTH GEAR

Checks	Causes
1-2-3-4 Clutch Assembly	• Inspect for damaged or worn 1-2-3-4 clutch plates (456-458). • Inspect for damaged or broken 1-2-3-4 clutch piston (461) and piston seals damaged, worn or delaminating. • Inspect for broken or binding 1-2-3-4 clutch piston return spring (460). • Inspect for broken or disengaged 1-2-3-4 clutch piston return spring retainer (459). • Inspect for broken or fatigued 1-2-3-4 clutch wave plate (458).
Output Sun Gear Assembly (457)	Inspect for stripped or sheared splines on the output sun gear shell.
Reaction Carrier Assembly (467)	• Inspect for stripped or sheared splines on the input ring gear. • Inspect for disengaged or broken input ring gear retainer.

Checks	Causes
Output Carrier Assembly (474)	• Low/reverse clutch assembly (OWC) (455) splines sheared or broken. • Inspect for disengaged or broken reaction ring gear retainer.
Case Assembly (51)	Inspect for worn or damaged case splines or retainer ring grooves.

NO SECOND AND SIXTH GEAR

Checks	Causes
2-6 Clutch Assembly	• Inspect for damaged or worn 2-6 clutch plates (445-447). • Inspect for damaged, worn, broken, improper surface finish or sheared splines on the 2-6 clutch backing plate (448).
Reaction Carrier Assembly (467)	• Inspect for stripped or sheared splines on the input ring gear. • Inspect for disengaged or broken input ring gear retainer.
Case Cover Assembly (403)	• Inspect for damaged or broken 2-6 clutch piston (405) and piston seals damaged, worn or delaminating. • Inspect for broken or binding 2-6 clutch piston return spring (406). • Inspect for broken or disengaged 2-6 clutch piston return spring retainer (407). • Inspect for damaged, worn or improper surface finish in the piston bore (403).
Case Assembly (51)	Inspect for stripped or sheared splines (51).

HARSH OR LATE FIRST, SECOND, THIRD, AND FOURTH SHIFT

Checks	Causes
1-2-3-4 Clutch Assembly	• Inspect for damaged or broken 1-2-3-4 clutch piston (461) and piston seals damaged, worn or leaking. • Inspect for fatigued or binding 1-2-3-4 clutch piston return spring (460). • Inspect for improper surface finish on 1-2-3-4 clutch plates (456-458). • Inspect for broken or fatigued 1-2-3-4 clutch waved plate (458).
Case	Inspect for leaking or damaged 1-2-3-4 clutch fluid passage seal (65).

HARSH FIRST AND REVERSE SHIFT

Checks	Causes
Case Cover Assembly (403)	Inspect for plugged or improperly positioned low and reverse piston (408) air bleed.
Low and Reverse Clutch	• Inspect for improper surface finish on low and reverse clutch plates (449-453). • Inspect for damaged or worn low and reverse clutch plates (452). • Inspect for damaged low and reverse clutch backing plate (453). • Inspect for worn splines on backing plate (453). • Inspect for damaged low and reverse clutch piston assembly (408), spring (409), and spring retaining ring (410). • Inspect for fatigued or binding low and reverse clutch piston return spring (409). • Inspect for broken low and reverse clutch wave plate (449).
Lower Valve Body	Inspect for stuck 4-5-6 clutch boost valve.

NO THIRD, FIFTH, AND REVERSE GEAR

Checks	Causes
3-5-Reverse Clutch Assembly	• Inspect for damaged, worn or stripped splines on 3-5-reverse clutch plates (423-426), backing plate (426). • Inspect for sheared or stripped splines on 3-5-rev/4-5-6 housing to turbine shaft (422). • Inspect for damage, improper surface finish, porosity, deformed or unbalanced 3-5-rev/4-5-6 housing (422). • Inspect for damaged, worn, loose or seized hub bushing in the 3-5-rev/4-5-6 housing. • Inspect for broken, porous or improper surface finish or plugged oil passages of the 3-5-rev/4-5-6 housing (422). • Inspect for failure of the Input shaft thrust bearing (32). • Inspect for disengaged or broken 3-5-reverse clutch backing plate retainer (427). • Inspect for disengaged or broken 3-5-reverse backing plate (426). • Inspect for damaged, worn or leaking 3-5-reverse clutch piston seals (419-421). • Inspect for damaged or broken 3-5-rev/4-5-6 clutch housing (422). • Inspect for warped, damaged, improper surface finish or debonding 3-5-reverse clutch piston (417).

Checks	Causes
	• Inspect for broken or fatigued 3-5-reverse clutch spring (418). • Inspect for disengaged or broken speed sensor reluctor retainer (415). • Inspect for broken speed sensor reluctor wheel (416). • Inspect for seized input shaft thrust bearing (32).
Reaction Carrier (467)	• Inspect for broken or disengaged input internal gear retainer. • Inspect for stripped or sheared splines on the input internal gear.
Output Carrier (474)	Inspect for stripped or sheared splines for the reaction internal ring gear.
4-5-6 Clutch Assembly	• Inspect for plugged or missing 4-5-6 piston dam oil feed hole. • Inspect for leaking 4-5-6 piston dam.

HARSH OR LATE SECOND AND SIXTH SHIFT

Checks	Causes
2-6 Clutch Assembly	• Inspect for worn or improper surface finish on the 2-6 Clutch Plates (446, 447) and Backing Plate (448) • Inspect for fatigued 2-6 Clutch Piston Cushion Spring (445)
Case Cover Assembly (403)	• Inspect for damaged or broken 2-6 Clutch Piston (405) and piston seals damaged, worn or delaminating • Inspect for fatigued 2-6 Clutch Piston Return Spring (406)

NO FOURTH, FIFTH, AND SIXTH GEAR

Checks	Causes
4-5-6 Clutch Assembly	• Inspect for damaged or broken 4-5-6 clutch piston (433) and piston seals (430-432). • Inspect for broken or disengaged 4-5-6 backing plate retainer (442). • Inspect for damaged or broken 4-5-6 clutch dam piston (435) and piston seals damaged, worn or delaminating. • Inspect for broken or disengaged 4-5-6 clutch dam retainer (436). • Inspect for sheared or stripped splines on the reaction carrier hub (438). • Inspect for sheared or stripped splines on 3-5-rev/4-5-6

Checks	Causes
	housing to turbine shaft (422). • Inspect for loose, worn or damaged 3-5-rev/4-5-6 housing bushing. • Inspect for broken, porous or improper surface finish or plugged oil passages of the 3-5-rev/4-5-6 housing (422). • Inspect for failure of the input shaft thrust bearing (32). • Inspect for damaged, stripped or sheared splines on 4-5-6 clutch plates (439-441). • Inspect for broken or fatigued 4-5-6 clutch piston return spring (434).

HARSH OR LATE THIRD, FIFTH, AND REVERSE SHIFT

Checks	Causes
3-5-Reverse Clutch Assembly	• Inspect for improper surface finish on 3-5-Reverse Clutch Plates (423-426), Backing Plate (426) • Inspect for plugged or restricted oil passages and air bleed of the 3-5-Rev/4-5-6 Housing (422) • Inspect for damaged, worn or leaking 3-5-Reverse Clutch Piston Seals (419-421) • Inspect for warped 3-5-Rev/4-5-6 Clutch Housing (422) • Inspect for fatigued 3-5-Reverse Clutch Waved Plate (423)

HARSH FOURTH, FIFTH, AND SIXTH SHIFT

Checks	Causes
4-5-6 Clutch Assembly	• Inspect for leaking 4-5-6 clutch piston (433) and piston seals (430-432). • Inspect for plugged or restricted 4-5-6 piston dam air bleed. • Inspect for fatigued 4-5-6 clutch piston spring (434). • Inspect for leaking 4-5-6 clutch dam seals (435). • Inspect for improper surface finish on 4-5-6 clutch plates (439-441). • Inspect for porous, improper surface finish, seal groove damage or plugged or restricted oil passages of the 3-5-rev/4-5-6 housing (422). • Inspect for leaking or damaged 4-5-6 piston dam (435).

NO TORQUE CONVERTER CLUTCH APPLY

Checks	Causes
Torque Converter Assembly (27)	• Inspect for damaged Torque Converter Clutch Seal (inside converter assembly). • Diagnose Torque Converter Assembly for possible internal damage. Refer to **Torque Converter Diagnosis**.
Upper Valve Body Assembly (349)	Inspect for worn, damaged or sticking TCC Regulator Apply (330) and TCC Regulator Apply Shuttle (331) Valves.
Transfer Drive Gear Support Assembly (208)	Inspect for worn or damaged Transfer Drive Gear Support Seal (213).
Torque Converter Housing Assembly (221)	Inspect for leaking or damaged Torque Converter Fluid Seal Assembly (225).

NO TORQUE CONVERTER CLUTCH RELEASE

Checks	Causes
Torque Converter Assembly (27)	Diagnose Torque Converter Assembly for possible internal damage. Refer to **Torque Converter Diagnosis**.
Upper Valve Body Assembly (349)	Inspect for worn, damaged or sticking TCC Regulator Apply (330) and TCC Regulator Apply Shuttle (331) Valves.

HARSH TORQUE CONVERTER CLUTCH APPLY, OR INOPERATIVE OR NO ELECTRONICALLY CONTROLLED CAPACITY CLUTCH CONTROL

Checks	Causes
Torque Converter Assembly (27)	• Inspect for leaking or damaged Torque Converter Clutch Hub Seal. • Diagnose Torque Converter Assembly for possible internal damage. Refer to **Torque Converter Diagnosis**.
Drive Gear Support Assembly (208)	Inspect for leaking Drive Gear Support Seal (213).

NO REVERSE GEAR

Checks	Causes
Low and Reverse Clutch Assembly (455)	• Inspect for disengaged or broken low and reverse clutch retainer (454). • Inspect for stripped or sheared splines on low and reverse clutch (455).
Low and Reverse Clutch	• Inspect for stripped or sheared splines on low and reverse clutch plates (449-453). • Inspect for damaged, deformed or improper surface finish on the low and reverse clutch plates (449-453).

Checks	Causes
3-5-Reverse Clutch Assembly	• Inspect for damaged, worn or stripped splines on 3-5-Reverse Clutch Plates (423-426), Backing Plate (426) • Inspect for sheared or stripped splines on 3-5-Rev/4-5-6 Housing to Turbine Shaft (422) • Inspect for damage, improper surface finish, porosity, deformed or unbalanced 3-5-Rev/4-5-6 Housing (422) • Inspect for damaged, worn, loose or seized hub bushing in the 3-5-Rev/4-5-6 Housing • Inspect for broken, porous or improper surface finish or plugged oil passages of the 3-5-Rev/4-5-6 Housing (422) • Inspect for failure of the Input Shaft Thrust Bearing (32) • Inspect for disengaged or broken 3-5-Reverse Clutch Backing Plate Retainer (427) • Inspect for damaged, worn or leaking 3-5-Reverse Clutch Piston Seals (419-421) • Inspect for damaged or broken 3-5-Rev/4-5-6 Clutch Housing (422) • Inspect for warped, damaged, improper surface finish or debonding 3-5-Reverse Clutch Piston (417) • Inspect for broken or fatiqued 3-5-Reverse Clutch Spring (418) • Inspect for disengaged or broken Speed Sensor Reluctor Retainer (415) • Inspect for broken Speed Sensor Reluctor Wheel (416) • Inspect for seized Input Shaft Thrust Bearing (32)

FLUID PRESSURE HIGH OR LOW

Checks	Causes
Fluid Pump Assembly (203)	• Inspect for loose fluid pump bolts (204). • Inspect for leaking or damaged fluid pump outlet seals (57) and oil filter seal (202). • Inspect for improperly installed or damaged oil filter (201). • Inspect for sticking line pressure blow off valve.
Front Differential Drive Gear Support Assembly (208)	• Inspect for leaking or damaged drive gear support torque converter seal assembly (206) or fluid passage tube gasket (212). • Inspect for leaking or damaged drive gear support fluid passage tube assembly (209).

Checks	Causes
Upper Valve Body Assembly (312)	• Inspect for leaking or damaged upper valve body assembly (309) gasket. • Inspect for worn, sticking or damaged pressure regulator valve (337) or pressure regulator valve spring (338).
Lower Valve Body Assembly (313)	Inspect for leaking or damaged lower valve body assembly (313) gasket.
Control Valve (w/Body and TCM) Valve Assembly (15)	• Inspect for leaking or damaged filter plate assembly seals (16). • Verify VBS operation in not stuck high or low.
Filter Assembly	Inspect for damaged, restricted, or mis-installed fluid filter assembly.
Case Assembly (51)	Inspect for missing lube oil circuit orifice or baffle (229).

Article GUID: A00737190

REPAIR INSTRUCTIONS - OFF VEHICLE

LIFT PLATE AND HOLDING FIXTURE INSTALLATION

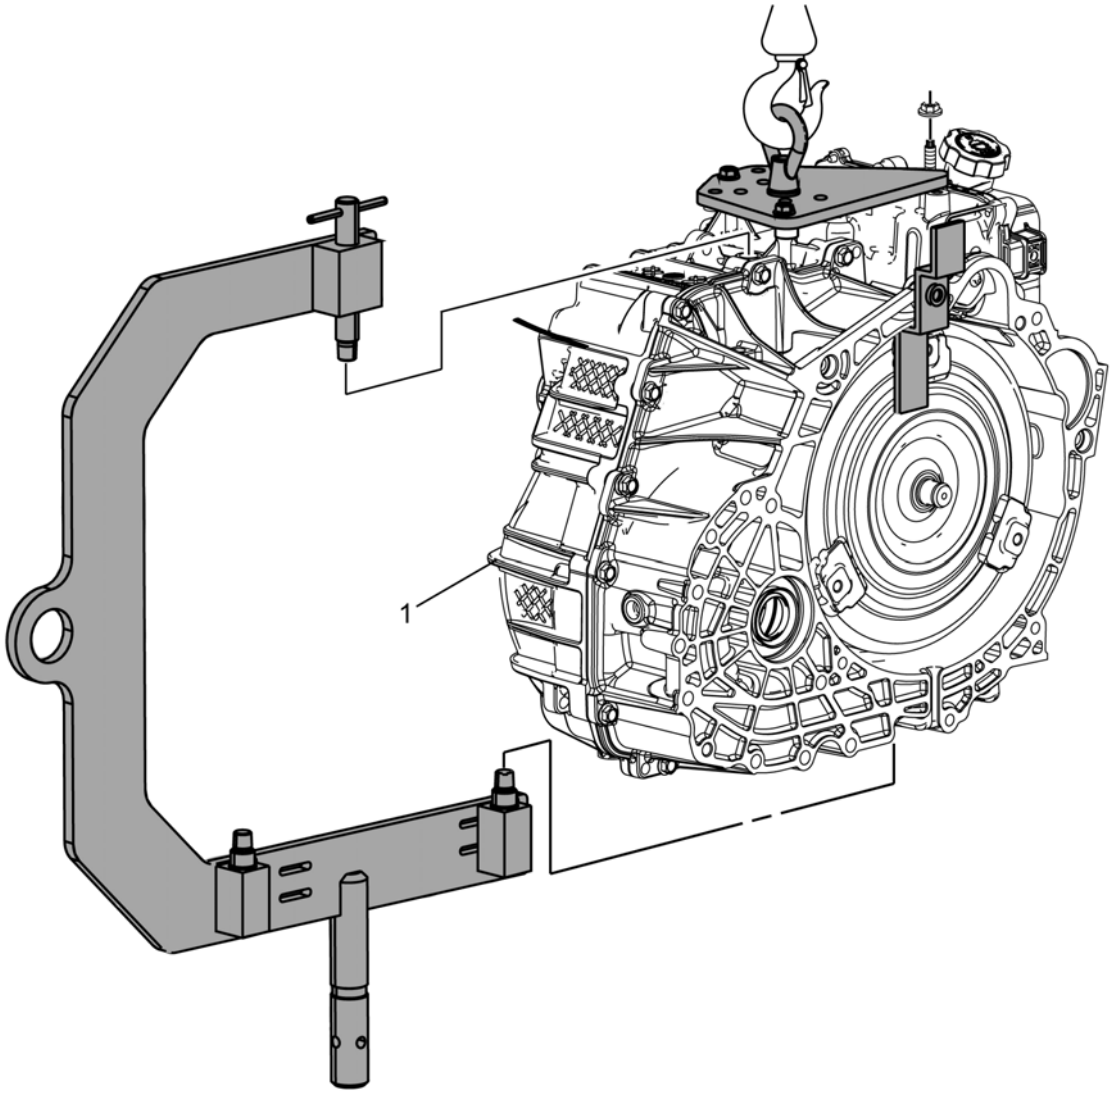

Fig. 1: Identifying Lift Plate & Holding Fixture
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	**DT-47811-A** Transmission Lift Plate **WARNING:** **Handle with care, the transmission assembly**

Callout	Component Name
	weighs over 90.7 kg (200 lbs). Bodily injury could occur if not handled properly. **NOTE:** **After Installation of lift plate, raise the transmission with an overhead hoist.** **Tighten** 12 N.m (9 lb ft) **Special Tools** **DT-47811-A** Transmission Lift Plate For equivalent regional tools, refer to **Special Tools** .
2	**DT-46625** Transmission Holding Fixture **CAUTION:** **Refer to Fastener Caution .** **NOTE:** **Adjust mounting block on fixture to match bosses on case, then tighten bolts to:** **Tighten** 13 N.m (10 lb ft) **Special Tools**

Callout	Component Name
	DT-46625 Transmission Holding Fixture For equivalent regional tools, refer to **Special Tools** .

TORQUE CONVERTER REMOVAL

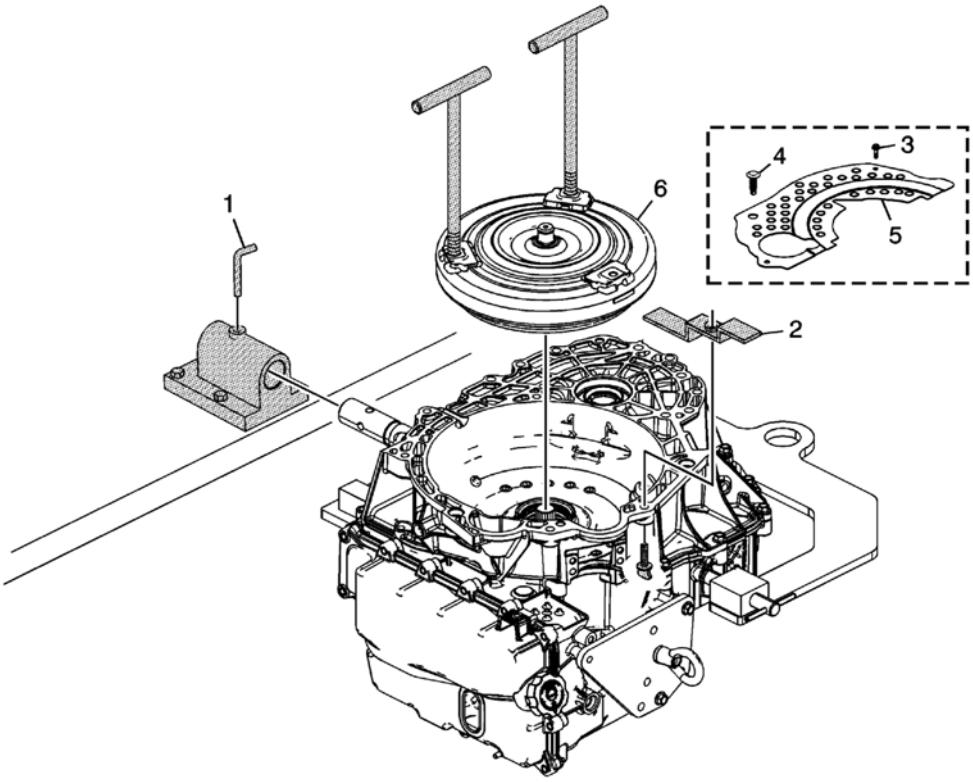

Fig. 2: View Of Torque Converter
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Lock Pin **WARNING:** **Lock pin must be secured into the bench fixture to hold the transmission and prevent bodily injury.** **NOTE:** **Ensure the DT 3289-20 holding**

Callout	Component Name
	fixture is mounted to a bench that is properly supported and will support the weight of the transmission assembly without tipping. **DT-39890 holding fixture adapter adapter and an engine stand can be used as an alternative method for supporting the transmission assembly during repairs.** **Special Tools** • **DT 3289-20** Holding Fixture • **DT-39890** Transmission Holding Fixture Adapter For equivalent regional tools, refer to **Special Tools** .
2	**DT 21366** Converter Holding Strap For equivalent regional tools, refer to **Special Tools** .
3	Dust Cover Bolts M10 x 25, model dependent (Qty: 2)
4	Dust Cover Push Pin, model dependent
5	Dust Cover, model dependent
6	Torque Converter Assembly **CAUTION:** **Only install the lift assist**

Callout	Component Name
	handles until it stops. Do not tighten. Over tightening the lift assist handles can cause damage to the torque converter. **NOTE:** **Failure to raise the torque converter straight up could damage the torque converter clutch lip seal inside the torque converter clutch assembly.** **Special Tools** **DT 46409** Torque Converter Lifting Handles For equivalent regional tools, refer to **Special Tools** .

CONTROL VALVE BODY ASSEMBLY REMOVAL

Control Valve Body Cover Removal

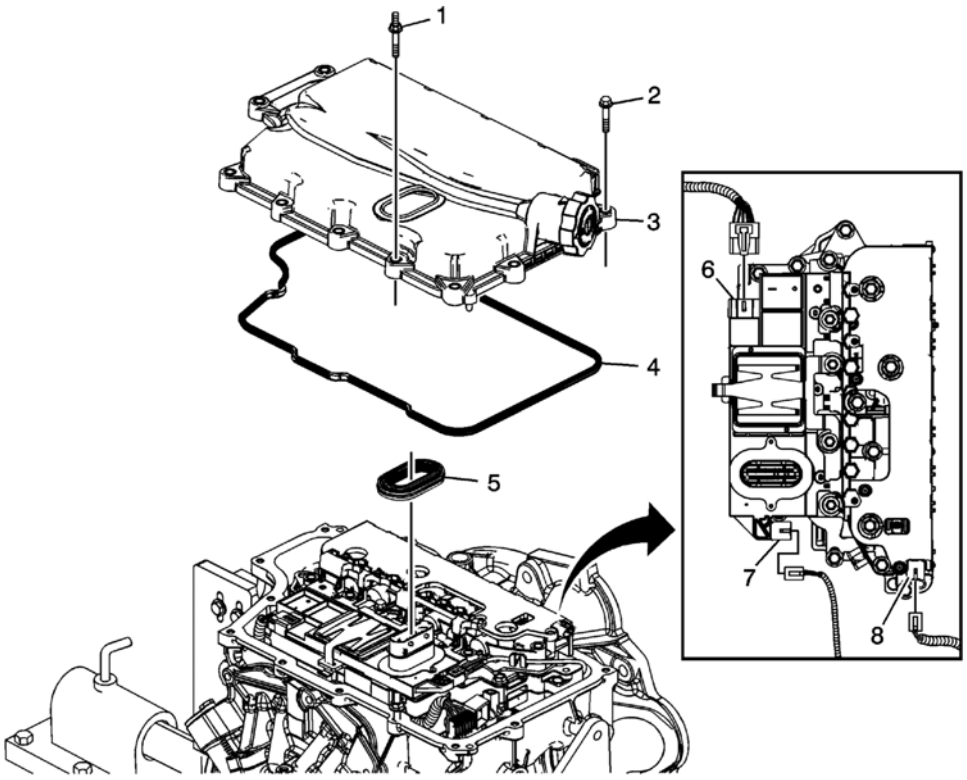

Fig. 3: View Of Control Valve Body Cover
Courtesy of GENERAL MOTORS COMPANY

Control Valve Body Cover Removal

Callout	Component Name
1	Control Valve Body Cover Stud M6 x 30 (Qty: 2)
2	Control Valve Body Cover Bolt M6 x 30 (Qty: 12)
3	Control Valve Body Cover
4	Control Valve Body Cover Gasket **NOTE:** **Do not re-use the valve body cover gasket.**
5	Control Valve Body Cover Wiring Connector Hole Seal **CAUTION:** **Support the control solenoid valve assembly around the connector**

Callout	Component Name
	when removing the seal. Excessive pulling force can damage the internal electrical connections.
6	Shift Position Switch Connector
7	Output Speed Sensor Connector
8	Input Speed Sensor Connector

Control Solenoid (w/Body and TCM) Valve Assembly Removal

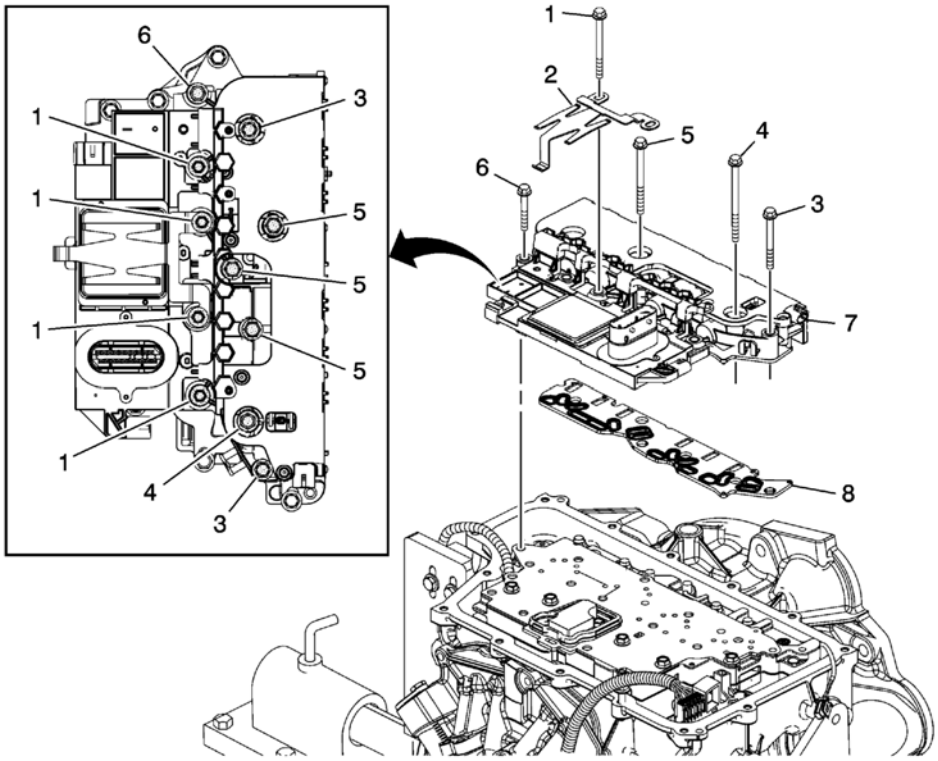

Fig. 4: Control Solenoid (W/ Body and TCM) Valve Assembly Components
Courtesy of GENERAL MOTORS COMPANY

Control Solenoid (w/Body and TCM) Valve Assembly Removal

Callout	Component Name
1	Control Valve Body Bolt M6 x 80 (Qty: 4)
2	Control Solenoid Valve Spring
3	Control Valve Body Bolt M6 x 65 (Qty: 2)
4	Control Valve Body Bolt M6 x 42 (Qty: 1)
5	Control Valve Body Bolt M6 x 95 (Qty: 3)

Callout	Component Name
6	Control Valve Body Bolt M6 x 55 (Qty: 1)
7	Control Solenoid (w/Body and TCM) Valve Assembly
8	Control Solenoid Valve Assembly Filter Plate **CAUTION:** **Use care when removing or installing the filter plate assembly. A broken or missing retaining tab may not adequately secure the filter plate to the control solenoid valve assembly, resulting in possible damage or contamination.** **NOTE:** • **Discard the filter plate. It is not reusable.** • **Inspect the pressure switch manifold seals for damage. Replace the control valve assembly as necessary.**

Control Valve Body Assembly and Output Speed Sensor Removal

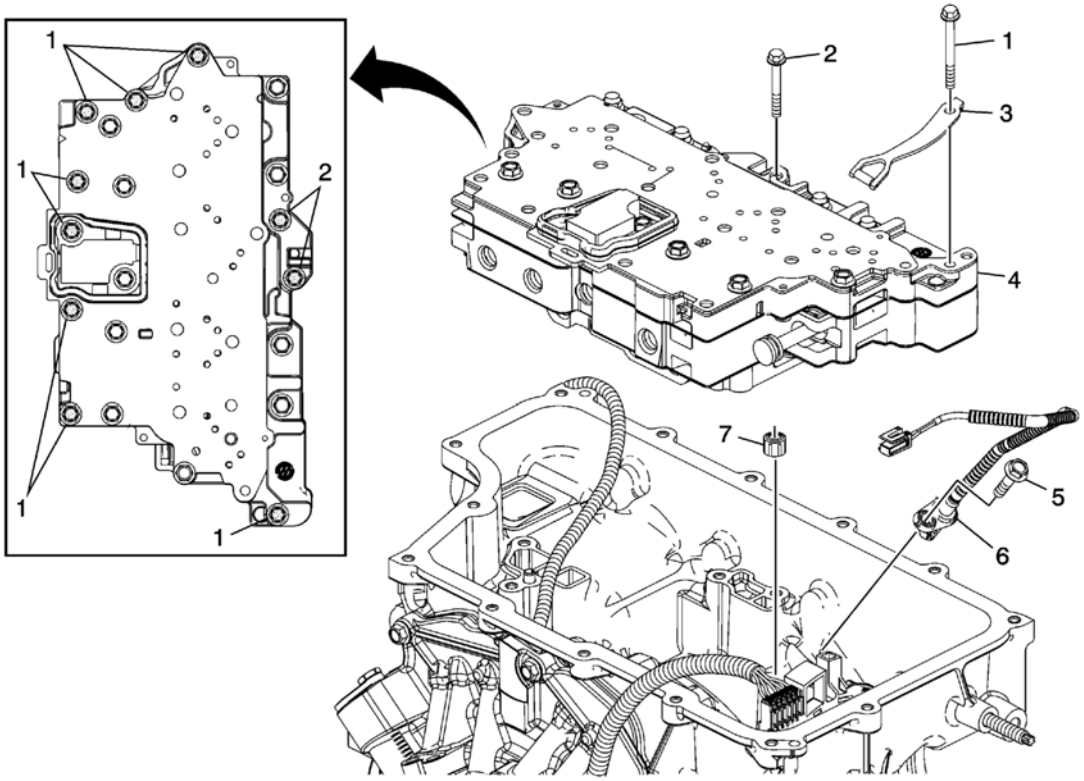

Fig. 5: Control Valve Body Assembly And Output Speed Sensor
Courtesy of GENERAL MOTORS COMPANY

Control Valve Body Assembly and Output Speed Sensor Removal

Callout	Component Name
1	Control Valve Body Bolt M6 x 65 (Qty: 8)
2	Control Valve Body Bolt M6 x 55 (Qty: 2)
3	Manual Shaft Detent Assembly
4	Control Valve Body Assembly
5	A/Trans Output Speed Sensor Bolt M6 x 25
6	A/Trans Output Speed Sensor
7	1-2-3-4 Clutch Fluid Passage Seal **NOTE:** **The seal is not reusable.**

CASE COVER AND 3-5-REVERSE AND 4-5-6 CLUTCH HOUSING REMOVAL

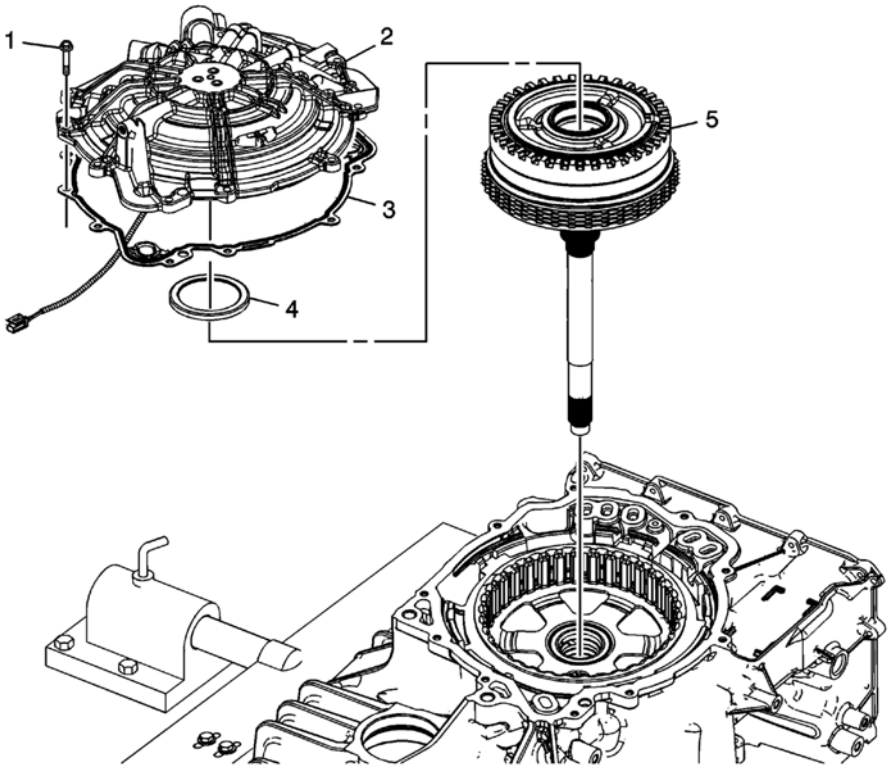

Fig. 6: Identifying Case Cover, 3-5-Reverse & 4-5-6 Clutch Housing
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	A/Trans Case Cover Assembly Bolt M6 x 30 (Qty: 10)
2	A/Trans Case Cover Assembly **CAUTION:** **Use care when pulling the input speed sensor wire harness through the case to avoid damaging the harness.**
3	A/Trans Case Cover Gasket **NOTE:** **The gasket is not reusable.**

Callout	Component Name
4	Input Shaft Thrust Bearing Assembly **NOTE:** **The bearing may be stuck to the case cover.**
5	3-5 Rev/4-5-6 Clutch Housing Assembly

REACTION CARRIER HUB AND 2-6 CLUTCH PLATE REMOVAL

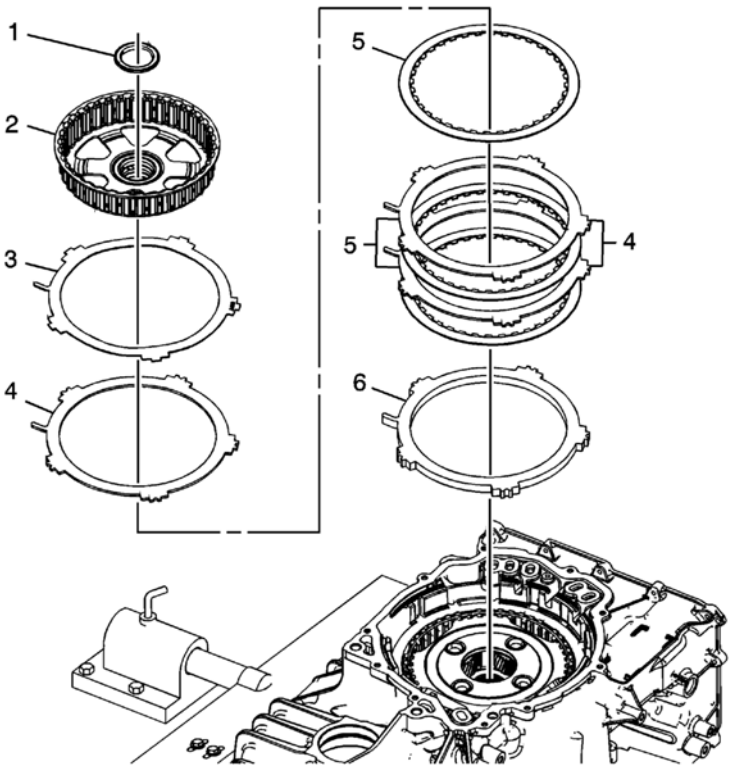

Fig. 7: Identifying Reaction Carrier Hub & 2-6 Clutch Plate
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	2-6 Clutch Hub Thrust Bearing Assembly **NOTE:** **The 2-6 clutch hub thrust bearing assembly may be stuck to the reaction**

Callout	Component Name
	carrier hub assembly.
2	Reaction Sun Gear Assembly
3	2-6 Clutch Cushion Spring
4	2-6 Clutch Plate (Qty: 3)
5	2-6 Clutch (w/Friction Material) Plate Assembly (Qty: 3)
6	2-6 Clutch Backing Plate

INPUT, REACTION, AND OUTPUT CARRIER REMOVAL

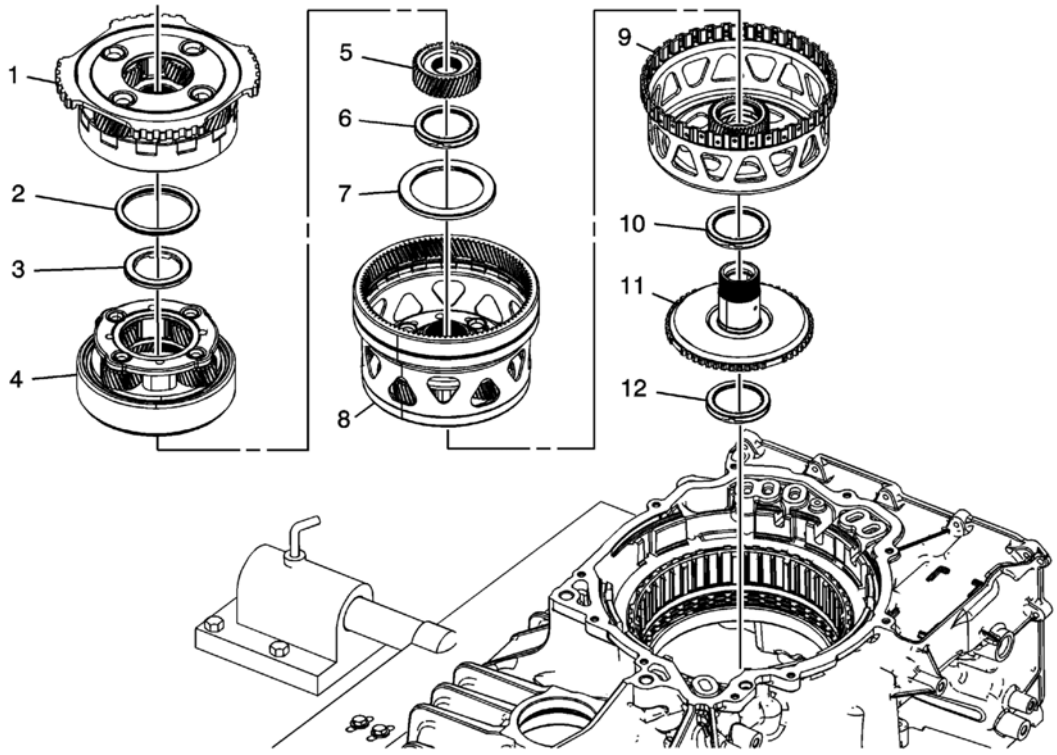

Fig. 8: View Of Input, Reaction & Output Carriers
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Reaction (w/Input Internal Gear) Carrier Assembly
2	Input Carrier Thrust Bearing Assembly
3	Input Sun Gear Thrust Bearing Assembly
4	Input (w/Output Internal Gear) Carrier Assembly
5	Input Sun Gear
6	Output Carrier Thrust Bearing Assembly
7	Output Carrier Thrust Bearing Assembly
8	Output Carrier Assembly
9	Output Sun Gear Assembly
10	Front Differential Transfer Drive Gear Input Hub Bearing Assembly

Callout	Component Name
11	Output Carrier Transfer Drive Gear Hub Assembly
12	Output Carrier Transfer Drive Gear Hub Bearing Assembly **NOTE:** **The bearing may be stuck to the support assembly.**

LOW AND REVERSE CLUTCH PLATE REMOVAL

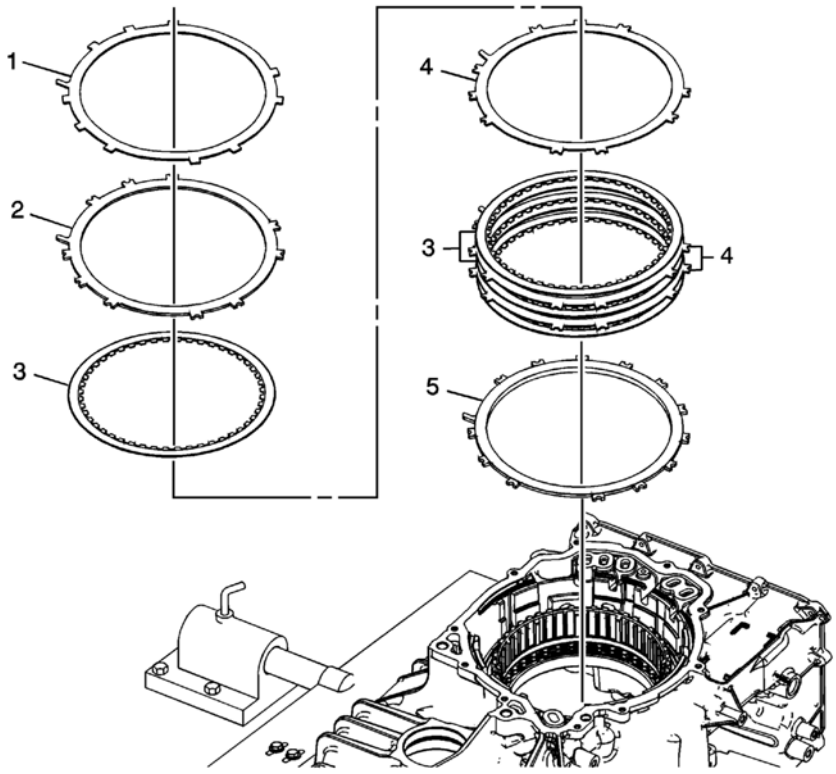

Fig. 9: Identifying Low & Reverse Clutch Plate
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Low and Reverse Clutch Cushion (Waved) Spring
2	Low and Reverse Clutch Apply Plate
3	Low and Reverse Clutch (w/Friction Material) Plate Assembly (Qty: 4)
4	Low and Reverse Clutch Plate (Qty: 3)
5	Low and Reverse Clutch Backing Plate

LOW AND REVERSE CLUTCH AND 1-2-3-4 CLUTCH PLATE REMOVAL

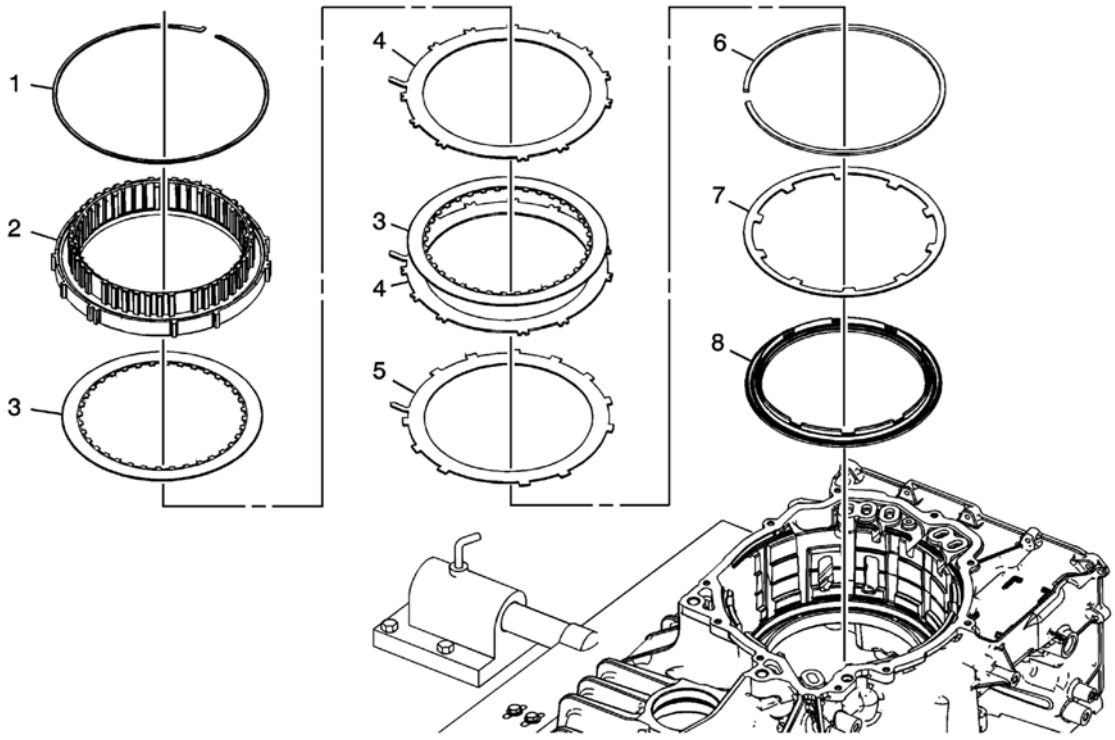

Fig. 10: Identifying Low, Reverse Clutch & 1-2-3-4 Clutch Plates
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Low and Reverse Clutch Retainer Ring
2	Low and Reverse Clutch Assembly
3	1-2-3-4 Clutch (w/Friction Material) Plate Assembly (Qty: 2)
4	1-2-3-4 Clutch Plate (Qty: 2)
5	1-2-3-4 Clutch (Waved) Plate
6	1-2-3-4 Clutch Spring Retainer Ring
7	1-2-3-4 Clutch Spring
8	1-2-3-4 Clutch Piston **NOTE:** • **Use pliers to remove the piston.** • **Inspect the piston seals for damage and/or**

Callout	Component Name
	wear. **The** **piston is** **reusable.**

TORQUE CONVERTER AND DIFFERENTIAL HOUSING, FRONT DIFFERENTIAL TRANSFER DRIVE GEAR, AND FRONT DIFFERENTIAL CARRIER REMOVAL

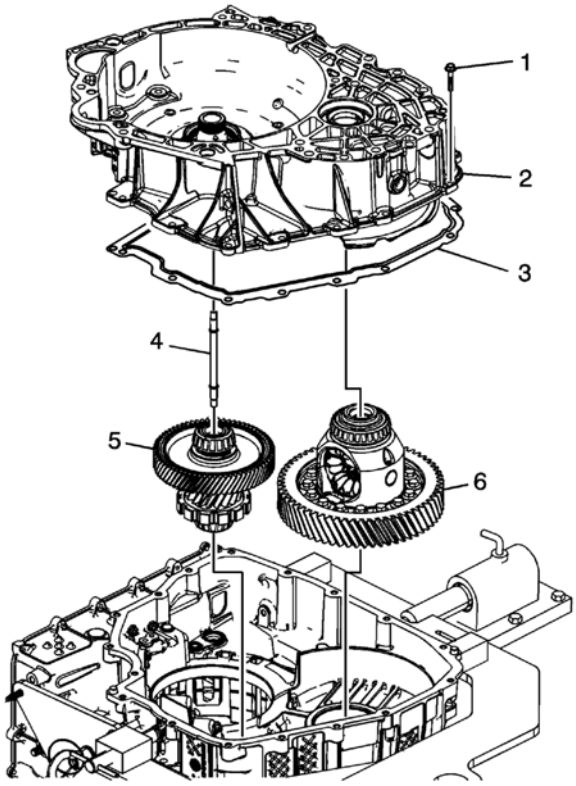

Fig. 11: Identifying Torque Converter, Differential Housing, Front Differential Transfer Drive Gear & Front Differential Carrier
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Torque Converter and Differential Housing Bolt M8 x 35 (Qty: 17)
2	Torque Converter, Support and A/Trans Fluid Pump Housing Assembly
3	Torque Converter Housing Outer Seal **NOTE:** **The seal is not reusable.**
4	Front Differential Drive Pinion Gear Lube Tube
5	Front Differential Drive Pinion (w/Transfer Gear) Gear Assembly
6	Front Differential Carrier Assembly

FLUID TROUGH REMOVAL

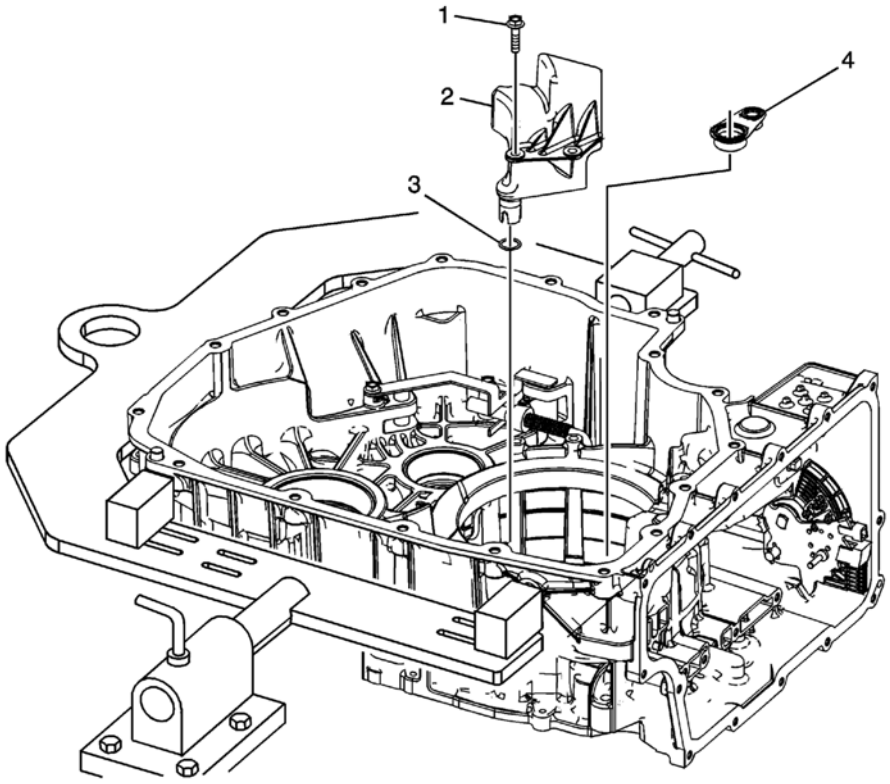

Fig. 12: Identifying Fluid Trough
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	A/Trans Fluid Trough Bolt M6 x 25 (Qty: 1)
2	A/Trans Fluid Trough
3	A/Trans Fluid Trough (O-Ring) Seal
4	A/Trans Fluid Pump Outlet Seal Assembly **NOTE:** **The seal assembly is not reusable.**

MANUAL SHIFT DETENT LEVER WITH SHAFT POSITION SWITCH ASSEMBLY AND PARK PAWL ACTUATOR REMOVAL

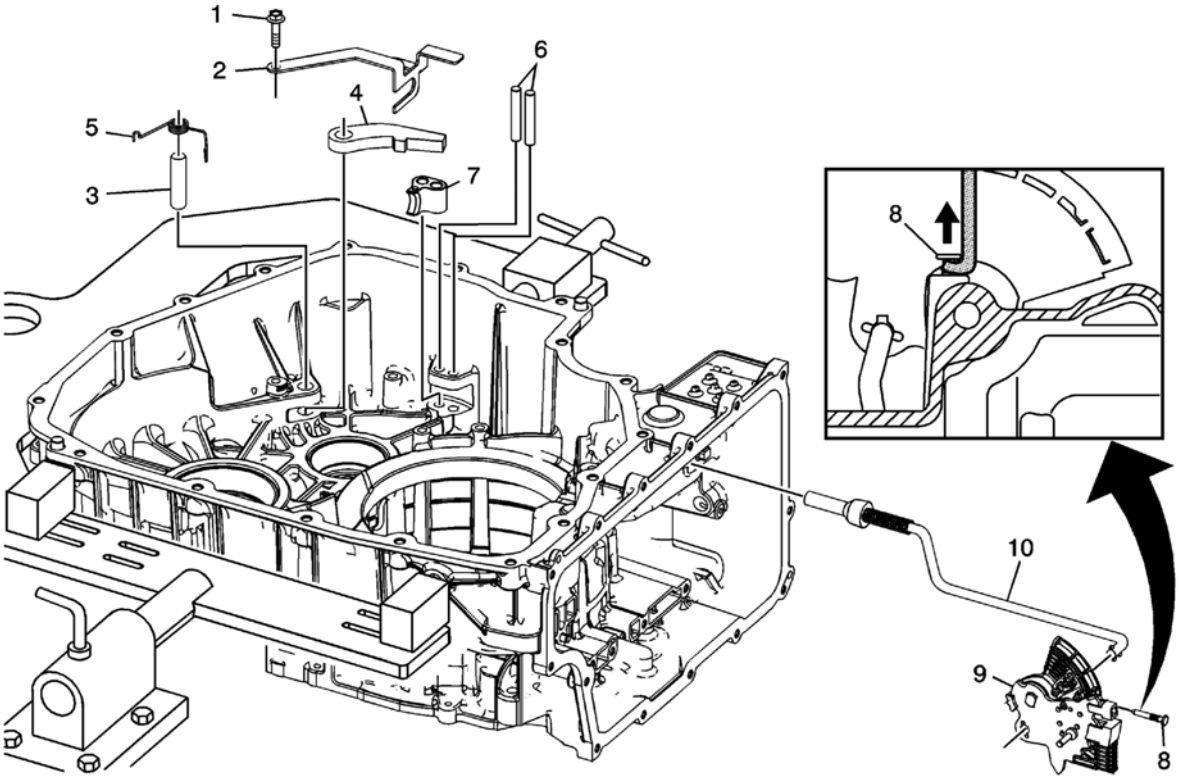

Fig. 13: Identifying Manual Shift Detent Lever With Shaft Position Switch Assembly & Park Pawl Actuator

Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Park Pawl Actuator Bracket Bolt M6 x 25 (Qty: 2)
2	Park Pawl Actuator Bracket
3	Park Pawl Shaft
4	Park Pawl
5	Park Pawl Spring
6	Park Pawl Actuator Guide Pin
7	Park Pawl Actuator Guide
8	Manual Shift Detent Lever Pin **NOTE:** • **Use a small nail puller or other suitable tool.** • **Discard the pin. The pin**

Callout	Component Name
	is not reusable. **Special Tools** • **DT 23129** Universal Seal Remover • **GE 6125-1B** Slide Hammer with Adapter For equivalent regional tools, refer to **Special Tools** .
9	Manual Shaft Detent (w/Shift Position Switch) Lever Assembly **NOTE:** **Rotate the assembly counterclockwise so the actuator rod will fit through the case opening.**
10	Park Pawl Actuator Assembly

MANUAL SHIFT SHAFT SEAL REPLACEMENT

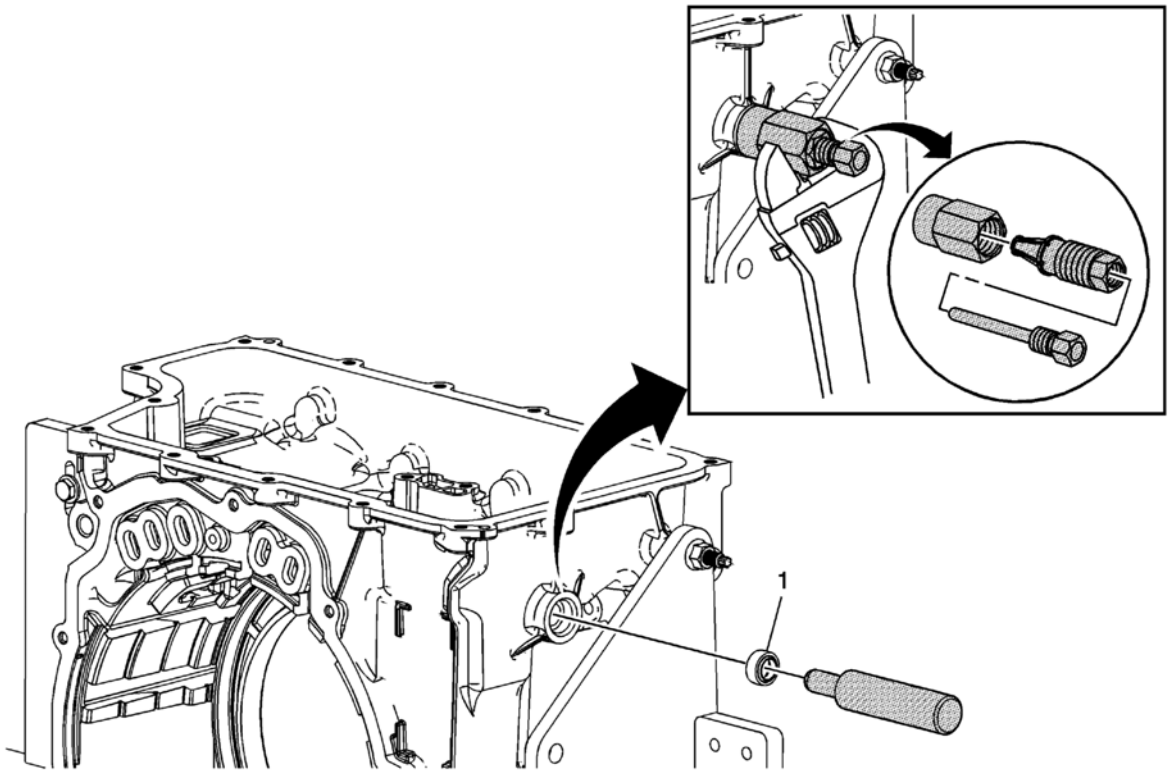

Fig. 14: Identifying Manual Shift Shaft Seal

Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Manual Shift Shaft Seal **Special Tools** • **DT 45201** Cooler Line Seal Remover • **DT 46626** Seal Installer For equivalent regional tools, refer to **Special Tools** .

FRONT WHEEL DRIVE SHAFT SEAL REPLACEMENT - CASE SIDE

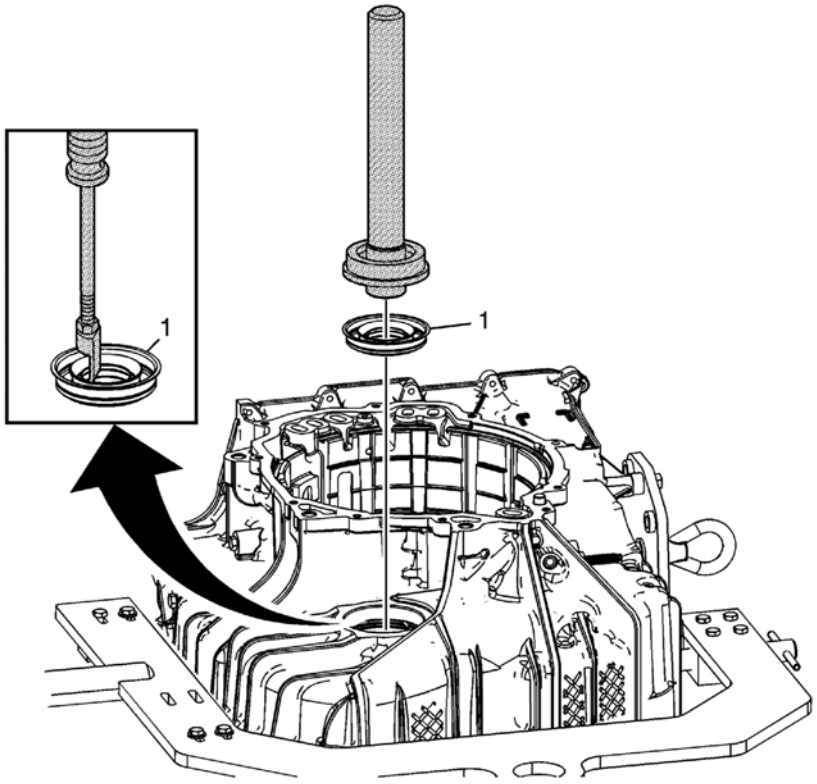

Fig. 15: Identifying Front Wheel Drive Shaft Oil Seal
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Front Wheel Drive Shaft Oil Seal Assemble **NOTE:** **Use the flat side of J 46629-A seal installer to seat the seal**

Callout	Component Name
	to the case surface. **Special Tools** • **DT 23129** Universal Seal Remover • **DT 46629-A** Seal Installer • **GE 6125-1B** Slide Hammer • **GE 8092** Driver Handle For equivalent regional tools, refer to **Special Tools** .

FRONT DIFFERENTIAL CARRIER BEARING CUP REPLACEMENT - CASE SIDE

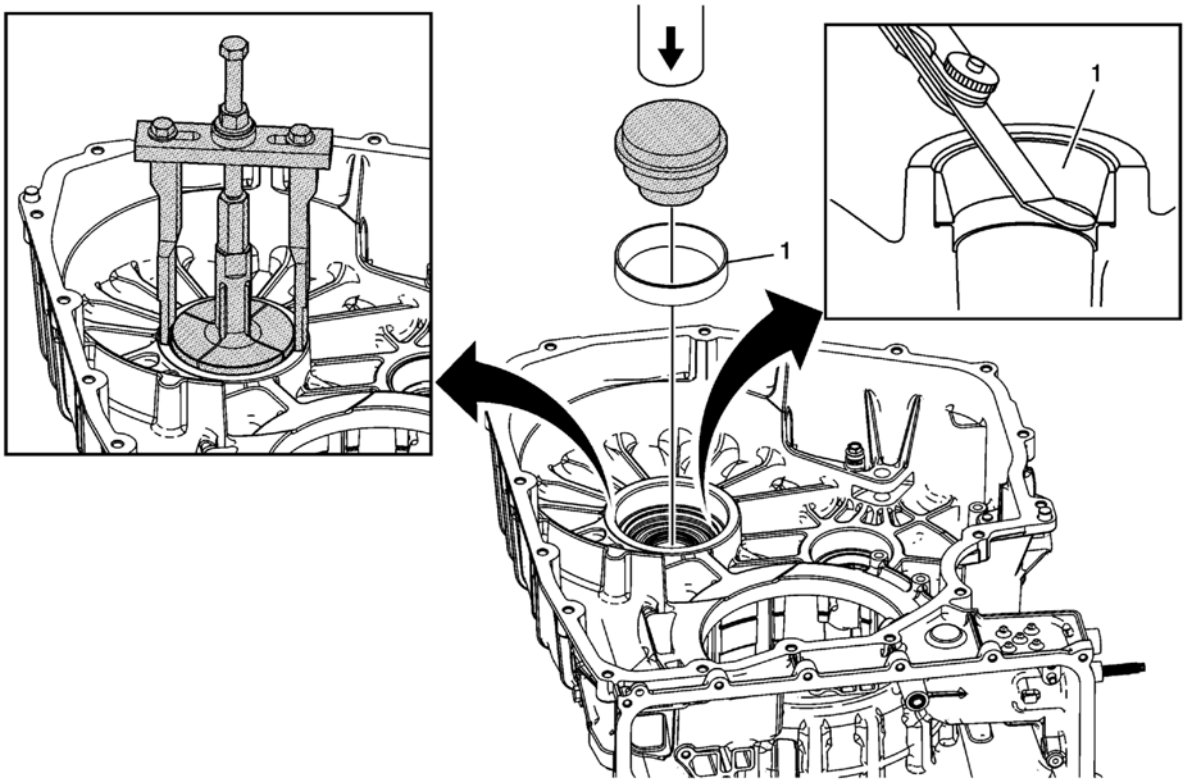

Fig. 16: Identifying Front Differential Carrier Bearing Cup
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Front Differential Bearing Cup **CAUTION:** **Support the back side of the case**

Callout	Component Name
	before installing the bearing cup. Apply a light coating of transmission fluid to the bore before pressing the cup into position. Install the bearing cup until it stops moving. Applying excessive pressure to the bearing cup once it is seated could cause damage to the case casting. **CAUTION: An unseated or improperly installed bearing cup will result in premature bearing failure. Visually inspect the bearing cup to insure there is"no gap" between the case, thrust washer, and the bearing cup. Use of a**

Callout	Component Name
	feeler gauge may assist in identifying a bearing cup that is not fully seated. **CAUTION:** **Failure to apply the lubricant will cause damage to the bolt and nut threads.** **CAUTION:** **There are first and second design front differential bearing cups. First design bearing cups are manufactured by Timken. Second design bearing cups are manufactured by NSK. Second design bearing cups require DT-45087-A cup installer. If installing second design bearing cups, second design front**

Callout	Component Name
	differential carrier bearings must be used. All four parts must be kept as a set to prevent damage to the transmission. **NOTE:** • **Tighten DT-47927-2 which is part of DT-47927 cup remover until it fits snugly on the bearing cup.** • **Adjust DT 45124 removal bridge so it sits on the torque converter housing surface just beyond the bearing cup opening.** • **Apply the extreme pressure lubricant DT 23444-A**

Callout	Component Name
	extreme press lubricant to the puller bolt threads to prevent damage to the bolt threads during bearing cup removal. • **Hold the puller bridge bolt and turn the nut to remove the bearing cup.** **Special Tools** • **DT 23444-A** Extreme Press Lubricant - 1/4 Ounce Tube • **DT-45087** Bearing Cup Installer • **DT-45087-A** Bearing Cup Installer • **DT 45124** Removal Bridge • **DT-47927** Bearing Cup Remover For equivalent regional tools, refer to **Special Tools** .

FRONT DIFFERENTIAL DRIVE PINION GEAR BEARING CUP AND LUBRICANT DAM REPLACEMENT

Removal

Removal

Callout	Component Name
1	Front Differential Drive Pinion Gear Bearing Cup **CAUTION:** **Failure to apply the lubricant will cause damage to the bolt and nut threads.** **NOTE:** • **Tighten DT-45094 cup remover until it fits snugly on the bearing cup.**

Callout	Component Name
	• Adjust DT 45124 removal bridge so it sits on the case surface just beyond the bearing cup opening. • Apply the extreme pressure lubricant DT 23444-A extreme press lubricant to the puller bolt threads to prevent damage to the bolt threads during bearing cup removal. • Hold the puller bridge nut and turn the bolt to remove the bearing

Callout	Component Name
	cup. **Special Tools** • **DT 23444-A** Extreme Press Lubricant - 1/4 Ounce Tube • **DT-45094** Bearing Cup Remover • **DT 45124** Removal Bridge For equivalent regional tools, refer to **Special Tools** .
2	Front Differential Drive Pinion Gear Lube Dam **Special Tools** • **DT-48055** Lube Dam Removal • **GE 6125-1B** Slide Hammer with Adapter For equivalent regional tools, refer to **Special Tools** .

Installation

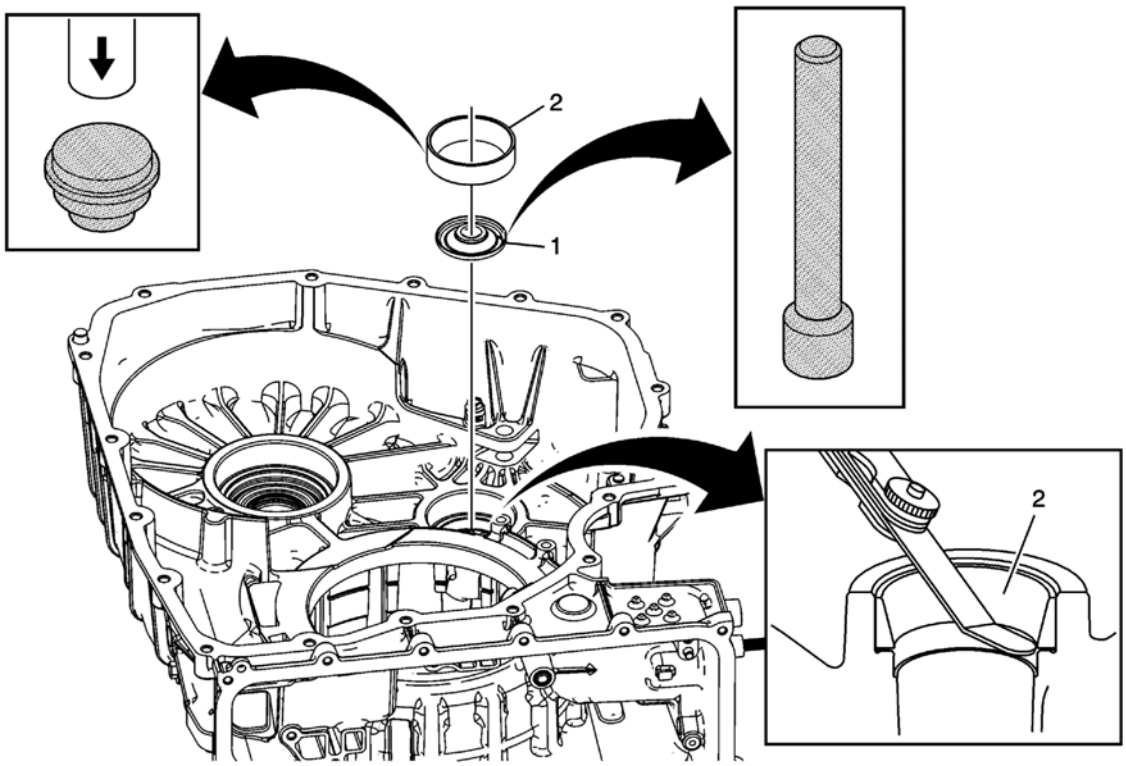

Fig. 18: View Of Front Differential Drive Pinion Gear Bearing Cup & Lube Dam
Courtesy of GENERAL MOTORS COMPANY

Installation

Callout	Component Name
1	Front Differential Drive Pinion Gear Lube Dam **Special Tools** • **DT-46630** Lube Dam Installer • **GE 8092** Driver Handle For equivalent regional tools, refer to **Special Tools** .
2	Front Differential Drive Pinion Gear Bearing Cup **CAUTION:** **Support the back side of the case before installing the bearing cup. Apply a light coating of transmission fluid to the bore before pressing the cup into position. Install the bearing cup until it stops moving. Applying excessive pressure to the bearing cup once it is seated could cause damage to the case casting.** **CAUTION:** **An unseated or improperly installed bearing cup**

Callout	Component Name
	will result in premature bearing failure. Visually inspect the bearing cup to insure there is"no gap" between the case, thrust washer, and the bearing cup. Use of a feeler gauge may assist in identifying a bearing cup that is not fully seated. **Special Tools** **DT-45087** Bearing Cup Installer For equivalent regional tools, refer to **Special Tools** .

TRANSMISSION CASE CLEANING AND INSPECTION

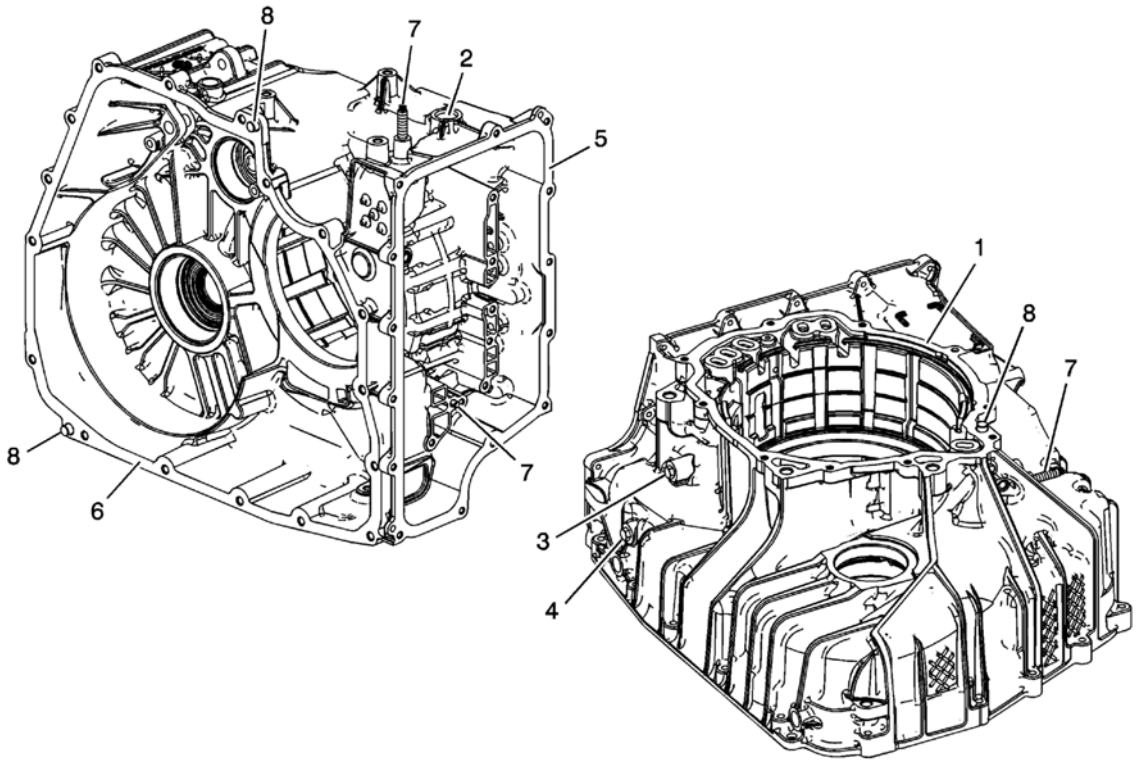

Fig. 19: Identifying Transmission Case Components
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
CAUTION: **Do not use abrasive pads or bristle devices to clean the sealing surfaces. Abrasive pads produce a fine grit that can effect transmission function. Abrasive pads can also remove enough metal to create oil leaks.**	

Callout	Component Name
CAUTION: **After cleaning the transmission components, allow to air dry. Do not use cloth or paper towels in order to dry any transmission components. Lint from the towels can cause component failure.** **CAUTION:** **Do not reuse cleaning solvents. Previously used solvents may deposit sediment which may damage the component.** **Preliminary Procedures** 1. Thoroughly clean the transmission case assembly, including case threads, with clean solvent. 2. Clean gasket sealing surfaces. Remove all residual gasket material. 3. Inspect all threaded holes. If necessary, repair any thread damage.	
1	Case Cover Sealing Surface
2	Manual Shift Shaft Seal Surface **NOTE:** **Refer to Manual Shift Shaft Seal Replacement.**

Callout	Component Name
3	Fluid Pressure Test Plug
4	Fluid Drain Plug
5	Control Valve Body Cover Sealing Surface
6	Torque Converter Housing Sealing Surface
7	Transmission Fluid Cooler Pipe Stud M8 x 30.5 (Qty: 2) **CAUTION:** **Refer to** **Fastener Caution .** **Tighten** 12 N.m (106 lb in)
8	Transmission Case Cover Locator Pin **Procedure** Inspect the locating pins to be fully seated in case.

MANUAL SHIFT DETENT LEVER WITH SHAFT POSITION SWITCH ASSEMBLY AND PARK PAWL ACTUATOR INSTALLATION

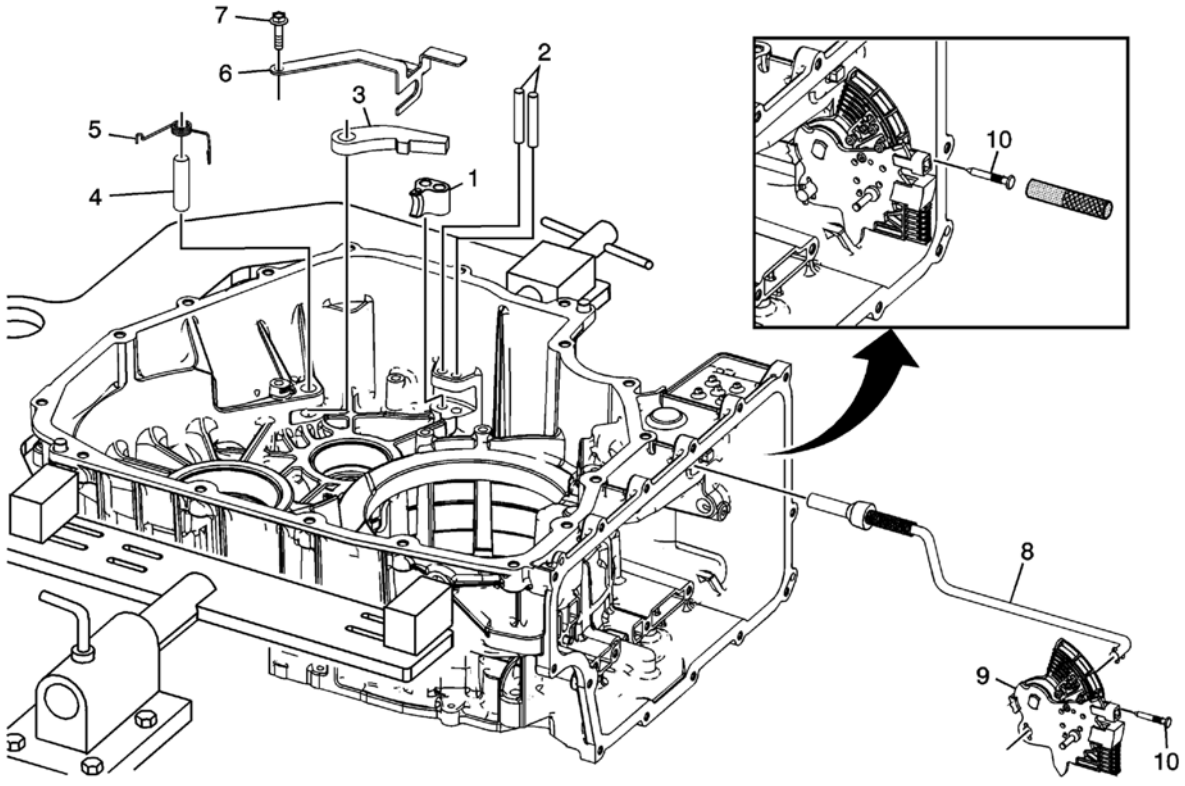

Fig. 20: Identifying Manual Shift Detent Lever With Shaft Position Switch Assembly & Park Pawl Actuator

Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Park Pawl Actuator Guide
2	Park Pawl Actuator Guide Pin
3	Park Pawl
4	Park Pawl Shaft
5	Park Pawl Spring
6	Park Pawl Actuator Bracket
7	Park Pawl Actuator Bracket Bolt M6 x 25 (Qty: 2) **CAUTION:** **Refer to Fastener Caution .** **Tighten** 12 N.m (106 lb in).
8	Park Pawl Actuator Assembly **NOTE:** **Install the park pawl actuator assembly onto the detent lever assembly.**
9	Manual Shaft Detent (w/Shift Position Switch) Lever Assembly **NOTE:** • **Rotate the assembly clockwise so the actuator rod will fit through the case opening.** • **Lubricate shaft with ATF to prevent damage to the**

Callout	Component Name
	manual shift shaft seal.
10	Manual Shift Shaft Pin **CAUTION:** **Use J 41229 to install the manual shaft pin at the correct height in order to properly secure the manual shaft. If you install the pin too deep, the case bore may crack.** **Procedure** 1. Use a NEW pin to ensure proper engagement to the case. 2. Inspect pin installed height is within 6.5-7.5 mm (0.25-0.30 in). **Special Tools** **DT 41229** Manual Shaft Pin Installer For equivalent regional tools, refer to **Special Tools** .

FLUID TROUGH INSTALLATION

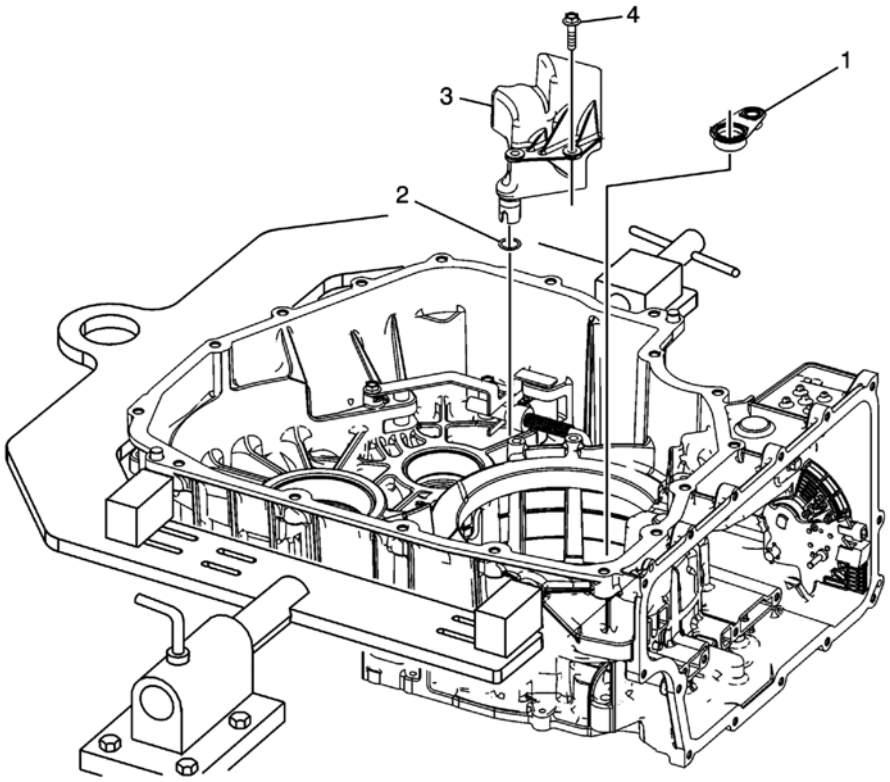

Fig. 21: Identifying Fluid Trough Components

5	Drive Sprocket Thrust Washer
6	A/Trans Fluid Pump Bolt M6 x 25 (Qty: 3)
7	A/Trans Fluid Pump Assembly
8	Drive Link Assembly **NOTE:** **Link and sprockets will be removed as an assembly.**
9	Drive Sprocket Thrust Washer **NOTE:** **Drive sprocket thrust**

Callout	Component Name
	washer may be stuck to the torque converter housing.
10	Driven Sprocket Thrust Washer

FRONT DIFFERENTIAL CARRIER BEARING CUP AND WASHER REPLACEMENT - TORQUE CONVERTER HOUSING SIDE

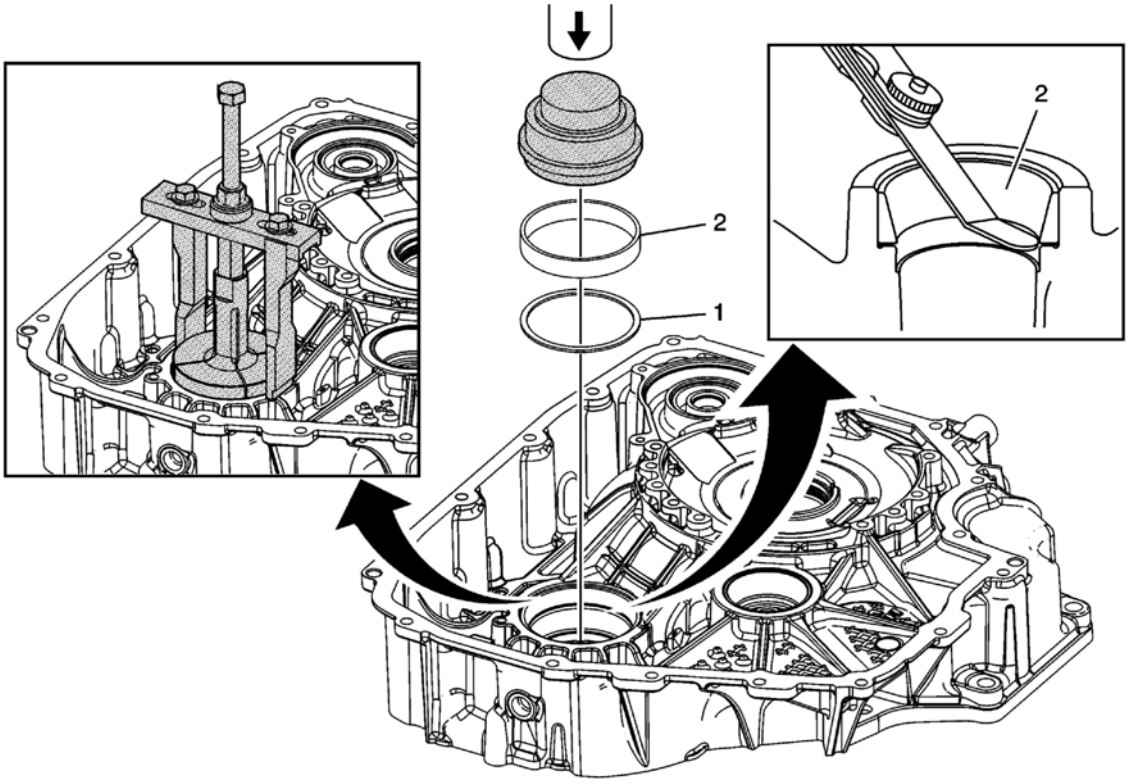

Fig. 23: Identifying Front Differential Carrier Bearing Cup & Washer
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedures • Do not install the bearing cup until after the selective washer measurement has been performed. • Install the correct differential bearing washer as determined by the thrust washer measurement procedure. Refer to **Front Differential Drive Pinion Gear Bearing Thrust Washer and Front Differential Bearing Washer Measurement**.	
1	Front Differential Bearing Thrust Washer
2	Front Differential Carrier Bearing Cup **CAUTION:**

Callout	Component Name
	Support the back side of the torque converter housing before installing the bearing cup. Apply a light coating of transmission fluid to the bore before pressing the cup into position. Install the bearing cup until it stops moving. Applying excessive pressure to the bearing cup once it is seated could cause damage to the torque converter housing casting. **CAUTION: An unseated or improperly installed bearing cup will result in premature bearing failure. Visually inspect the bearing cup to insure**

Callout	Component Name
	there is"no gap" between the converter housing, thrust washer, and the bearing cup. Use of a feeler gauge may assist in identifying a bearing cup that is not fully seated. CAUTION: Failure to apply the lubricant will cause damage to the bolt and nut threads. CAUTION: There are first and second design front differential bearing cups. First design bearing cups are manufactured by Timken. Second design bearing cups are manufactured by NSK. Second design bearing cups

Callout	Component Name
	require DT-45087-A cup installer. If installing second design bearing cups, second design front differential carrier bearings must be used. All four parts must be kept as a set to prevent damage to the transmission. **Procedure** 1. Tighten DT 47927-1 which is part of **DT-47927** bearing cup remover until it fits snugly on the bearing cup. 2. Adjust **DT 45124** remover bridge so it sits on the torque converter housing surface just beyond the bearing cup opening. 3. Apply the extreme pressure lubricant supplied with **DT 23444-A** extreme press lubricant to the puller bolt threads to prevent damage to the bolt threads during bearing cup removal. 4. Hold the puller bridge bolt and turn the nut to remove the bearing cup. **Special Tools** • **DT 23444-A** Extreme Press Lubricant - 1/4 Ounce Tube • **DT-45087** Bearing Cup Installer • **DT-45087-A** Bearing Cup Installer • **DT 45124** Remover Bridge • **DT-47927** Bearing Cup Remover For equivalent regional tools, refer to **Special Tools** .

FRONT DIFFERENTIAL DRIVE PINION BEARING CUP, WASHER, AND LUBRICANT DAM REPLACEMENT - TORQUE CONVERTER HOUSING SIDE

Bearing Cup, Washer and Lubricant Dam Removal

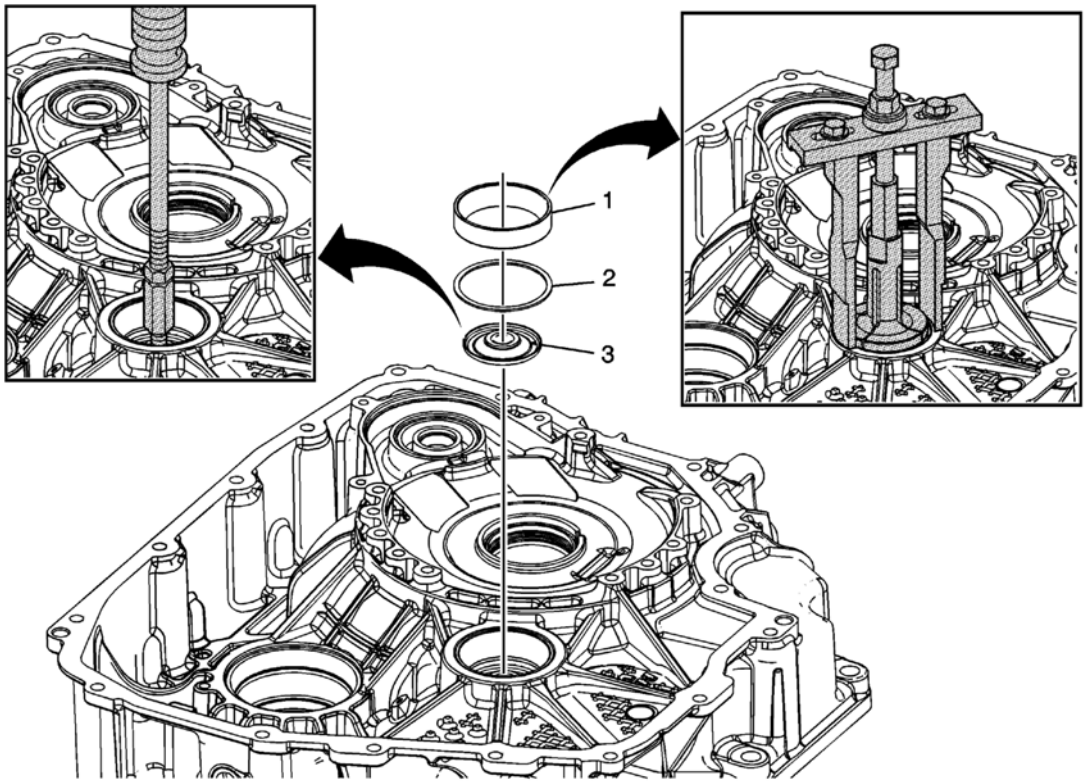

Fig. 24: View Of Front Differential Drive Pinion Bearing Cup, Washer & Lube Dam
Courtesy of GENERAL MOTORS COMPANY

Bearing Cup, Washer and Lubricant Dam Removal

Callout	Component Name
Preliminary Procedure Do not install the bearing cup until after the selective washer measurement has been performed.	
1	Front Differential Drive Pinion Gear Bearing Cup **CAUTION:** **Failure to apply the lubricant will cause damage to the bolt and nut threads.** **Procedure** 1. Tighten **DT-45094** bearing cup remover until it fits snugly on the bearing cup. 2. Adjust **DT 45124** removal bridge so it sits on the torque converter housing surface just beyond the bearing cup opening. 3. Apply the extreme pressure lubricant **DT 23444-A** extreme press lubricant to the puller bolt threads to prevent damage to the bolt threads during bearing cup removal.

Callout	Component Name
	4. Hold the puller bridge bolt and turn the nut to removal the bearing cup. **Special Tools** • **DT 23444-A** Extreme Press Lubricant - 1/4 Ounce Tube • **DT-45087** Transfer Shaft and Differential Bearing Cup Installer • **DT-45094** Bearing Cup Remover • **DT 45124** Removal Bridge • **DT-47927** Bearing Cup Remover For equivalent regional tools, refer to **Special Tools** .
2	Front Differential Drive Pinion Gear Bearing Thrust Washer
3	Front Differential Drive Pinion Gear Lube Dam **Special Tools** • **DT-48055** Lube Dam Remover • **GE 6125-1B** Slide Hammer with Adapter or equivalent For equivalent regional tools, refer to **Special Tools** .

Bearing Cup, Washer and Lubricant Dam Installation

Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Torque Converter Fluid Seal **CAUTION:** **Support the back side of the torque**

Callout	Component Name
	converter housing while installing the seal. Install the seal until it stops moving. Applying excessive pressure to the seal once it is seated could cause damage to the torque converter housing casting. **Special Tools** • **DT 23129** Universal Seal Remover • **DT 49861** Seal Installer • **GE 6125-1B** Slide Hammer with Adapter or equivalent For equivalent regional tools, refer to **Special Tools** .

FRONT DIFFERENTIAL TRANSFER DRIVE GEAR SUPPORT ASSEMBLY DISASSEMBLE

Seal Removal

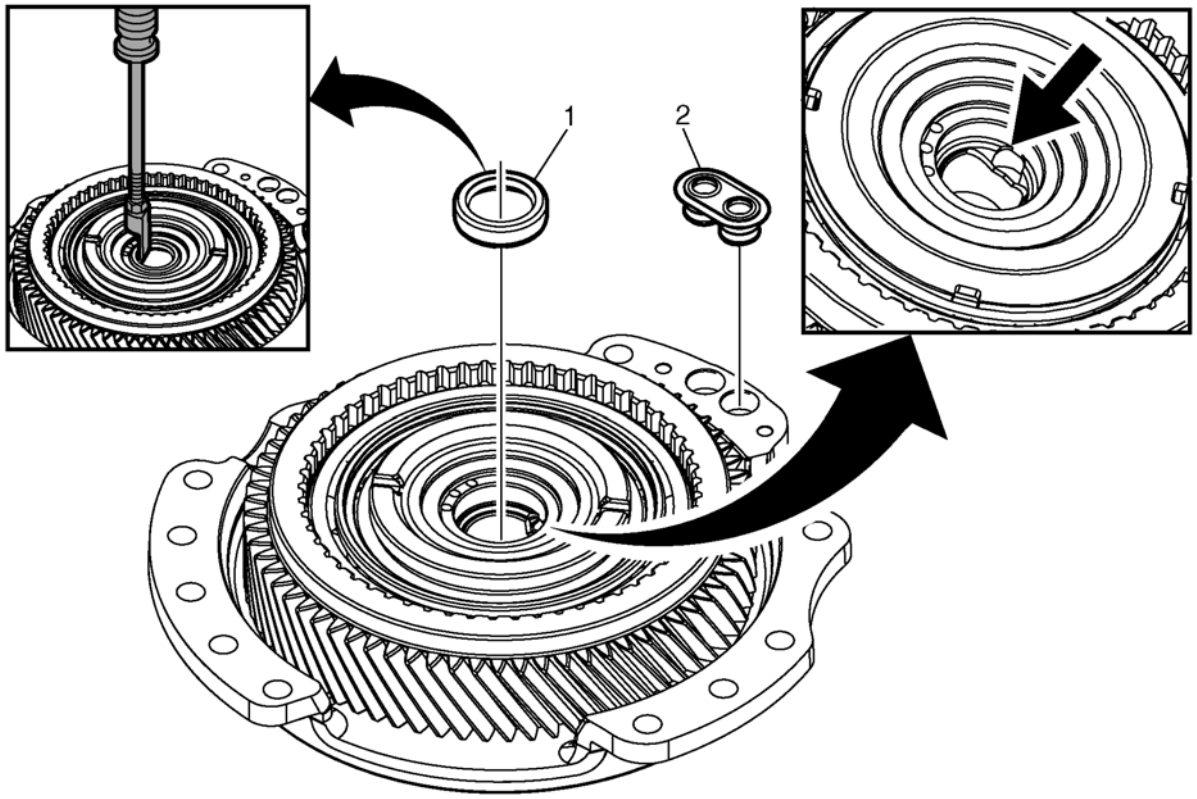

Fig. 29: Identifying Front Differential Transfer Drive Gear Support Seal
Courtesy of GENERAL MOTORS COMPANY

Seal Removal

Callout	Component Name
CAUTION: **Do not remove the transfer drive gear bearing retaining nut. The drive gear and bearing are not serviceable. Removing the retaining nut will damage the support.**	

Preliminary Procedure

- Inspect the support assembly for damage or wear to the splines, bushings, machined surfaces and threaded holes.

Callout	Component Name
• Inspect the transfer drive gear for damage or wear. • Inspect the transfer drive gear bearing assembly for proper operation. • The bearing should roll smoothly and quietly.	
1	Front Differential Transfer Drive Gear Support Seal **Special Tools** • **DT 23129** Universal Seal Remover • **GE 6125-1B** Slide Hammer with Adapter or equivalent For equivalent regional tools, refer to **Special Tools** .

Differential Thrust Washer Gauge Installation

Callout	Component Name
1	Front Differential Carrier Assembly **NOTE:** **Install the differential assembly and the pinion gear assembly together to avoid interference with the**

Callout	Component Name
	gears during installation.
2	Front Differential Drive Pinion (w/Transfer Gear) Gear Assembly **NOTE:** **Install the differential assembly and the pinion gear assembly together to avoid interference with the gears during installation.**
3	Front Differential Drive Pinion Gear Bearing Cup **NOTE:** **After placing the bearing cup on the gear, place DT 47800-2 which is part of DT-47800 selection gauge kit , onto the bearing cup.** **Special Tools** **DT-47800** Thrust Washer Selection Gauge Kit For equivalent regional tools, refer to **Special Tools** .
4	Front Differential Carrier Bearing Cup **NOTE:** **After placing the bearing cup on the gear, place DT 47800-1 which is part of DT-47800**

Callout	Component Name
	selection gauge kit , onto the bearing cup. **Special Tools** **DT-47800** Thrust Washer Selection Gauge Kit For equivalent regional tools, refer to **Special Tools** .
5	Torque Converter Housing Outer Seal

Callout	Component Name
6	Torque Converter and Support and A/Trans Fluid Pump Housing Assembly **NOTE:** • **Install 2 DT 47800-6 which is part of DT-47800 selection gauge kit , into a case threaded hole at approximately 180 degrees apart.** • **Some alignment of DT 47800-1 and 2 which is part of DT-47800 selection gauge kit , may be required while lowering the TC housing onto the case.** • **Install DT 47800-3 which is part of DT-47800 selection gauge kit , spacer over DT 47800-6.** **Special Tools** **DT-47800** Thrust Washer Selection Gauge Kit For equivalent regional tools, refer to **Special Tools** .

Torque Sequence

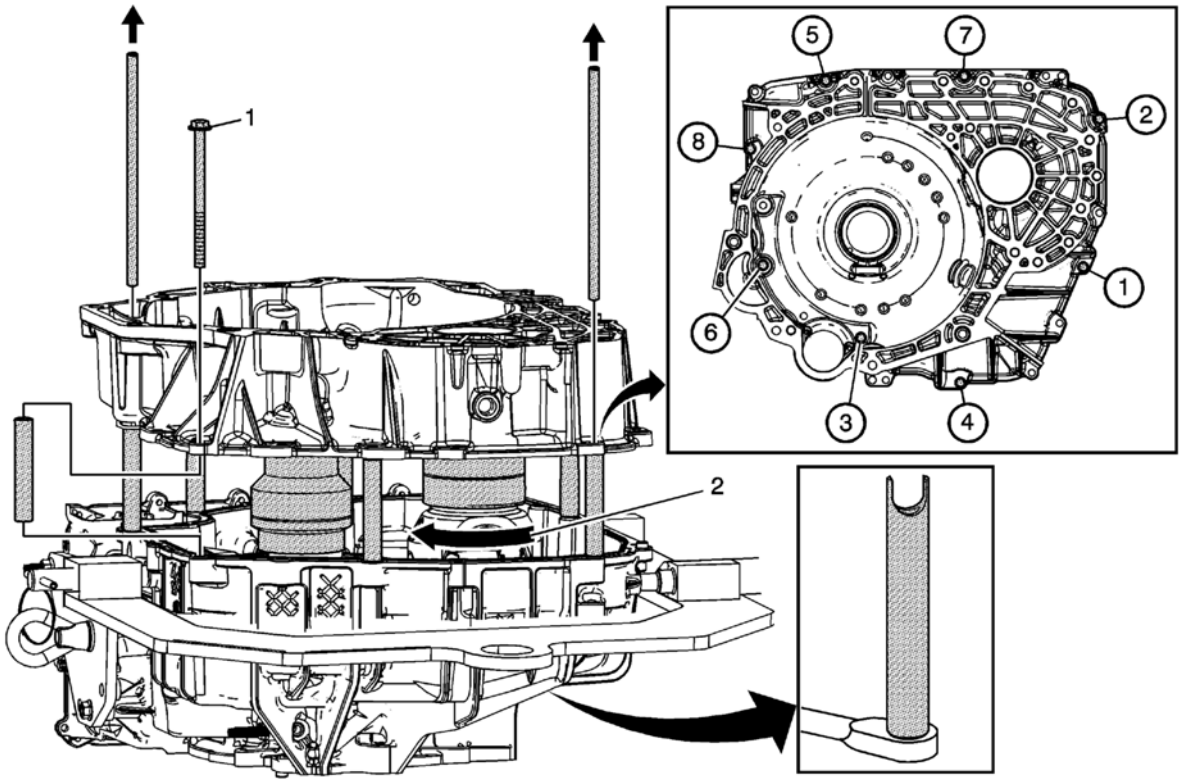

Fig. 36: Identifying Front Differential Carrier Assembly Torque Sequence
Courtesy of GENERAL MOTORS COMPANY

Torque Sequence

Callout	Component Name
1	Spacer Bolt M8 x 127 (Qty: 8) **CAUTION:** **Refer to Fastener Caution .** **Procedure** 1. Install the remaining spacers evenly at every other bolt hole. 2. Remove the DT 47800-6 which is part of **DT-47800** selection gauge kit , guide pins and install spacer bolts in all bolt holes at spacer locations. 3. Tighten the bolts in sequence. **Tighten** 30 N.m (22 lb ft) **Special Tools** **DT-47800** Thrust Washer Selection Gauge Kit For equivalent regional tools, refer to **Special Tools** .

Callout	Component Name
2	Front Differential Carrier Assembly **CAUTION:** **If the bearings are not properly seated into the bearing cups, the washer selection will be inaccurate and the bearing pre-load will be set too low. Low bearing pre-load will cause premature failure of the front differential drive pinion gear.** **Procedure** Rotate the differential assembly 10 revolutions to allow the bearings to seat into the cups. **NOTE:** **Differential rotating tool DT-47793 differential rotating tool can be used to rotate the differential from the case side.** **Special Tools** **DT-47793** Differential Rotating Tool For equivalent regional tools, refer to **Special Tools** .

Differential Thrust Washer Selection

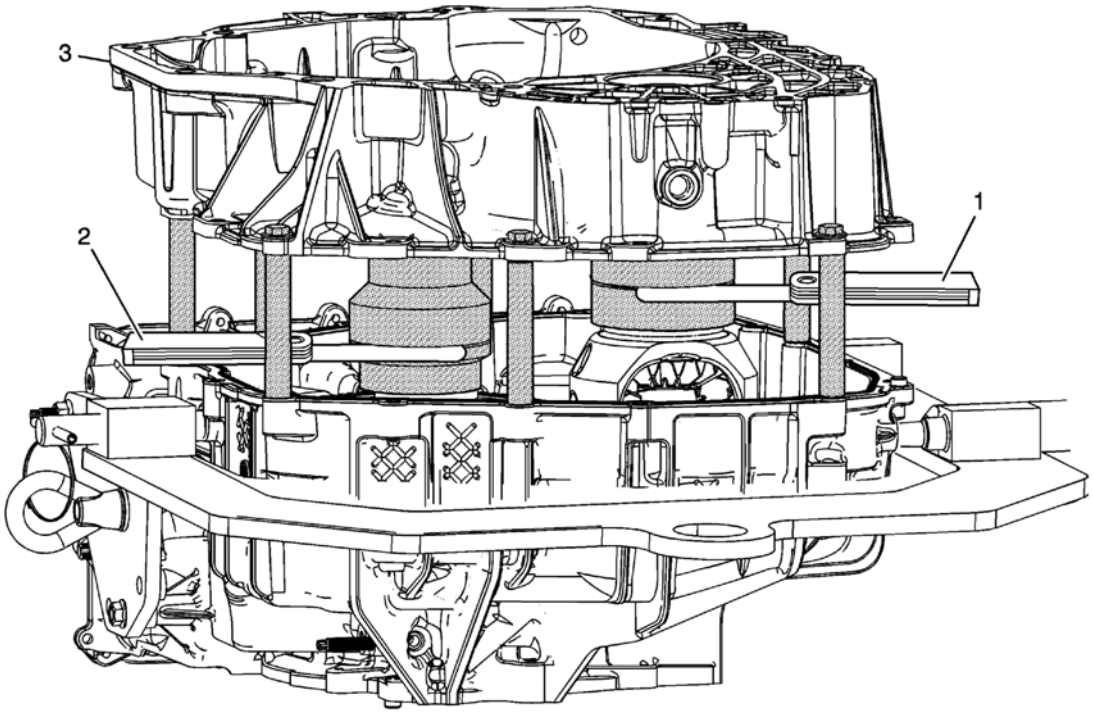

Fig. 37: Identifying Differential Thrust Washer Selection
Courtesy of GENERAL MOTORS COMPANY

Differential Thrust Washer Selection

Callout	Component Name
CAUTION: **Improper thrust washer selection can cause insufficient taper bearing pre-load which will cause premature failure of the front differential drive pinion gear.**	
1	Front Differential Bearing Washer **Procedure** Place DT 47800-7 in the gap in DT 47800-2 which are both part of **DT-47800** selection

Callout	Component Name
	gauge kit , to determine the proper thrust washer. Choose the correct thrust washer. Refer to **Taper Bearing Preload Selective Specifications** . **NOTE:** • **Continue trying different sizes of DT 47800-7 which is part of DT-47800 selection gauge kit , until the gauge will no longer fit into the gap. The correct thrust washer size is equal to the largest blade gauge that fits into the gap.** • **Match the size of the correct DT 47800-7 blade which is part of DT-47800 selection gauge kit , to the color code in the thrust washer specification chart. The washer color coding is on the outside diameter of the washer.** • **The gap in DT 47800-2 which are both part of DT-47800 selection gauge kit may not be even.**

Callout	Component Name
	Hold the top of the gauge and rotate the bottom of the gauge to even out the gap. Take two gap measurements 180 degrees apart. Average the two measurements and select the thrust washer that is closest to the average. • **The washer color coding is on the outside diameter of the washer.** **Special Tools** **DT-47800** Thrust Washer Selection Gauge Kit For equivalent regional tools, refer to **Special Tools** .
2	Front Differential Drive Pinion Gear Bearing Thrust Washer **Procedure** Place DT 47800-7 in the gap in DT 47800-1 which are both part of **DT-47800** selection gauge kit , to determine the proper thrust washer. Choose the correct thrust washer. Refer to **Taper Bearing Preload Selective Specifications** . **NOTE:** • **Continue trying different sizes of DT 47800-7 which is part of DT-47800 selection gauge kit , until the gauge will no longer fit into**

Callout	Component Name
	the gap. The correct thrust washer size is equal to the largest gauge that fits into the gauge. • **Match the size of the correct DT 47800-7 blade which is part of DT-47800 selection gauge kit to the color code in the thrust washer selection chart.** • **The gap in DT 47800-1 which is part of DT-47800 selection gauge kit may not be even. Hold the top of the gauge and rotate the bottom of the gauge to even out the gap. Take two gap measurements 180 degrees apart. Average the two measurements and select the thrust washer that is closest to the average.** • **The washer color coding is on the outside**

Callout	Component Name
	diameter of the washer. **Special Tools** **DT-47800** Thrust Washer Selection Gauge Kit For equivalent regional tools, refer to **Special Tools** .
3	Torque Converter and Support and A/Trans Fluid Pump Housing Assembly **Procedure** 1. Remove DT 47800-3 which are both part of **DT-47800** selection gauge kit , bolts and spacers. 2. Remove the torque converter housing. 3. Remove DT 47800-1 and DT 47800-2 which are both part of **DT-47800** selection gauge kit. 4. Remove the torque converter housing seal. 5. Remove the pinion gear and differential bearing cups. 6. Install the bearing cups and thrust washers into the torque converter housing per the replacement procedures. Refer to **Front Differential Carrier Bearing Cup and Washer Replacement - Torque Converter Housing Side**, and **Front Differential Drive Pinion Bearing Cup, Washer, and Lubricant Dam Replacement - Torque Converter Housing Side**. **NOTE:** **DT 47800-1 and DT 47800-2 which are both part of DT-47800 selection gauge kit , may stick in the torque converter housing. Be careful not to drop the gauges.** **Special Tools** **DT-47800** Thrust Washer Selection Gauge Kit For equivalent regional tools, refer to **Special Tools** .

3	Front Differential Carrier Bearing Assembly **NOTE:**

Callout	Component Name
	• **AWD differential may need longer bolts, 2-3/8 x 5 x 24 thread bolts.** • **When removing the front differential carrier bearing assembly use DT 41816-2 step plate.** **Special Tools** • **DT 8433-1** Puller Bar or equivalent • **DT 22912-B** Split Plate Bearing Remover or equivalent • **DT 41816-2** Step Plate For equivalent regional tools, refer to **Special Tools** .

Installation

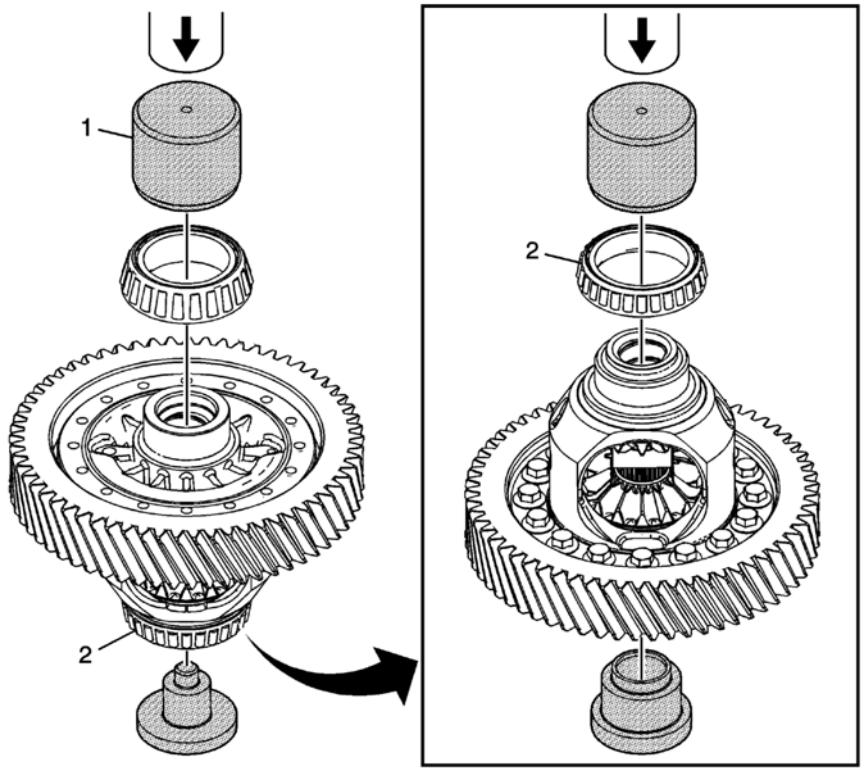

Fig. 43: View Of Front Differential Carrier Bearing
Courtesy of GENERAL MOTORS COMPANY

Installation

Callout	Component Name
1	Front Differential Carrier Bearing Assembly **CAUTION:** **Pressing against the bearing assembly can damage the bearing and cause premature bearing failure.** **CAUTION:** **There are first and second design front differential carrier bearings.**

Callout	Component Name
	First design bearings have twenty eight rollers and are manufactured by Timken. Second design bearings have 30 rollers and are manufactured by NSK. If installing second design bearings, second design front differential carrier bearing cups must be used. All four parts must be kept as a set to prevent damage to the transmission. **Special Tools** **DT-47928** Bearing Installer For equivalent regional tools, refer to **Special Tools** .
2	Front Differential Carrier Bearing Assembly **CAUTION:** **Pressing against the bearing assembly can damage the bearing and cause**

Callout	Component Name
	premature bearing failure. CAUTION: There are first and second design front differential carrier bearings. First design bearings have twenty eight rollers and are manufactured by Timken. Second design bearings have 30 rollers and are manufactured by NSK. If installing second design bearings, second design front differential carrier bearing cups must be used. All four parts must be kept as a set to prevent damage to the transmission. Special Tools

Callout	Component Name
	DT-47928 Bearing Installer For equivalent regional tools, refer to **Special Tools** .

FRONT DIFFERENTIAL CARRIER CLEANING AND INSPECTION

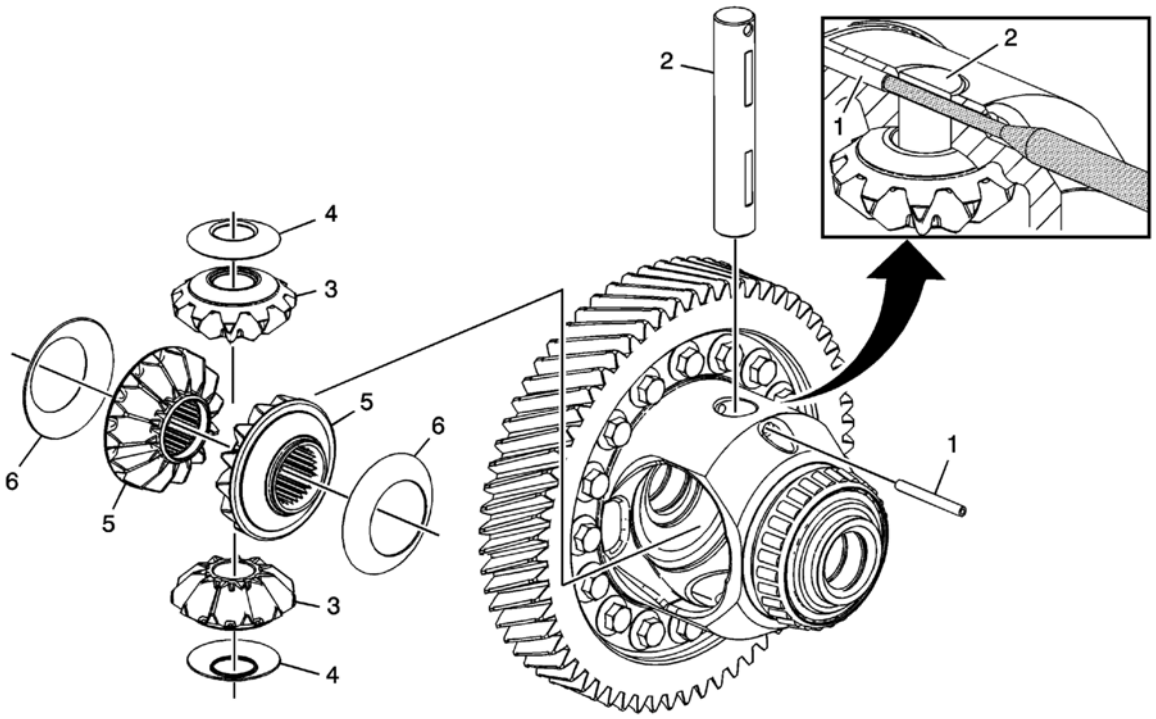

Fig. 44: Identifying Front Differential Carrier Components
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
CAUTION: **After cleaning the transmission components, allow to air dry. Do not use cloth or paper towels in order to dry any transmission components. Lint from the towels can cause component**	

Callout	Component Name
failure. **CAUTION:** **Do not reuse cleaning solvents. Previously used solvents may deposit sediment which may damage the component.** **CAUTION:** **Keep the thrust washers with gear it was matched to. The thrust washers are selective sizes and it is difficult to identify the proper washer thickness. Improper assembly can cause premature failure of the differential assembly.** **Preliminary Procedure** Clean and inspect the differential assembly, pinion gears and thrust washers for scoring, wear or damage. The differential assembly is only serviced as an assembly.	
1	Front Differential Pinion Gear Shaft Retainer **NOTE:** **Discard and use a new**

Callout	Component Name
	retainer. **Special Tools** 3/16 in (5 mm) 7 in Punch or equivalent For equivalent regional tools, refer to **Special Tools** .
2	Front Differential Pinion Gear Shaft
3	Front Differential Pinion Gears
4	Front Differential Carrier Thrust Washers
5	Front Differential Pinion Side Gears
6	Front Differential Side Gear Thrust Washer

FRONT DIFFERENTIAL DRIVE PINION GEAR AND CARRIER INSTALLATION

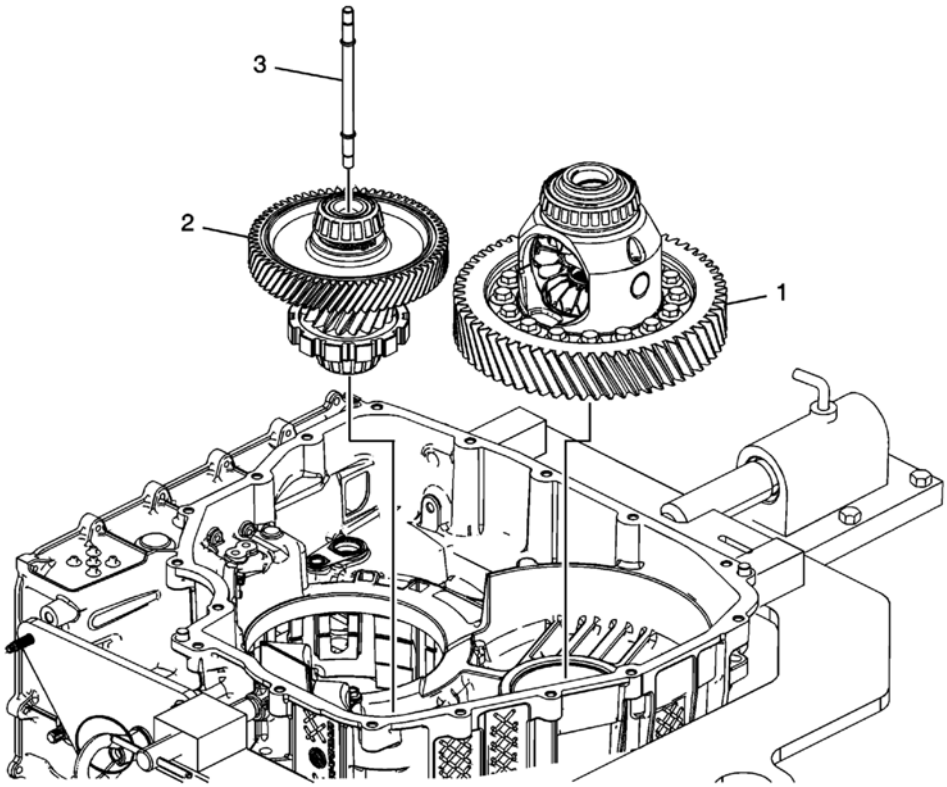

Fig. 45: Identifying Front Differential Carrier Assembly
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Front Differential Carrier Assembly **NOTE:** **Install the differential assembly and the**

Callout	Component Name
	pinion gear assembly together to avoid interference with the gears during installasion.
2	Front Differential Drive Pinion (w/Transfer Gear) Gear Assembly
3	Front Differential Drive Pinion Gear Lube Tube

TORQUE CONVERTER AND DIFFERENTIAL HOUSING INSTALLATION

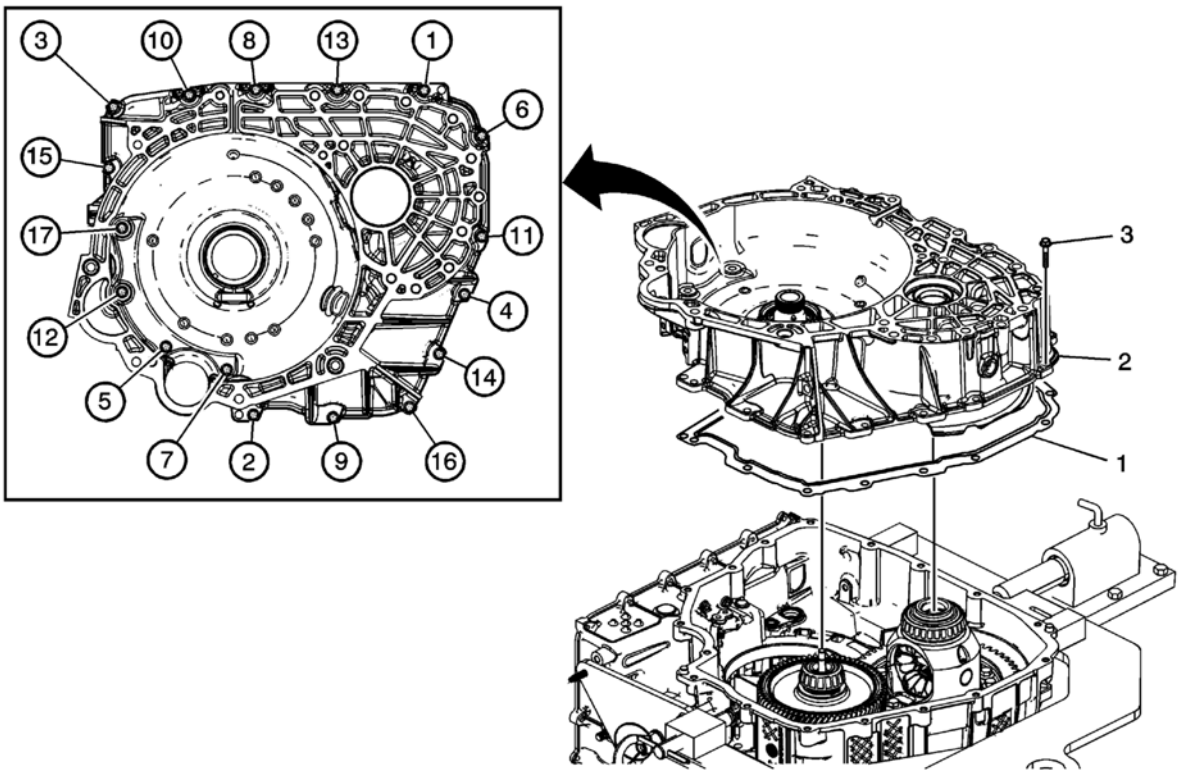

Fig. 46: Identifying Torque Converter & Differential Housing
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Torque Converter Housing Outer Seal
2	Torque Converter and Support and A/Trans Fluid Pump Housing Assembly
3	Torque Converter and Differential Housing Bolts M8 x 35 (Qty: 17) **CAUTION:** **Some bolt torques specifications**

Callout	Component Name
	are different. Over tightening the bolts at the 12, 15 and 17 positions in the sequence could cause damage to the case threads. **CAUTION:** **Refer to Fastener Caution .** **Procedure:** Tighten in sequence shown. **Tighten** • Bolts 1-11, 13-14 and 16 to 36 N.m (27 lb ft) • Bolts 12, 15 and 17 to 30 N.m (22 lb ft)

FRONT DIFFERENTIAL CARRIER PRELIMINARY ROTATIONAL TORQUE MEASUREMENT

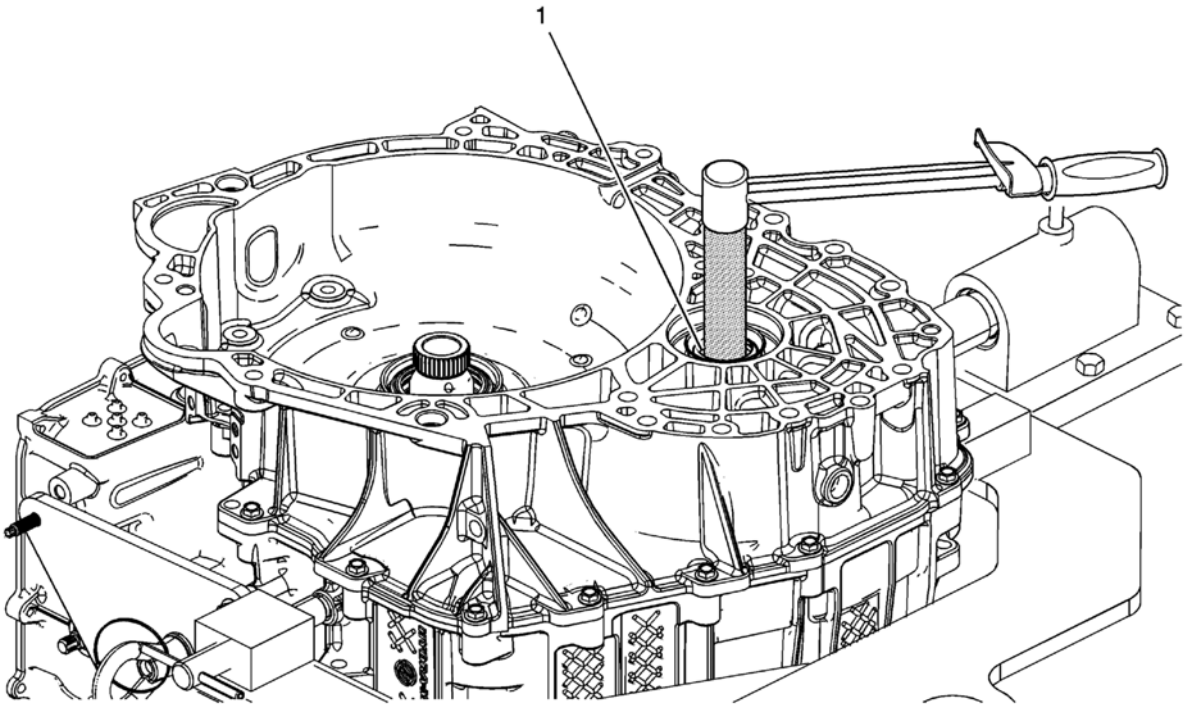

Fig. 47: Front Differential Carrier Preliminary Rotational Torque Measurement Tool
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Front Differential Carrier Assembly **CAUTION:** **Low bearing pre-load will cause premature failure of the front differential drive pinion gear.** **CAUTION:** **Refer to Fastener Caution .** **NOTE:** • **If the turning torque is not within**

Callout	Component Name
	specifications, the transfer gear assembly and differential bearing thrust washer is incorrect and must be corrected. Refer to Front Differential Drive Pinion Gear Bearing Thrust Washer and Front Differential Bearing Washer Measurement. • **Use a dial or beam torque wrench with DT-47793 differential rotating tool to measure turning torque.** **Tighten** 4-12 N.m (35-106 lb in) **Special Tools** **DT-47793** Differential Rotating Tool For equivalent regional tools, refer to **Special Tools** .

1-2-3-4 CLUTCH PLATE AND LOW AND REVERSE CLUTCH INSTALLATION

Piston and Spring Installation

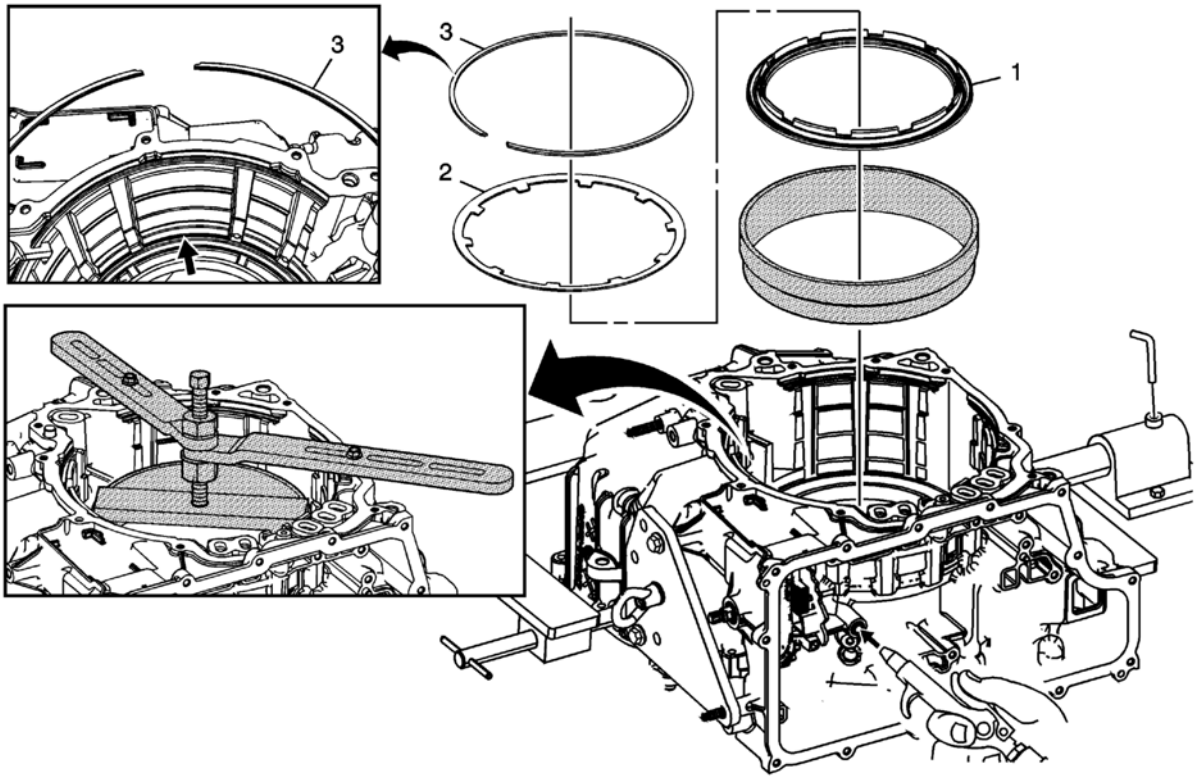

Fig. 48: Identifying 1-2-3-4 Clutch Components
Courtesy of GENERAL MOTORS COMPANY

Piston and Spring Installation

Callout	Component Name

Callout	Component Name
1	1-2-3-4 Clutch Piston **NOTE:** **DT-46623 seal protector prevents the piston seal lip from damage during installation. Apply a thin coat of ATF to the I.D. of DT-46623 seal protector to ease the installation of the piston.** **Special Tools** **DT-46623** Piston Seal Protector For equivalent regional tools, refer to **Special Tools** .
2	1-2-3-4 Clutch Spring
3	1-2-3-4 Clutch Spring Retainer Ring **CAUTION:** **Refer to Fastener Caution .** **Procedure:** 1. The retainer opening should be supported by a spline tooth of the case. 2. Install **DT-46632** spring compressor and **DT-48056** spring compressor bridge and retain to the case using 2 case cover assembly bolts. 3. Turn the **DT-48056** spring compressor bridge compressor bolt to compress the 1-2-3-4 Clutch Spring until the retaining ring groove is exposed. 4. Push retainer ring into the groove. 5. Remove **DT-48056** spring compressor bridge and **DT-46632** spring compressor. 6. Air check the piston operation by applying air to the 1-2-3-4 clutch feed passage in the

Callout	Component Name
	case. 7. Excessive air leaks indicate damage to the clutch piston seal. **Tighten** 12 N.m (9 lb ft). **Special Tools** • **DT-48056** Spring Compressor Bridge • **DT-46632** Piston Spring Compressor For equivalent regional tools, refer to **Special Tools** .

1-2-3-4 Clutch Plates and Low Reverse Clutch Installation

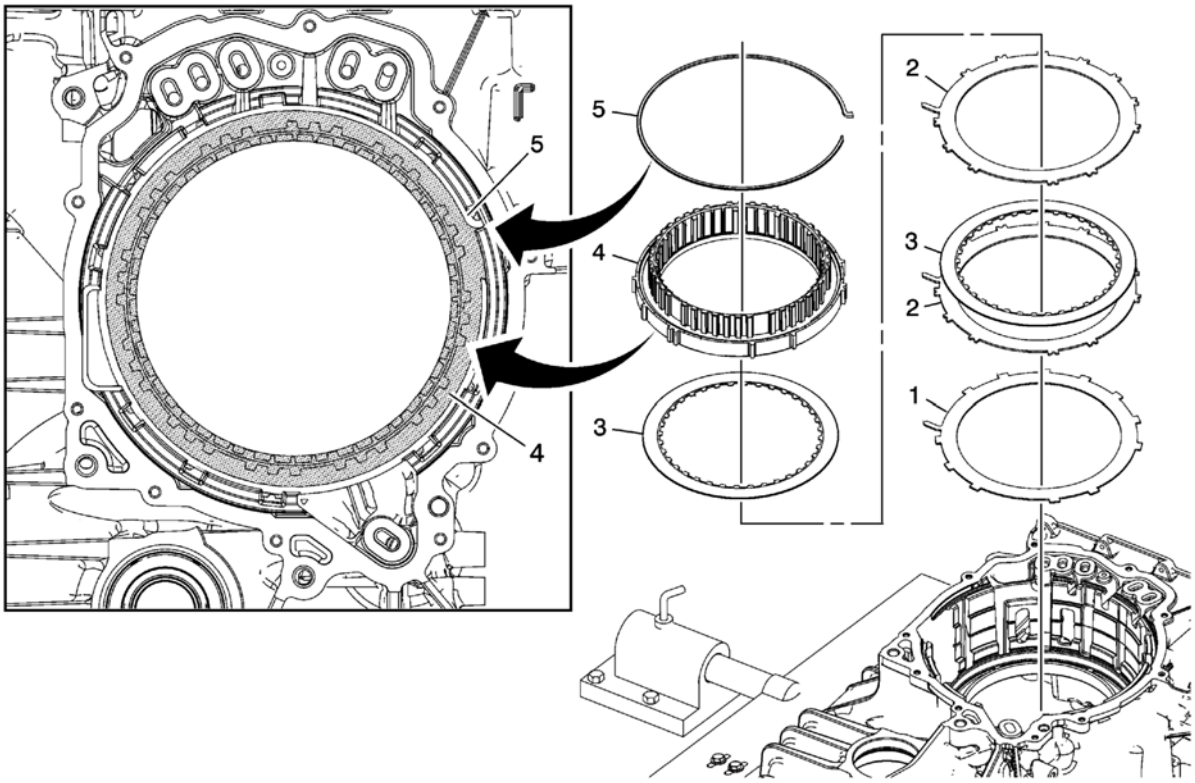

Fig. 49: Identifying 1-2-3-4 Clutch Plates & Low Reverse Clutch Installation Order
Courtesy of GENERAL MOTORS COMPANY

1-2-3-4 Clutch Plates and Low Reverse Clutch Installation

Callout	Component Name
1	1-2-3-4 Clutch (Waved) Plate **NOTE:**

Callout	Component Name
	The tab on the clutch plate faces the bottom of the case.
2	1-2-3-4 Clutch Plate (Qty: 2) **NOTE:** **The tab on the clutch plate faces the bottom of the case.**
3	1-2-3-4 Clutch (w/Friction Material) Plate Assembly (Qty: 2)
4	Low and Reverse Clutch Assembly **NOTE:** **The low and reverse clutch assembly should rotate freely in one direction and lock in the opposite direction. Rotate the clutch assembly and listen/feel for the ratchet of the clutch in it's designed rotational direction.**
5	Low and Reverse Clutch Retaining Ring **NOTE:** **The tab needs to go in groove at about 2**

Callout	Component Name
	o'clock and snap ring opening needs to face 3 o'clock.

Low and Reverse Clutch Plate Installation

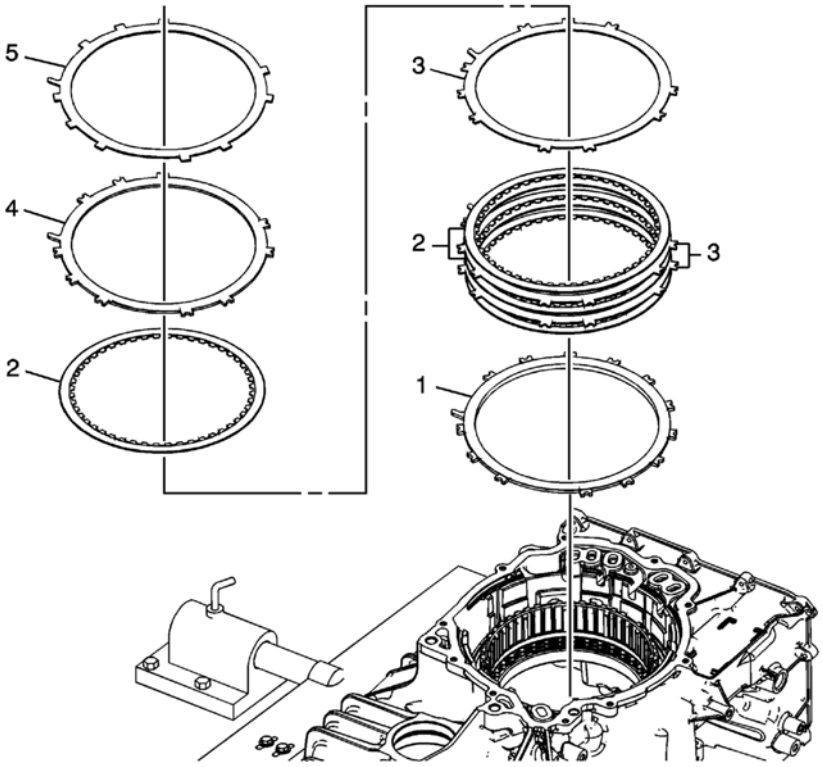

Fig. 50: Identifying Low & Reverse Clutch Plate
Courtesy of GENERAL MOTORS COMPANY

Low and Reverse Clutch Plate Installation

Callout	Component Name
1	Low and Reverse Clutch Backing Plate **NOTE:** **The tab on the clutch plate faces the bottom of the case.**
2	Low and Reverse Clutch (w/Friction Material) Plate Assembly (Qty: 4)
3	Low and Reverse Clutch Plate (Qty: 3)

Callout	Component Name
	NOTE:
4	Low and Reverse Clutch Apply Plate **The tab on the clutch plates faces the bottom of the case.** **NOTE:** **The tab on the clutch plate faces the bottom of the case.**
5	Low and Reverse Clutch Cushion (Waved) Spring **NOTE:** **The tab on the clutch plate faces the bottom of the case.**

REACTION CARRIER CLEANING AND INSPECTION

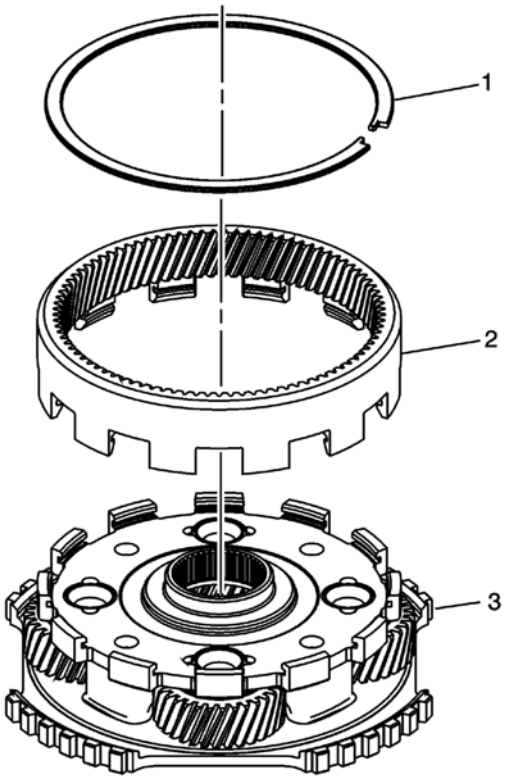

Fig. 51: View Of Reaction Carrier Assembly & Components
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedures	

Callout	Component Name
Clean and Inspect the carrier as an assembly. If wear or damage is found disassemble to replace the affected component.	
1	Input Internal Gear Retaining Ring
2	Input Internal Gear
3	Reaction Carrier Assembly

OUTPUT CARRIER CLEANING AND INSPECTION

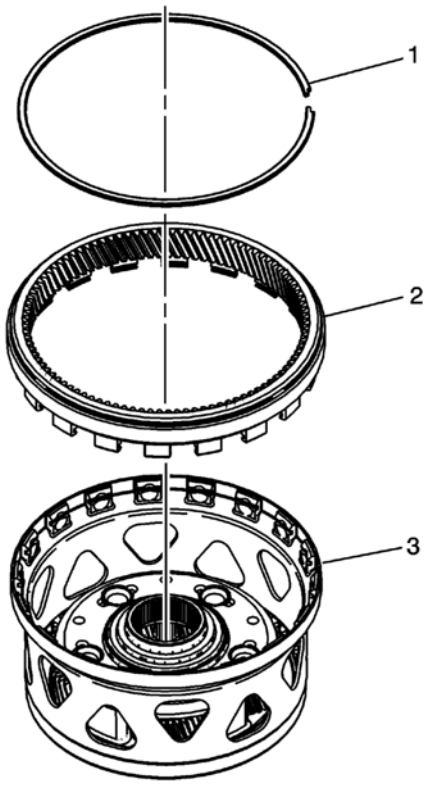

Fig. 52: View Of Output Carrier Components
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedures Clean and Inspect the carrier as an assembly. If wear or damage is found disassemble to replace the affected component.	
1	Reaction Internal Gear Retaining Ring
2	Reaction Carrier Internal Gear
3	Output Carrier Assembly

INPUT, REACTION, AND OUTPUT CARRIER INSTALLATION

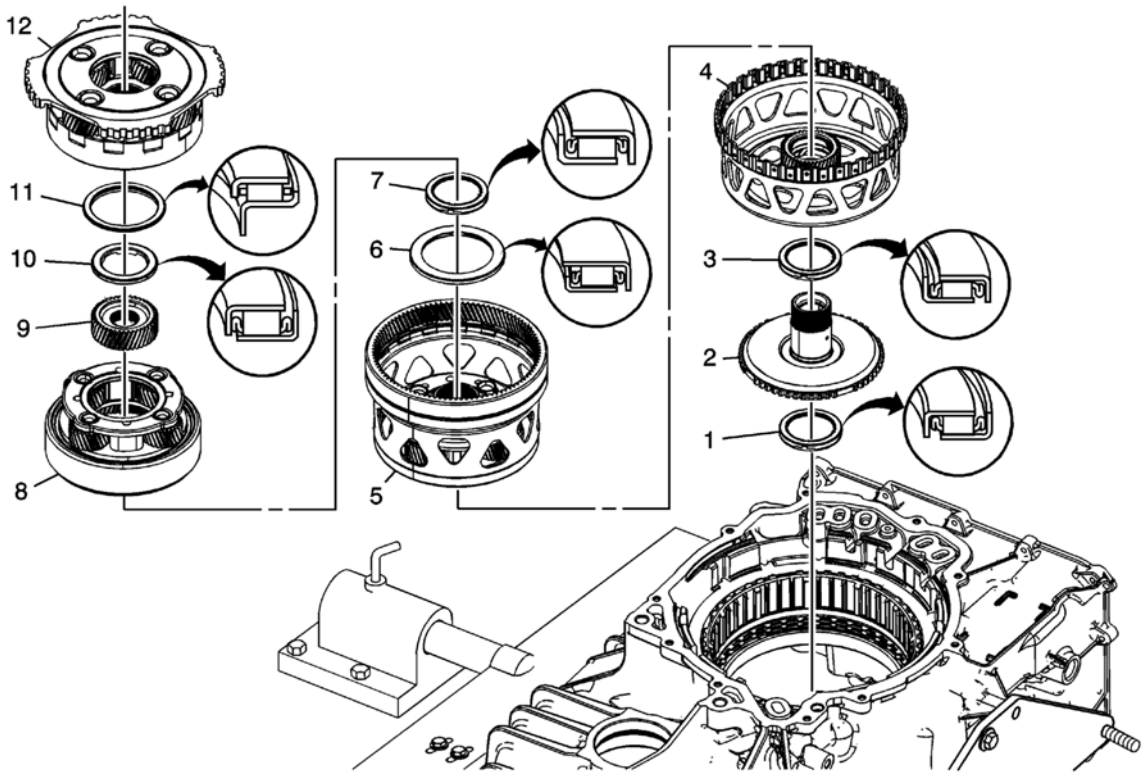

Fig. 53: Identifying Input, Reaction & Output Carrier
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure Note location of the orientation lip on bearings. All thrust bearings can only be assembled one way.	
1	Input Shaft Thrust Bearing Assembly
2	Output Carrier Transfer Drive Gear Hub Assembly
3	Front Differential Transfer Drive Gear Input Hub Bearing Assembly
4	Output Sun Gear Assembly
5	Output Carrier Assembly
6	Output Carrier Thrust Bearing Assembly
7	Output Carrier Thrust Bearing Assembly
8	Input (w/Output Internal Gear) Carrier Assembly
9	Input Sun Gear
10	Input Sun Gear Thrust Bearing Assembly
11	Input Carrier Thrust Bearing Assembly
12	Reaction (w/Input Internal Gear) Carrier Assembly

2-6 CLUTCH PLATE INSTALLATION

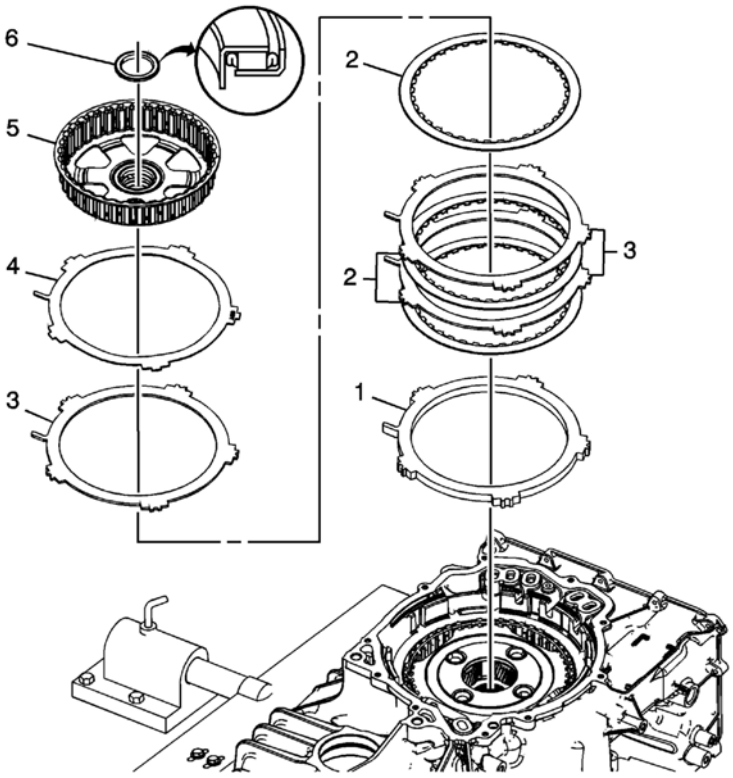

Fig. 54: Identifying 2-6 Clutch Plate
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	2-6 Clutch Backing Plate **NOTE:** **The tab on the clutch plate faces the bottom of the case.**
2	2-6 Clutch (w/Friction Material) Plate Assembly (Qty: 3)
3	2-6 Clutch Plate (Qty: 3) **NOTE:** **The tab on the clutch plate faces the bottom of the case.**
4	2-6 Clutch Cushion Spring
5	Reaction Sun Gear Assembly
6	2-6 Clutch Hub Thrust Bearing Assembly **NOTE:**

Callout	Component Name
	Note location of the orientation lip on bearing. All thrust bearings can only be assembled one way.

3-5-REVERSE AND 4-5-6 CLUTCH HOUSING DISASSEMBLE

Reluctor Wheel and Piston Removal

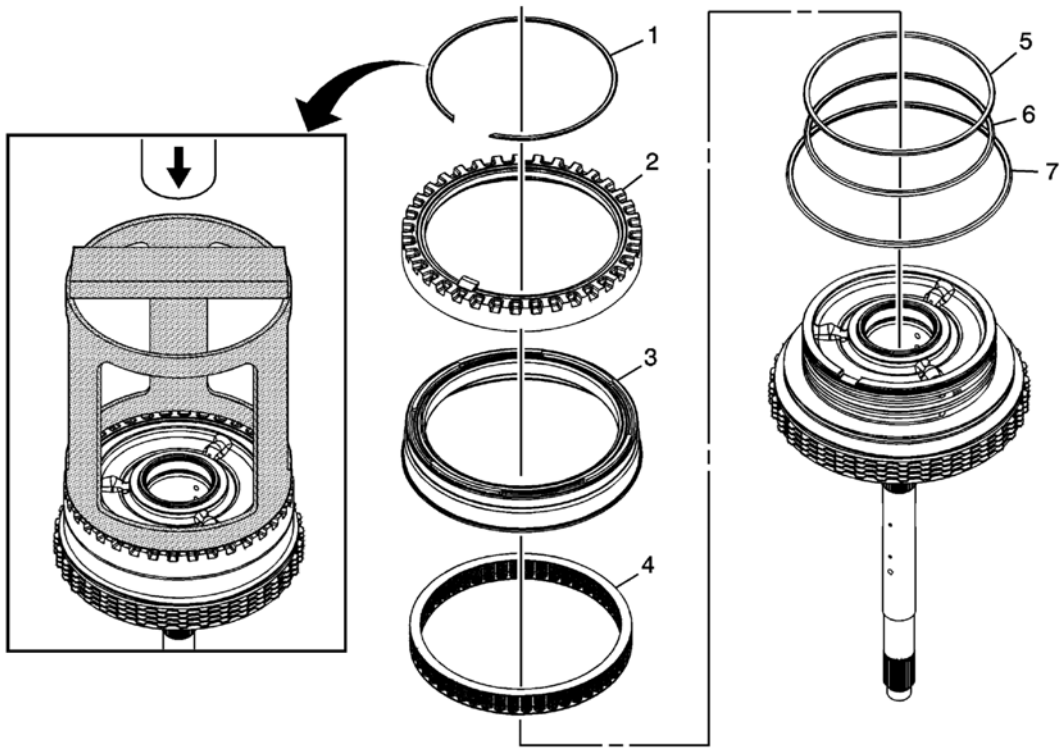

Fig. 55: View Of Input Shaft Speed Sensor Reluctor Wheel Piston & 3-5 Reverse Clutch Piston
Courtesy of GENERAL MOTORS COMPANY

Reluctor Wheel and Piston Removal

Callout	Component Name
1	A/Trans Input Shaft Speed Sensor Reluctor Ring Retaining Ring **CAUTION:** **Compress the reluctor**

Callout	Component Name
	wheel just enough to clear the retainer. Over compressing the reluctor wheel will break the alignment tab and the clutch housing. **Special Tools** **DT-47694** Piston Spring Compressor For equivalent regional tools, refer to **Special Tools** .
2	A/Trans Input Shaft Speed Sensor Reluctor Wheel
3	3-5 Reverse Clutch Piston **NOTE:** **Inspect piston seals for damage and/or wear. Piston is reusable.**
4	3-5 Reverse Clutch Spring Assembly
5	3-5 Reverse Clutch Piston Inner Seal (Orange)
6	3-5 Reverse Clutch Piston Inner Seal (Black)
7	3-5 Reverse Clutch Piston Dam Seal

Clutch Plate Removal

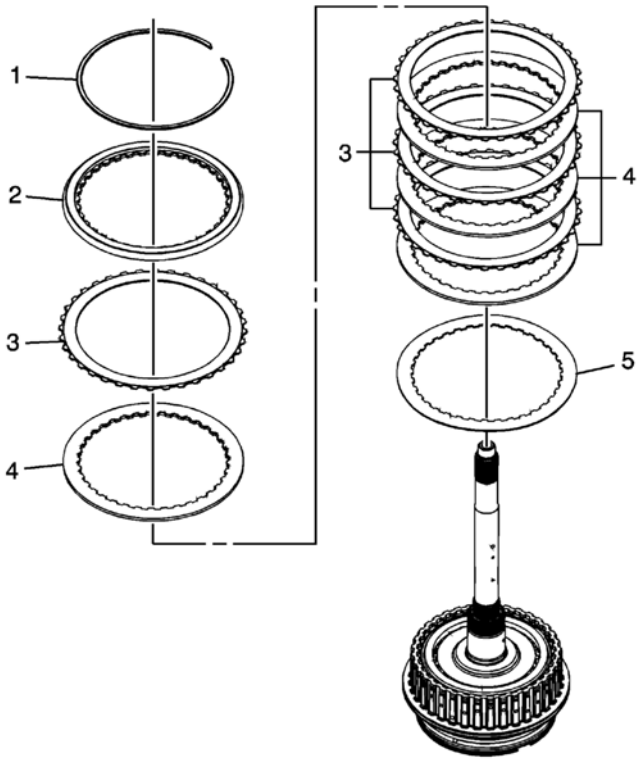

Fig. 56: View Of 3-5 Reverse Clutch Plates
Courtesy of GENERAL MOTORS COMPANY

Clutch Plate Removal

Callout	Component Name
1	3-5 Reverse Clutch Backing Plate Retaining Ring
2	3-5 Reverse Clutch Backing Plate
3	3-5 Reverse Clutch (w/Friction Material) Plate Assembly (Qty: 4)
4	3-5 Reverse Clutch Plate (Qty: 4)
5	3-5 Reverse Clutch (Waved) Plate

4-5-6 Clutch Hub Removal

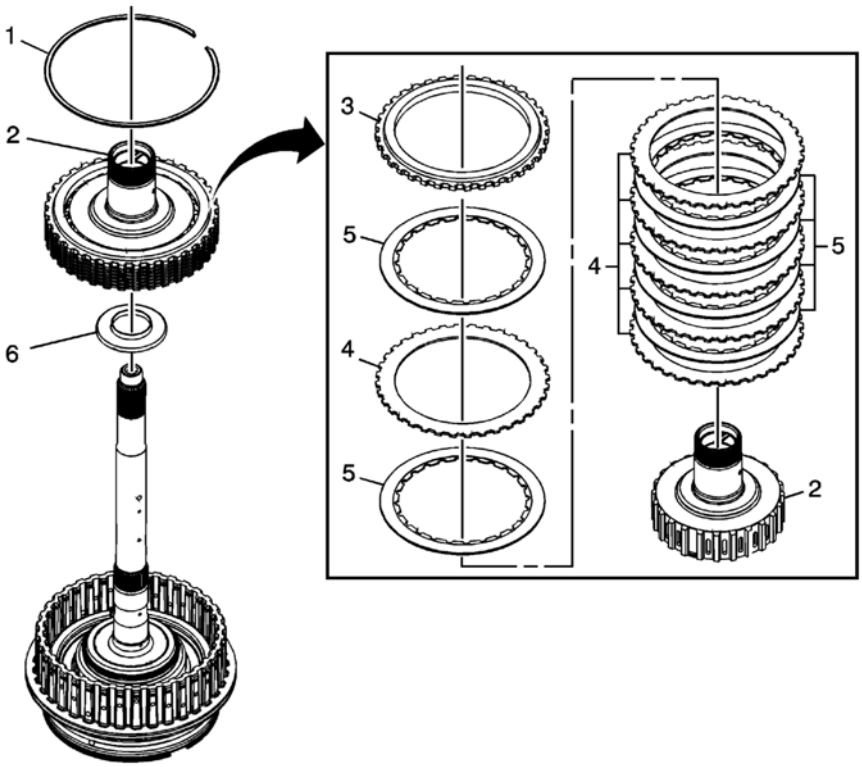

Fig. 57: View Of Reaction Carrier Hub Assembly
Courtesy of GENERAL MOTORS COMPANY

4-5-6 Clutch Hub Removal

Callout	Component Name
1	4-5-6 Backing Plate Retaining Ring **NOTE:** **Gently push down on the backing plate to get enough clearance between the backing plate and retainer.**
2	Reaction Carrier Hub Assembly **NOTE:** **The clutch plates will come out of the housing with the hub assembly.**

Callout	Component Name
3	4-5-6 Clutch Backing Plate
4	4-5-6 Clutch Plate (Qty: 6)
5	4-5-6 Clutch (w/Friction Material) Plate Assembly (Qty: 6)
6	4-5-6 Clutch Hub Thrust Bearing Assembly **NOTE:** **The bearing may stick to the reaction carrier hub.**

4-5-6 Clutch Piston Removal

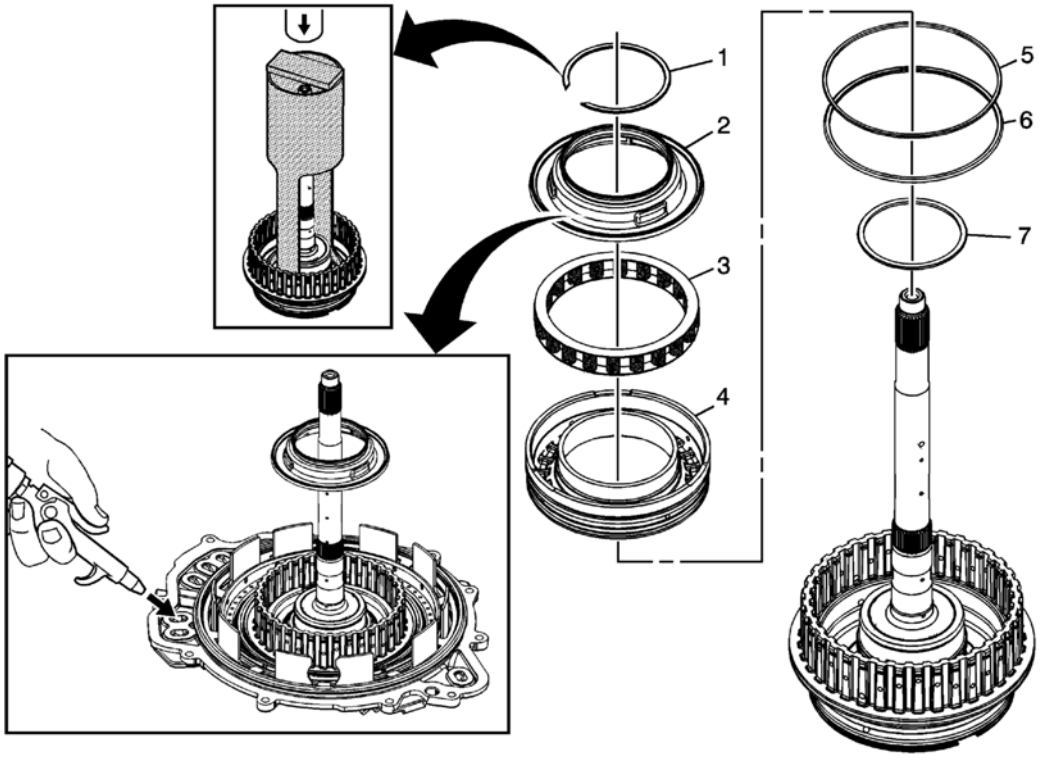

Fig. 58: Identifying 4-5-6 Clutch Piston
Courtesy of GENERAL MOTORS COMPANY

4-5-6 Clutch Piston Removal

Callout	Component Name
1	4-5-6 Clutch Dam Retaining Ring **Special Tools** • **DT-47693** Dam Protector • **GE 8059** Snap Ring Pliers-Parallel Jaw or equivalent

Callout	Component Name
	For equivalent regional tools, refer to **Special Tools** .
2	4-5-6 Clutch Piston Fluid Dam **Procedure:** 1. Place the 3-5-R and 4-5-6 clutch housing onto the case cover assembly. 2. Apply shop air to the 4-5-6 clutch feed hole using a rubber tipped air gun to dislodge the dam piston and the 4-5-6 clutch piston from the clutch housing.
3	4-5-6 Clutch Spring Assembly
4	4-5-6 Clutch Piston
5	4-5-6 Clutch Piston Outer Seal (Stepped)
6	4-5-6 Clutch Piston Outer Seal (Rounded)
7	4-5-6 Clutch Piston Inner Seal

3-5-REVERSE AND 4-5-6 CLUTCH HOUSING ASSEMBLE

4-5-6 Clutch Piston Installation

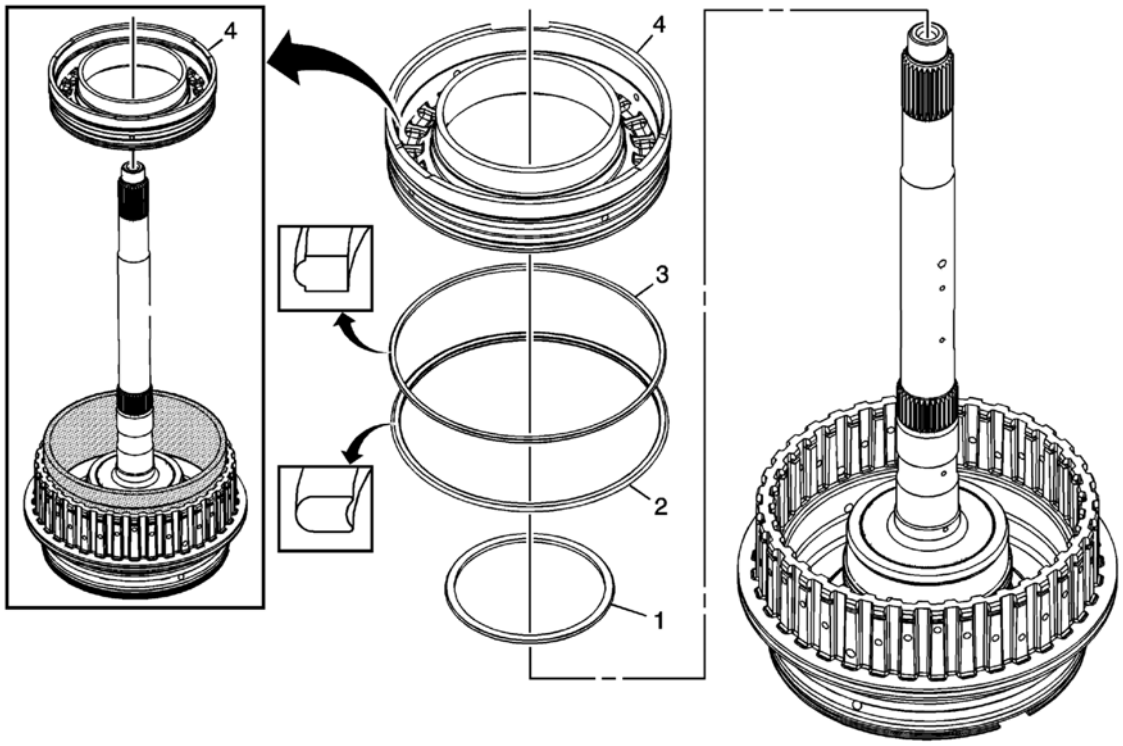

Fig. 59: Identifying 4-5-6 Clutch Piston
Courtesy of GENERAL MOTORS COMPANY

4-5-6 Clutch Piston Installation

Callout	Component Name
1	4-5-6 Clutch Piston Inner Seal
2	4-5-6 Clutch Piston Outer Seal (Rounded)

Callout	Component Name
3	4-5-6 Clutch Piston Outer Seal (Stepped) (Orange)
4	4-5-6 Clutch Piston **NOTE:** **DT-47859 outer seal protector prevents the piston seal lip from damage during installation. Apply a thin coat of ATF to the I.D. of DT-47859 outer seal protector to ease the installation of the piston.** **Special Tools** **DT-47859** Piston Outer Seal Protector For equivalent regional tools, refer to **Special Tools** .

4-5-6 Clutch Dam Installation

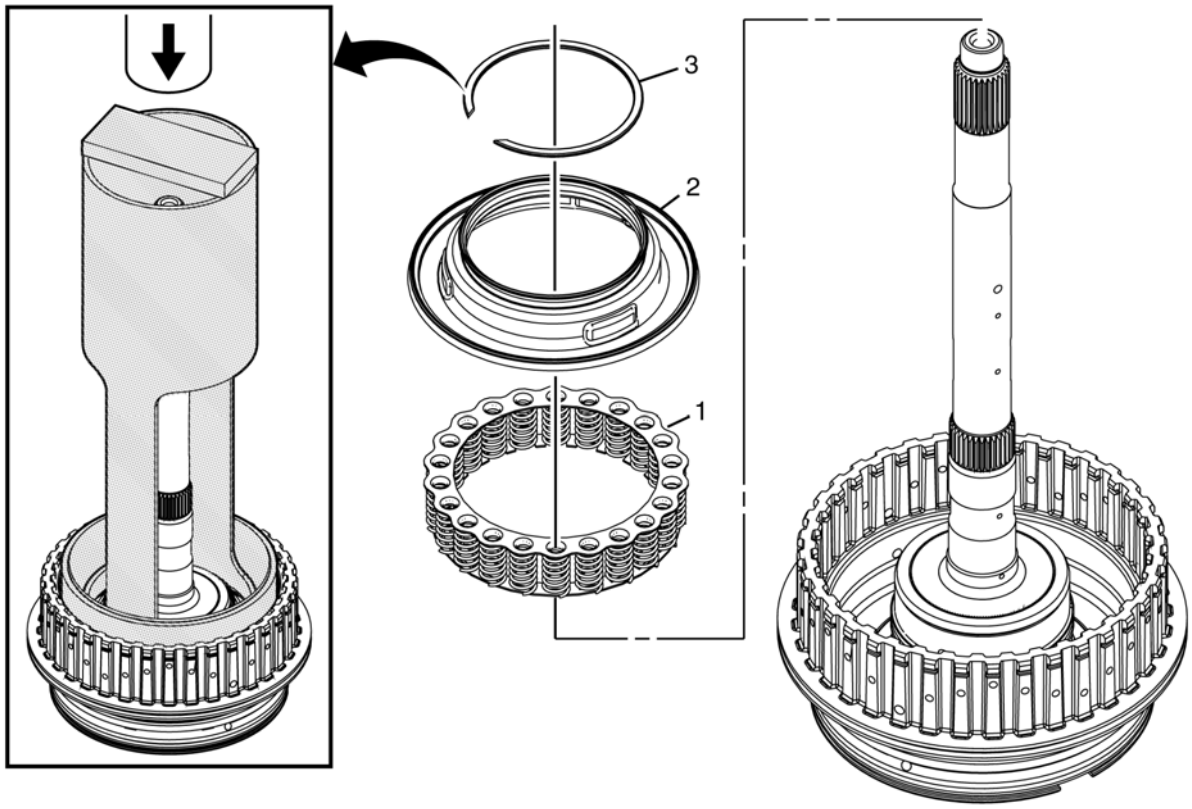

Fig. 60: View Of 4-5-6 Clutch Dam
Courtesy of GENERAL MOTORS COMPANY

4-5-6 Clutch Dam Installation

Callout	Component Name
1	4-5-6 Clutch Spring
2	4-5-6 Clutch Piston Fluid Dam **NOTE:** **DT 47693-1 which is part of DT-47693 dam protector prevents the dam seal lip from damage during installation. Apply a thin coat of ATF to the I.D. of DT 47693-1 which is part of DT-47693**

Callout	Component Name
	dam protector to ease the installation of the dam. **Special Tools** **DT-47693** Dam Protector For equivalent regional tools, refer to **Special Tools** .
3	4-5-6 Clutch Dam Retaining Ring **Special Tools** • DT 47693-2 Clutch Spring Compressor which is part of **DT-47693** Dam Protector • **GE 8059** Snap Ring Pliers-Parallel Jaw or equivalent For equivalent regional tools, refer to **Special Tools** .

4-5-6 Clutch Plates Installation

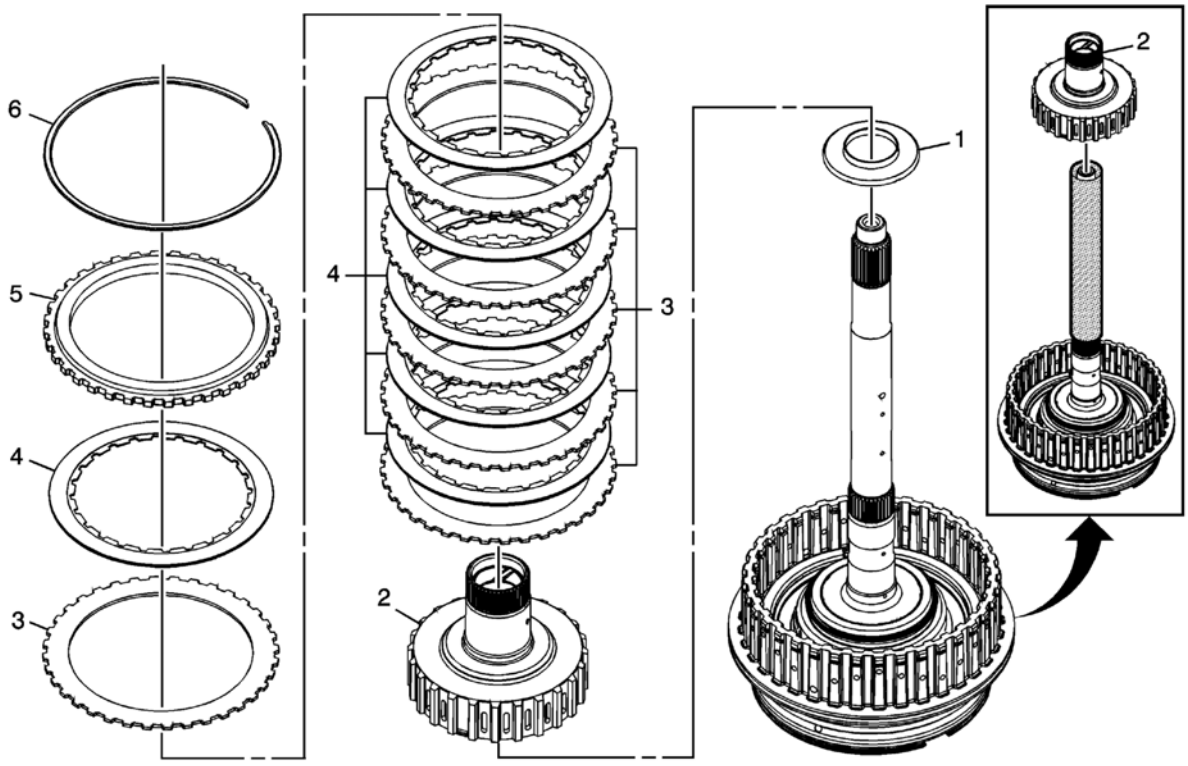

Fig. 61: Locating 4-5-6 Clutch Plates
Courtesy of GENERAL MOTORS COMPANY

4-5-6 Clutch Plates Installation

Callout	Component Name
1	4-5-6 Clutch Hub Thrust Bearing **NOTE:** **Note location of the orientation lip on bearing. All thrust bearings can only be assembled one way.**
2	Reaction Carrier Hub Assembly **CAUTION:** **Failure to use DT 48551 could cause damage to the hub assembly bushings which could cause premature transmission failure.** **Special Tools** **DT-48551** Reaction Hub Bushing Protector For equivalent regional tools, refer to **Special Tools** .
3	4-5-6 Clutch Plate (Qty: 6)
4	4-5-6 Clutch (w/Friction Material) Plate Assembly (Qty: 6)
5	4-5-6 Clutch Backing Plate
6	4-5-6 Clutch Backing Plate Retaining Ring **NOTE:** **Gently push down on the backing plate to get enough**

Callout	Component Name
	clearance between the backing plate and retainer.

3-5 Reverse Clutch Plates Installation

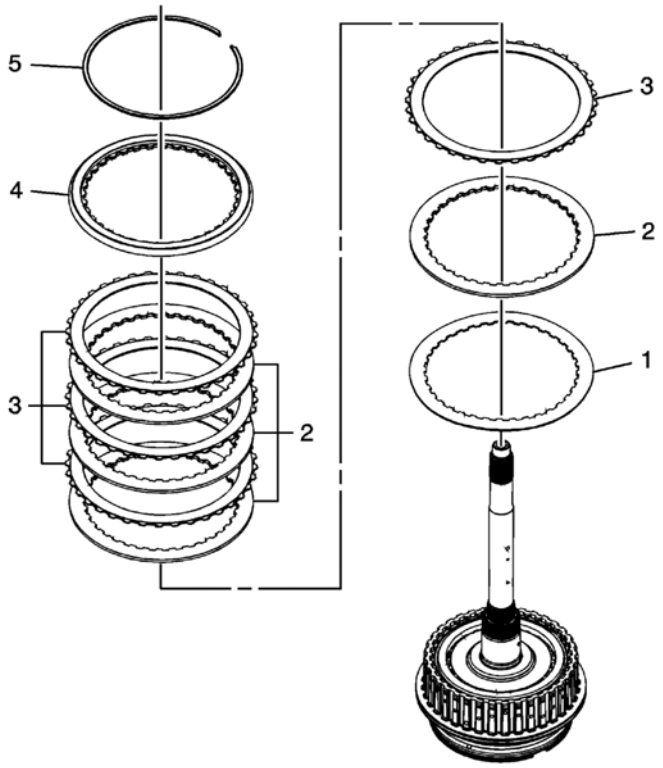

Fig. 62: Identifying 3-5 Reverse Clutch Plates
Courtesy of GENERAL MOTORS COMPANY

3-5 Reverse Clutch Plates Installation

Callout	Component Name
1	3-5 Reverse Clutch (Waved) Plate
2	3-5 Reverse Clutch Plate (Qty: 4)
3	3-5 Reverse Clutch (w/Friction Material) Plate Assembly (Qty: 4)
4	3-5 Reverse Clutch Backing Plate
5	3-5 Reverse Clutch Backing Plate Retaining Ring

Piston and Reluctor Wheel Installation

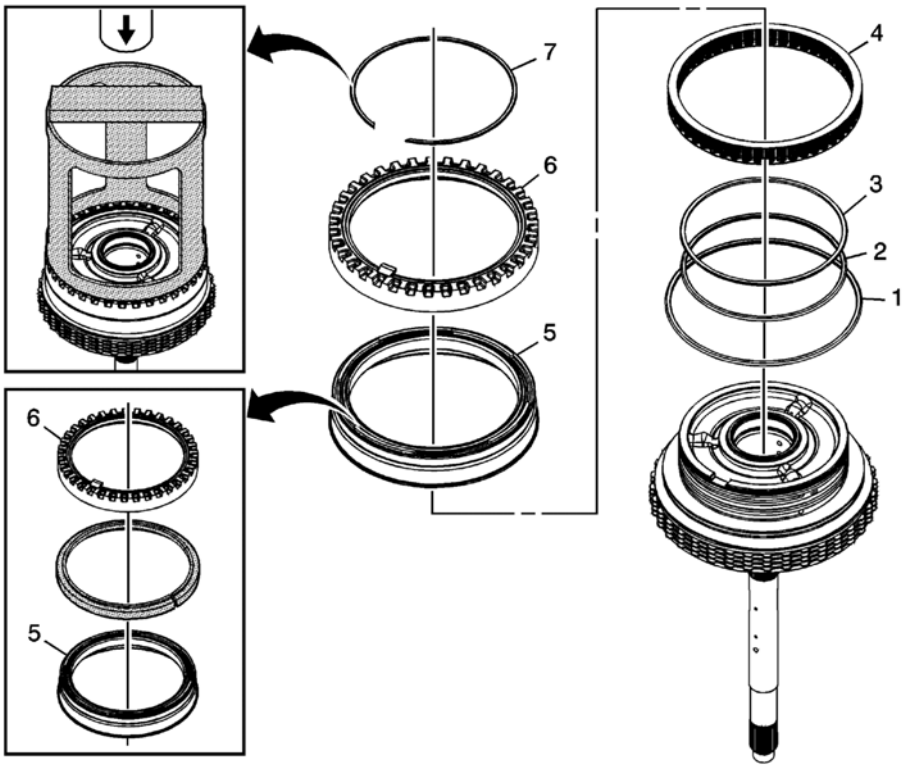

Fig. 63: View Of Piston & Reluctor Wheel
Courtesy of GENERAL MOTORS COMPANY

Piston and Reluctor Wheel Installation

Callout	Component Name
1	3-5 Reverse Clutch Piston Dam Seal
2	3-5 Reverse Clutch Piston Inner Seal (Black) **NOTE:** **Apply a thin coat of ATF to the seal to ease the installation of the piston.**
3	3-5 Reverse Clutch Piston Inner Seal (Orange) **NOTE:** **Apply a thin coat of ATF to the seal to ease the installation of the piston.**

Callout	Component Name
4	3-5 Reverse Clutch Spring Assembly
5	3-5 Reverse Clutch Piston **NOTE:** • **DT-46622 seal protector prevents the piston seal lip from damage during installation. Apply a thin coat of ATF to the I.D. of DT-46622 seal protector to ease the installation of the piston.** • **Install DT-46622 seal protector onto the speed sensor reluctor wheel. Push the 3-5 Reverse Clutch piston into the reluctor wheel until it stops against J-46622 seal protector. Remove**

Callout	Component Name
	DT-46622 seal protector by separating it at the opening. **Special Tools** **DT-46622** Piston Seal Protector For equivalent regional tools, refer to **Special Tools** .
6	A/Trans Input Shaft Speed Sensor Reluctor Wheel
7	A/Trans Input Shaft Speed Sensor Reluctor Wheel Retaining Ring **CAUTION:** **Compress the reluctor wheel just enough to clear the retainer ring groove. Over compressing the reluctor wheel will break the alignment tab and the clutch housing.** **Special Tools** **DT-47694** Piston Spring Compressor For equivalent regional tools, refer to **Special Tools** .

3-5-R and 4-5-6 Clutch Piston Air Check

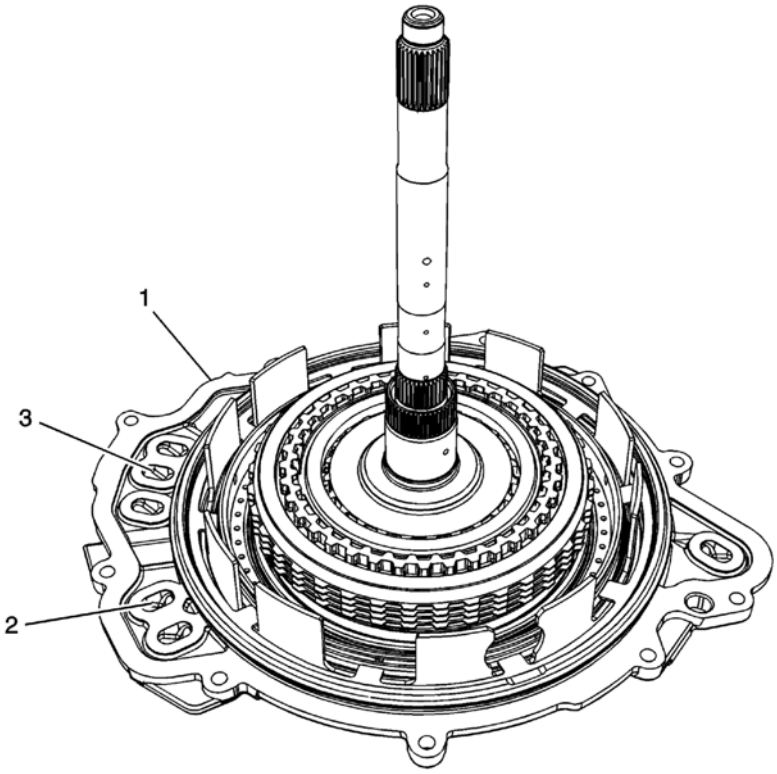

Fig. 64: View of 35R and 4-5-6 Clutch Piston Air Check
Courtesy of GENERAL MOTORS COMPANY

3-5-R and 4-5-6 Clutch Piston Air Check

Callout	Component Name
1	Case Cover Assembly **NOTE:** **The fluid seal rings should be in place and not damaged.**
2	4-5-6 Clutch Feed Fluid Passage **CAUTION:** **Regulate the air pressure to 40 psi maximum. High pressure could cause the piston to over travel and damage**

Callout	Component Name
	the piston seals. **Procedure** 1. Apply shop air to the 4-5-6 clutch feed passage. 2. Observe the 4-5-6 piston movement. **NOTE:** **Minimal piston movement and excessive air leaking could indicate damage to the 4-5-6 piston seals or improper assembly.**
3	3-5 Rev Clutch Feed Fluid Passage **CAUTION:** **Regulate the air pressure to 40 psi maximum. High pressure could cause the piston to over travel and damage the piston seals.** **Procedure** 1. Apply shop air to the 3-5-Rev clutch feed passage. 2. Observe the 3-5-Rev piston movement. **NOTE:** **Minimal piston**

Callout	Component Name
	movement and excessive air leaking could indicate damage to the 3-5-Rev piston seals or improper assembly.

3-5-REVERSE AND 4-5-6 CLUTCH HOUSING INSTALLATION

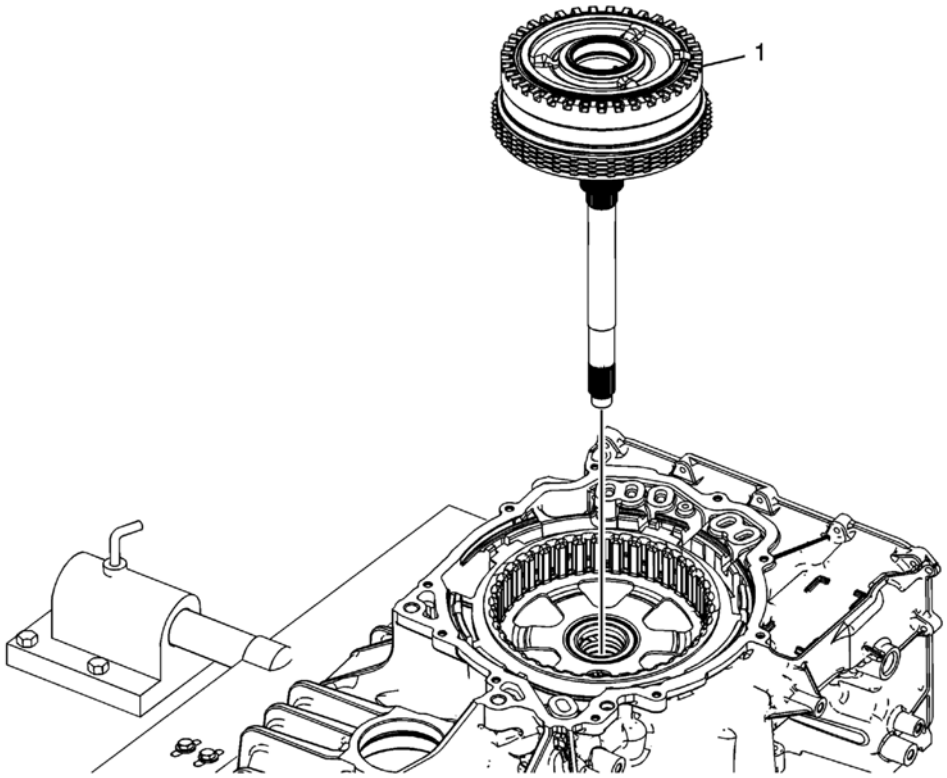

Fig. 65: Identifying 3-5 Reverse & 4-5-6 Clutch Housing
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	3-5 Reverse and 4-5-6 Clutch Assembly **NOTE:** **Rotate the assembly back and forth to align the 3-5**

Callout	Component Name
	reverse clutch plates with the reaction sun gear housing.

CASE COVER ASSEMBLY DISASSEMBLE

ISS Removal

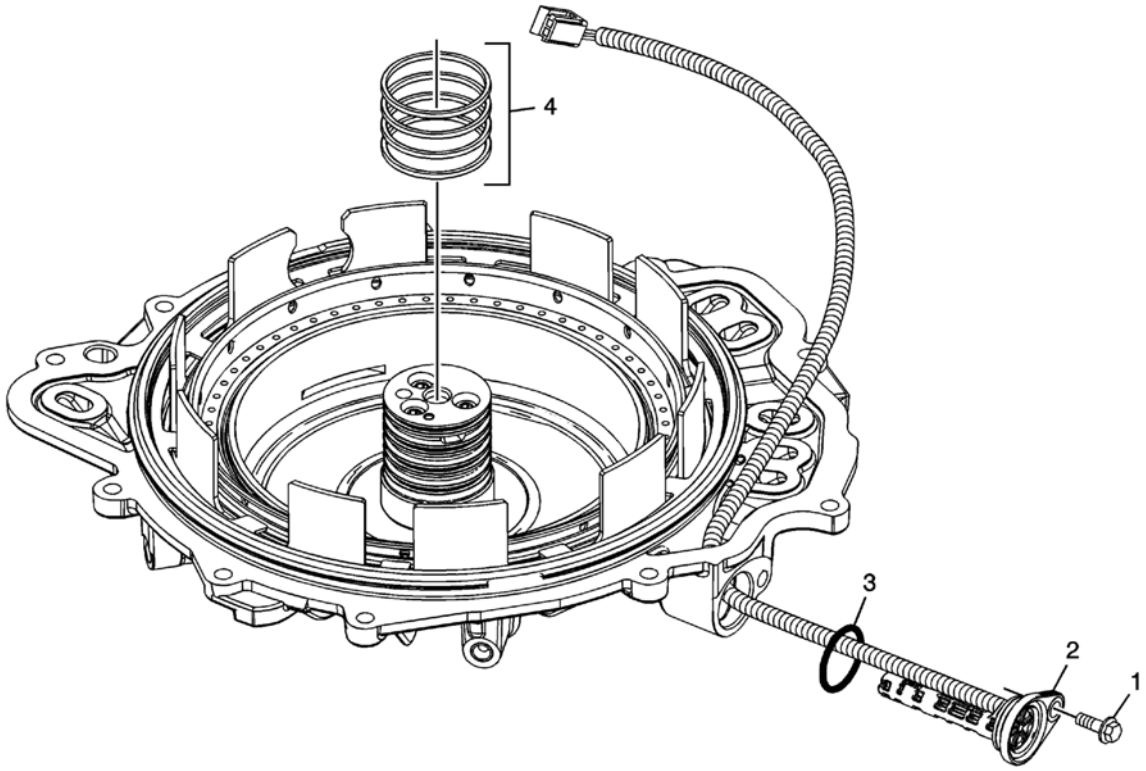

Fig. 66: View Of 3-5 Reverse & 4-5-6 Clutch Fluid Seal Ring
Courtesy of GENERAL MOTORS COMPANY

ISS Removal

Callout	Component Name
1	A/Trans Input Speed Sensor Bolt M6 x 25
2	A/Trans Input Speed Sensor
3	A/Trans Input Speed Sensor Seal **NOTE:** **Discard the seal.**
4	3-5 Reverse and 4-5-6 Clutch Fluid Seal Ring **NOTE:**

Callout	Component Name
	Discard the seals.

Low and Reverse Clutch Piston Removal

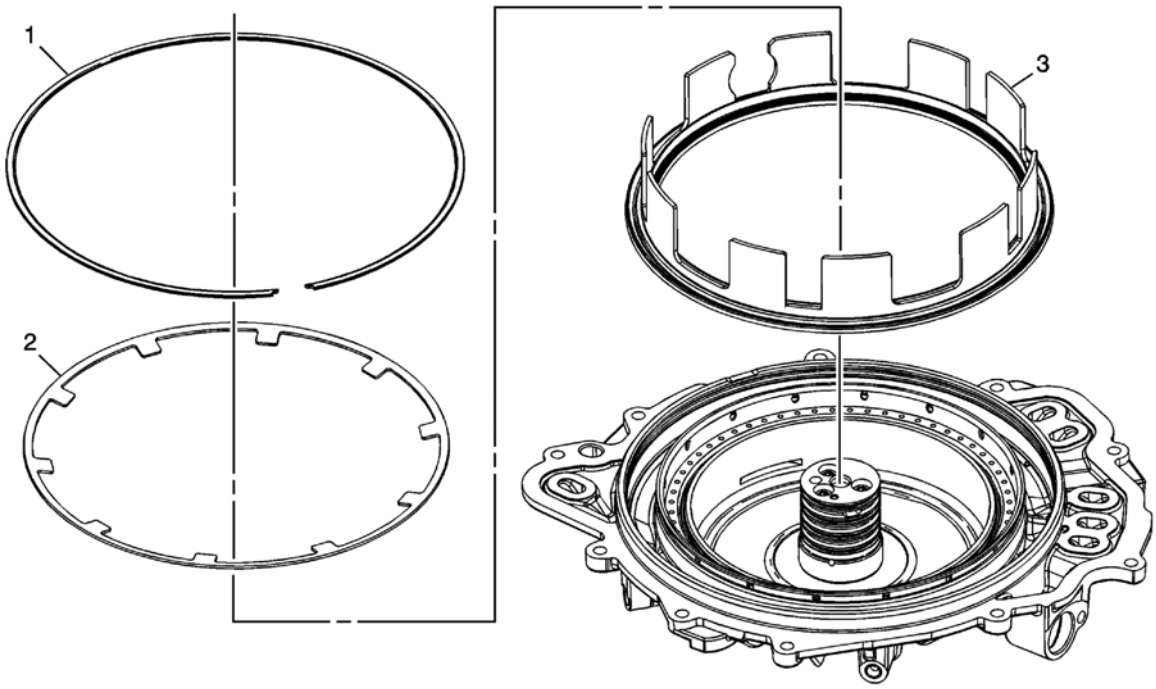

Fig. 67: Identifying Low & Reverse Clutch Piston
Courtesy of GENERAL MOTORS COMPANY

Low and Reverse Clutch Piston Removal

Callout	Component Name
1	Low and Reverse Clutch Spring Retaining Ring
2	Low and Reverse Clutch Spring
3	Low and Reverse Clutch Piston Assembly **NOTE:** **Inspect piston seals for damage and/or wear. Piston is reusable.**

2-6 Clutch Piston Removal

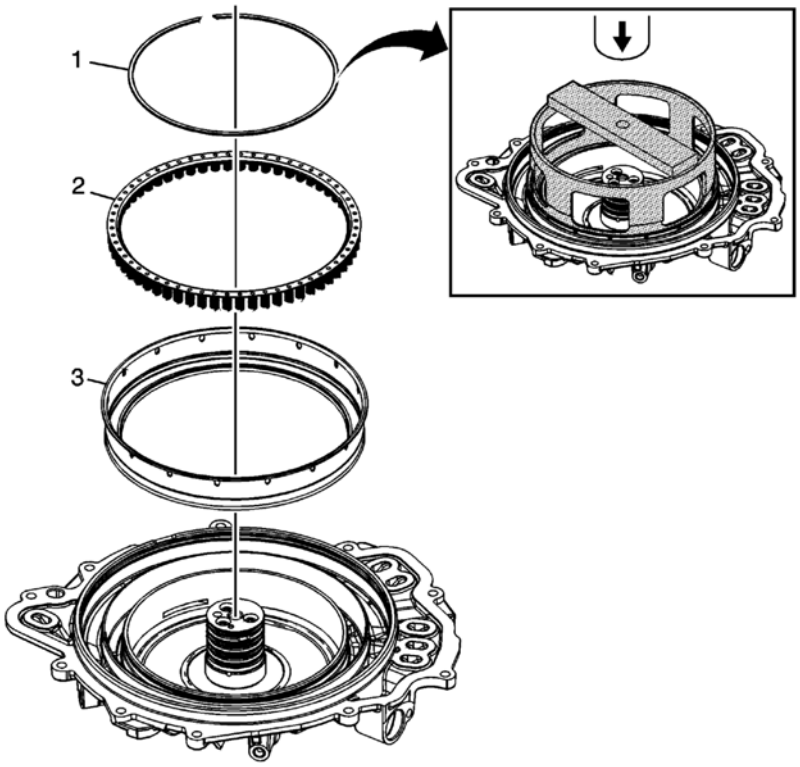

Fig. 68: View Of 2-6 Clutch Piston
Courtesy of GENERAL MOTORS COMPANY

2-6 Clutch Piston Removal

Callout	Component Name
1	2-6 Clutch Spring Retaining Ring **Special Tools** **DT-46632** Spring Compressor For equivalent regional tools, refer to **Special Tools** .
2	2-6 Clutch Spring Assembly
3	2-6 Clutch Piston **NOTE:** **Inspect piston seals for damage and/or wear. Piston is reusable.**

Clean and Inspect

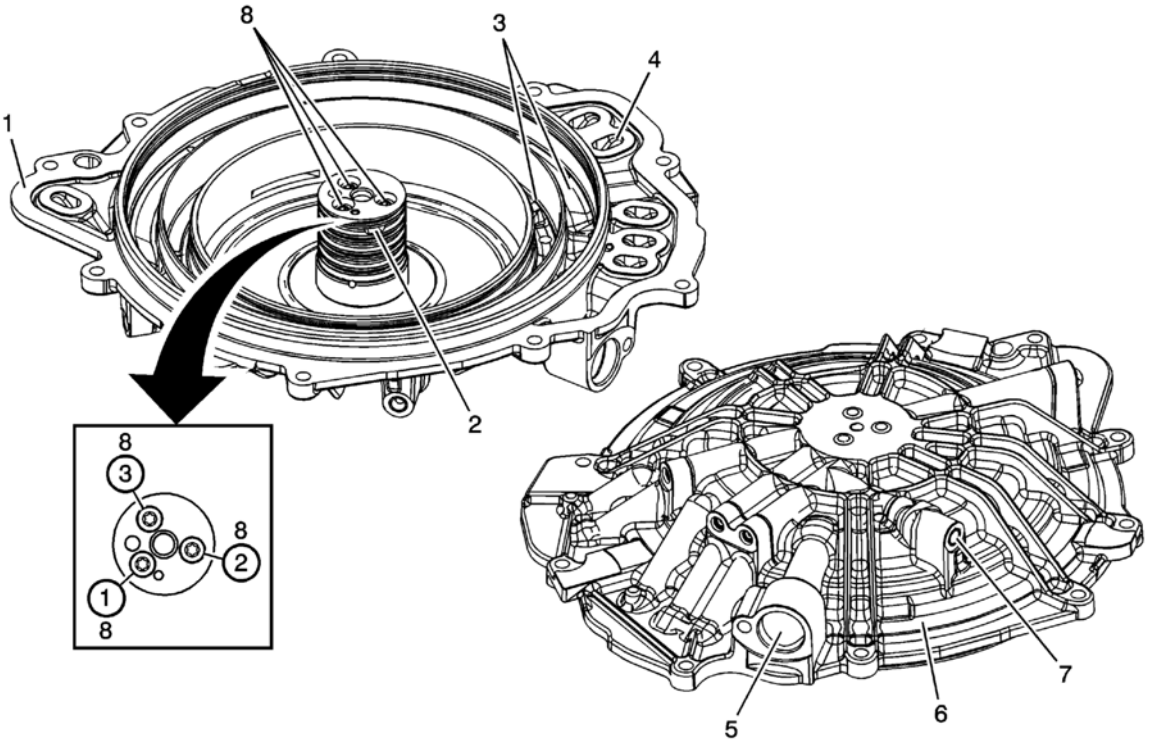

Fig. 69: Identifying Case Cover Assembly Components
Courtesy of GENERAL MOTORS COMPANY

Clean and Inspect

Callout	Component Name
CAUTION: **After cleaning the transmission components, allow to air dry. Do not use cloth or paper towels in order to dry any transmission components. Lint from the towels can cause component failure.** **CAUTION:**	

Callout	Component Name
Do not reuse cleaning solvents. Previously used solvents may deposit sediment which may damage the component. **Preliminary Procedures** 1. Thoroughly clean the case cover assembly, including threads, with clean solvent. 2. Clean gasket sealing surfaces. Remove all residual gasket material. 3. Inspect all threaded holes. If necessary, repair any thread damage.	
1	Gasket Sealing Surface
2	Fluid Passages
3	Piston Bores
4	Cover to Case Passages
5	A/Trans Input Speed Sensor Assembly Bore
6	Cover Casting
7	Passage Cup Plugs
8	Input Shaft Support Bolts **CAUTION:** **Refer to Fastener Caution .** **Procedure** Tightened bolts in sequence. **Tighten** 12 N.m (106 lb in).

CASE COVER ASSEMBLY ASSEMBLE

Fluid Seal Ring Installation

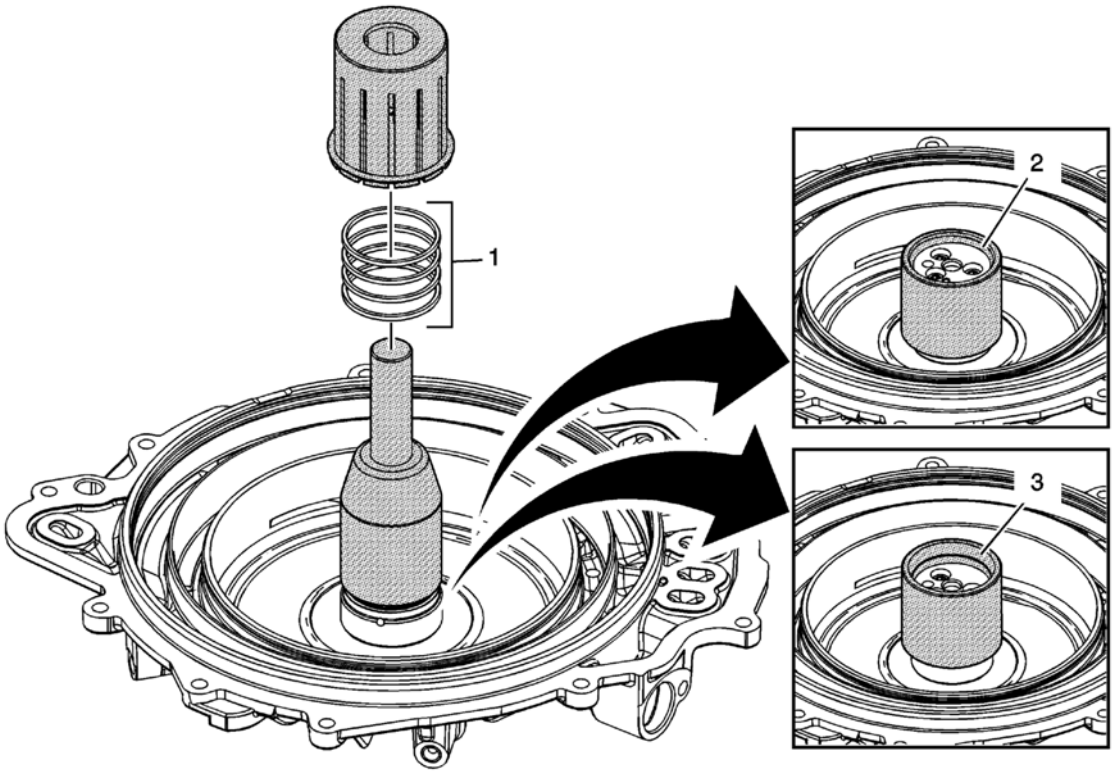

Fig. 70: Identifying Fluid Seal Ring
Courtesy of GENERAL MOTORS COMPANY

Fluid Seal Ring Installation

Callout	Component Name
1	3-5 Reverse and 4-5-6 Clutch Fluid Seal Ring **Procedure** 1. Place DT 46620-3 which is part of **DT-46620** seal installer over the case cover hub and adjust it so that only the bottom seal ring is exposed. 2. Place a NEW fluid seal ring onto DT 46620-3 which is part of **DT-46620** seal installer. 3. Use DT 46620-2 which is part of **DT-46620** seal installer to push the fluid seal ring down over DT 46620-3 which is part of **DT-46620** seal installer into the hub ring groove. 4. Repeat the above steps to install all 4 seal rings, adjusting DT 46620-3 which is part of **DT-46620** seal installer to the appropriate ring groove. **Special Tools** **DT-46620** Seal Installer For equivalent regional tools, refer to **Special Tools** .
2	Small Chamfer Up **CAUTION:**

Callout	Component Name
	Do not force the seal installer down over the seals as this will roll and damage the seals. The large chamfer is designed to fit over the over stretched seal. Use a hand to help shrink the seal if the seal installer is difficult to install over the seal rings. **Procedure** Install DT 46620-1 which is part of **DT-46620** seal installer with the large chamfer end down over the fluid seal rings and leave DT 46620-1 which is part of **DT-46620** seal installer on the seals for at least 60 seconds.
3	Large Chamfer Up **Procedure** 1. Install DT 46620-1 which is part of **DT-46620** seal installer with the small chamfer end facing down for at least 60 seconds. This will properly size the bottom seal ring. 2. Leaving DT 46620-1 which is part of **DT-46620** seal installer on the fluid seal rings for an extended period of time could cause a fluid leak on the initial clutch piston circuit until the seal rings warm up and expand to the proper dimension.

2-6 Clutch Piston Installation

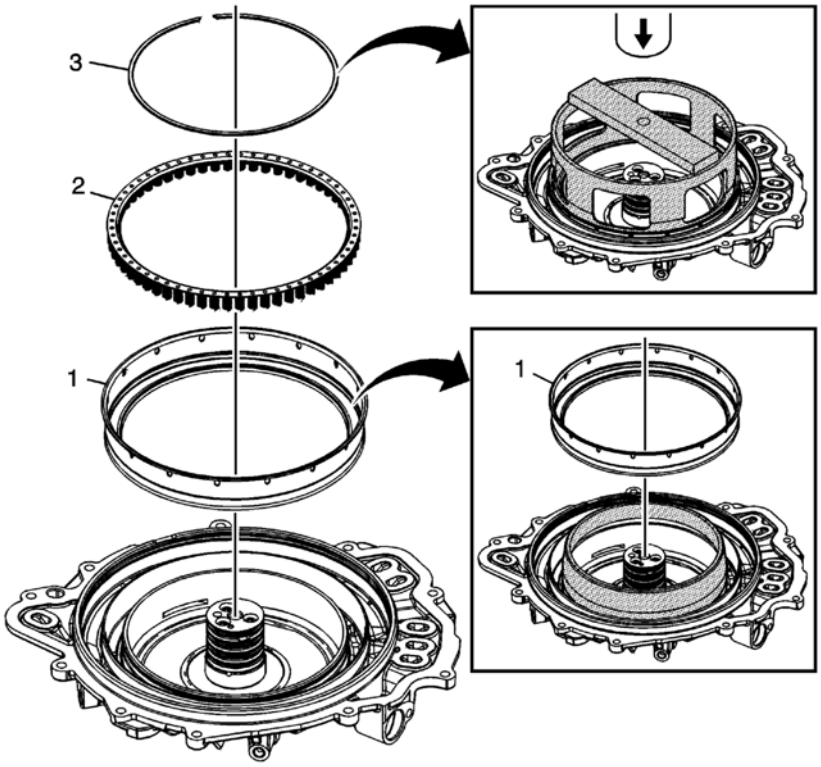

Fig. 71: View Of 2-6 Clutch Piston
Courtesy of GENERAL MOTORS COMPANY

2-6 Clutch Piston Installation

Callout	Component Name
1	2-6 Clutch Piston **Procedure** **DT-46621** seal protector prevents the piston seal lip from damage over the retaining ring groove during installation. Apply a thin coat of ATF to the O.D. of **DT-46621** seal protector to ease the installation of the piston. **Special Tools** **DT-46621** Seal Protector For equivalent regional tools, refer to **Special Tools** .
2	2-6 Clutch Spring Assembly
3	2-6 Clutch Spring Assembly **Procedure** 1. Install the retaining ring with the opening positioned to the top of the case cover. 2. Place the retainer ring inside **DT-46632** spring compressor prior to placing **DT-46632** spring compressor onto the spring. **Special Tools** **DT-46632** Spring Compressor For equivalent regional tools, refer to **Special Tools** .

Low and Reverse Clutch Piston Installation

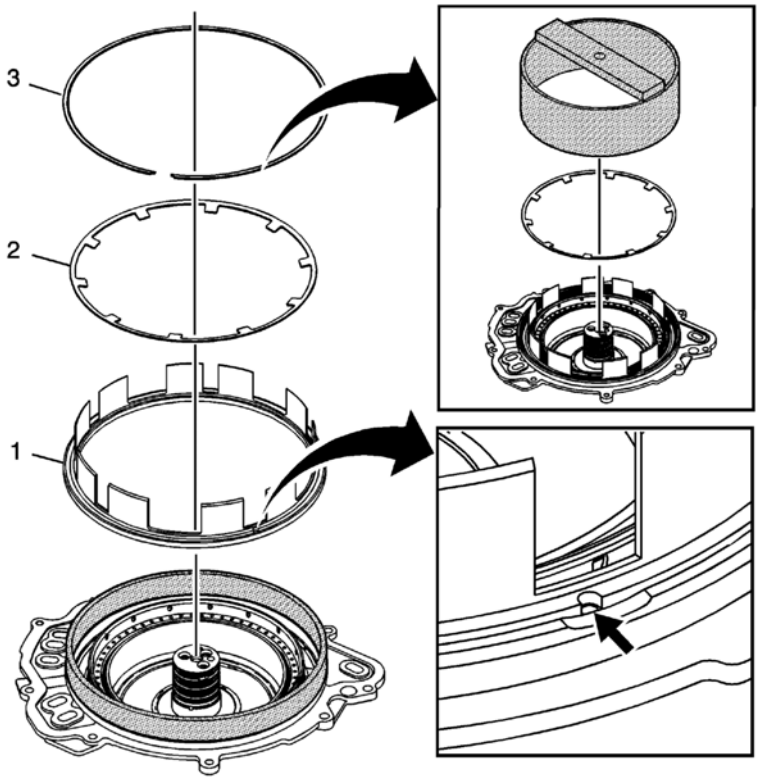

Fig. 72: Identifying Low & Reverse Clutch Piston
Courtesy of GENERAL MOTORS COMPANY

Low and Reverse Clutch Piston Installation

Callout	Component Name
1	Low and Reverse Clutch Piston Assembly **Procedure** 1. Install the L/R piston with the air bleed positioned at the alignment feature on the cover, using **DT-46628-1** seal protector. This will orient the piston fingers with the openings in the case. 2. **DT-46628-1** seal protector prevents the piston seal lip from damage during installation. Apply a thin coat of ATF to the I.D. of **DT-46628-1** seal protector to ease the installation of the piston. **Special Tools** **DT-46628-1** Piston Seal Protector For equivalent regional tools, refer to **Special Tools** .
2	Low and Reverse Clutch Spring
3	Low and Reverse Clutch Spring Retaining Ring **NOTE:**

Callout	Component Name
	Do not align the retainer opening with other retaining ring openings. **Special Tools** **DT-46628-2** Spring Compressor For equivalent regional tools, refer to **Special Tools** .

2-6 and Low-Reverse Piston Function Inspection

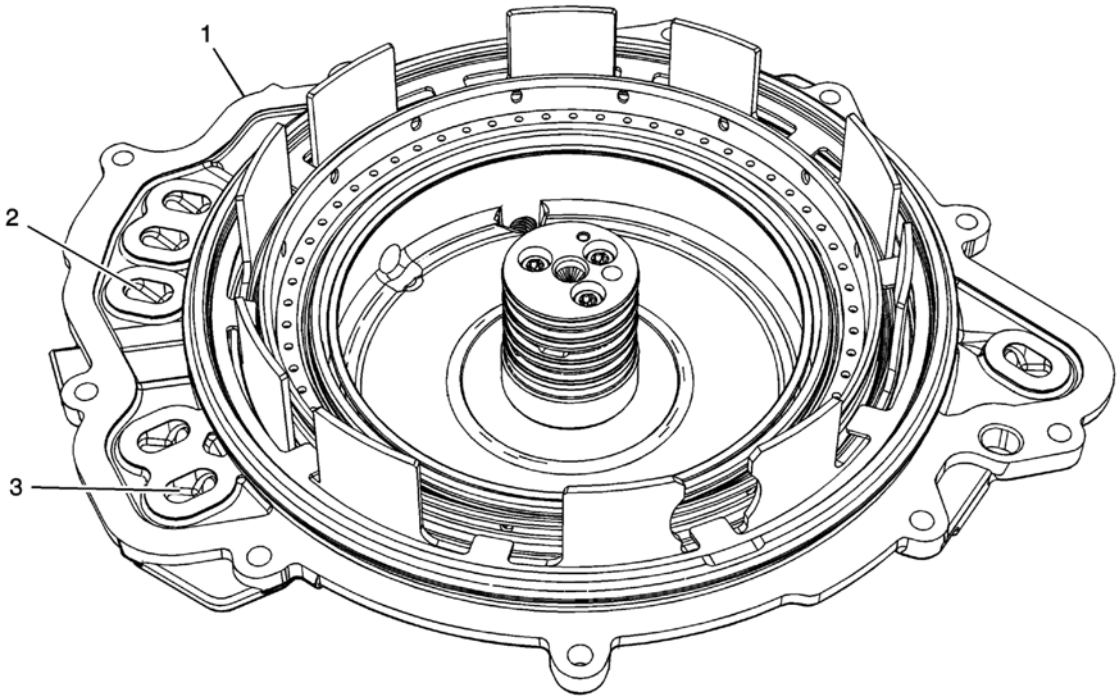

Fig. 73: 2-6 and Low-Reverse Piston Function Inspection
Courtesy of GENERAL MOTORS COMPANY

2-6 and Low-Reverse Piston Function Inspection

Callout	Component Name
1	Case Cover Assembly **NOTE:** **The fluid seal rings should be in**

Callout	Component Name
	place and not damaged.
2	2-6 Clutch Feed Passage **CAUTION:** **Regulate the air pressure to 40 psi maximum. High pressure could cause the piston to over travel and damage the piston seals.** **Procedure** Apply shop air to the 2-6 clutch feed. Observe the 2-6 piston movement. **NOTE:** **Minimal piston movement and excessive air leaking could indicate damage to the 2-6 piston seals or improper assembly.**
3	Low and Reverse Clutch Feed Passage **CAUTION:** **Regulate the air pressure to 40 psi maximum. High pressure**

Callout	Component Name
	could cause the piston to over travel and damage the piston seals. **Procedure** Apply shop air to the Low and Reverse clutch feed. Observe the Low and Reverse piston movement. **NOTE:** **Minimal piston movement and excessive air leaking could indicate damage to the Low and Reverse piston seals or improper assembly.**

Input Speed Sensor Installation

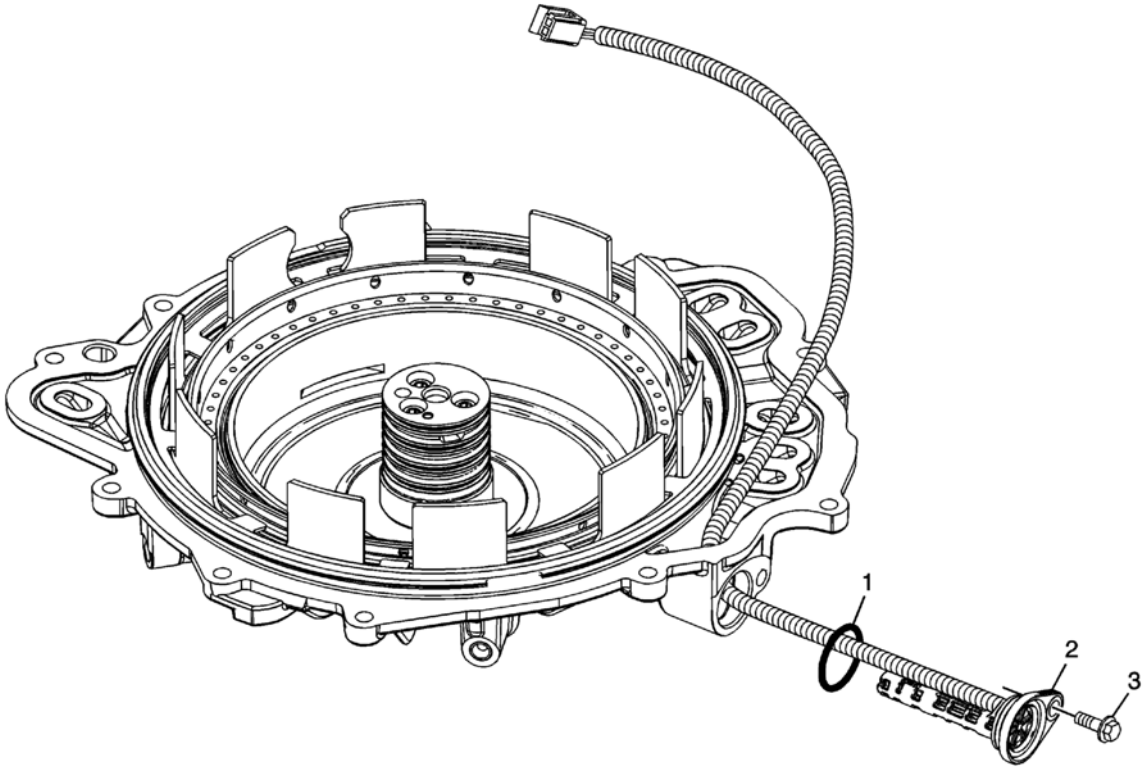

Fig. 74: View Of Input Speed Sensor
Courtesy of GENERAL MOTORS COMPANY

Input Speed Sensor Installation

Callout	Component Name
1	Input Speed Sensor Seal
2	A/Trans Input Speed Sensor Assembly
3	A/Trans Input Speed Sensor Bolt M6 x 25 **CAUTION:** **Refer to Fastener Caution .** **Procedure** Apply threadlocker or equivalent to the input speed sensor bolt. Refer to **Adhesives, Fluids, Lubricants, and Sealers** . **NOTE:** **The seal is coated with a dry lubricant. If the coating is missing, lubricate the**

Callout	Component Name
	seal with automatic transmission fluid prior to installation. **Tighten** 9 N.m (7 lb ft)

CASE COVER ASSEMBLY INSTALLATION

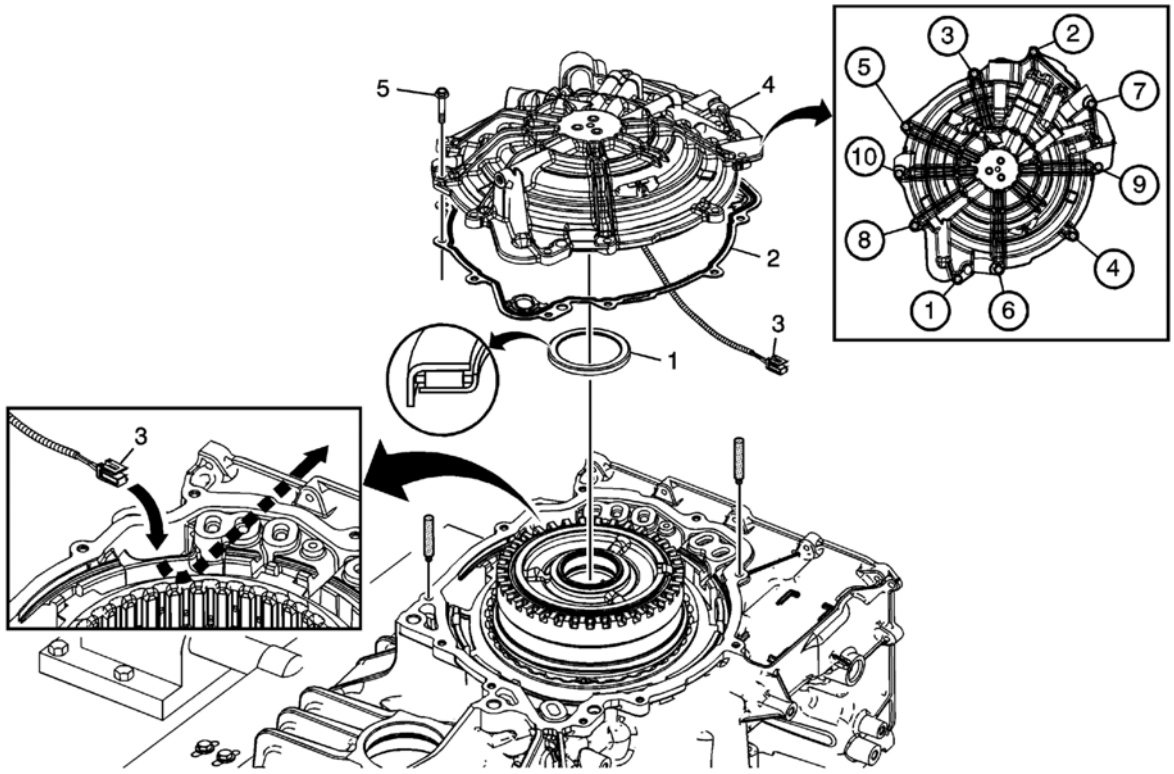

Fig. 75: Identifying Case Cover Assembly Components
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Input Shaft Thrust Bearing **NOTE:** **Note location of the orientation lip on bearing. All thrust**

Callout	Component Name
	bearings can only be assembled one way.
2	A/Trans Case Cover Gasket
3	Input Speed Sensor Wire Harness **NOTE:** **Route the input speed sensor wire harness through the case passage.**
4	A/Trans Case Cover Assembly **Procedure** 1. Use guide pins to install the case cover assembly to prevent damage to the input shaft thrust bearing. 2. Pull the input speed sensor wire harness through the case passage while lowering the cover assembly onto the case. **Special Tools** **39068** Guide Pins For equivalent regional tools, refer to **Special Tools** .
5	A/Trans Case Cover Assembly Bolt M6 x 30 (Qty: 10) **CAUTION:** **Refer to Fastener Caution .** **Procedure** Tighten in sequence shown. **Tighten** 12 N.m (106 lb in)

FRONT DIFFERENTIAL CARRIER FINAL ROTATIONAL TORQUE MEASUREMENT

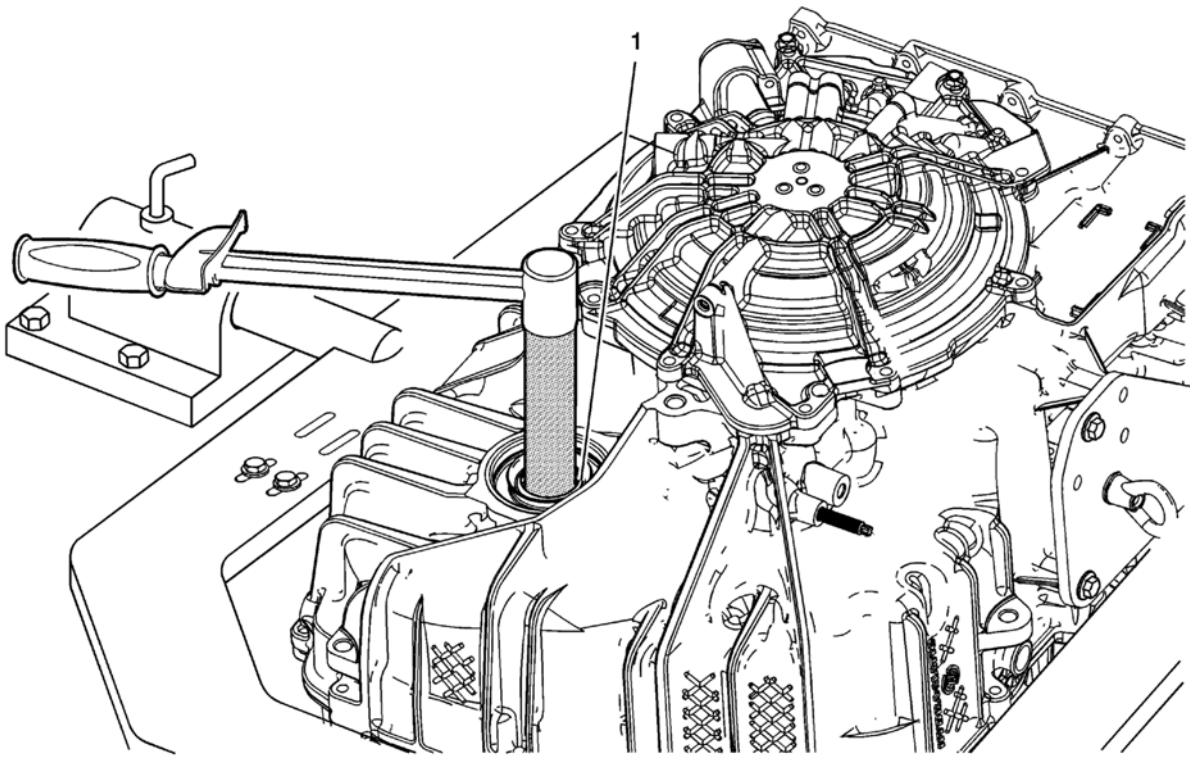

Fig. 76: Front Differential Carrier Final Rotational Torque Measurement
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Front Differential Carrier Assembly **CAUTION:** **Low bearing pre-load will cause premature failure of the front differential drive pinion gear.** **CAUTION:** **Refer to Fastener Caution .** **NOTE:** • **If the turning torque is not within**

Callout	Component Name
	specifications, the transfer gear assembly and differential bearing thrust washer is incorrect and must be corrected. Refer to Front Differential Drive Pinion Gear Bearing Thrust Washer and Front Differential Bearing Washer Measurement. • **Use a dial or beam torque wrench with DT-47793 differential rotating tool to measure turning torque.** **Tighten** 14-22 N.m (10-16 lb ft) **Special Tools** **DT-47793** Differential Rotating Tool For equivalent regional tools, refer to **Special Tools** .

CONTROL VALVE BODY ASSEMBLY DISASSEMBLE

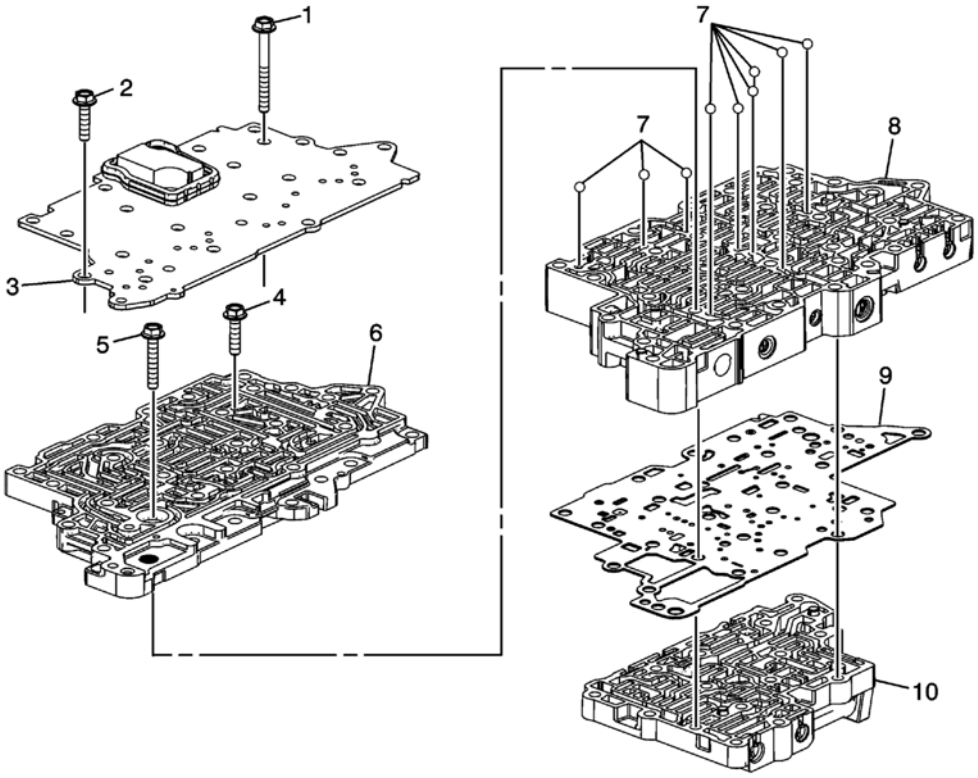

Fig. 77: Control Valve Body Assembly Components
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Control Valve Body Bolt M6 x 65 (Qty: 5)
2	Control Valve Body Bolt M6 x 35 (Qty: 3)
3	Control Valve Channel Upper Plate Assembly **NOTE:** • **Inspect the upper channel plate bolt pass through holes for damage or brinelling. Any damage near the PCS feed hole will cause incorrect pressure switch**

Callout	Component Name
	operation. Replace as necessary. • **The TCU pin gasket is not serviceable. If the gasket is damaged, the control valve channel upper plate assembly must be replaced.**
4	Control Valve Body Bolt M6 x 55 (Qty: 2)
5	Control Valve Body Bolt M6 x 55 (Qty: 1)
6	Control Valve Channel Plate Assembly
7	Control Valve Body Ball Check Valve (Qty: 9)
8	Control Valve Upper Body Assembly
9	Control Valve Lower Body Spacer Plate Assembly **NOTE:** **Discard the spacer plate assembly.**
10	Control Valve Lower Body Assembly

CONTROL VALVE LOWER BODY ASSEMBLY CLEANING AND INSPECTION

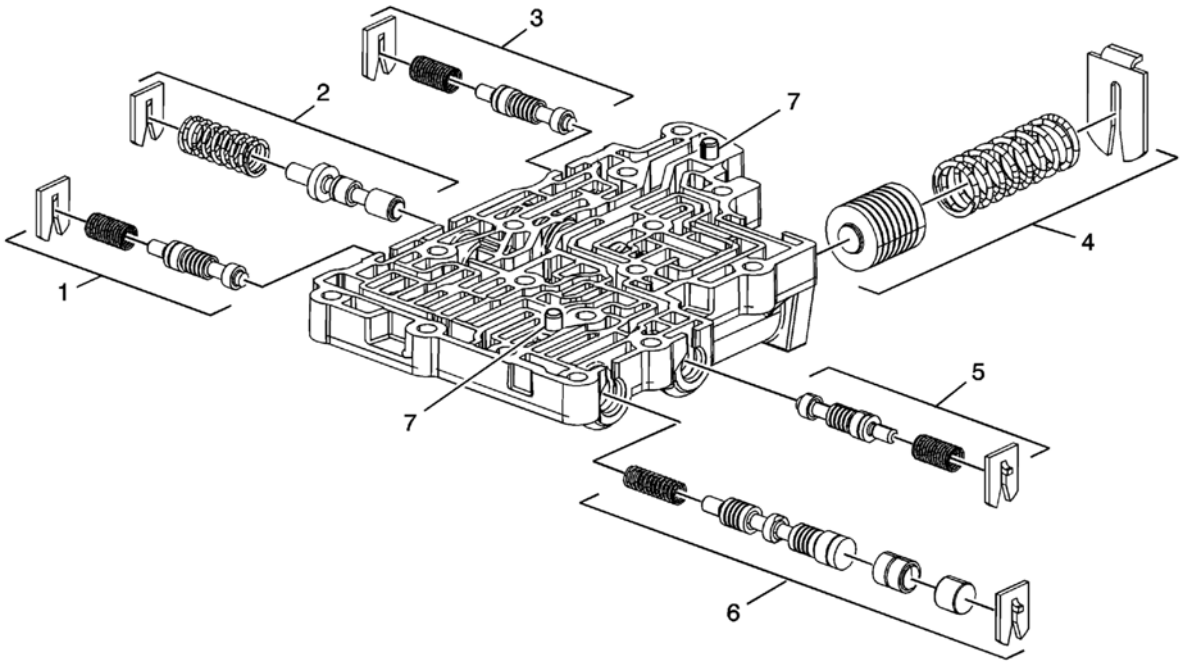

Fig. 78: Identifying Control Valve Lower Body Assembly Components
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
WARNING: **Valve springs can be tightly compressed. Use care when removing retainers and plugs. Personal injury could result.** **CAUTION:** **After cleaning the transmission components, allow to air dry. Do not use cloth or paper towels**	

Callout	Component Name
in order to dry any transmission components. Lint from the towels can cause component failure. **CAUTION:** **Do not reuse cleaning solvents. Previously used solvents may deposit sediment which may damage the component.** **Preliminary Procedure** Clean and inspect all valve components and the valve body. The control valve lower body is replaceable only as an assembly.	
1	3-5 Reverse Clutch Boost Valve Train
2	Accumulator Feed Limit Valve Train
3	4-5-6 Clutch Boost Valve Train
4	4-5-6 Clutch Accumulator Piston Assembly
5	1-2-3-4 Clutch Boost Valve Train
6	1-2-3-4 Clutch Regulator Valve Train
7	Control Valve Body Locating Pins (Qty: 2) **NOTE:** **Inspect Valve Body locating pins for proper installed height of 4.25 mm (0.17 in).**

CONTROL VALVE UPPER BODY ASSEMBLY CLEANING AND INSPECTION

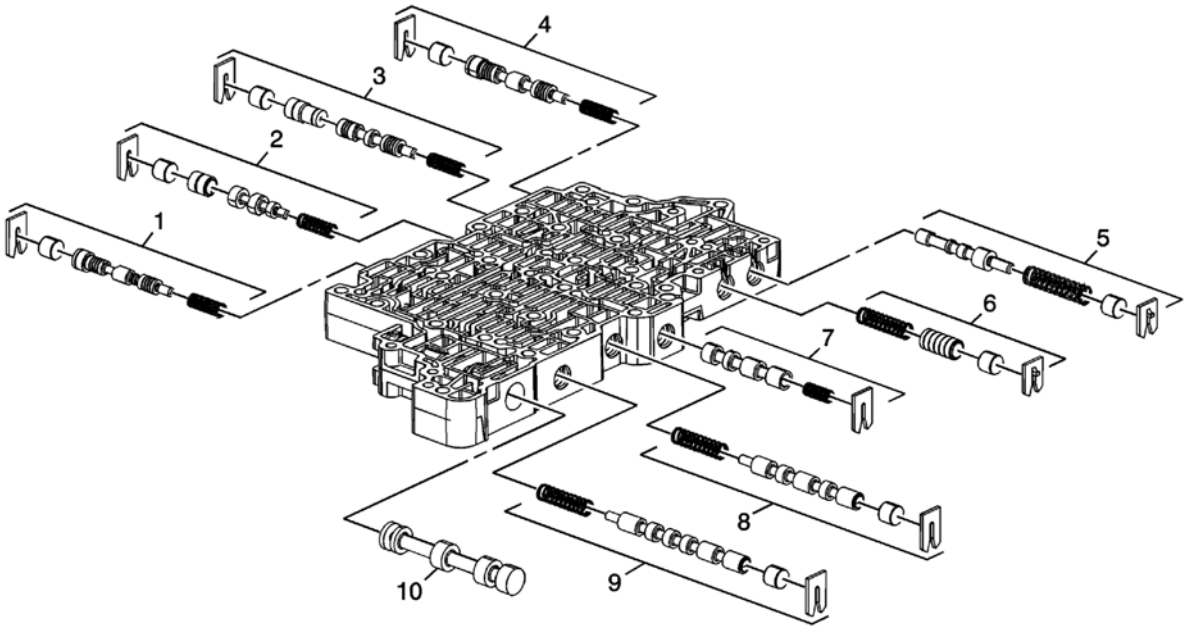

Fig. 79: Identifying Control Valve Upper Body Assembly Components
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
WARNING: **Valve springs can be tightly compressed. Use care when removing retainers and plugs. Personal injury could result.** **CAUTION:** **After cleaning the transmission components, allow to air dry. Do not use cloth or paper towels**	

Callout	Component Name
in order to dry any transmission components. Lint from the towels can cause component failure. **CAUTION:** **Do not reuse cleaning solvents. Previously used solvents may deposit sediment which may damage the component.** **Preliminary Procedure** Clean and inspect all valve components and the valve body. The control valve upper body is replaceable only as an assembly.	
1	1st Reverse and 4-5-6 Clutch Regulator Valve Train
2	TCC Regulator Apply Valve Train
3	2-6 Clutch Regulator Valve Train
4	3-5 Reverse Clutch Regulator Valve Train
5	Pressure Regulator Valve Train
6	Isolator Valve Train
7	TCC Control Valve Train
8	Clutch Select Solenoid #3 Valve Train
9	Clutch Select Solenoid #2 Valve Train
10	Manual Valve

CONTROL VALVE CHANNEL PLATE CLEANING AND INSPECTION

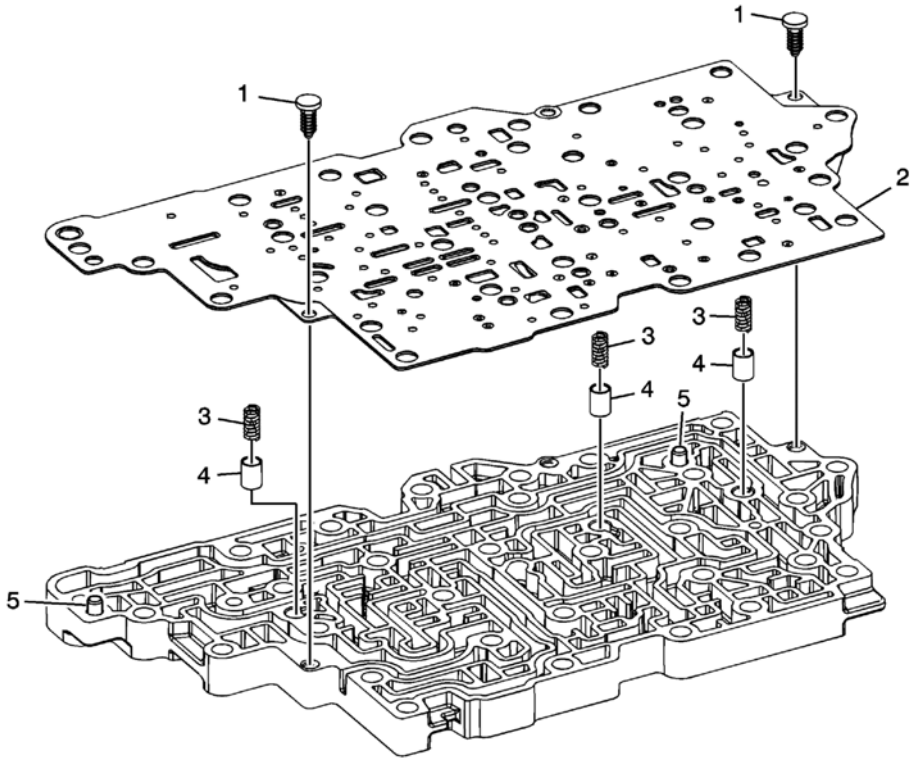

Fig. 80: Identifying Control Valve Channel Plate Components
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
CAUTION: **After cleaning the transmission components, allow to air dry. Do not use cloth or paper towels in order to dry any transmission components. Lint from the towels can cause component failure.** **CAUTION:** **Do not reuse cleaning solvents.**	

Callout	Component Name
Previously used solvents may deposit sediment which may damage the component.	
1	Control Valve Body Spacer Plate Retainer (Qty: 2)
2	Control Valve Upper Body Spacer Plate Assembly
3	Actuator Feed Accumulator Spring (Qty: 3)
4	Actuator Feed Accumulator Piston (Qty: 3)
5	Control Valve Body Locating Pin (Qty: 2) **NOTE:** **Inspect locating pins for proper installed height of 4.25 mm (0.17 in).**

CONTROL VALVE BODY ASSEMBLY ASSEMBLE

Lower and Upper Body Assemble

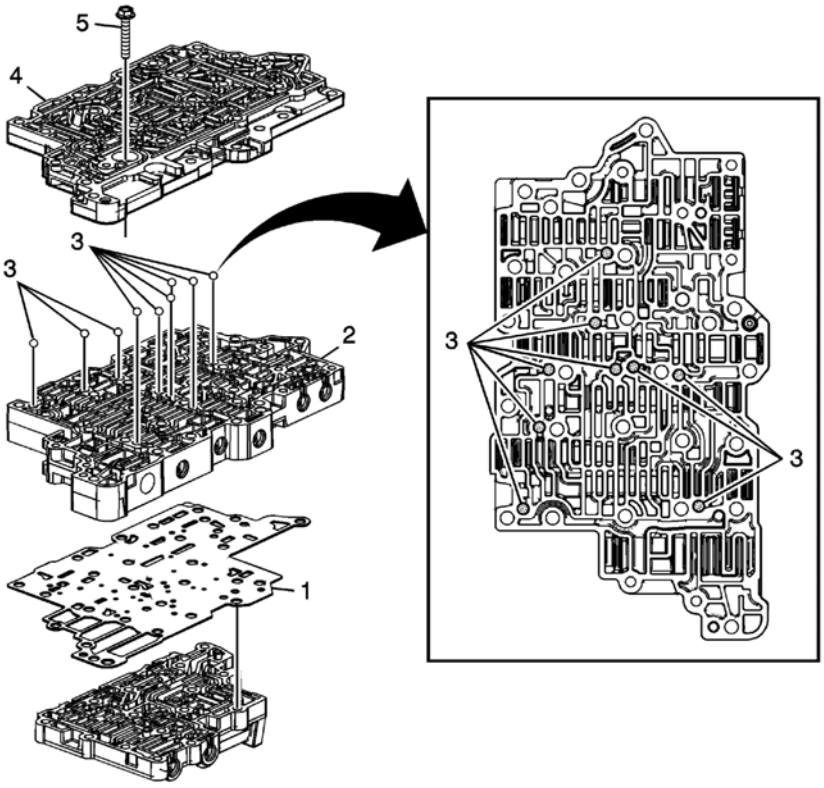

Fig. 81: Identifying Control Valve Body & Bolt
Courtesy of GENERAL MOTORS COMPANY

Lower and Upper Body Assemble

Callout	Component Name
1	Control Valve Lower Body Spacer Plate Assembly **CAUTION:** **Do not use the old spacer plate. Install a NEW spacer plate. Reusing an old spacer plate may cause internal transmission leaks and transmission damage.** **NOTE:** **Inspect the upper channel plate bolt through holes for damage or brinelling. Any damage around the PCS switch feed holes could cause leakage around the PCS switch seals. Replace as necessary.**
2	Control Valve Upper Body Assembly
3	Control Valve Body Ball Check Valve (Qty: 9) **CAUTION:**

Callout	Component Name
	Do not use any type of grease or other material to hold the check ball valves in place during assembly. Grease will cause the valves to not operate properly, resulting in damage to the transmission.
4	Control Valve Channel Plate Assembly
5	Control Valve Body Bolt 6 x 55 (Qty: 1) **CAUTION:** **Refer to Fastener Caution .** **Tighten** 12 N.m (9 lb ft)

Channel Plate and Upper Channel Plate Assemble

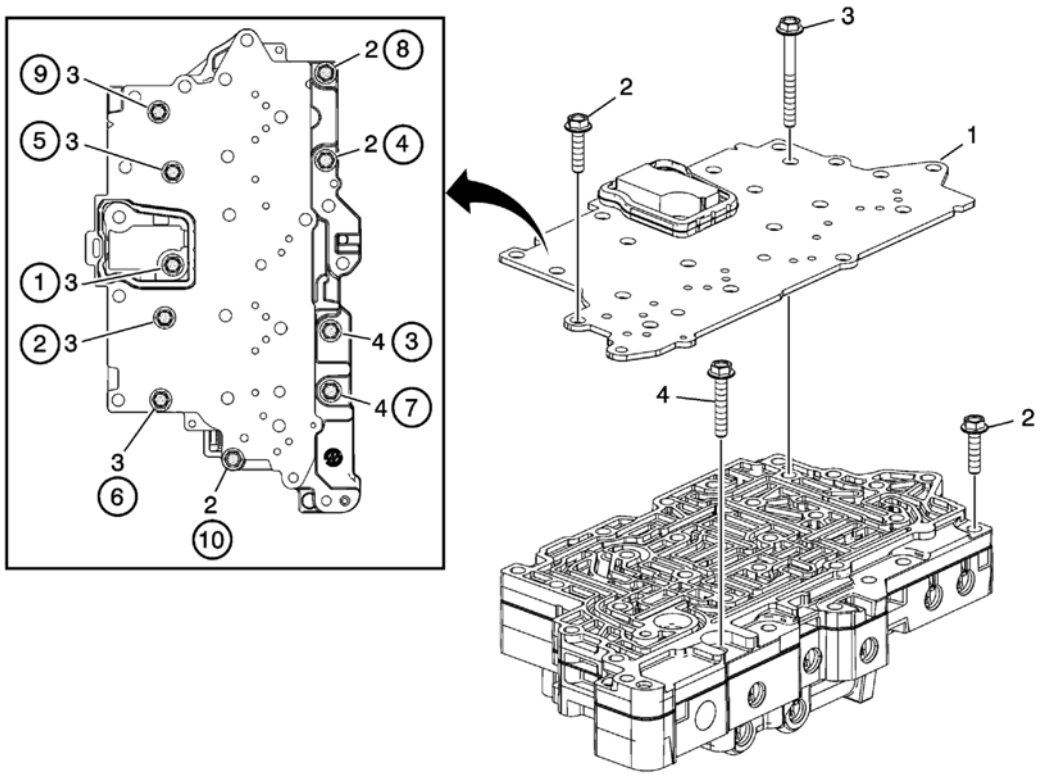

Fig. 82: Channel Plate And Upper Channel Plate
Courtesy of GENERAL MOTORS COMPANY

Channel Plate and Upper Channel Plate Assemble

Callout	Component Name
1	Control Valve Channel Upper Plate Assembly **NOTE:** • **Inspect the upper channel plate bolt pass through holes for damage or burnelling. Any damage near the PCS feed holes could cause leaking around the PCS switch seal.**

Callout	Component Name
	Replace as necessary. • **The TCU pin gasket is not serviceable. If the gasket is damaged, the control valve channel upper plate assembly must be replaced.**
2	Control Valve Body Bolt M6 x 35 (Qty: 3) **CAUTION:** **Refer to Fastener Caution .** **Procedure** Hand tighten for alignment, then tighten in sequence, after all bolts are installed. **Tighten** 12 N.m (9 lb ft)
3	Control Valve Body Bolt M6 x 65 (Qty: 5) **Procedure** Tighten in sequence. **Tighten** 12 N.m (9 lb ft)
4	Control Valve Body Bolt M6 x 55 (Qty: 2) **Procedure** Tighten in sequence. **Tighten** 12 N.m (9 lb ft)

CONTROL VALVE BODY ASSEMBLY INSTALLATION

Output Speed Sensor and Valve Body Installation

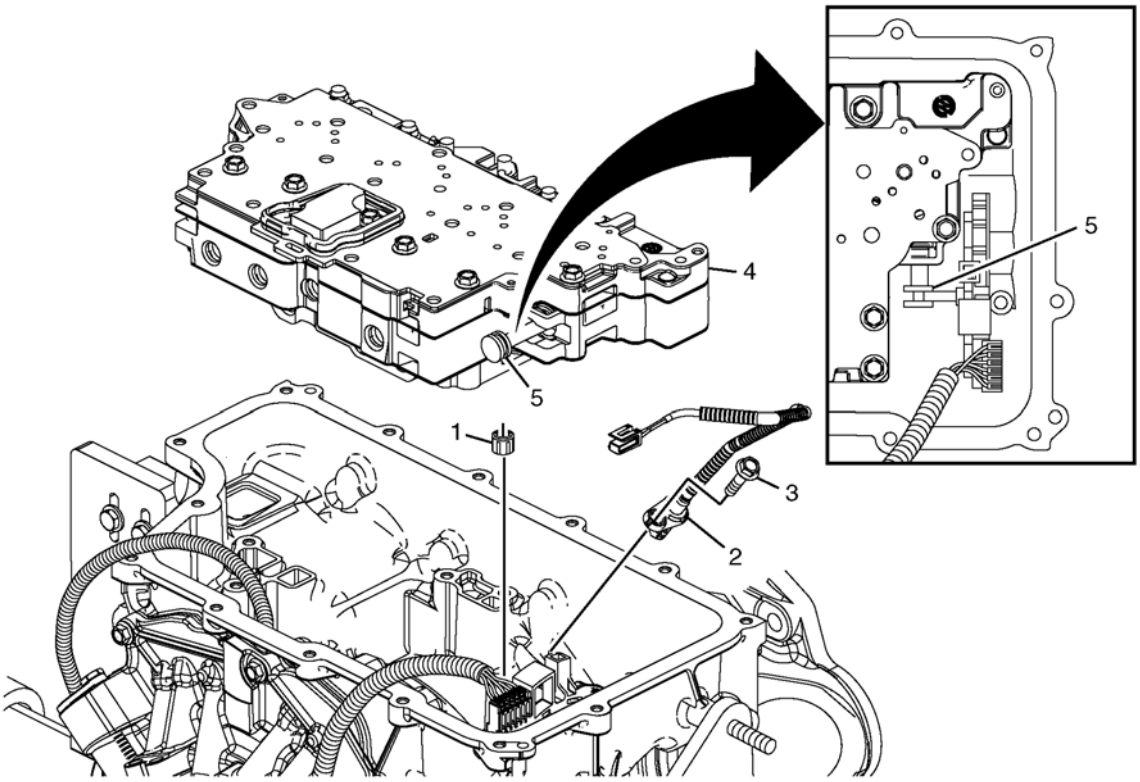

Fig. 83: Output Speed Sensor And Control Valve Body Assembly
Courtesy of GENERAL MOTORS COMPANY

Output Speed Sensor and Valve Body Installation

Callout	Component Name
1	1-2-3-4 Clutch Fluid Passage Seal
2	A/Trans Output Speed Sensor Assembly
3	A/Trans Output Speed Sensor Assembly Bolt M6 x 25 **CAUTION:** **Refer to Fastener Caution .** **Tighten** 12 N.m (9 lb ft)
4	Control Valve Body Assembly
5	Manual Valve **NOTE:** • **Align the manual valve to the detent**

Callout	Component Name
	lever assembly. • **Removing the manual shaft assembly pin will aid in aligning the manual valve to the detent lever. Install the manual shaft pin after the valve body assembly is installed using DT 41229 pin installer , if it was not installed previously. Refer to Manual Shift Detent Lever with Shaft Position Switch Assembly and Park Pawl Actuator Removal.** **Special Tools** **DT 41229** Manual Shaft Pin Installer For equivalent regional tools, refer to **Special Tools** .

Control Valve Body Bolts Installation

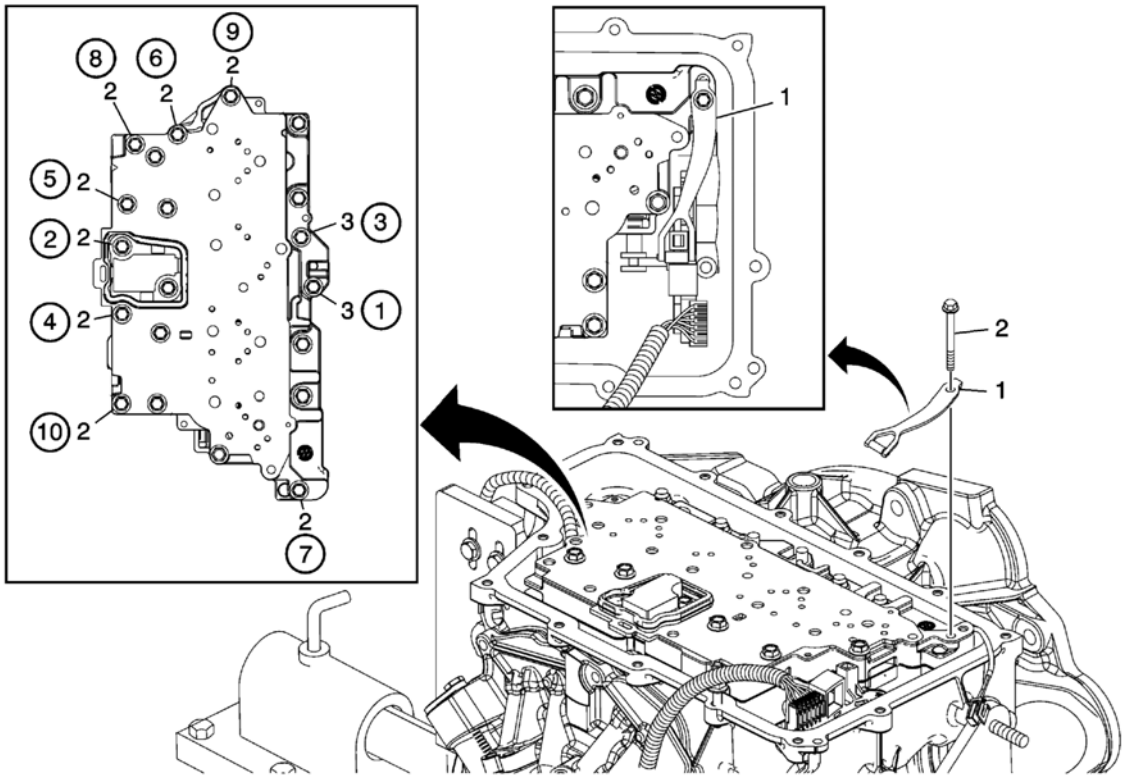

Fig. 84: Control Valve Body Bolt Tightening Sequence
Courtesy of GENERAL MOTORS COMPANY

Control Valve Body Bolts Installation

Callout	Component Name
1	Manual Shaft Detent Assembly **NOTE:** **Ensure proper alignment of the detent assembly to the detent lever assembly with position switch while tightening the bolt. The detent assembly can move and hit the valve body**

Callout	Component Name
	assembly that could cause improper engagement with the detent lever assembly.
2	Control Valve Body Bolt M6 x 65 (Qty: 8) **CAUTION:** **Refer to Fastener Caution .** **Procedure** Tighten in sequence. **Tighten** 12 N.m (9 lb ft).
3	Control Valve Body Bolt M6 x 55 (Qty: 2) **Procedure** Tighten in sequence. **Tighten** 12 N.m (9 lb ft).

Filter Plate Installation

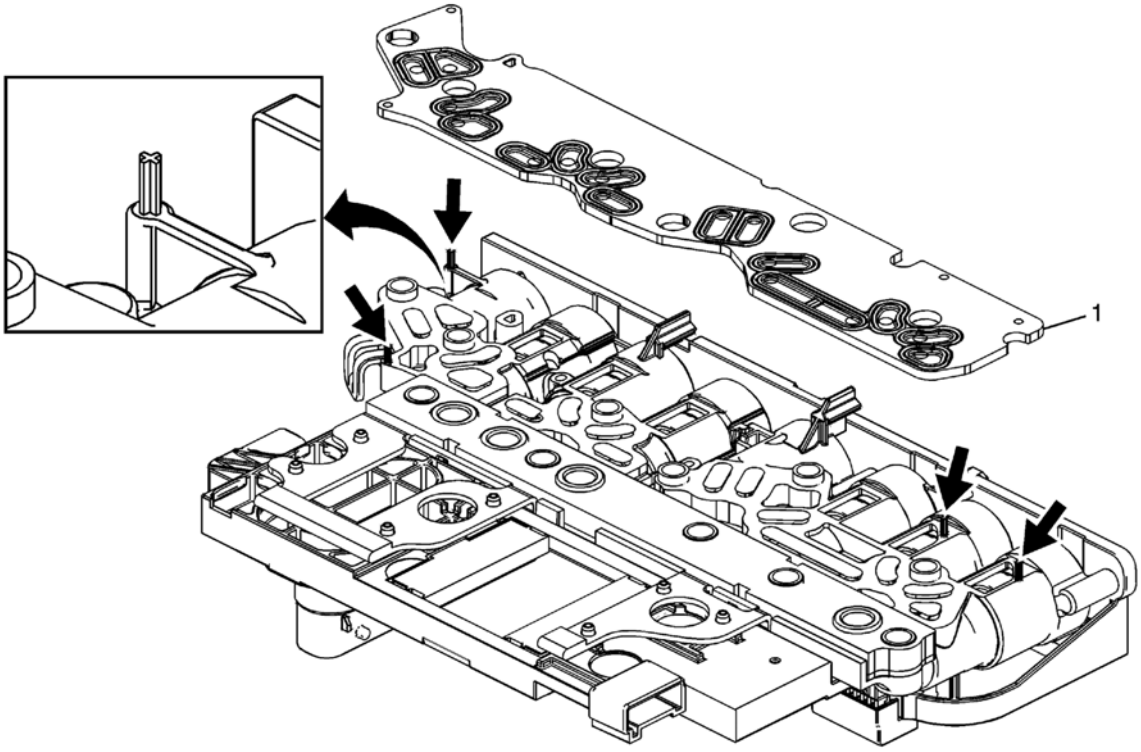

Fig. 85: View Of Filter Plate
Courtesy of GENERAL MOTORS COMPANY

Filter Plate Installation

Callout	Component Name
1	Control Solenoid Valve Assembly Filter Plate **CAUTION:** **Use care when removing or installing the filter plate assembly. A broken or missing retaining tab may not adequately secure the filter plate to the control solenoid valve assembly, resulting in possible damage or contamination.**

Callout	Component Name
	NOTE: **Install a NEW filter plate to prevent fluid leaks past the oil seals.**

Control Solenoid (w/Body and TCM) Valve Assembly Installation

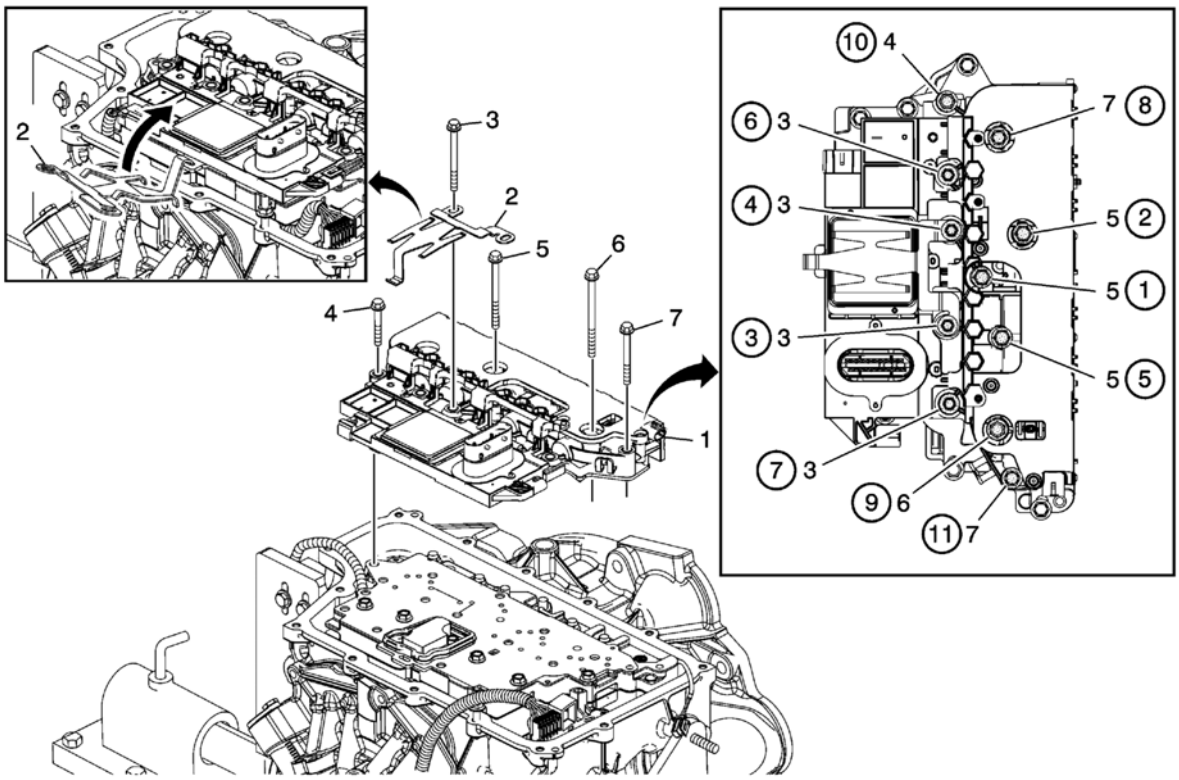

Fig. 86: Control Solenoid (w/Body and TCM) Valve Assembly
Courtesy of GENERAL MOTORS COMPANY

Control Solenoid (w/Body and TCM) Valve Assembly Installation

Callout	Component Name
	CAUTION: **Refer to Fastener Caution .** **Preliminary Procedure** Install all bolts before tightening, then tighten in sequence to 12 N.m (9 lb ft).
1	Control Solenoid (w/Body and TCM) Valve Assembly **CAUTION:**

Callout	Component Name
	Do not drop the control solenoid with body and transmission control module (TCM) valve assembly. Internal damage can occur if the control solenoid with body and TCM valve assembly is dropped. DO NOT reuse the control solenoid with body and TCM valve assembly if it is dropped.
2	Control Solenoid Valve Spring **NOTE:** • **If the control solenoid spring is missing or improperly installed, the TCM may overheat causing the TCM to shut down. The transmission will default to 3rd or 5th gear.**

Callout	Component Name
	• **Insert tab of spring into slot on spacer plate, then rotate into position.**
3	Control Valve Body Bolt M6 x 80 (Qty: 4)
4	Control Valve Body Bolt M6 x 55 (Qty: 1)
5	Control Valve Body Bolt M6 x 95 (Qty: 3)
6	Control Valve Body Bolt M6 x 42 (Qty: 1)
7	Control Valve Body Bolt M6 x 65 (Qty: 2)

Wire Routing and Connector Locations

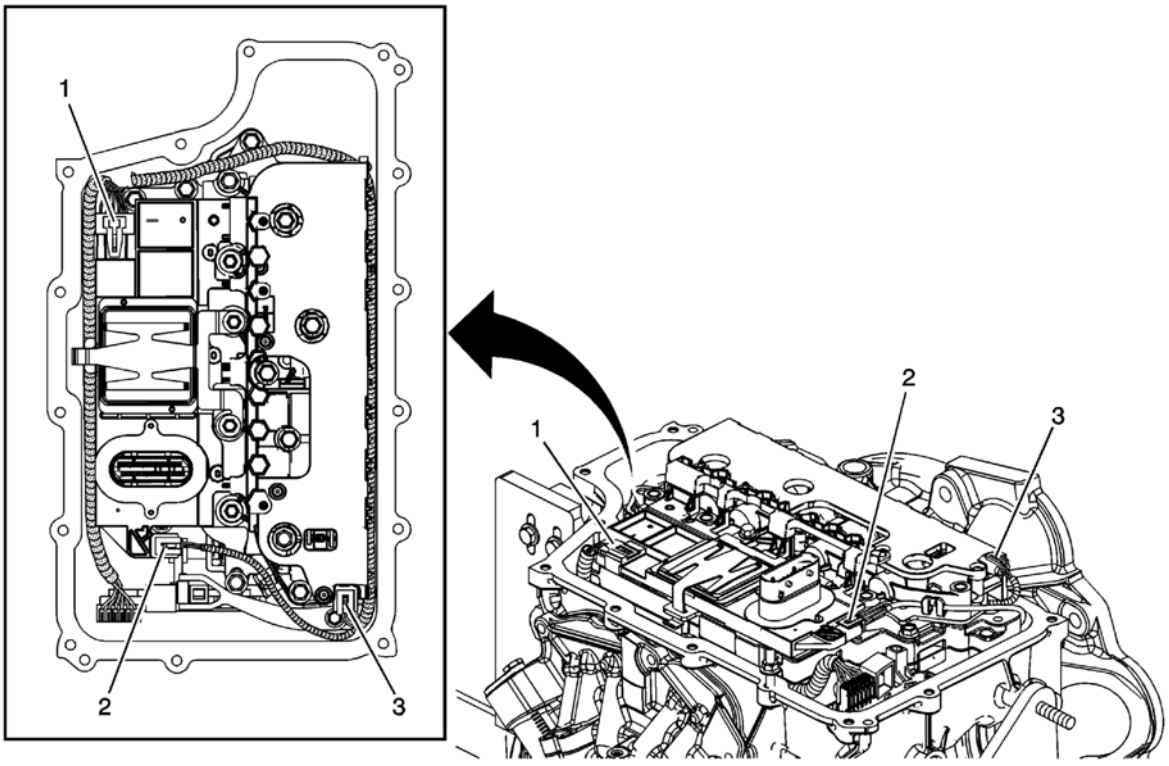

Fig. 87: Identifying Wire Routing & Connector Locations
Courtesy of GENERAL MOTORS COMPANY

Wire Routing and Connector Locations

Callout	Component Name
Preliminary Procedure Route all wires as shown.	
1	Shift Position Switch Connector
2	Output Speed Sensor Connector

Callout	Component Name
3	Input Speed Sensor Connector

Control Valve Body Cover Installation

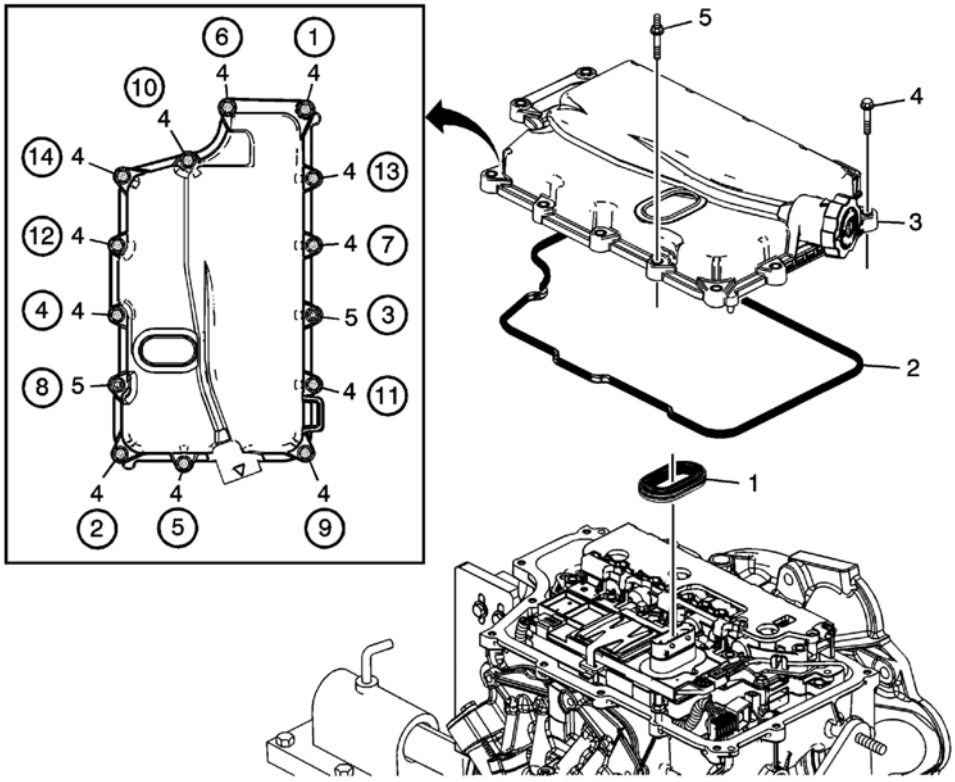

Fig. 88: Identifying Control Valve Body Cover Wiring Connector Hole Seal & Bolt Tightening Sequence
Courtesy of GENERAL MOTORS COMPANY

Control Valve Body Cover Installation

Callout	Component Name
1	Control Valve Body Cover Wiring Connector Hole Seal **NOTE:** **Holes in the seal must face down.**
2	Control Valve Body Cover Assembly Gasket
3	Control Valve Body Cover Assembly
4	Control Valve Body Cover Bolt M6 x 30 (Qty: 12) **CAUTION:** **Refer to Fastener Caution .**

Callout	Component Name
	Procedure Tighten in sequence. **Tighten** 12 N.m (9 lb ft).
5	Control Valve Body Cover Stud M6 x 30 (Qty: 2) **Procedure** Tighten in sequence. **Tighten** 12 N.m (9 lb ft).

TORQUE CONVERTER INSTALLATION

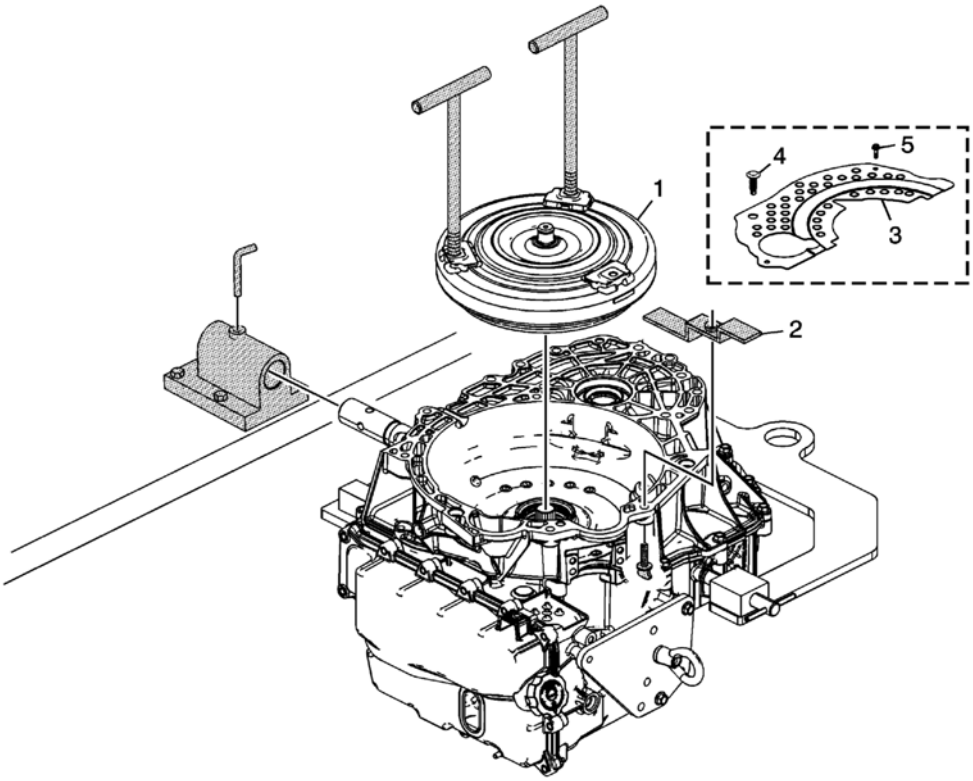

Fig. 89: View Of Torque Converter
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Torque Converter Assembly **CAUTION:** **Lower the torque converter straight down. Failure to lower the**

Callout	Component Name
	torque converter straight down could damage the torque converter clutch lip seal inside the torque converter clutch assembly. **Special Tools** **DT 46409** Torque Converter Lifting Handles For equivalent regional tools, refer to **Special Tools** .
2	**DT 21366** Converter Holding Strap **WARNING:** **The torque converter must be held to the torque converter housing by a retaining device such as shipping brackets. Without the retaining device, the torque converter may slide forward, disengaging the oil pump, or may fall completely out of the transmission causing personal injury and/or**

Callout	Component Name
	property damage.
3	Dust Cover - Model Dependant
4	Dust Cover Push Pin - Model Dependant (Qty: 2)
5	Dust Cover Bolt - Model Dependant **CAUTION:** **Refer to Fastener Caution .** **Tighten** 75 N.m (37 lb ft)

LIFT PLATE AND HOLDING FIXTURE REMOVAL

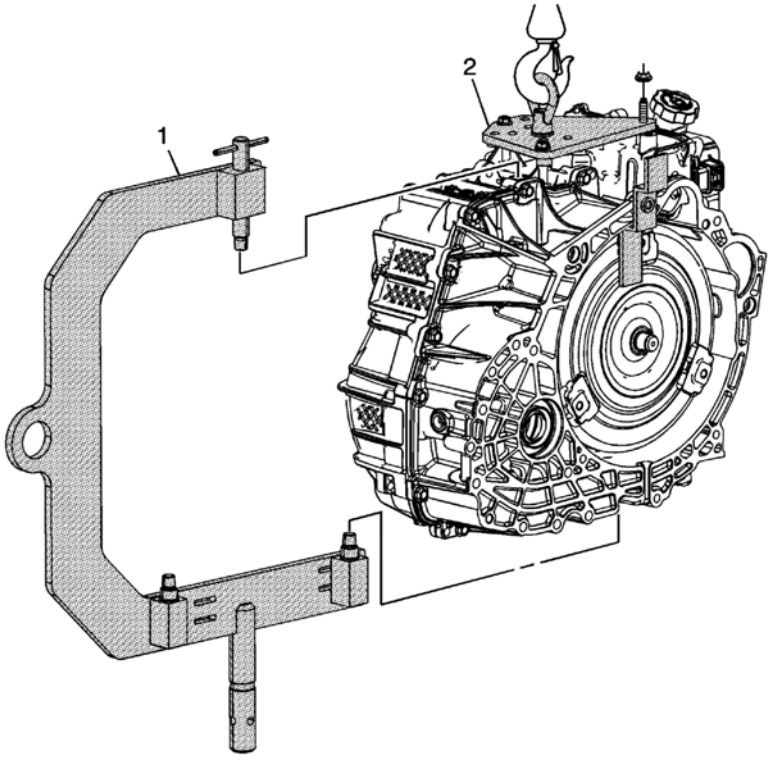

Fig. 90: Identifying Lift Plate & Holding Fixture
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	**DT 46625** Transmission Holding Fixture **NOTE:**

Callout	Component Name
	Raise the transmission in order to remove the holding fixture. For equivalent regional tools, refer to **Special Tools** .
2	**DT-47811-A** Lift Plate **NOTE:** **Lower the transmission assembly onto the transmission jack in order to remove the lift plate.** For equivalent regional tools, refer to **Special Tools** .

Article GUID: A00737250

REPAIR INSTRUCTIONS - ON VEHICLE

MANUAL SHIFT DETENT LEVER WITH SHAFT POSITION SWITCH ASSEMBLY REPLACEMENT

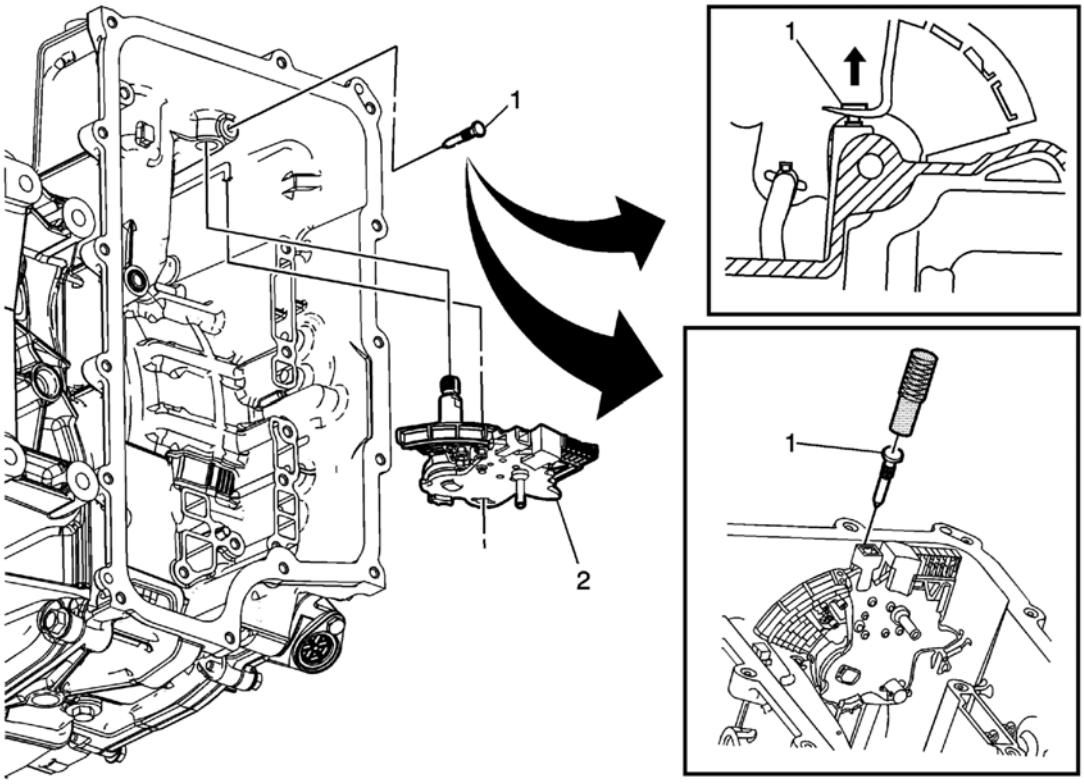

Fig. 1: Identifying Manual Shift Detent Lever & Shaft Position Switch Assembly
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedures 1. Remove the transmission range selector lever. Refer to **Automatic Transmission Range Selector Lever Replacement**. 2. Remove the lower control valve body. Refer to **Control Valve Lower Body and Upper Body Replacement**.	
1	Manual Shaft Detent Lever Pin **CAUTION:** **Use J 41229 to install the manual shaft**

Callout	Component Name
	pin at the correct height in order to properly secure the manual shaft. If you install the pin too deep, the case bore may crack. • Use a small nail puller to remove the pin. Discard the pin, it is not reusable. • Use **DT-41229** Manual Shaft Pin Installer to install the pin. Inspect that the pin installed height is within 6.5 mm-7.5 mm (0.25 in-0.30 in). **Special Tools** **DT 41229** Manual Shaft Pin Installer
2	Manual Shaft Detent Lever Assembly (With Shift Position Switch) **Procedure** • Removal: Partly lower the manual shaft detent lever assembly (w/shift position switch) in order to rotate the detent lever and disconnect the park actuator rod. Then fully remove the manual shaft detent lever assembly from the transmission case. • Installation: Partly install the manual shaft detent lever assembly (w/shift position switch). Rotate the detent lever and connect the park actuator rod. Then fully install the manual shaft detent lever assembly in the transmission case. • Lubricate the manual shaft with automatic transmission fluid (ATF) to prevent damage to the manual shift shaft seal. **TIP:** Do not pull the park actuator rod end out beyond the machined oil passage surface in the case. A no park condition will exist if the park pawl actuator assembly is pulled out of the transmission too far and the actuator rod disengages from the park pawl. The transmission assembly will require disassembly to re-install the actuator rod over the park pawl.

TRANSMISSION CONTROL LEVER KNOB REPLACEMENT

Removal Procedure

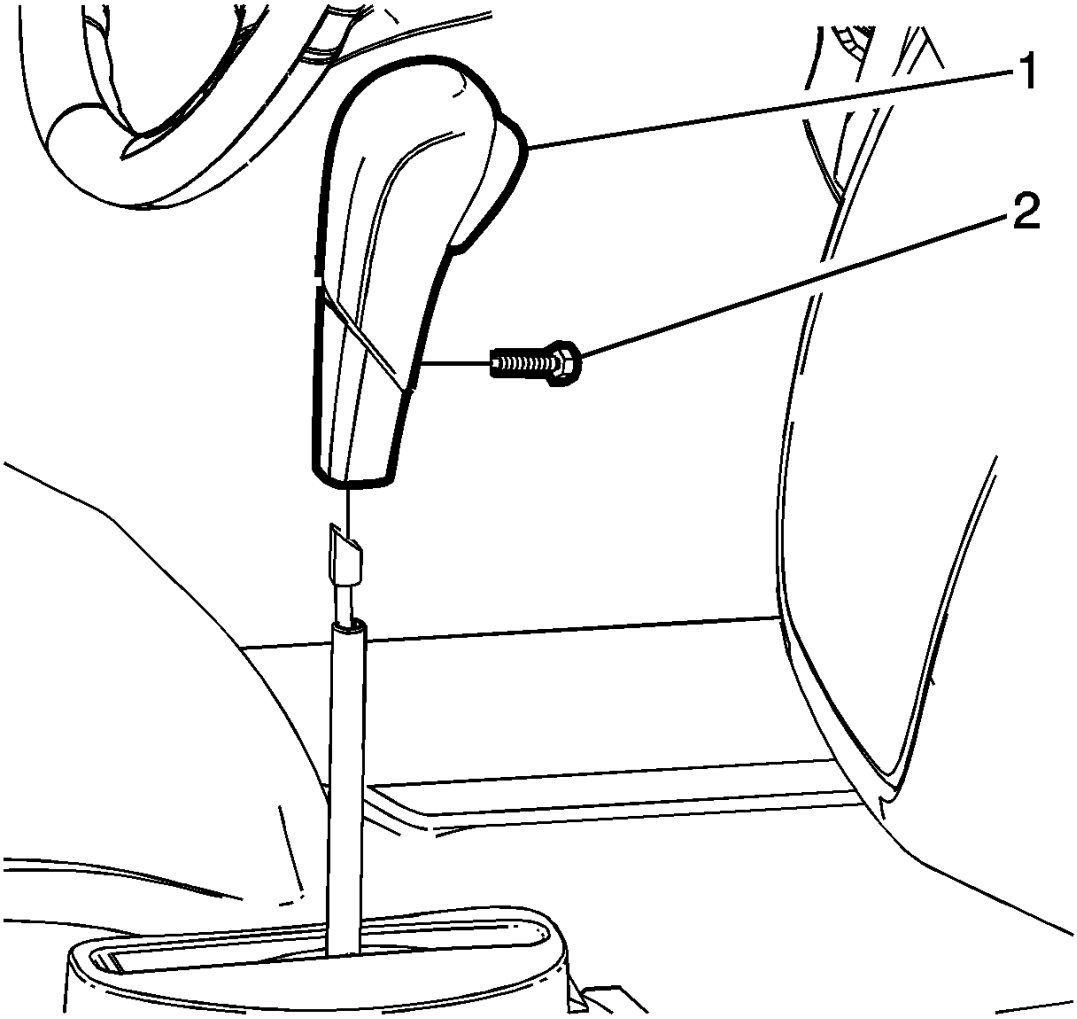

Fig. 2: Shift Knob And Retaining Screw
Courtesy of GENERAL MOTORS COMPANY

NOTE: **Place the shift control in NEUTRAL before attempting to remove the shift knob screw.**

1. Remove the shift knob retaining screw (2).
2. Remove the shift knob (1) from the shift control lever.

Installation Procedure

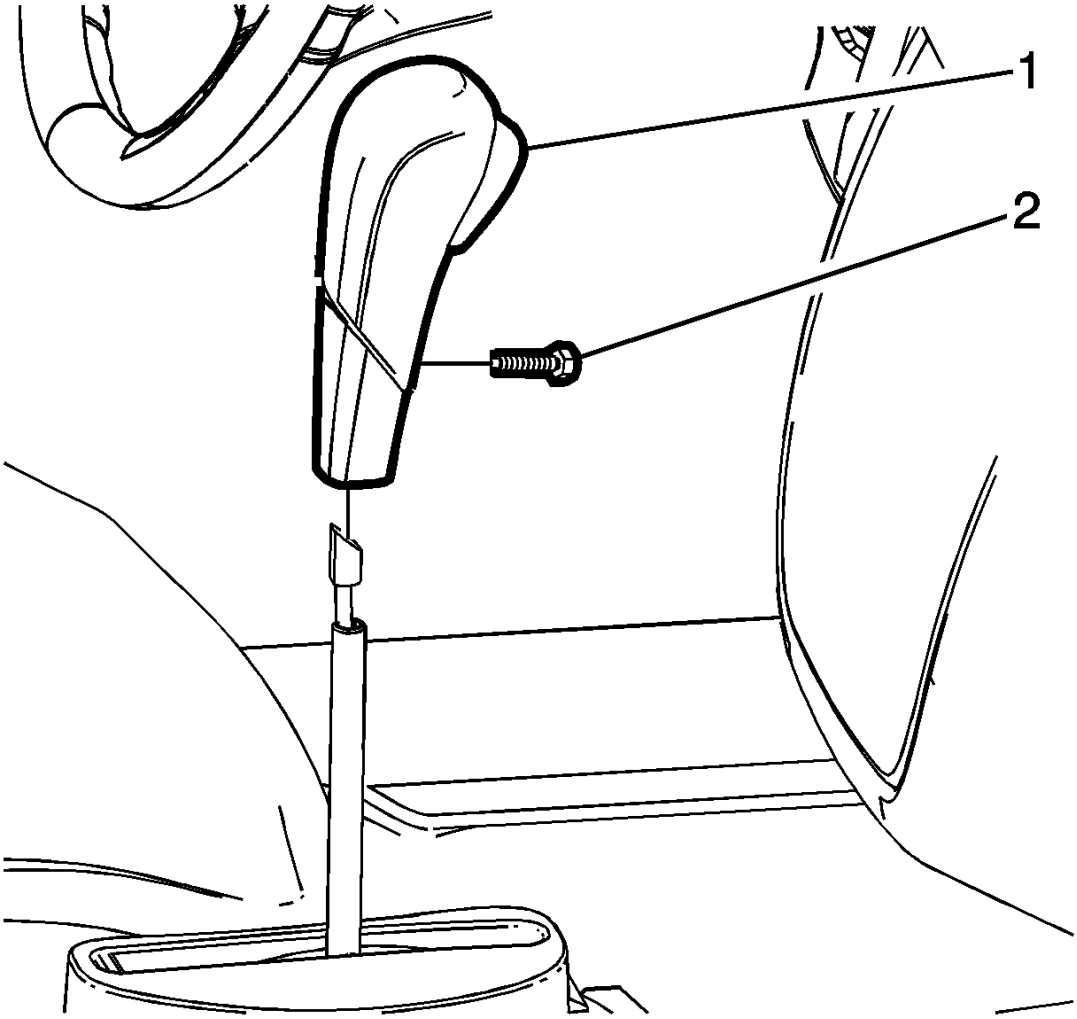

Fig. 3: Shift Knob And Retaining Screw
Courtesy of GENERAL MOTORS COMPANY

NOTE: **Place the shift control in NEUTRAL before attempting to install the shift knob screw.**

1. Install the shift knob (1) to the shift control lever.

CAUTION: **Refer to Fastener Caution .**

2. Install the shift knob retaining screw (2) and tighten to 9 N.m (80 lb in).

TRANSMISSION CONTROL REPLACEMENT

Removal Procedure

1. Remove the console trim plate . Refer to **Front Floor Console Replacement** .
2. Remove the console wiring harness.

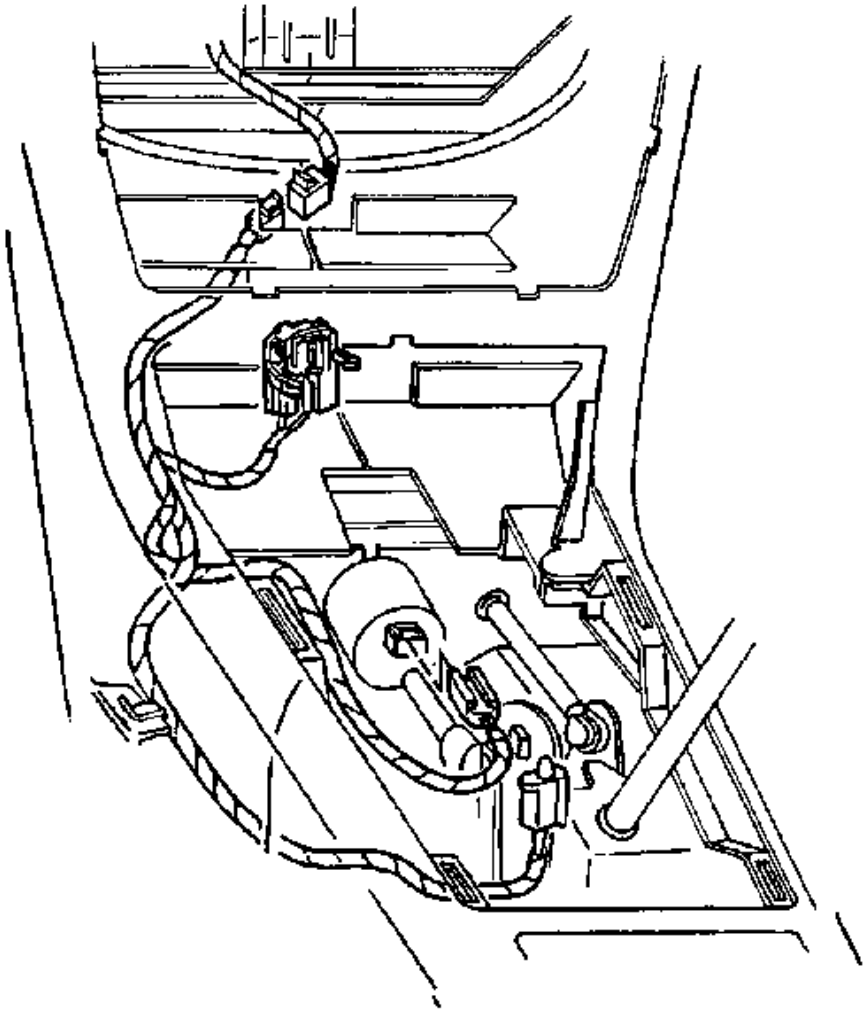

Fig. 4: Removing Console Shift Control Wiring Harness
Courtesy of GENERAL MOTORS COMPANY

3. Remove the console shift control wiring harness.
4. Remove the automatic transaxle range selector cable. Refer to **Range Selector Lever Cable Replacement (Column Shift)Range Selector Lever Cable Replacement (Floor Shift)**.
5. Disconnect the light bulb and the retainer from the shiftier.

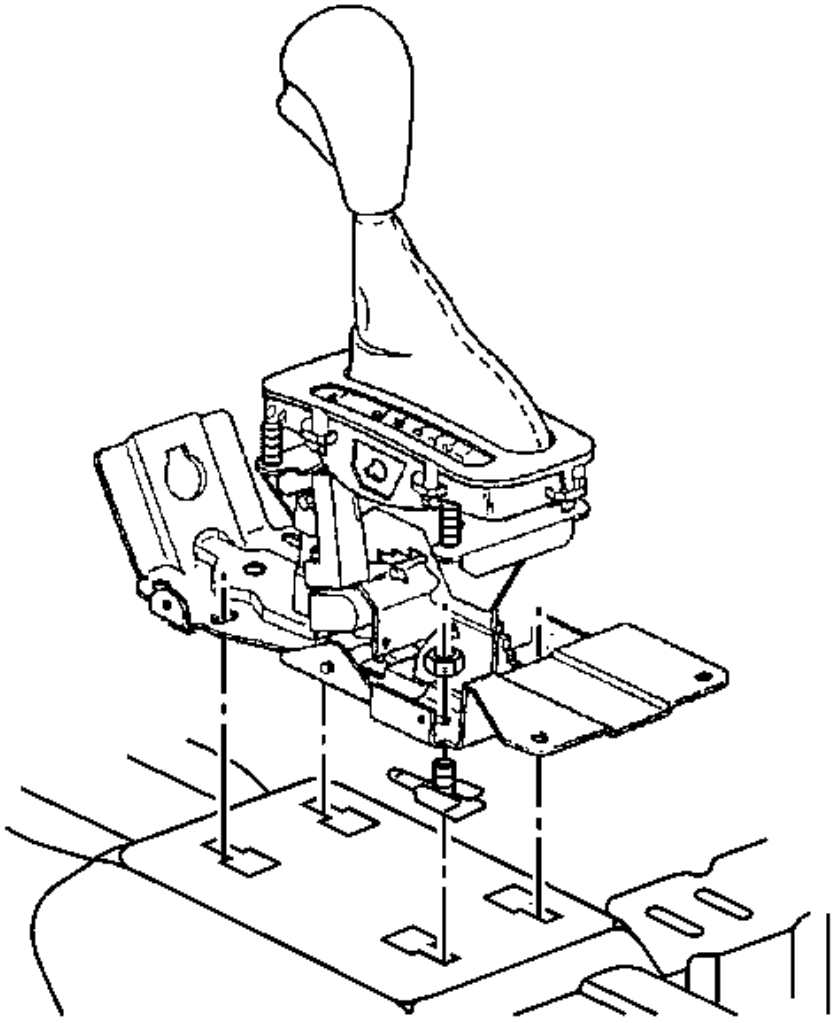

Fig. 5: Console Shift Control Assembly
Courtesy of GENERAL MOTORS COMPANY

6. Remove the console shift control retaining nuts.
7. Remove the console shift control assembly from the vehicle.

Installation Procedure

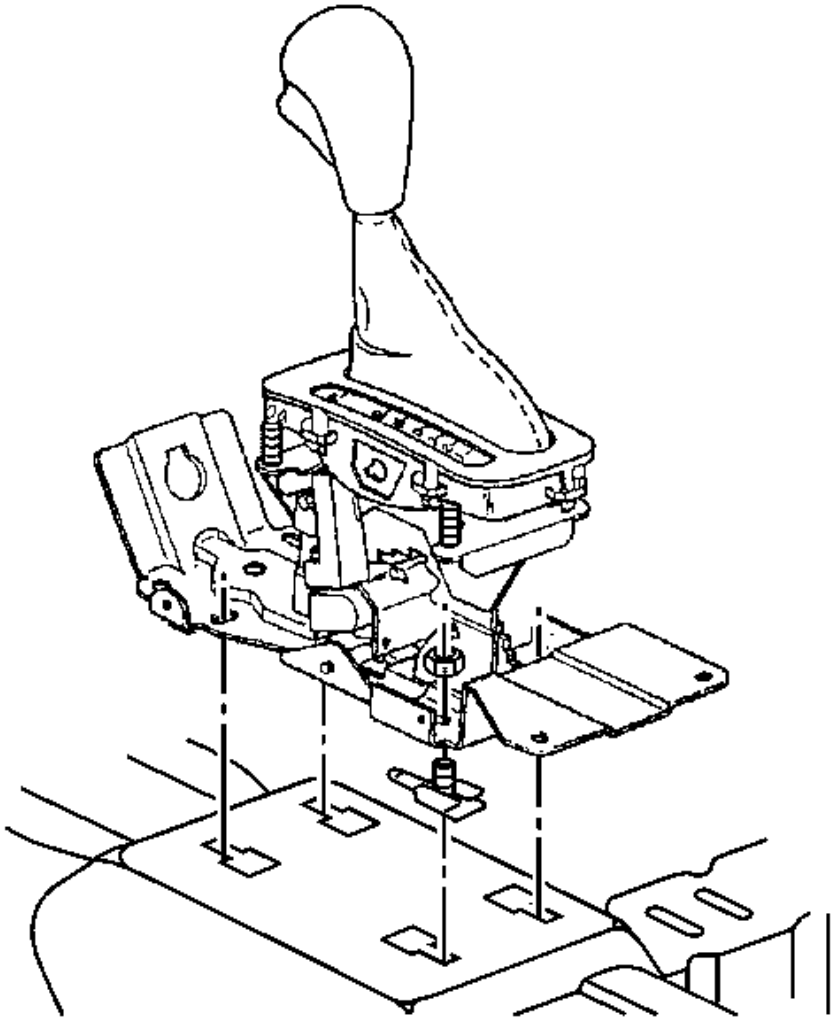

Fig. 6: Console Shift Control Assembly
Courtesy of GENERAL MOTORS COMPANY

1. Install the console shift control into the vehicle.

CAUTION: **Refer to Fastener Caution .**

2. Install the console shift control retaining nuts and tighten to 20 N.m (15 lb ft).
3. Install the automatic transaxle range selector cable. Refer to **Range Selector Lever Cable Replacement (Column Shift)Range Selector Lever Cable Replacement (Floor Shift)**.

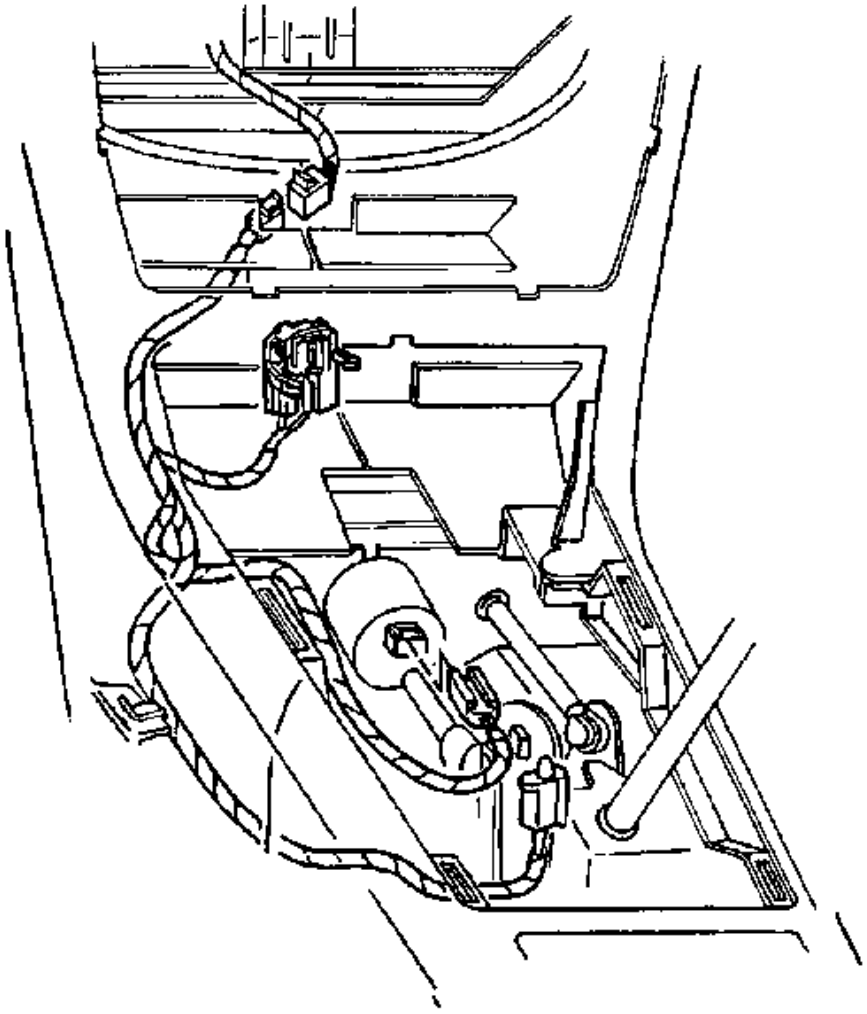

Fig. 7: Removing Console Shift Control Wiring Harness
Courtesy of GENERAL MOTORS COMPANY

4. Install the console shift control wiring harness.
5. Install the console wiring harness.
6. Install the console trim plate. Refer to **Front Floor Console Replacement** .

TRANSMISSION CONTROL CLEANING AND INSPECTION

NOTE: **Do not use any solvent based cleaning products. These products will destroy the materials and/or components in the shift control assembly. Only use Leather, Vinyl, and Plastic Cleaner GM P/N 88861401 (Canadian P/N 88861409) or equivalent.**

1. Remove the necessary trim panels to access the shift control internal components. Refer to the appropriate interior trim procedures.
2. Protect the floor carpet panels on both sides of the console base with absorbent towels to prevent staining from the liquid cleaner.

3. Clean all external shift control components including the shifter handle, bezel and the moving shift lever closeout panel.

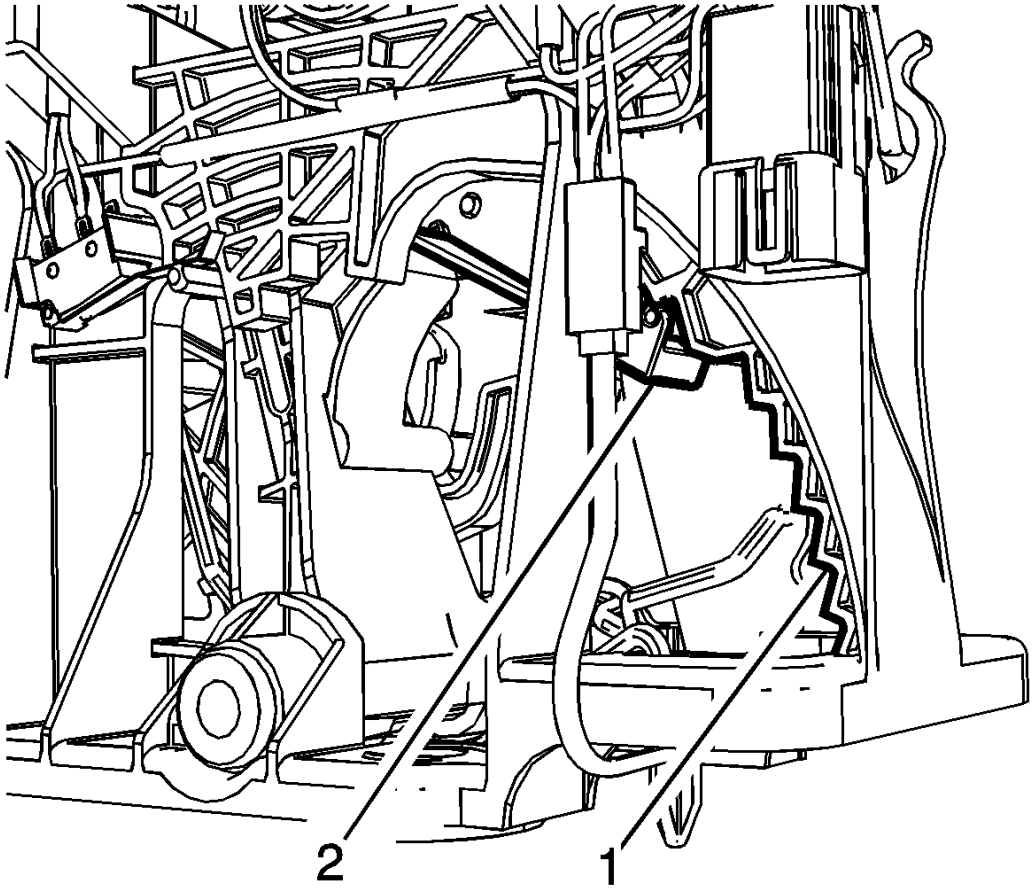

Fig. 8: Stepped Selector Section And Detent Spring
Courtesy of GENERAL MOTORS COMPANY

4. Locate the stepped selector section (1) and detent spring (2) within the shifter assembly.

NOTE: **Do not spray the cleaner directly at any of the electrical components.**

NOTE: **It may be necessary to move the shifter from park in order to completely clean all surfaces of stepped selector or detent spring.**

5. Clean all surfaces of the stepped selector section and detent spring within the shifter assembly that are sticking or binding. Use a small brush to completely clean the working surfaces of the stepped selector and detent spring to remove any foreign material.
6. After thoroughly cleaning the components, wipe off the remaining cleaner with an absorbent towel.
7. Use of low pressure compressed air may be used to assist in drying the components and surrounding area. Using care not to spread the cleaner onto other interior components.

8. Verify the operation of the mechanical and electrical components after cleaning.
9. Install the interior trim panels. Refer to the appropriate interior trim procedures.
10. Thoroughly inspect the shift control, console area and carpet for left over cleaner. Remove excess cleaner, if necessary.

AUTOMATIC TRANSMISSION RANGE SELECTOR LEVER REPLACEMENT

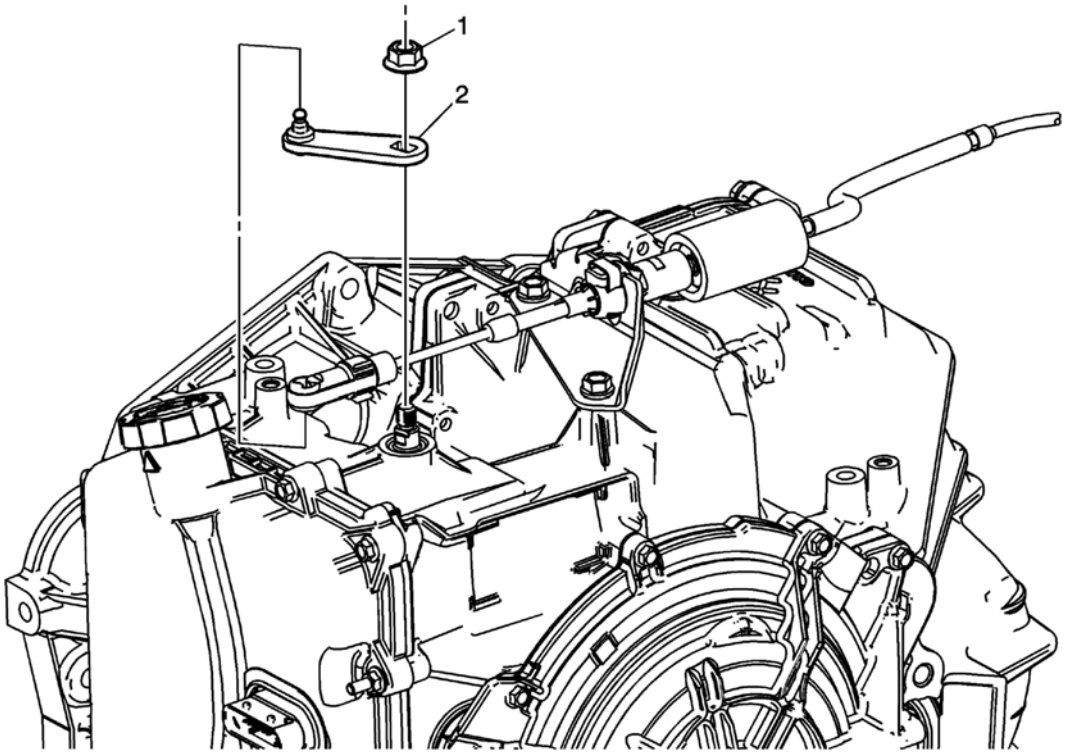

Fig. 9: Identifying A/T Range Selector Lever Components
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedures 1. Set the park brake and chock the wheels. 2. Disconnect the range selector cable from the range selector lever.	
1	Transmission Range Selector Lever Nut **WARNING:** **Hold the transmission range selector lever while removing or installing the**

Callout	Component Name
	lever retaining nut. Failure to hold the lever can cause damage to the transmission internal park system components which could allow the vehicle to roll when placed in the park position. **CAUTION:** **Refer to Fastener Caution .** **Tighten** 20 N.m (15 lb ft)
2	Transmission Range Selector Lever

RANGE SELECTOR LEVER CABLE REPLACEMENT (COLUMN SHIFT)

Removal Procedure

1. Set the park brake and chock the wheels.
2. Remove the driver knee bolster reinforcement. Refer to **Driver Knee Bolster Reinforcement Replacement** .

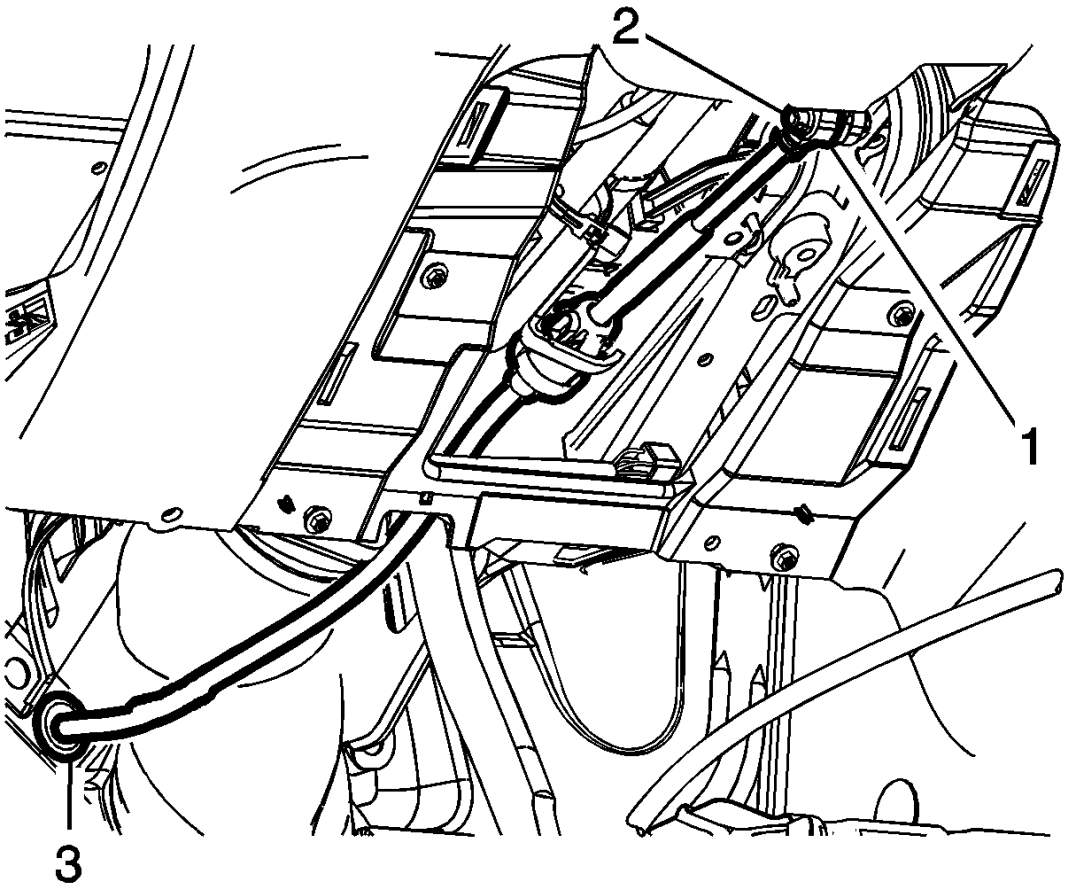

Fig. 10: Transmission Range Selector Lever Cable Terminal And Transmission Manual Shift Lever Pin

Courtesy of GENERAL MOTORS COMPANY

3. Disconnect the transmission range selector lever cable terminal (1) from the transmission manual shift lever pin (2).

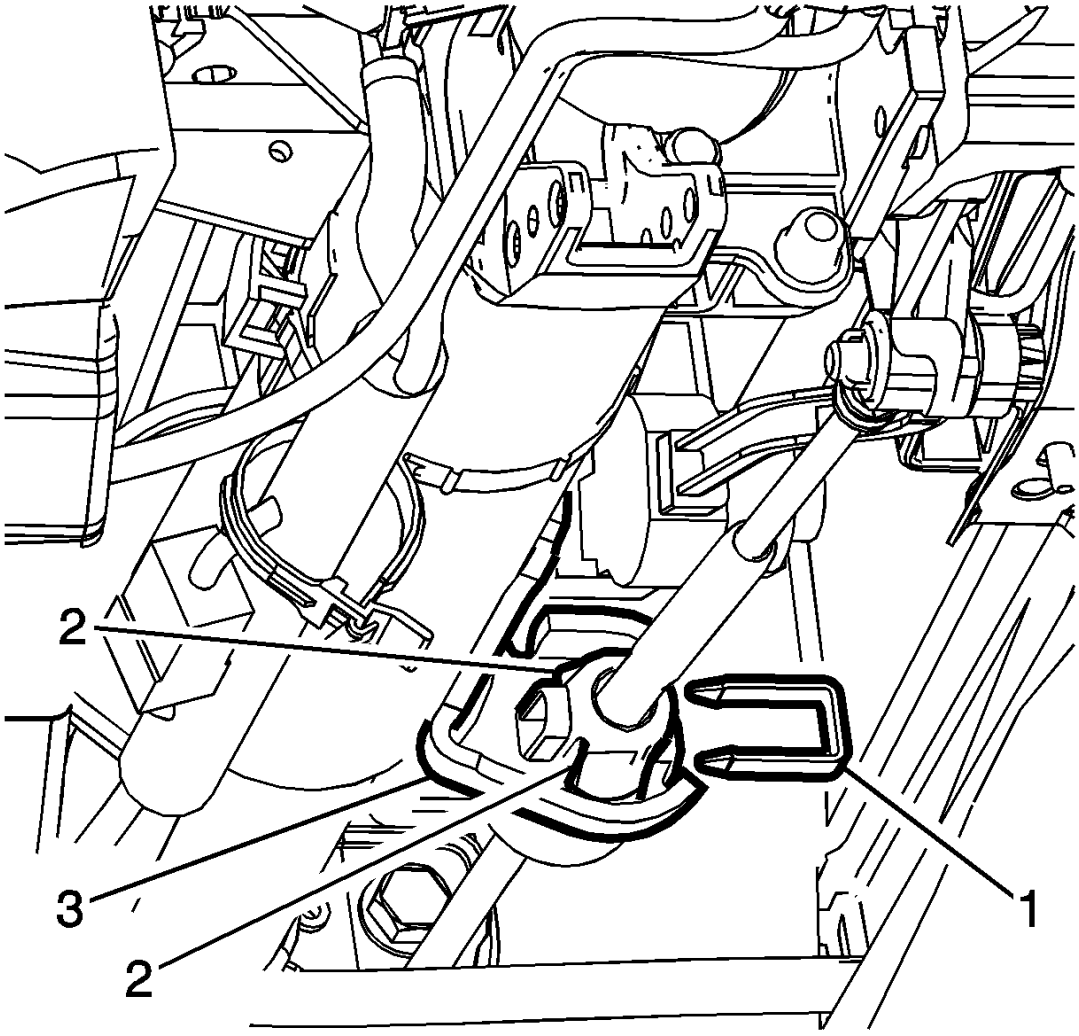

Fig. 11: Cable Interface Retainer, Steering Column Bracket And Range Selector Lever Cable Retaining Tabs
Courtesy of GENERAL MOTORS COMPANY

4. Remove the cable interface retainer (1) from the shift cable.
5. Press the range selector lever cable retaining tabs (2) inward.
6. Remove the range selector lever cable from the steering column bracket (3).
7. Remove the air cleaner assembly from the vehicle. Refer to **Air Cleaner Assembly Replacement** .

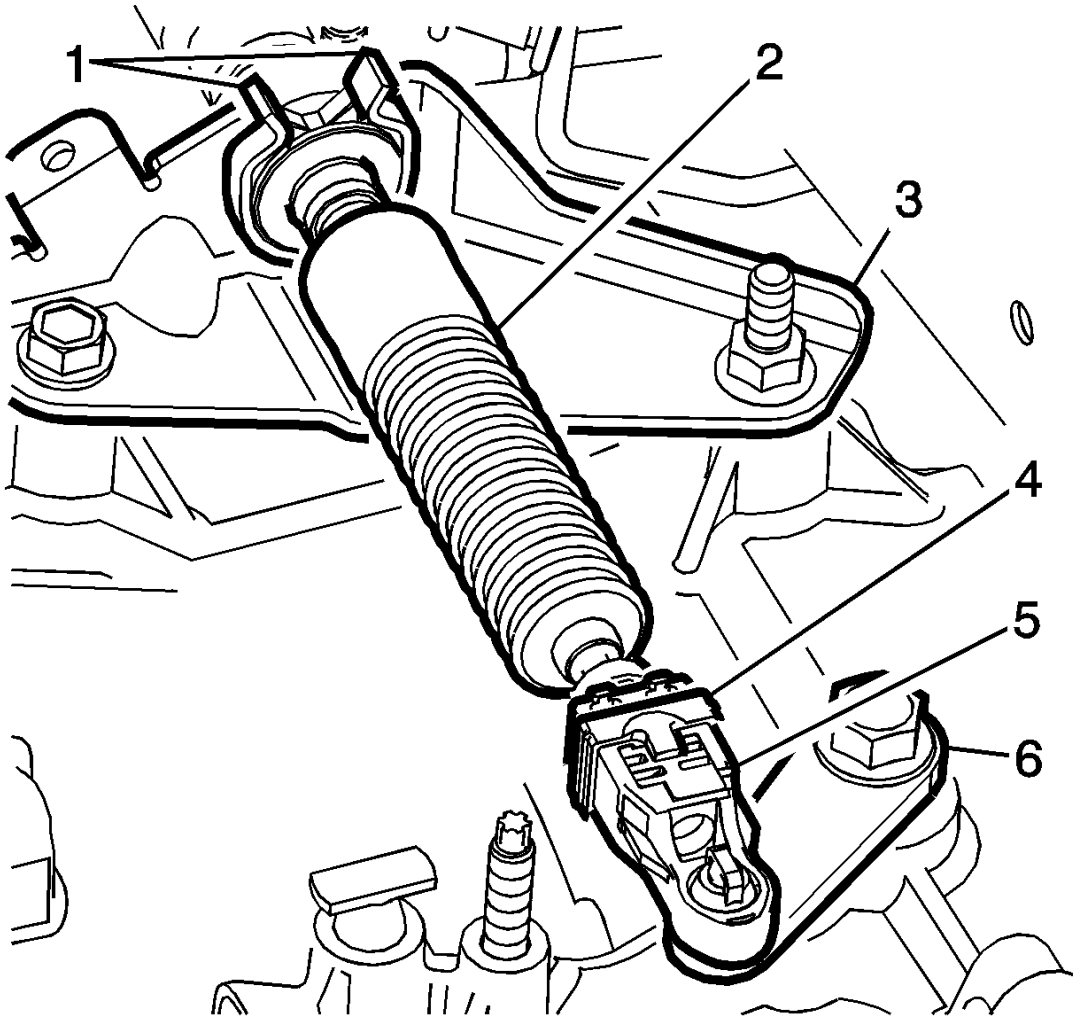

Fig. 12: Transmission Shifter Cable
Courtesy of GENERAL MOTORS COMPANY

8. Disconnect the range selector lever cable (2) from the transmission selector lever (6).
9. Press the locking tabs (1) inward in order to release the range selector lever cable (2) from the cable bracket (3).

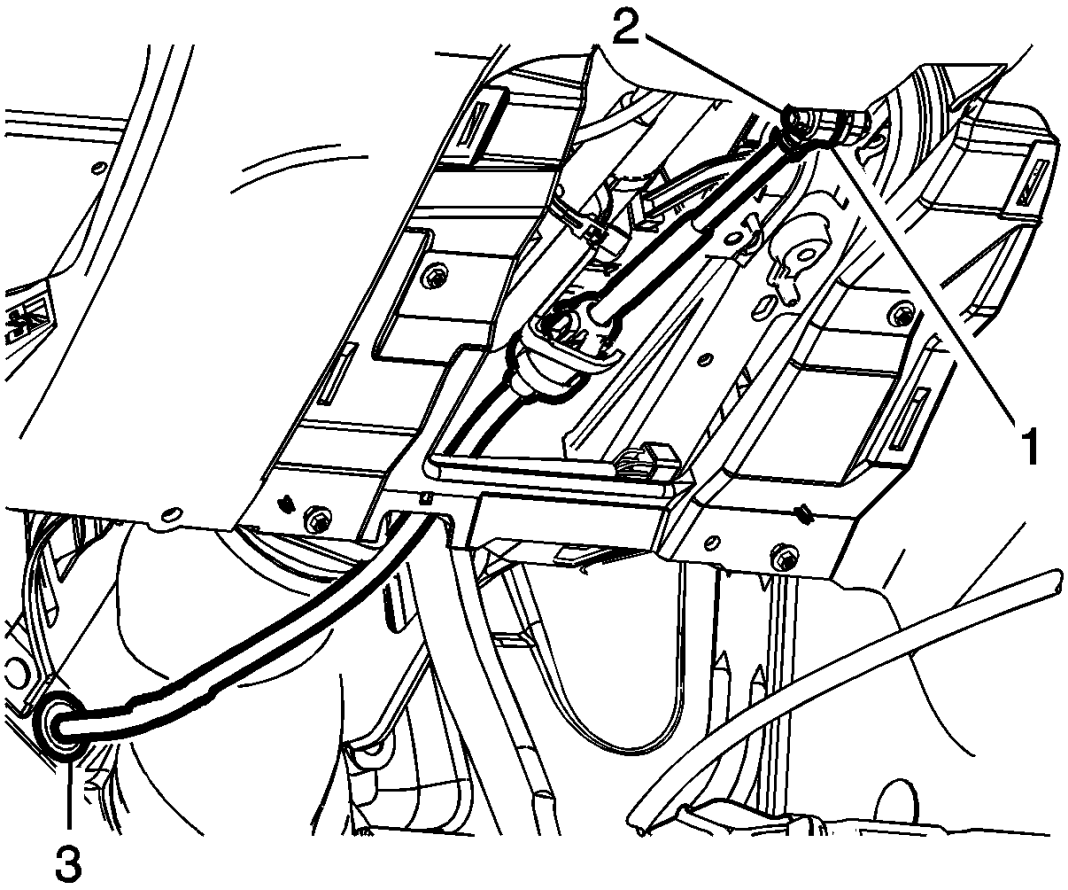

Fig. 13: Transmission Range Selector Lever Cable Terminal And Transmission Manual Shift Lever Pin
Courtesy of GENERAL MOTORS COMPANY

10. Disengage the transmission range selector lever cable grommet (3) from the cowl panel.
11. Remove the transmission range selector lever cable from the vehicle.

Installation Procedure

1. Install the transmission range selector lever cable to the vehicle.

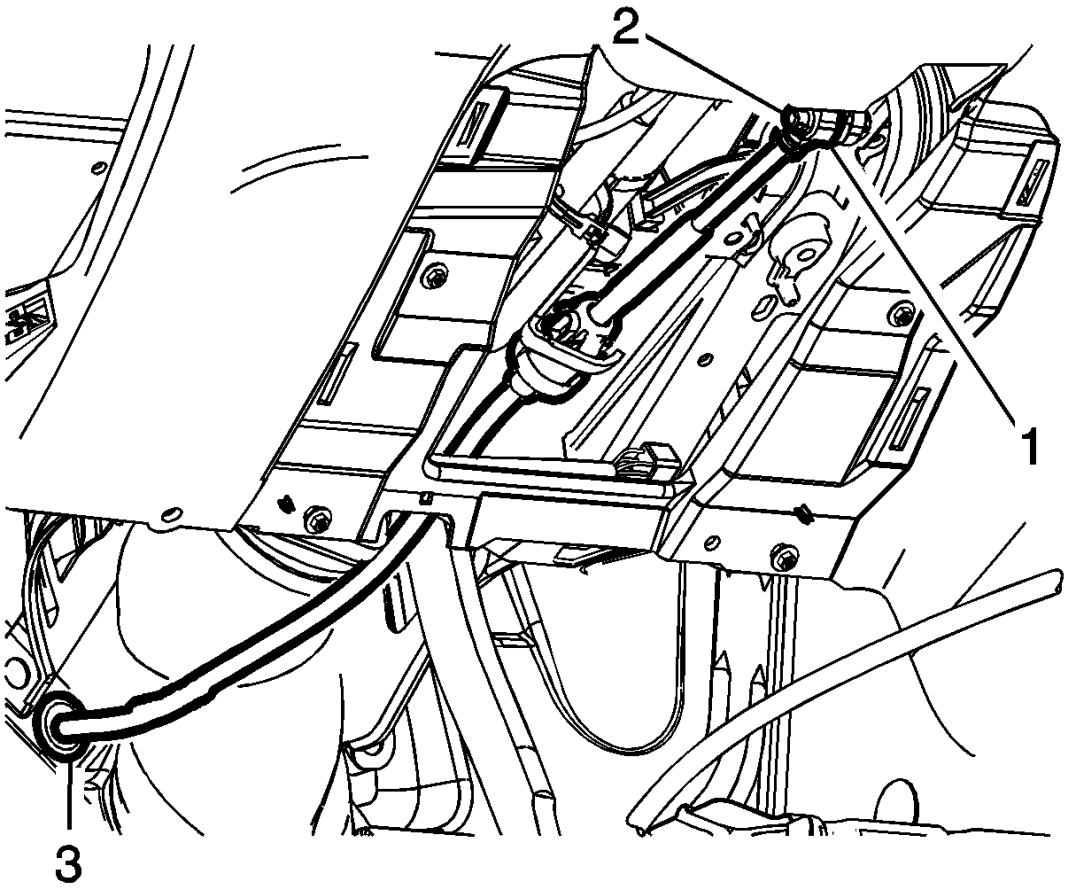

Fig. 14: Transmission Range Selector Lever Cable Terminal And Transmission Manual Shift Lever Pin
Courtesy of GENERAL MOTORS COMPANY

2. Install the transmission range selector lever cable grommet (3) to the cowl panel.

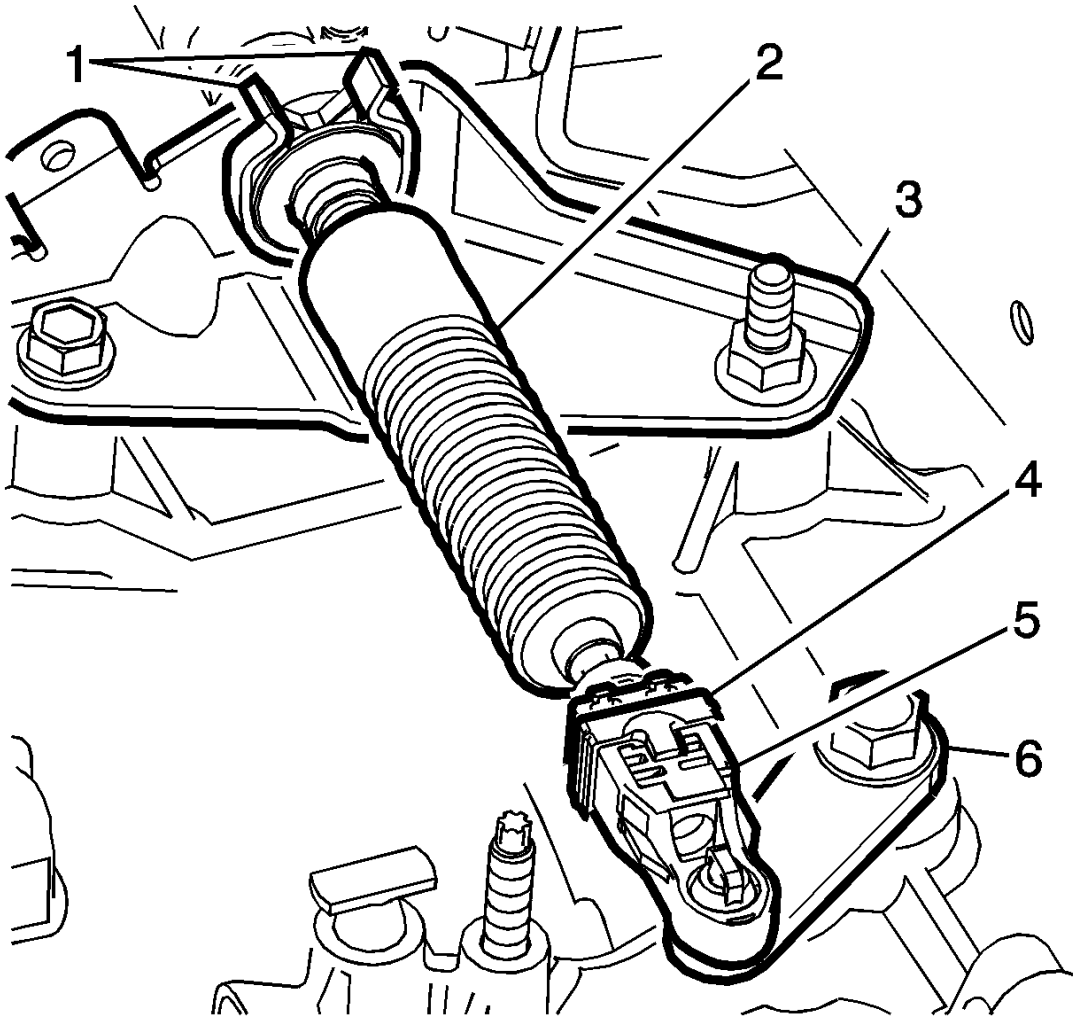

Fig. 15: Transmission Shifter Cable
Courtesy of GENERAL MOTORS COMPANY

3. Connect the range selector lever cable (2) to the transmission selector lever (6).

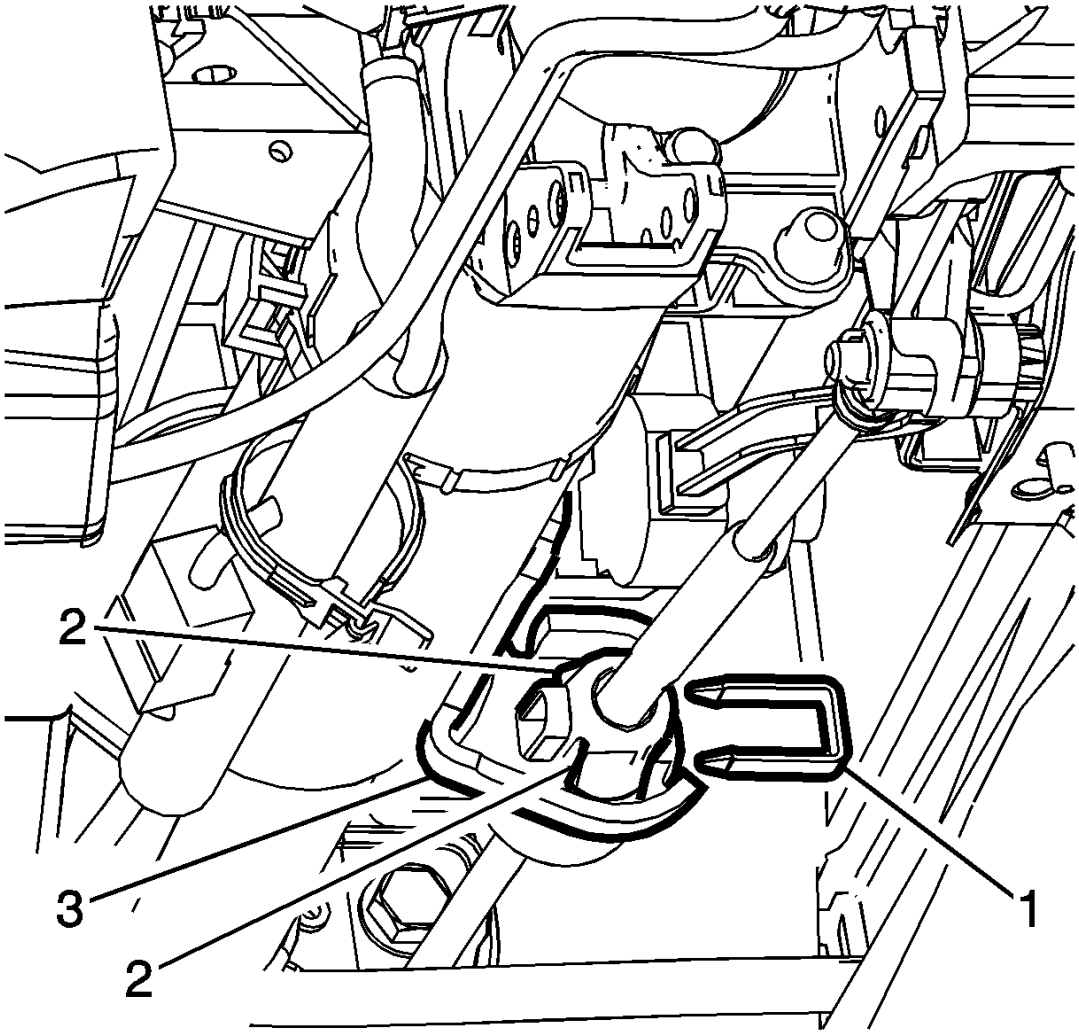

Fig. 16: Cable Interface Retainer, Steering Column Bracket And Range Selector Lever Cable Retaining Tabs
Courtesy of GENERAL MOTORS COMPANY

4. Press the locking tabs (1) inward, then insert the range selector lever cable (2) into the cable bracket (3).
5. Install the range selector lever cable into the steering column bracket (3).
6. Install the cable interface retainer (1) into the range selector lever cable.

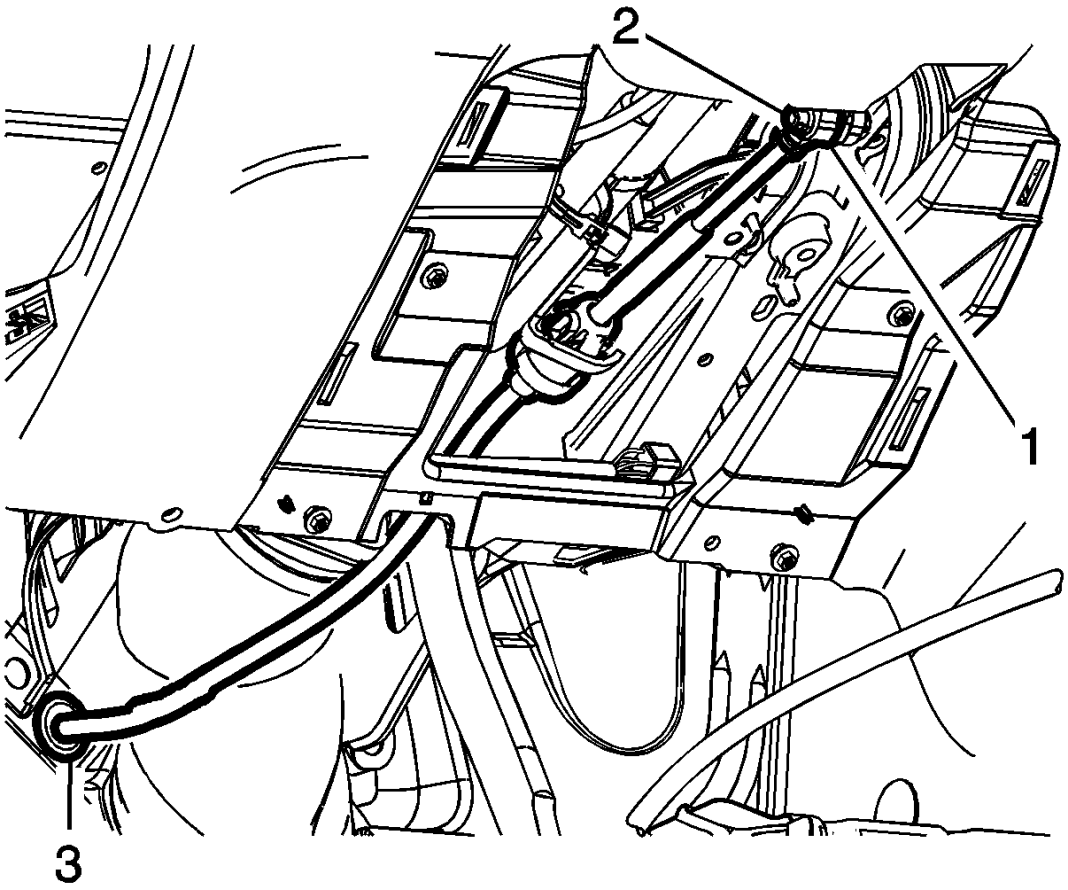

Fig. 17: Transmission Range Selector Lever Cable Terminal And Transmission Manual Shift Lever Pin
Courtesy of GENERAL MOTORS COMPANY

7. Connect the transmission range selector lever cable terminal (1) to the transmission manual shift lever pin (2).
8. Install the driver knee bolster reinforcement. Refer to **Driver Knee Bolster Reinforcement Replacement** .
9. Adjust the range selector lever cable. Refer to **Range Selector Lever Cable Adjustment**.
10. Install the air cleaner assembly in the vehicle. Refer to **Air Cleaner Assembly Replacement** .

RANGE SELECTOR LEVER CABLE REPLACEMENT (FLOOR SHIFT)

Removal Procedure

WARNING: Refer to Automatic Transmission Range Selector Cable Warning .

1. Remove the air cleaner assembly from the vehicle. Refer to **Air Cleaner Assembly Replacement** .

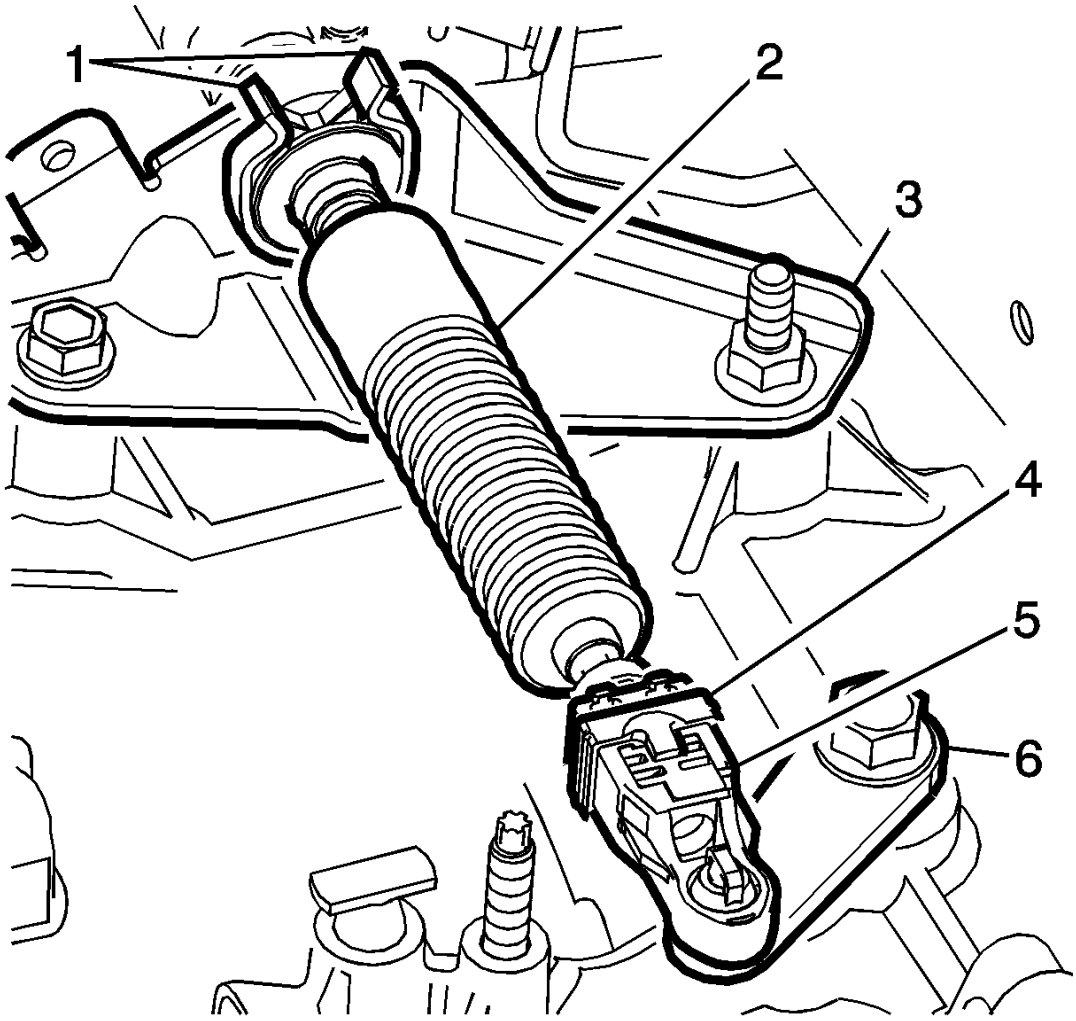

Fig. 18: Transmission Shifter Cable
Courtesy of GENERAL MOTORS COMPANY

2. Remove the automatic transaxle range selector cable (2) from the automatic transaxle range selector lever (6).
3. Press the locking tabs (1) inward in order to release the range selector lever cable (2) from the cable bracket (3).
4. Remove the automatic transaxle range selector cable (2) from the automatic transaxle range selector cable bracket (3).
5. Remove the front floor console. Refer to **Front Floor Console Replacement** .
6. Pull the carpet back to expose the automatic transaxle range selector cable. Refer to **Floor Panel Carpet Replacement (Impala)** .

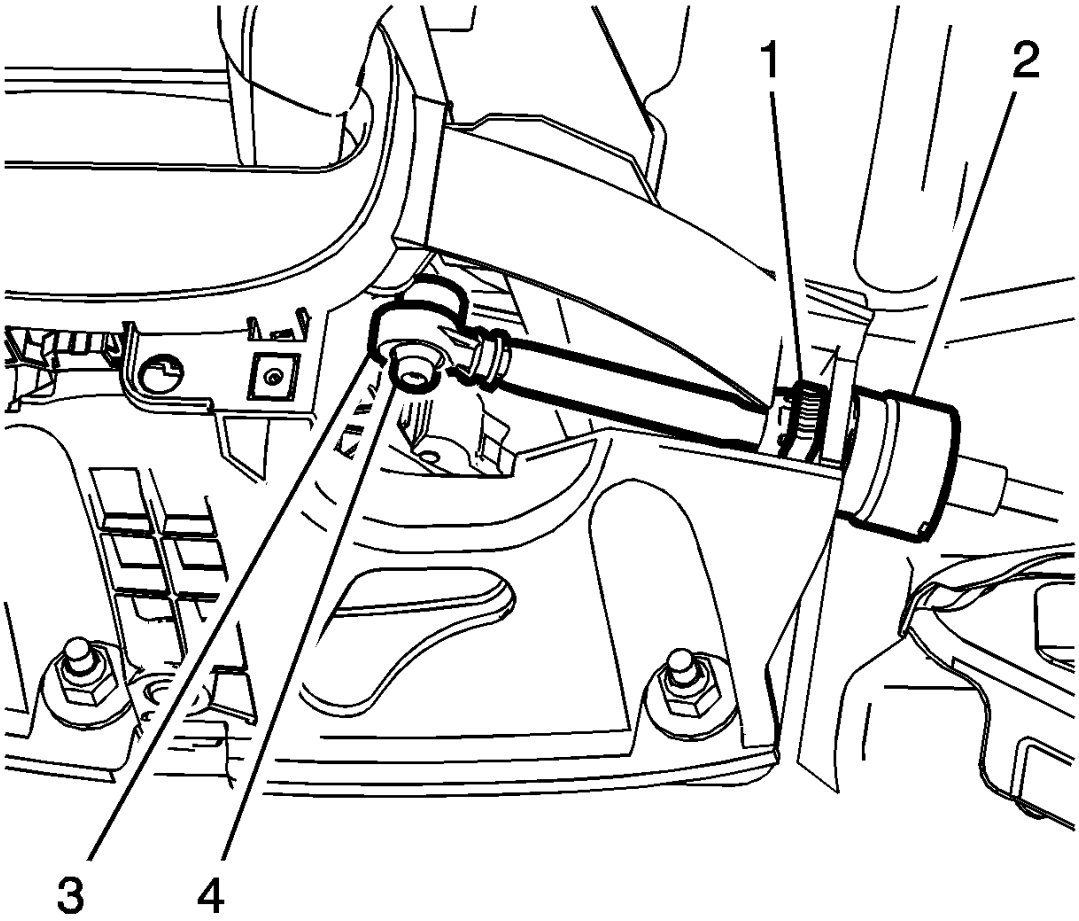

Fig. 19: Automatic Transaxle Range Selector Cable, Retainer, Terminal And Transmission Control Shift Lever Pin

Courtesy of GENERAL MOTORS COMPANY

7. Remove the automatic transaxle range selector cable retainer (1) from the Transmission control assembly.
8. Disconnect the cable terminal (3) from the transmission control shift lever pin (4).
9. Remove the automatic transaxle range selector cable (2) from the console shift control.
10. Install a piece of mechanics wire to the end of the automatic transmission range selector cable.

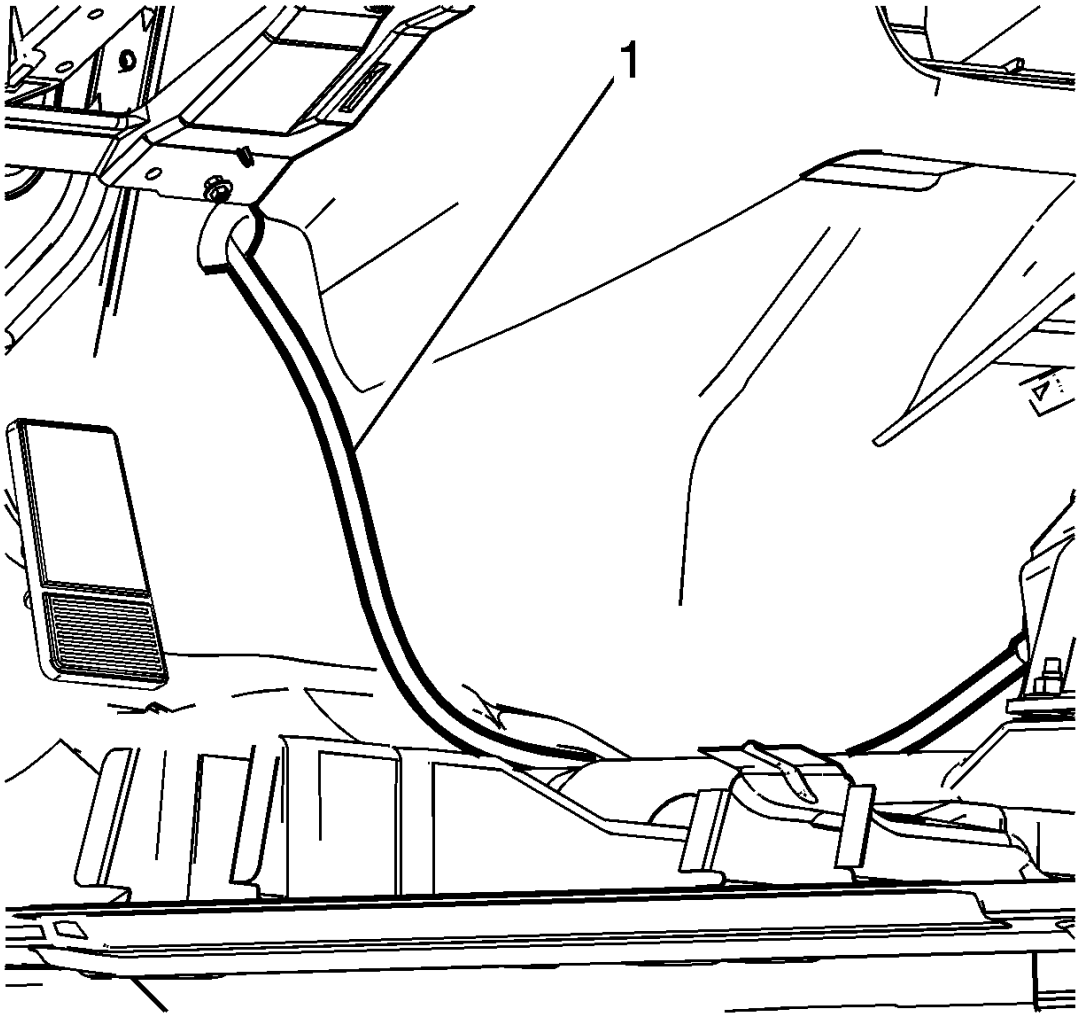

Fig. 20: Automatic Transmission Range Selector Cable And Grommet
Courtesy of GENERAL MOTORS COMPANY

11. Remove the automatic transmission range selector cable and grommet (1) through the hole in the cowl.

Installation Procedure

WARNING: Refer to Automatic Transmission Range Selector Cable Warning .

1. Install the automatic transmission range selector cable through the hole in the cowl.

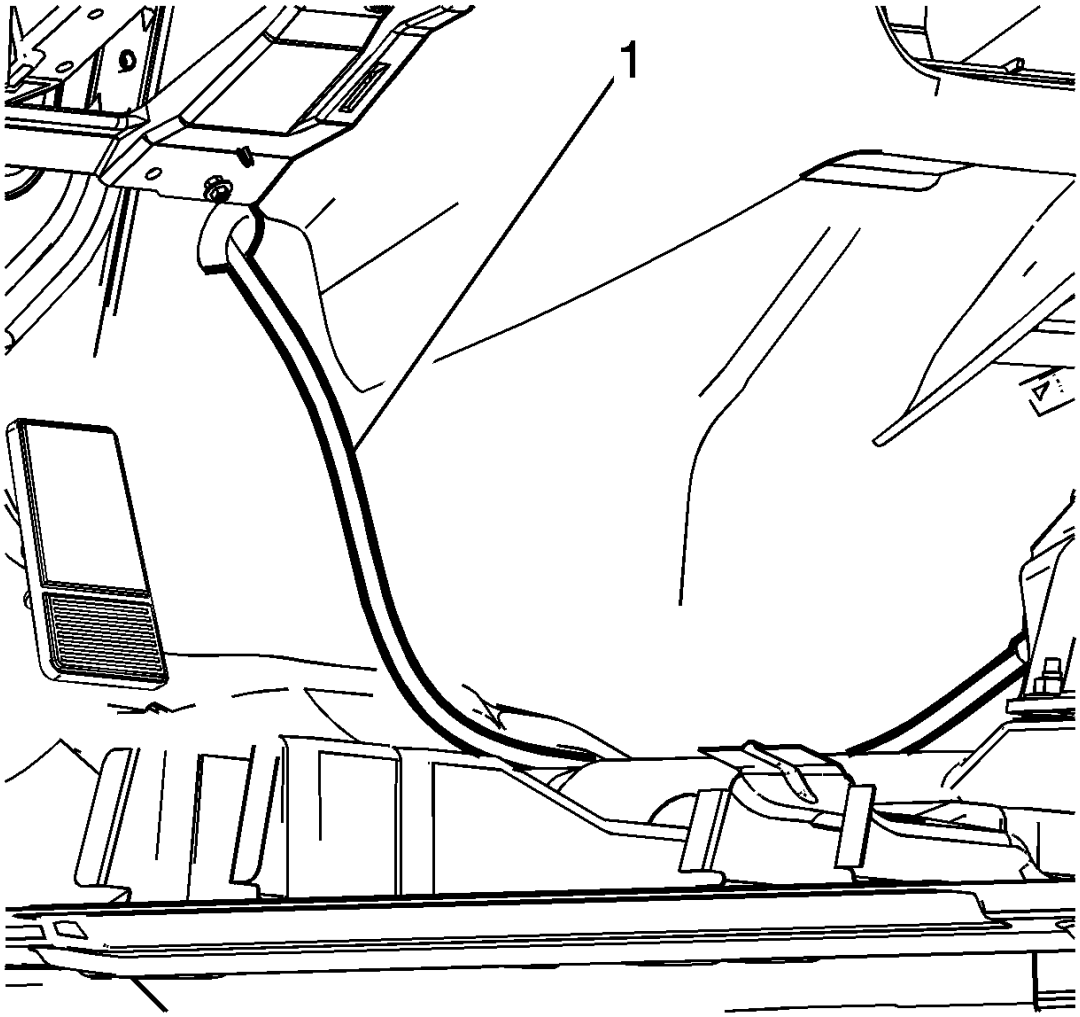

Fig. 21: Automatic Transmission Range Selector Cable And Grommet
Courtesy of GENERAL MOTORS COMPANY

2. Seat the grommet (1) in the cowl.
3. Remove the mechanics wire from the end of the automatic transmission range selector cable.

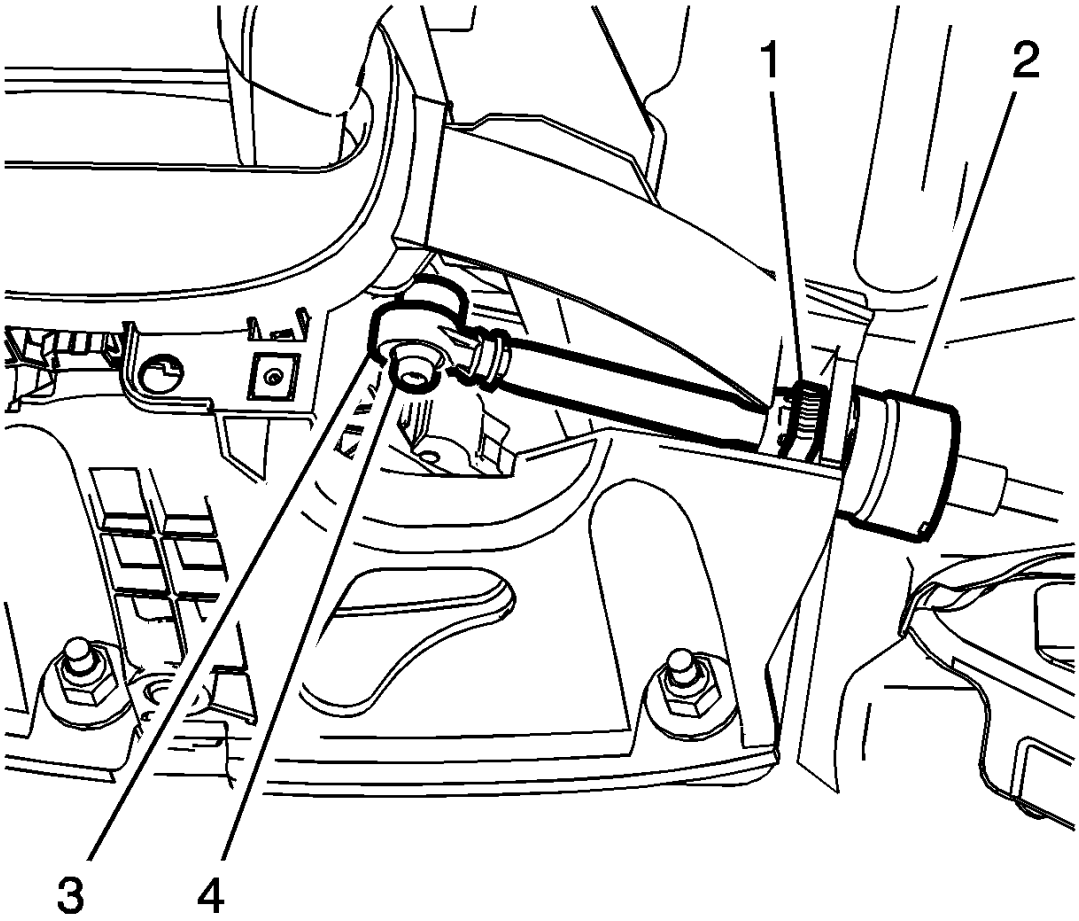

Fig. 22: Automatic Transaxle Range Selector Cable, Retainer, Terminal And Transmission Control Shift Lever Pin
Courtesy of GENERAL MOTORS COMPANY

4. install the automatic transaxle range selector cable (2) to the transmission control assembly.
5. Install the automatic transaxle range selector cable terminal (3) to the transmission control shift lever pin (4).
6. Install the automatic transaxle range selector cable retainer (1) to the console shift control.
7. Install the carpet into position. Refer to **Floor Panel Carpet Replacement (Impala)** .
8. Install the front floor console. Refer to **Front Floor Console Replacement** .
9. Properly route and position the automatic transmission range selector cable in the engine compartment.

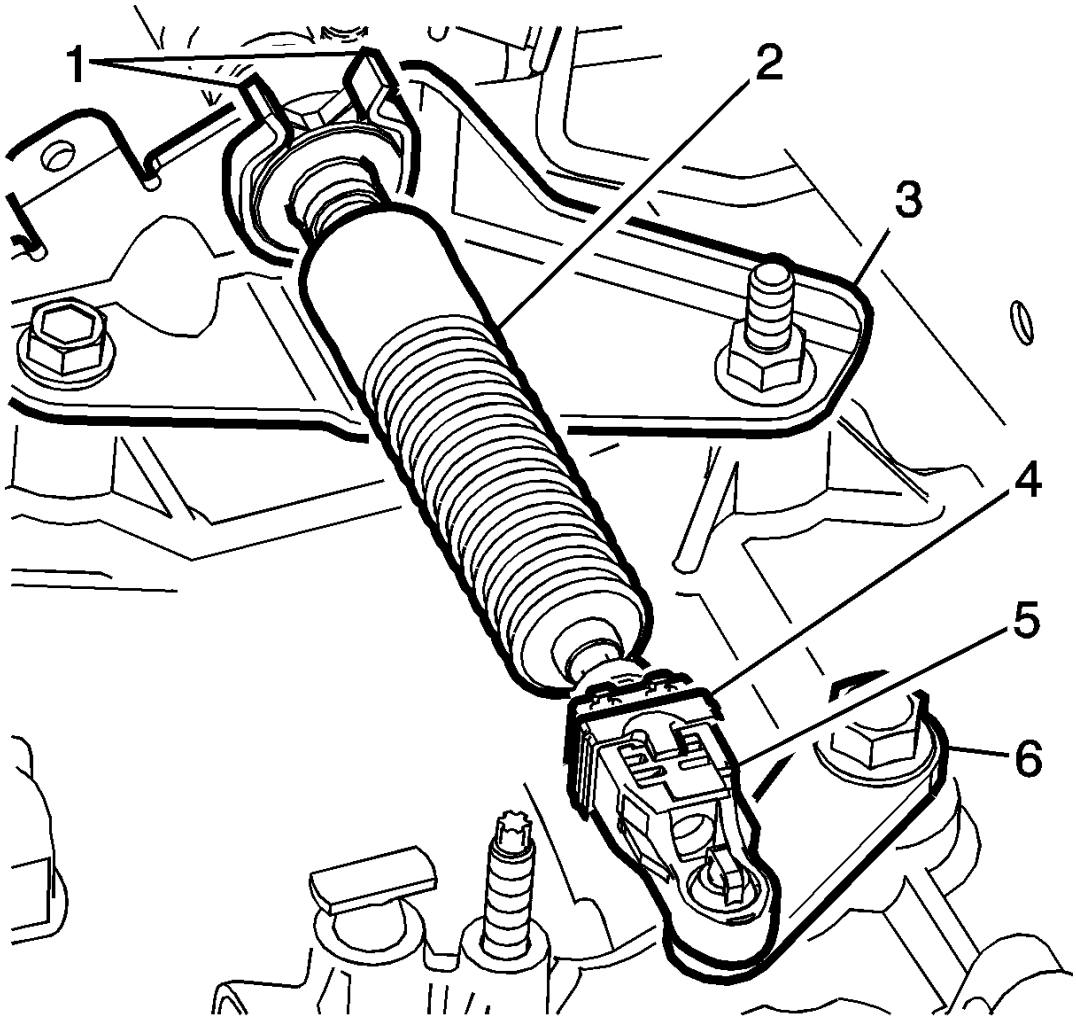

Fig. 23: Transmission Shifter Cable
Courtesy of GENERAL MOTORS COMPANY

10. Install the automatic transaxle range selector cable (2) to the automatic transaxle range selector cable bracket (3).
11. Install the automatic transaxle range selector cable (2) to the automatic transaxle range selector lever (6).
12. Adjust the automatic transaxle range selector cable. Refer to **Range Selector Lever Cable Adjustment**.
13. Install the air cleaner assembly in the vehicle. Refer to **Air Cleaner Assembly Replacement** .

RANGE SELECTOR LEVER CABLE ADJUSTMENT

1. Remove the air cleaner assembly from the vehicle. Refer to **Air Cleaner Assembly Replacement** .

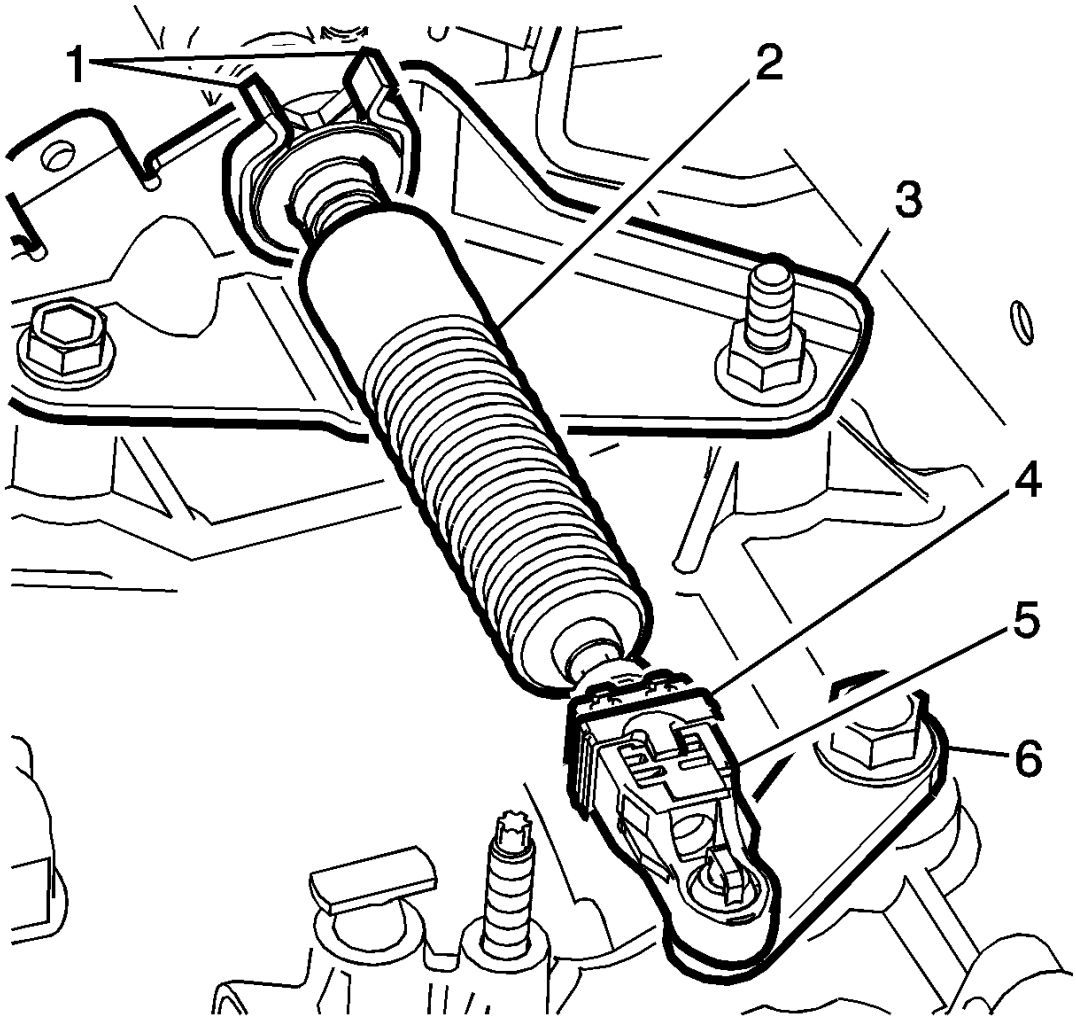

Fig. 24: Transmission Shifter Cable
Courtesy of GENERAL MOTORS COMPANY

2. Pull the secondary adjuster lock (4) rearward.
3. Using a flat bladed tool, push the primary adjuster lock (5) upward.
4. Ensure that the shift lever and the transmission control are in the Park position.
5. Press the primary adjuster lock (5) downward in order to lock the range selector lever cable.
6. Push the secondary adjuster lock (4) forward to lock in the primary adjuster lock.
7. Verify the proper operation of the transmission.
8. Install the air cleaner assembly in the vehicle. Refer to **Air Cleaner Assembly Replacement** .

RANGE SELECTOR LEVER CABLE BRACKET REPLACEMENT

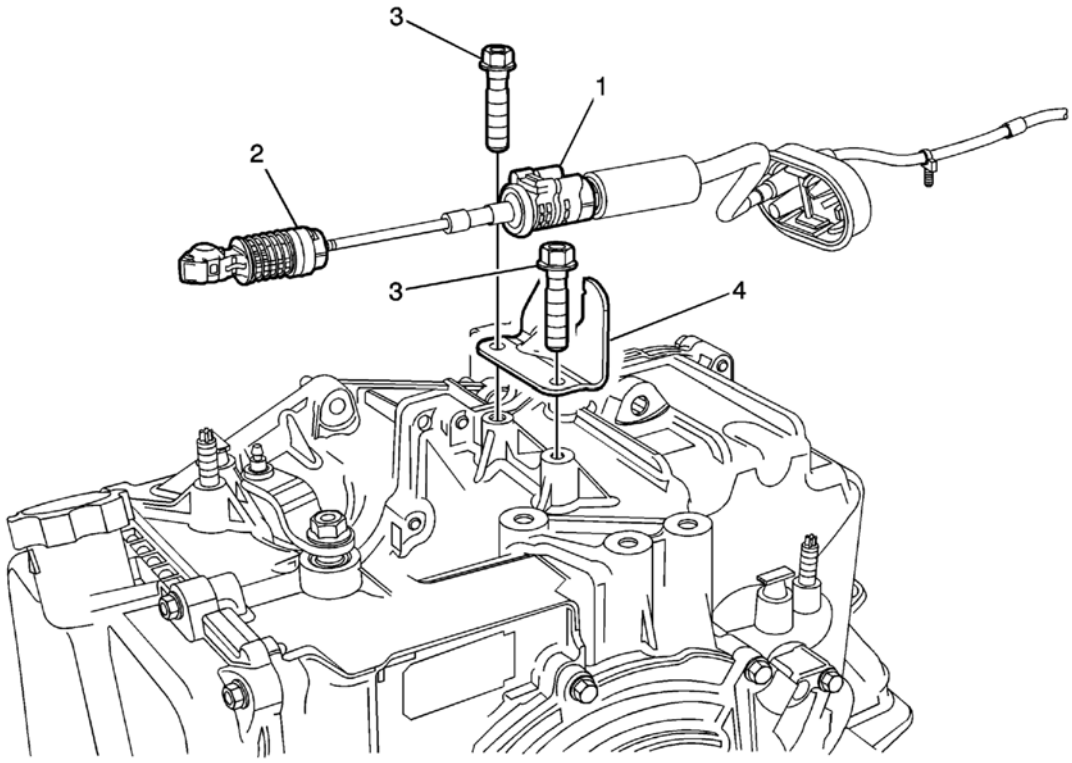

Fig. 25: Range Selector Lever Cable Bracket
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedures 1. Set the park brake and chock the wheels. 2. Remove the battery tray. Refer to **Battery Tray Replacement** .	
1	Transmission Range Selector Lever Cable Retaining Lock
2	Transmission Range Selector Lever Cable
3	Transmission Range Selector Lever Cable Bracket Bolt (Qty: 2) **CAUTION:** **Refer to Fastener Caution .** **Tighten** 25 N.m (18 lb ft)
4	Transmission Range Selector Lever Cable Bracket **Procedure** Adjust the cable. Refer to **Range Selector Lever Cable Adjustment**.

TRANSMISSION FLUID DRAIN AND FILL

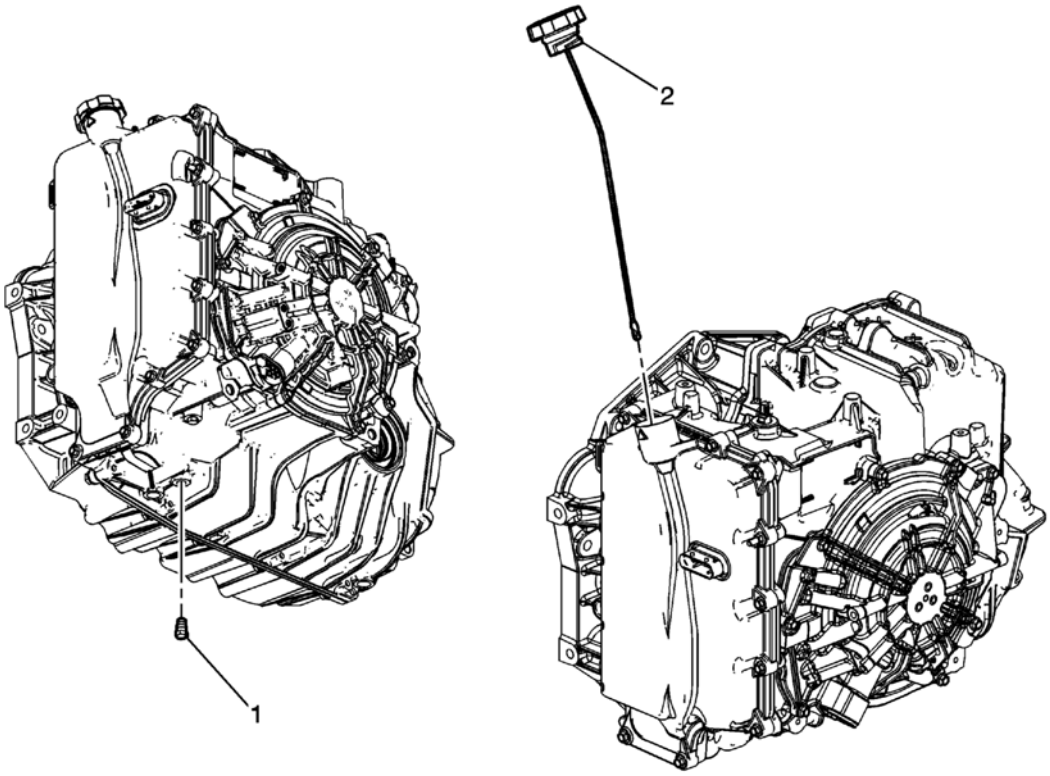

Fig. 26: Identifying Fluid Level Indicator & Drain Plug
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure Raise the vehicle. Refer to **Lifting and Jacking the Vehicle** .	
1	Fluid Drain Plug **CAUTION:** **Refer to Fastener Caution .** **TIP:** Place a drain pan capable of containing more than 5 quarts of fluid under the transmission before removing the plug to drain the fluid. **Tighten** 12 N.m (106 lb in)
2	Fluid Level Indicator • Transmission will require approximately 5 quarts of fluid. • Fill the transmission with fluid. Refer to **Transmission Fluid Level and Condition Check** .

AUTOMATIC TRANSMISSION FLUID PRESSURE TEST HOLE PLUG REPLACEMENT

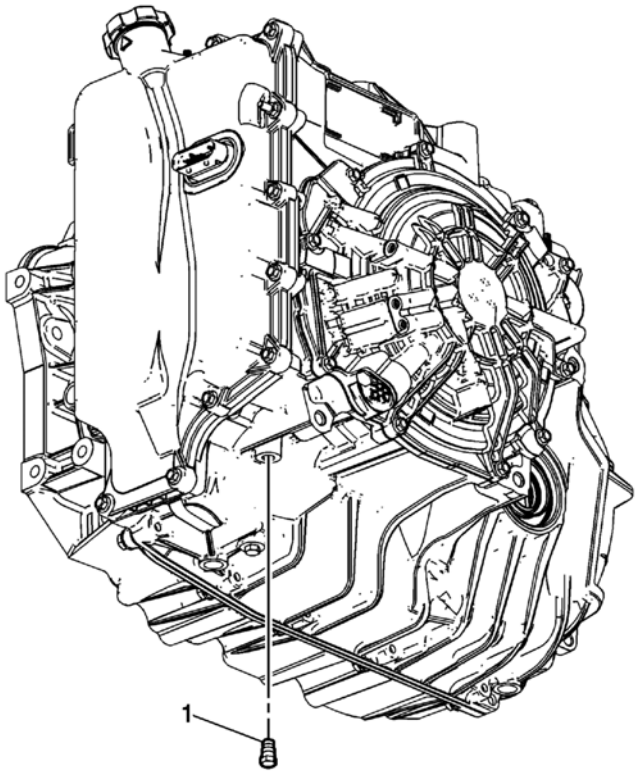

Fig. 27: Identifying Automatic Transmission Fluid Pressure Test Hole Plug
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure Raise the vehicle. Refer to **Lifting and Jacking the Vehicle** .	
1	Fluid Pressure Test Plug **CAUTION:** **Refer to** **Fastener** **Caution** **.** **Tighten** 12 N.m (106 lb in)

FRONT WHEEL DRIVE SHAFT SEAL REPLACEMENT - LEFT SIDE

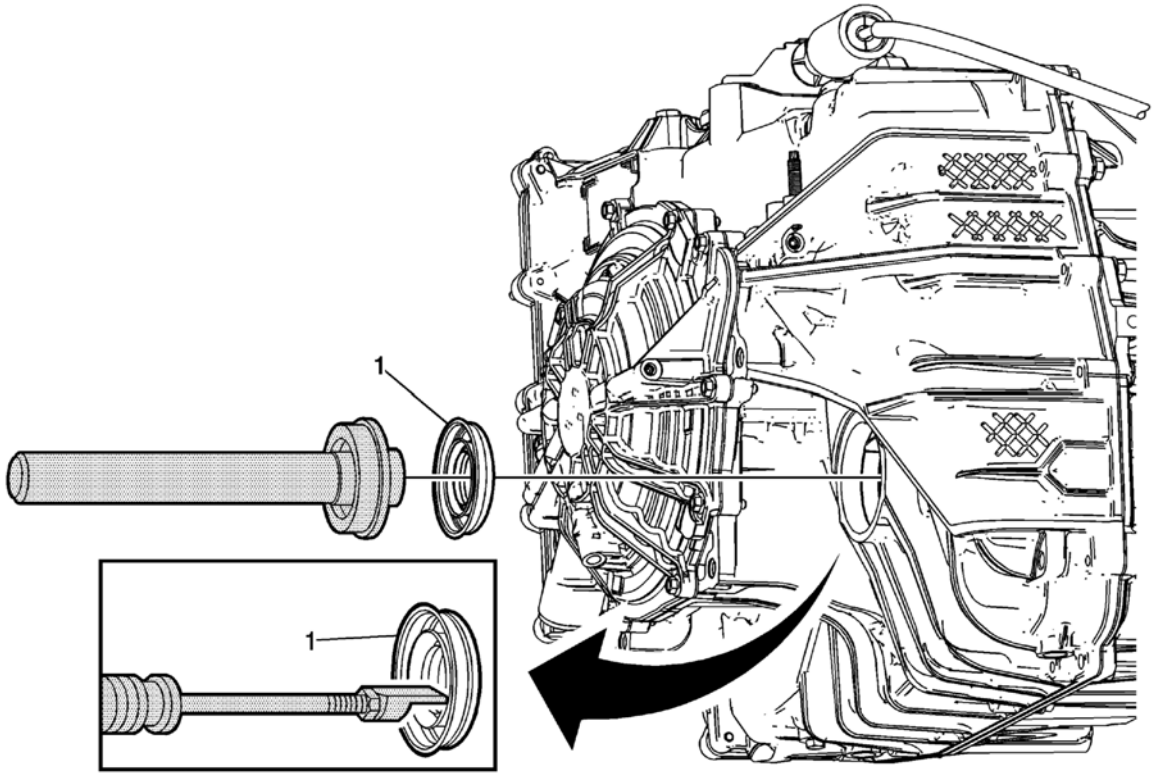

Fig. 28: View Of Front Wheel Drive Shaft Oil Seal - Left Side
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedures 1. Raise the vehicle. Refer to **Lifting and Jacking the Vehicle** . 2. Remove the left wheel drive shaft. Refer to **Wheel Drive Shaft Replacement (Left Side)** **Wheel Drive Shaft Replacement (Right Side)** .	
1	Left Front Wheel Drive Shaft Oil Seal • For seal removal use **GE-6125-1B** hammer with **DT-23129** remover. • For seal installation use **DT-8092** handle with **J-46629-A** installer. **Special Tools** • **GE-6125-1B** Slide Hammer • **DT-23129** Universal Seal Remover • **DT-8092** Driver Handle • **J-46629-A** Axle Seal Installer

FRONT WHEEL DRIVE SHAFT SEAL REPLACEMENT - RIGHT SIDE

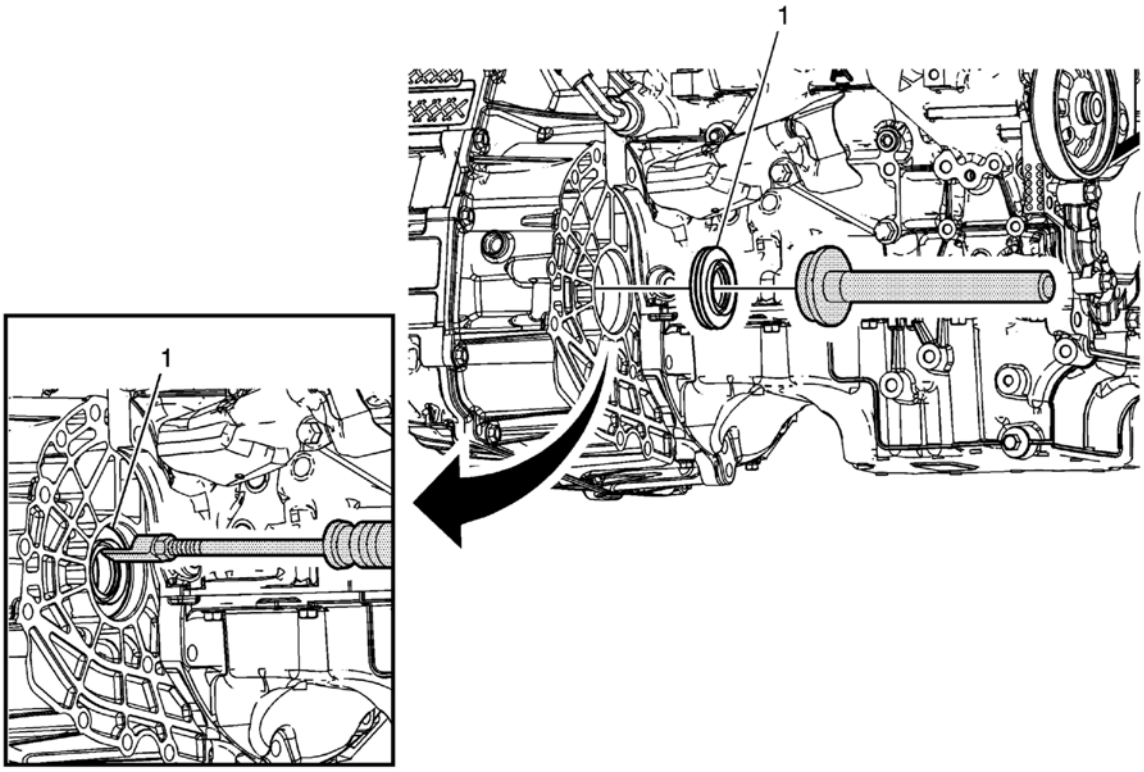

Fig. 29: Identifying Front Wheel Drive Shaft Oil Seal - Right Side
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedures 1. Raise the vehicle. Refer to **Lifting and Jacking the Vehicle** . 2. Front wheel drive models, remove the intermediate drive shaft. Refer to **Front Wheel Drive Intermediate Shaft Replacement** .	
1	Right Front Wheel Drive Shaft Oil Seal • For seal removal use **GE-6125-1B** hammer with **DT-23129** remover Universal Seal Remover. • For seal installation use **DT-8092** handle with **DT-46629-A** installer. **Special Tools** • **GE-6125-1B** Slide Hammer • **DT-8092** Driver Handle • **DT-23129** Universal Seal Remover • **DT-46629-A** Axle Seal Installer For equivalent regional tools, refer to **Special Tools** .

MANUAL SHIFT SHAFT AND SEAL REPLACEMENT

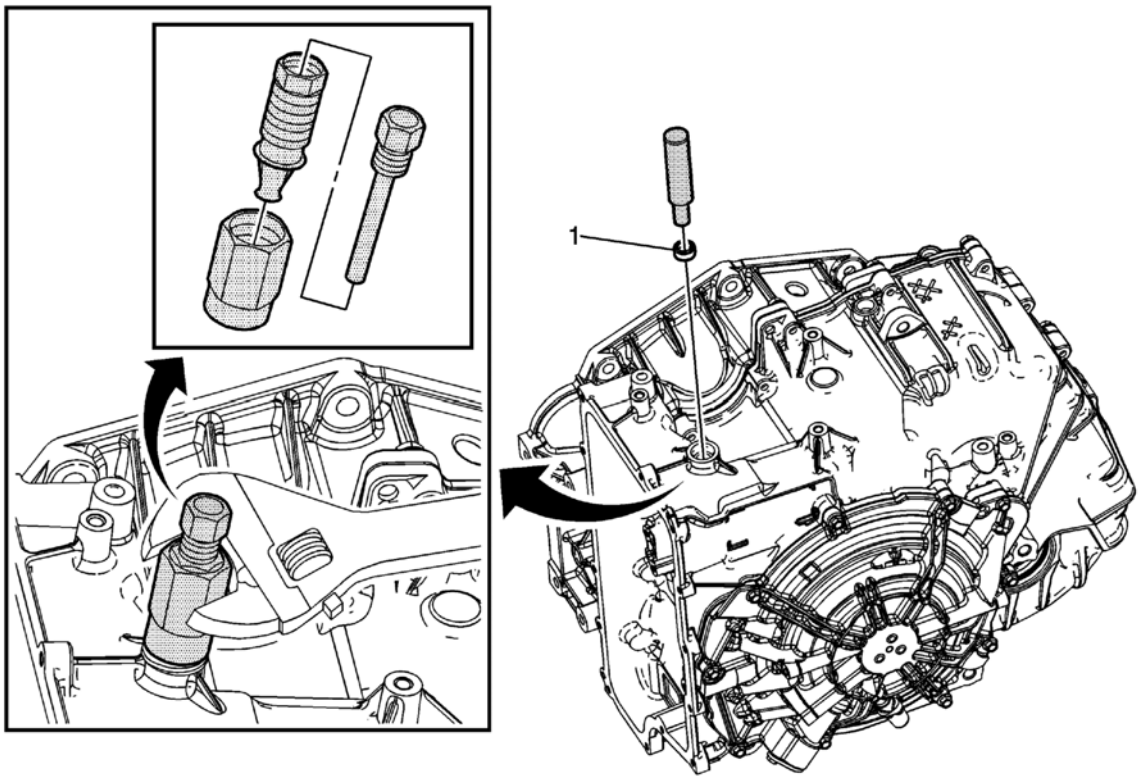

Fig. 30: Identifying Manual Shift Shaft & Seal
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedures 1. Remove the battery tray. Refer to **Battery Tray Replacement** . 2. Remove the manual shaft and position switch assembly. Refer to **Manual Shift Detent Lever with Shaft Position Switch Assembly Replacement**.	
1	Manual Shift Shaft Seal • For seal removal use **DT-45201** Manual Shaft Seal Remover. • For seal installation use **DT-46626** Manual Shift Shaft Seal Installer. • Lubricate the manual shaft with automatic transmission fluid (ATF) to prevent damage to the manual shift shaft seal. **Special Tools** • **DT-45201** Manual Shaft Seal Remover • **DT-46626** Manual Shift Shaft Seal Installer

CONTROL VALVE BODY COVER REPLACEMENT

Removal Procedure

1. Remove the air cleaner assembly. Refer to **Air Cleaner Assembly Replacement** .
2. Drain the transmission. Refer to **Transmission Fluid Drain and Fill**.

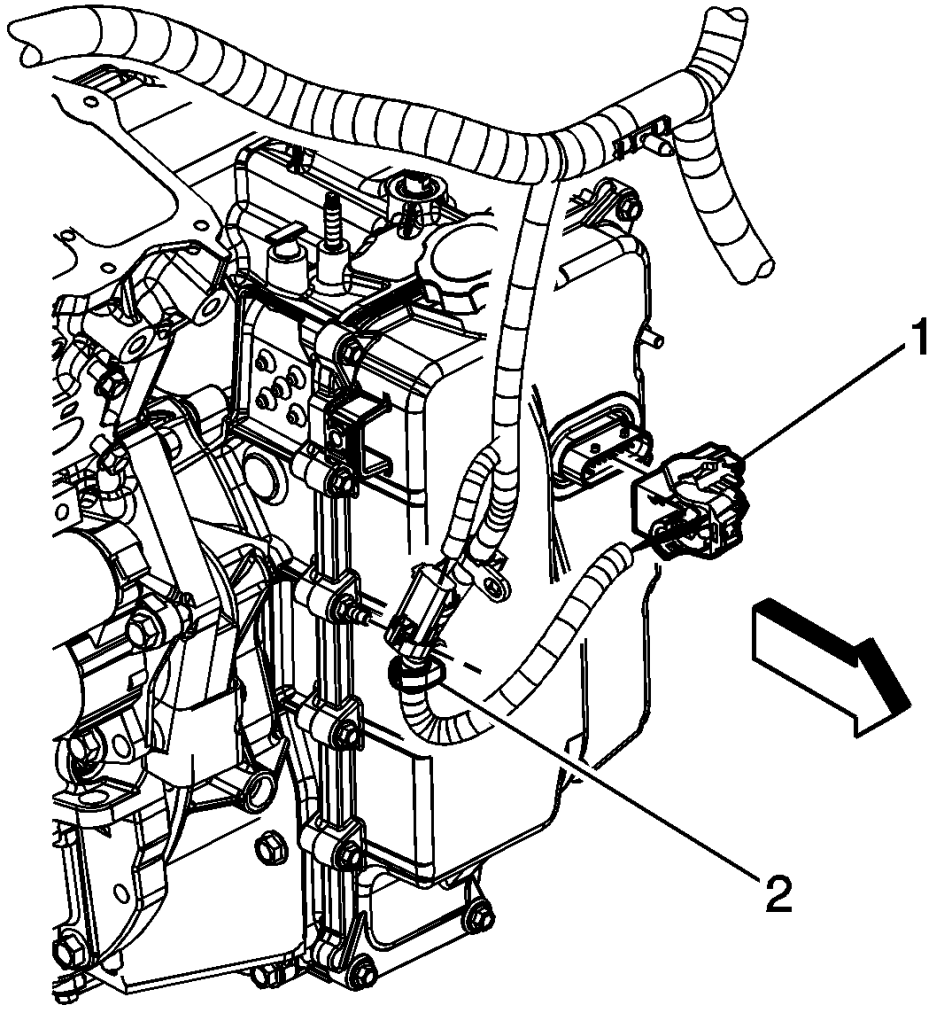

Fig. 31: Identifying Wire Harness Retainer & TCM Electrical Connector
Courtesy of GENERAL MOTORS COMPANY

3. Remove the wire harness retainer (2) from the control valve body cover stud.
4. Disconnect the control valve body transmission control module (TCM) electrical connector (1).

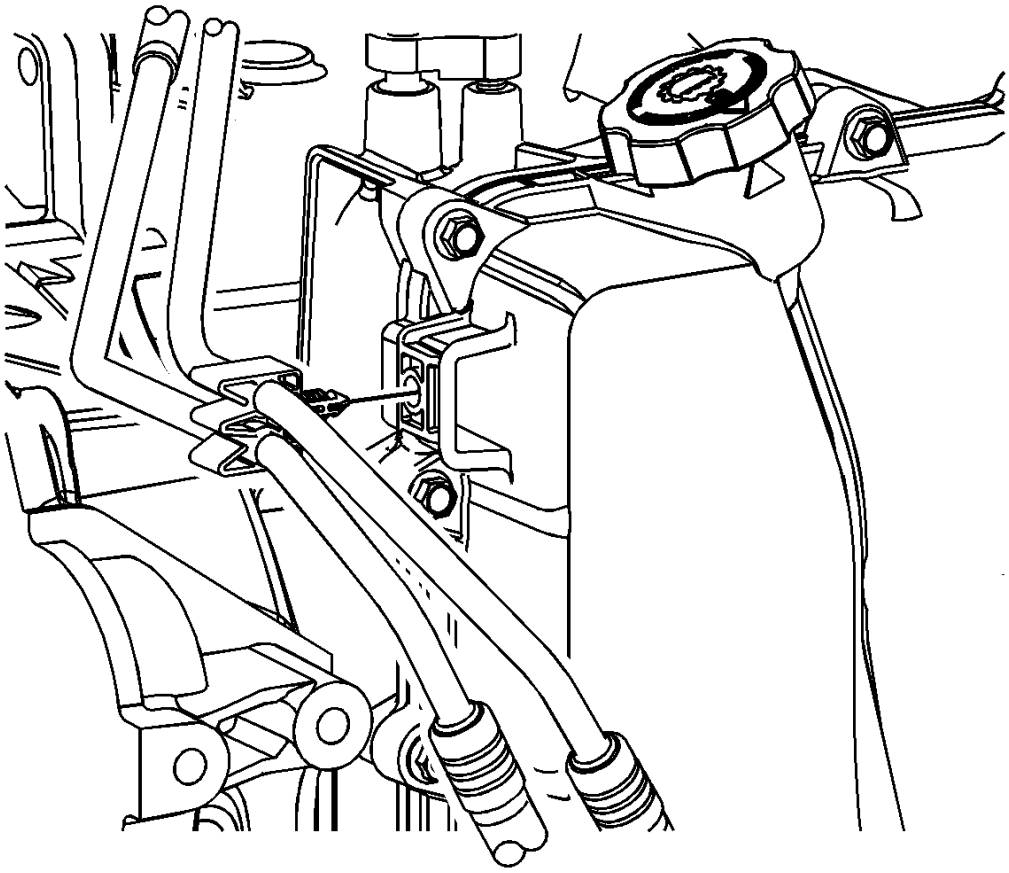

Fig. 32: Identifying Oil Cooler Inlet And Outlet Hoses
Courtesy of GENERAL MOTORS COMPANY

5. Remove the oil cooler inlet and outlet hoses from the retainer on the control valve body cover.

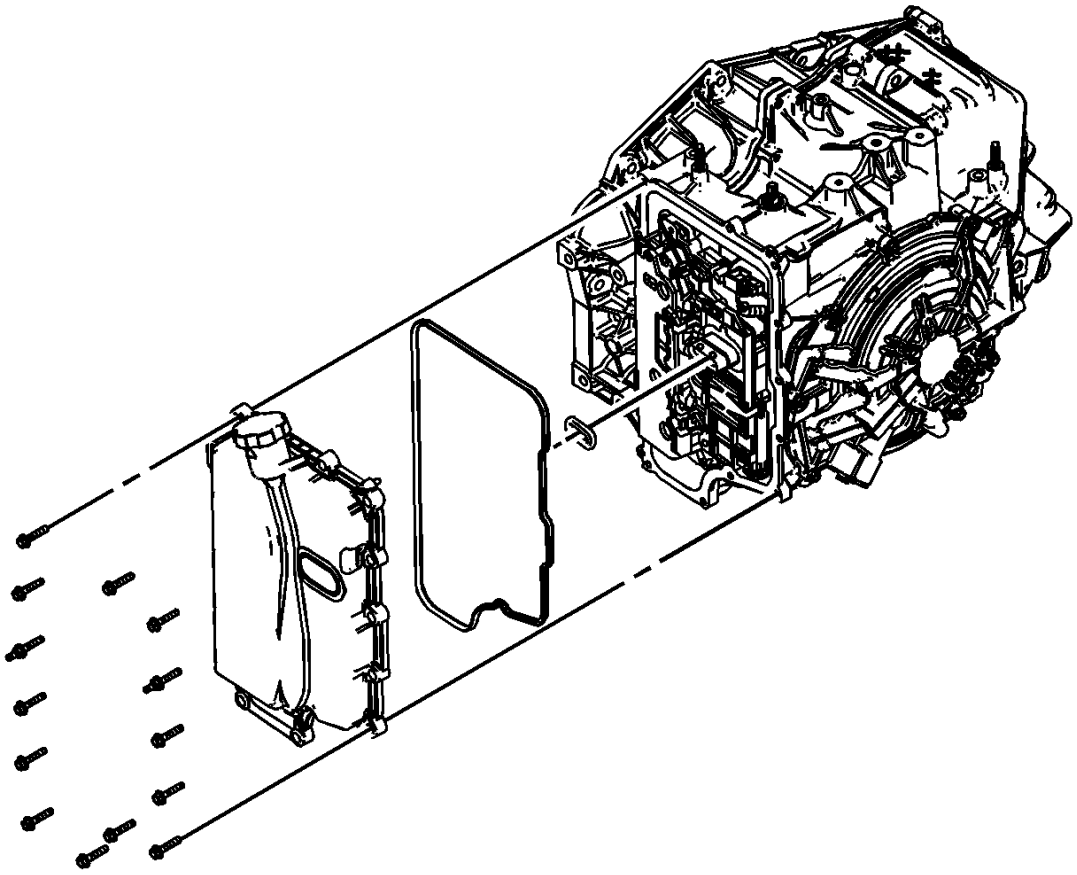

Fig. 33: Identifying Control Valve Body Cover Studs & Bolts
Courtesy of GENERAL MOTORS COMPANY

6. Remove the 2 control valve body cover studs M6 x 30.
7. Remove the 9 lower control valve body cover bolts M6 x 30.
8. Lower the vehicle.
9. Disconnect the transmission wire harness retainer from the bracket on top of the transmission.
10. Remove the top 3 control valve body cover bolts M6 x 30.
11. Remove the control valve body cover.
12. Remove the control valve body cover gasket.
13. Remove the control valve body cover wiring connector hole seal.
14. Remove all traces of the old gasket material. Clean the transmission case and control valve body cover gasket surfaces.

Installation Procedure

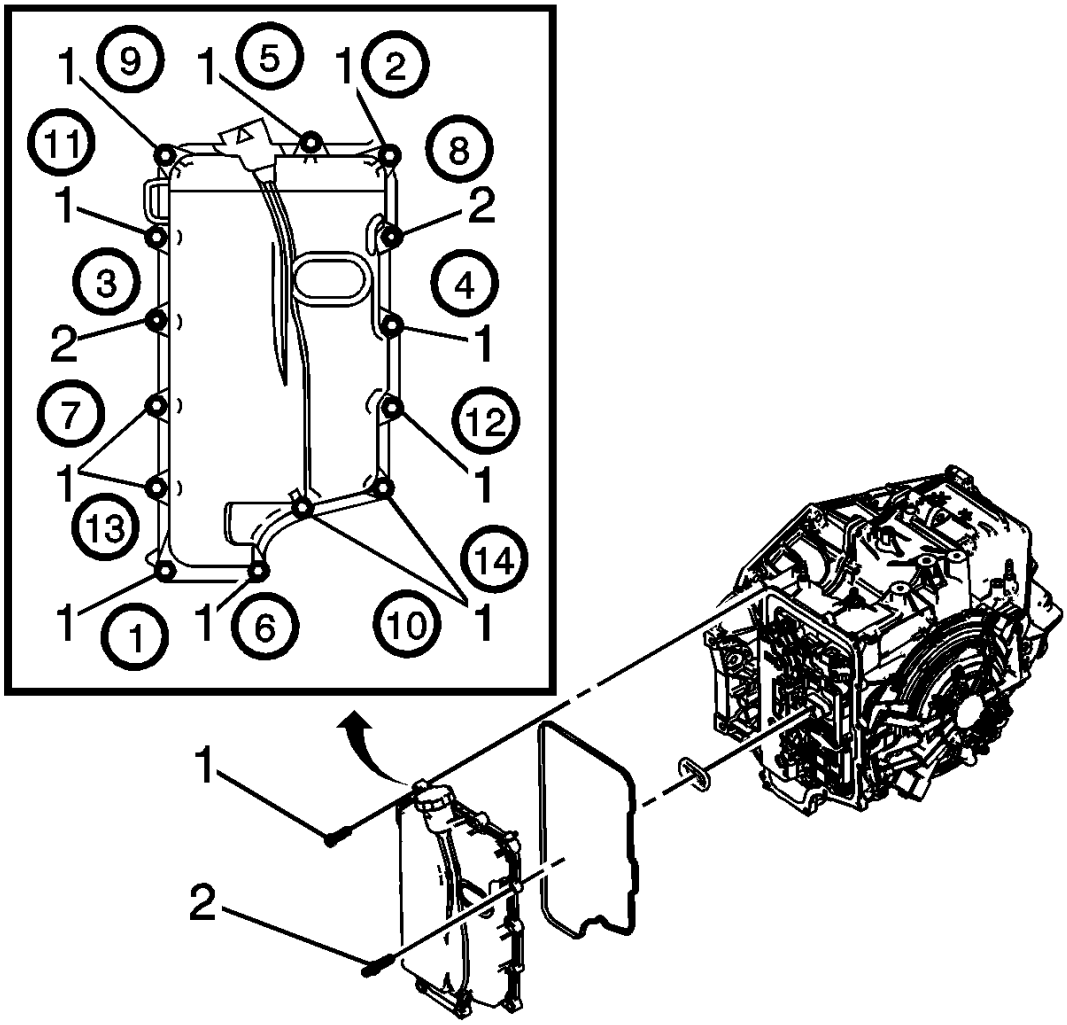

Fig. 34: Identifying Control Valve Body Cover Bolts Torque Sequence
Courtesy of GENERAL MOTORS COMPANY

1. Install the control valve body cover wiring connector hole seal.
2. Install the control valve body cover gasket to the control valve body cover.
3. Install the control valve body cover.

CAUTION: Refer to Fastener Caution .

4. Install the top 3 control valve body cover bolts (1) M6 x 30.
5. Connect the transmission wire harness retainer to the bracket on top of the transmission.
6. Raise the vehicle.
7. Install the 9 lower control valve body cover bolts (1) M6 x 30.
8. Install the 2 control valve body cover studs (2) M6 x 30.
9. Tighten the 12 bolts and 2 studs in sequence to 12 N.m (106 lb in).

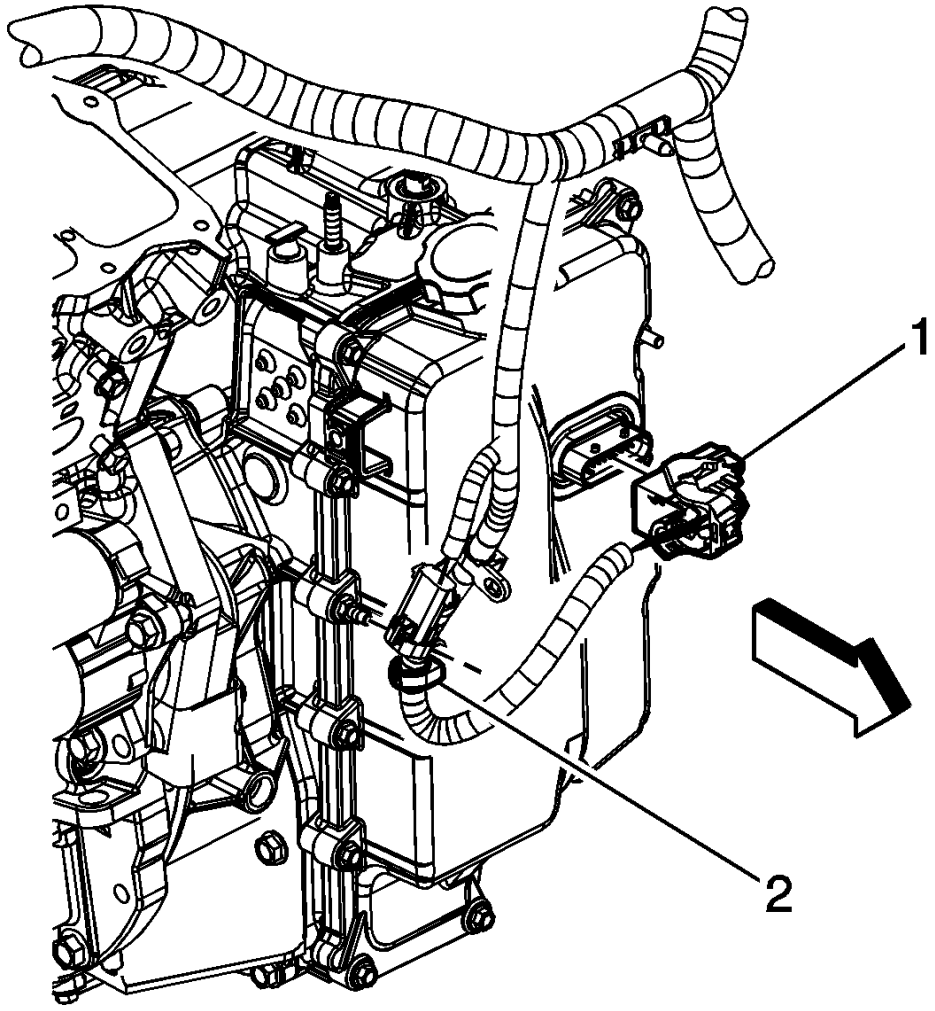

Fig. 35: Identifying Wire Harness Retainer & TCM Electrical Connector
Courtesy of GENERAL MOTORS COMPANY

10. Connect the control valve body TCM electrical connector (1).

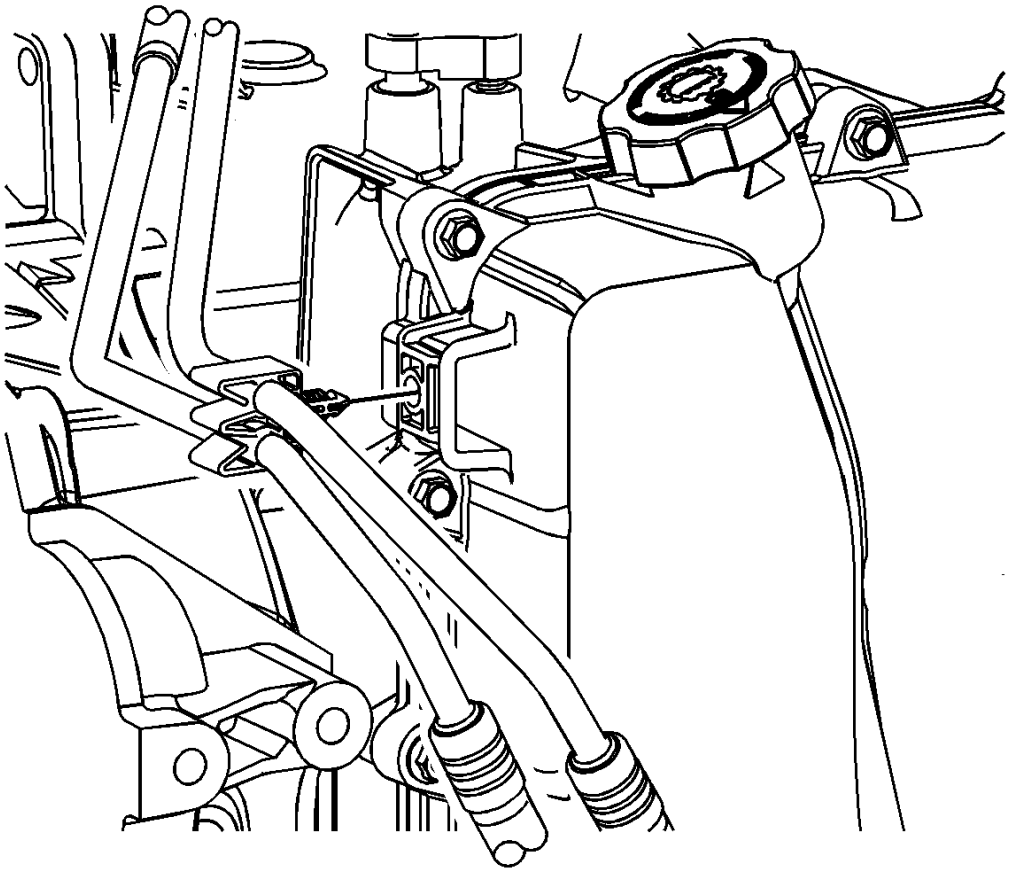

Fig. 36: Identifying Oil Cooler Inlet And Outlet Hoses
Courtesy of GENERAL MOTORS COMPANY

11. Install the oil cooler inlet and outlet hoses to the retainer on the control valve body cover.
12. Install the wire harness retainer to the control valve body cover stud.
13. Tighten the nut to 12 N.m (106 lb in).
14. Fill the transmission. Refer to **Transmission Fluid Drain and Fill**.
15. Install the air cleaner assembly. Refer to **Air Cleaner Assembly Replacement** .
16. Check for leaks.

CONTROL SOLENOID VALVE AND TRANSMISSION CONTROL MODULE ASSEMBLY REPLACEMENT

Removal Procedure

1. Remove the control valve body cover. Refer to **Control Valve Body Cover Replacement**.

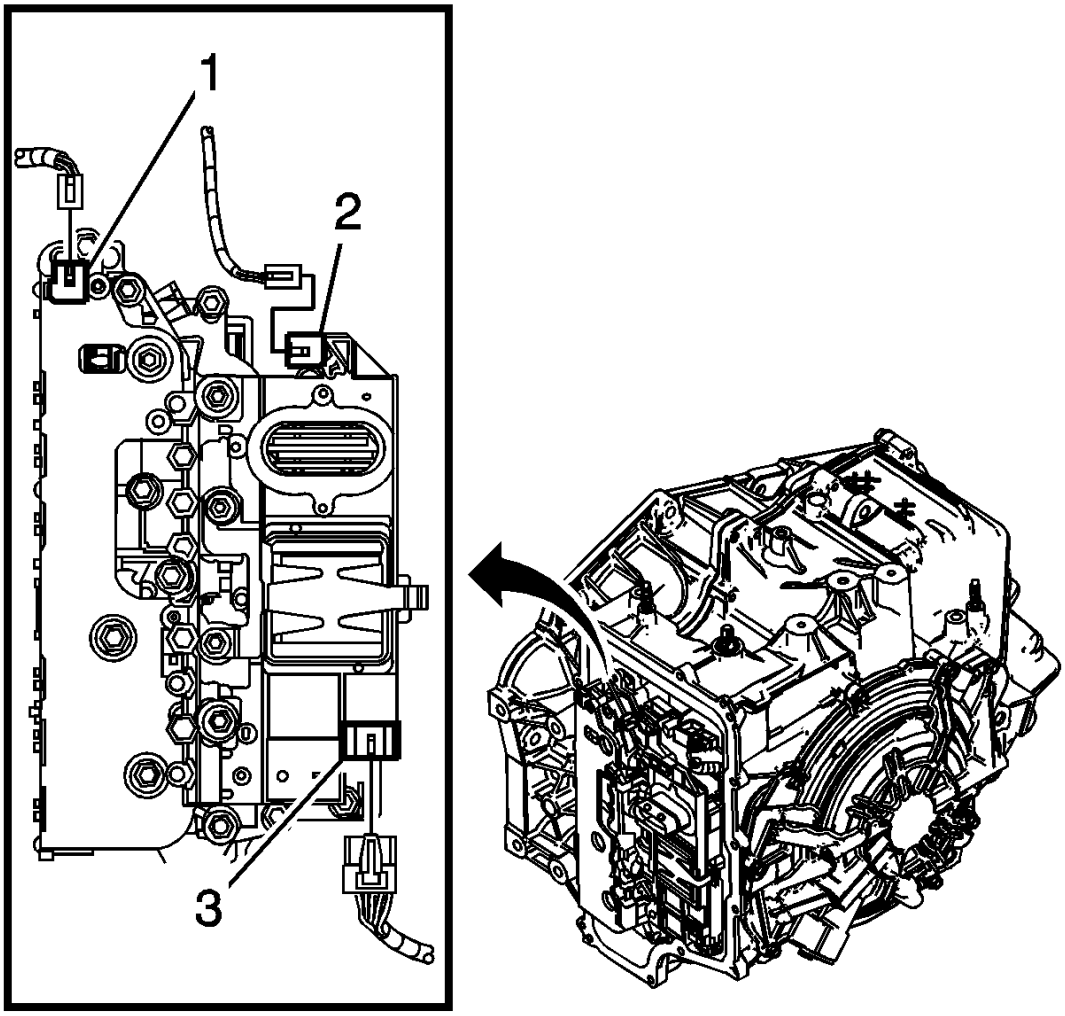

Fig. 37: Identifying Input Speed Sensor
Courtesy of GENERAL MOTORS COMPANY

2. Disconnect the input speed sensor electrical connector (1).
3. Disconnect the output speed sensor electrical connector (2).
4. Disconnect the shift position switch electrical connector (3).

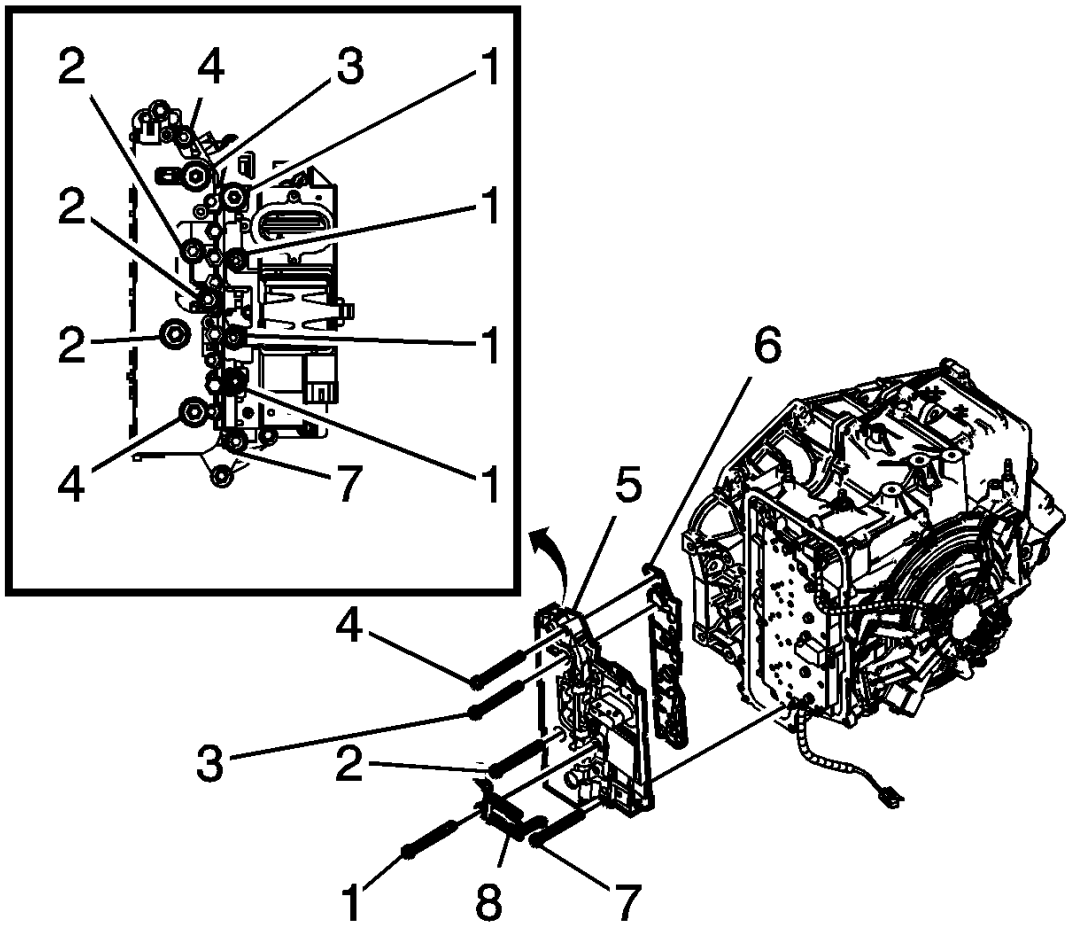

Fig. 38: Identifying Control Valve Body Bolts
Courtesy of GENERAL MOTORS COMPANY

5. Remove the 4 control valve body bolts (1) M6 x 80.
6. Position the control solenoid valve spring (8) to the side. Spring will be released with the removal of the control valve body assembly.
7. Remove the 2 control valve body bolts (4) M6 x 65.
8. Remove the control valve body bolt (3) M6 x 42.
9. Remove the 3 control valve body bolts (2) M6 x 95.
10. Remove the control valve body bolt (7) M6 x 55.
11. Remove the control solenoid valve body and transmission control module (TCM) assembly (5).

CAUTION: Use care when removing or installing the filter plate assembly. A broken or missing retaining tab may not adequately secure the filter plate to the control solenoid valve assembly, resulting in possible damage or contamination.

12. Remove the control solenoid valve assembly filter plate (6).

- Discard the filler plate. It is not reusable.
- Inspect the pressure switch manifold seals for damage or contamination. Replace the control solenoid valve assembly as necessary.
- Inspect the upper channel plate bolt holes for damage, peening or burnelling. Any damage around the bolt holes near the pressure control switch (PCS) feed holes could cause leakage around the PCS seals. Replace the upper channel plate as necessary.

Installation Procedure

CAUTION: Use care when removing or installing the filter plate assembly. A broken or missing retaining tab may not adequately secure the filter plate to the control solenoid valve assembly, resulting in possible damage or contamination.

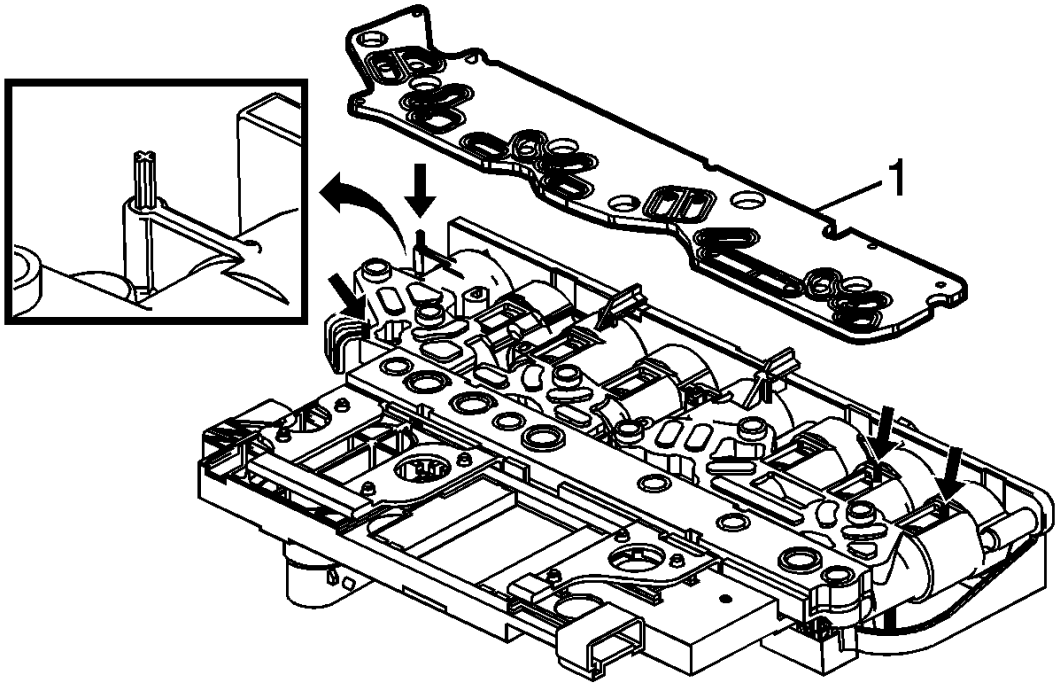

Fig. 39: Identifying Control Solenoid Valve Assembly Filter Plate
Courtesy of GENERAL MOTORS COMPANY

1. Install a NEW control solenoid valve assembly filter plate (1).

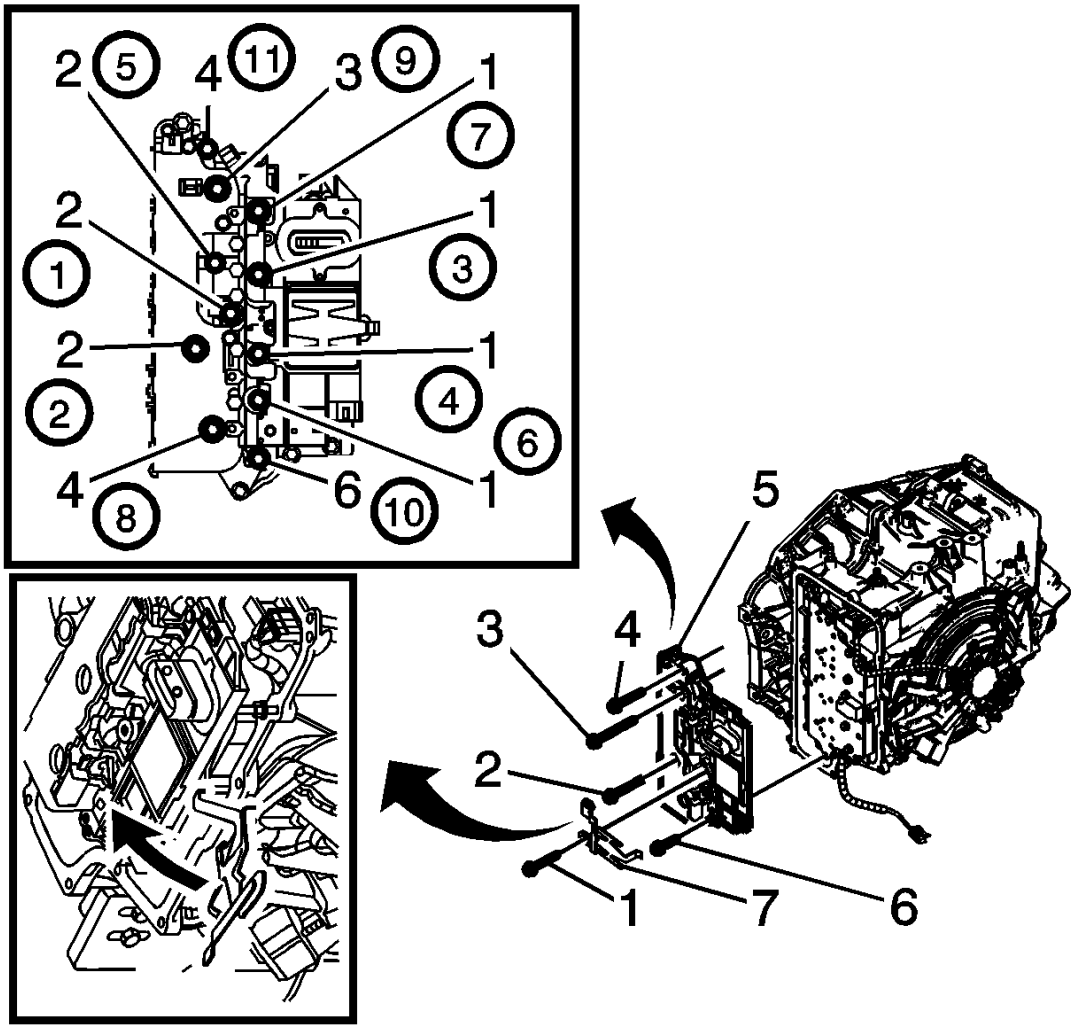

Fig. 40: Identifying Control Valve Body Bolts Torque Sequence
Courtesy of GENERAL MOTORS COMPANY

2. Install the control solenoid valve body and TCM assembly (5).
3. Rotate the control solenoid valve spring (7) into position.

CAUTION: Refer to Fastener Caution .

NOTE: Install all bolts before tightening, then tighten in specified sequence.

4. Install the 4 control valve body bolts (1) M6 x 80.
5. Install the control valve body bolt (6) M6 x 55.
6. Install the 3 control valve body bolts (2) M6 x 95.
7. Install the control valve body bolt (3) M6 x 42.
8. Install the 2 control valve body bolts (4) M6 x 65 and tighten to 12 N.m (106 lb in).

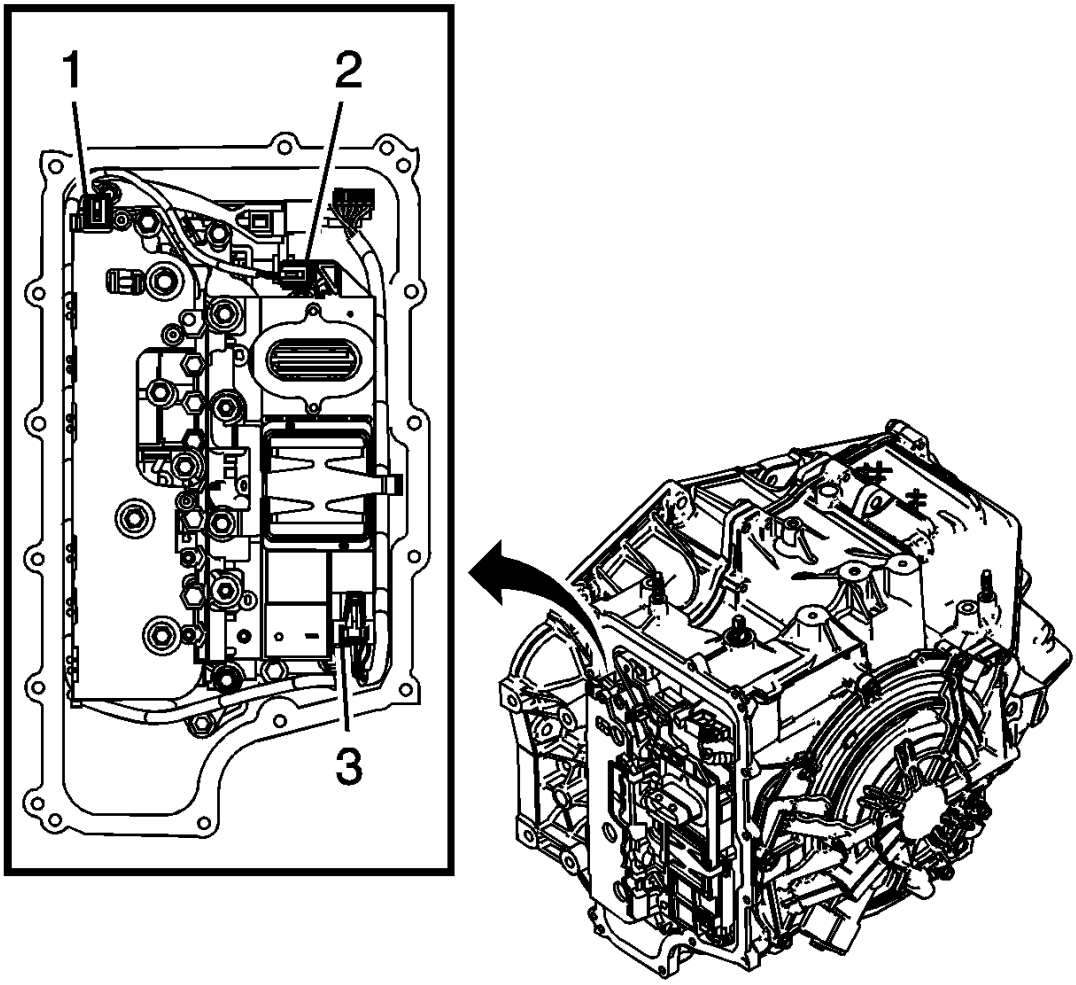

Fig. 41: Identifying Electrical Connectors
Courtesy of GENERAL MOTORS COMPANY

9. Connect the input speed sensor electrical connector (1).
10. Connect the output speed sensor electrical connector (2).
11. Connect the shift position switch electrical connector (3).
12. Install the control valve body cover. Refer to **Control Valve Body Cover Replacement**.
13. If a NEW TCM has been installed into the vehicle, the NEW module needs to be reprogrammed. Refer to **Service Programming System (SPS)** .

NOTE: **The Reset Transmission Adapts procedure must be performed when one of the following repairs have been made to the vehicle. Failure to perform the procedure after one of the following repairs may result in poor transmission performance, as well as transmission DTCs being set:**

- **Transmission internal service/overhaul**
- **Valve body repair or replacement**
- **Control solenoid valve assembly replacement**

- **TCM software/calibration update**
- **Any service in response to a shift quality concern**

14. Perform the Reset Transmission Adapts. Refer to **Reset Transmission Adapts** .

CONTROL VALVE LOWER BODY AND UPPER BODY REPLACEMENT

Removal Procedure

1. Remove the control valve body cover. Refer to **Control Valve Body Cover Replacement**.

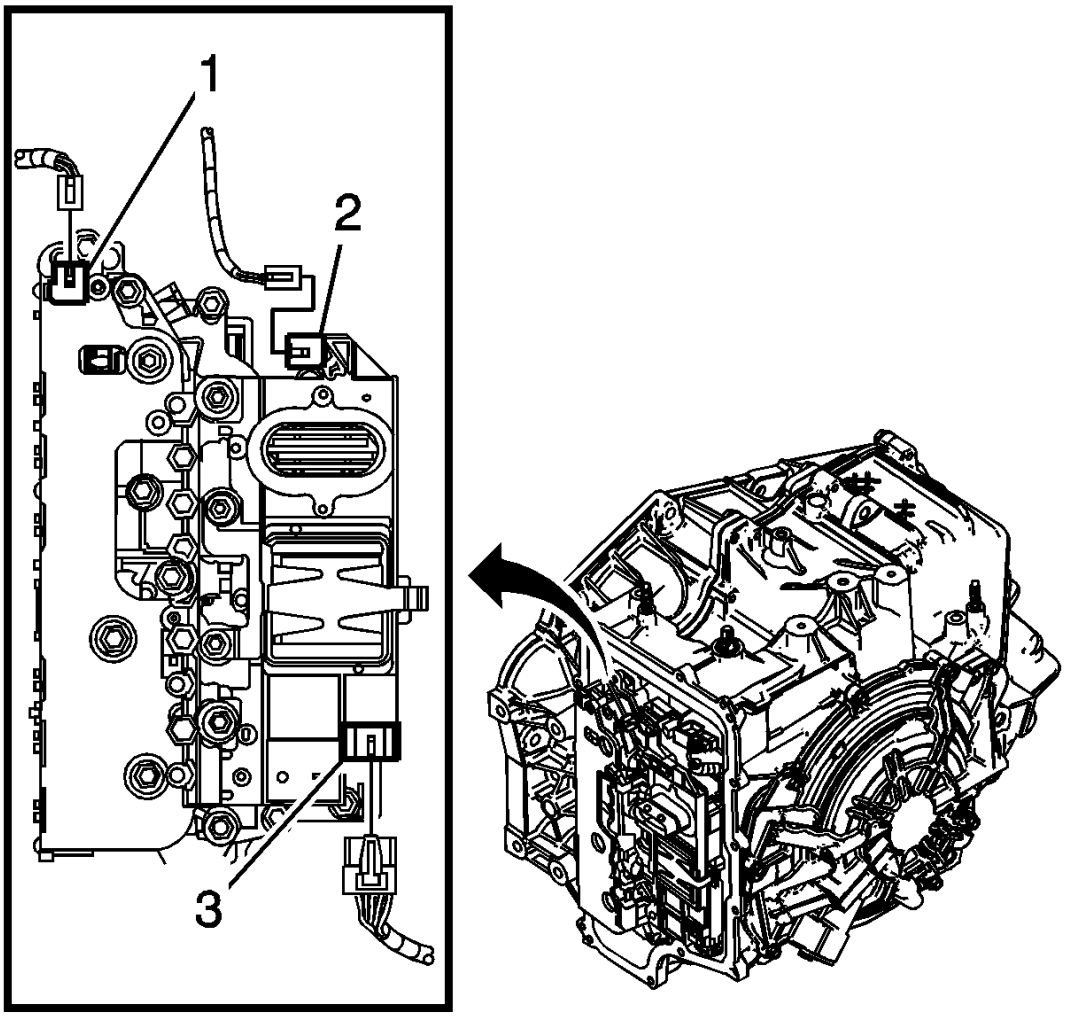

Fig. 42: Identifying Input Speed Sensor
Courtesy of GENERAL MOTORS COMPANY

2. Disconnect the input speed sensor electrical connector (1).
3. Disconnect the output speed sensor electrical connector (2).
4. Disconnect the shift position switch electrical connector (3).

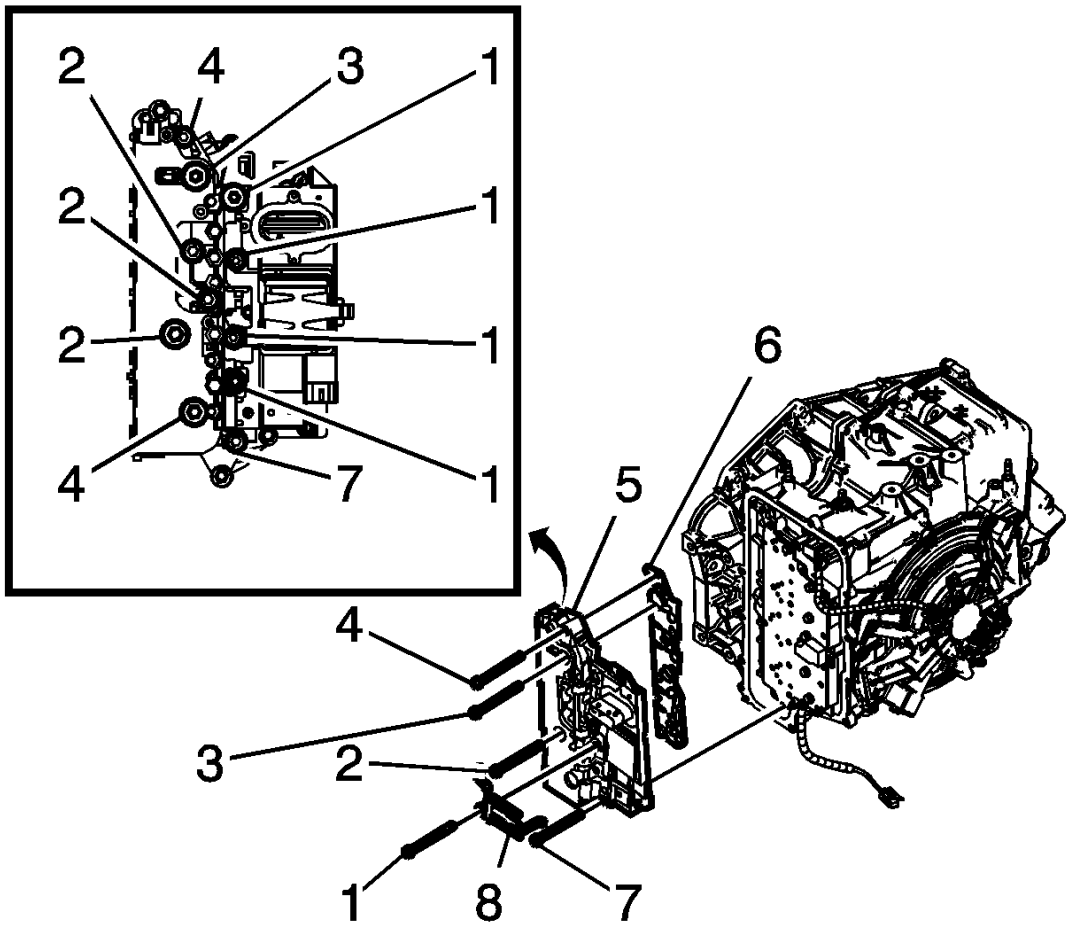

Fig. 43: Identifying Control Valve Body Bolts
Courtesy of GENERAL MOTORS COMPANY

5. Remove the 4 control valve body bolts (1) M6 x 80.
6. Position the control solenoid valve spring (8) to the side. Spring will be released with removal of lower control valve body.
7. Remove the 2 control valve body bolts (4) M6 x 65.
8. Remove the control valve body bolt (3) M6 x 42.
9. Remove the 3 control valve body bolts (2) M6 x 95.
10. Remove the control valve body bolt (7) M6 x 55.
11. Remove the control solenoid valve body and transmission control module (TCM) assembly (5).

CAUTION: Use care when removing or installing the filter plate assembly. A broken or missing retaining tab may not adequately secure the filter plate to the control solenoid valve assembly, resulting in possible damage or contamination.

12. Remove the control solenoid valve body assembly filter plate (6).

- Discard the filler plate. It is not reusable.
- Inspect the pressure switch manifold seals for damage or contamination. Replace the control solenoid valve assembly as necessary.
- Inspect the upper channel plate bolt holes for damage, peening or burnelling. Any damage around the bolt holes near the PCS switch feed holes could cause leakage around the PCS switch seals. Replace the upper channel plate as necessary.

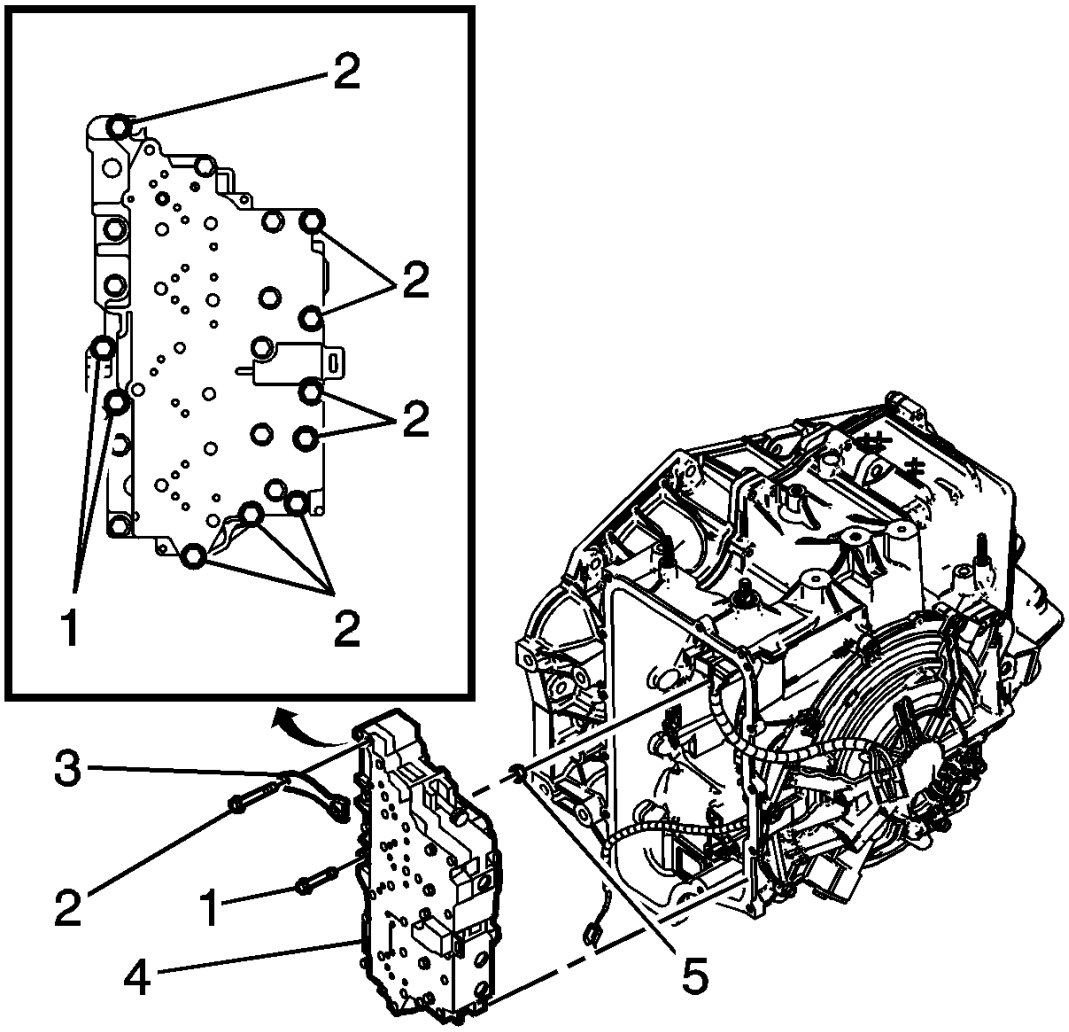

Fig. 44: Identifying Control Valve Body Bolts
Courtesy of GENERAL MOTORS COMPANY

13. Remove the 8 control valve body bolts (2) M6 x 65.
14. Remove the 2 control valve body bolts (1) M6 x 55.
15. Remove the manual shaft detent assembly (3).
16. Remove the control valve body assembly (4).
17. The control solenoid valve spring can now be fully removed from the lower control valve body assembly.

NOTE: **The clutch fluid passage seal is not reusable.**

18. Remove the 1-2-3-4 clutch fluid passage seal (5).

19. Transfer parts as needed. Refer to **Control Valve Body Assembly Disassemble** , and **Control Valve Body Assembly Assemble** .

Installation Procedure

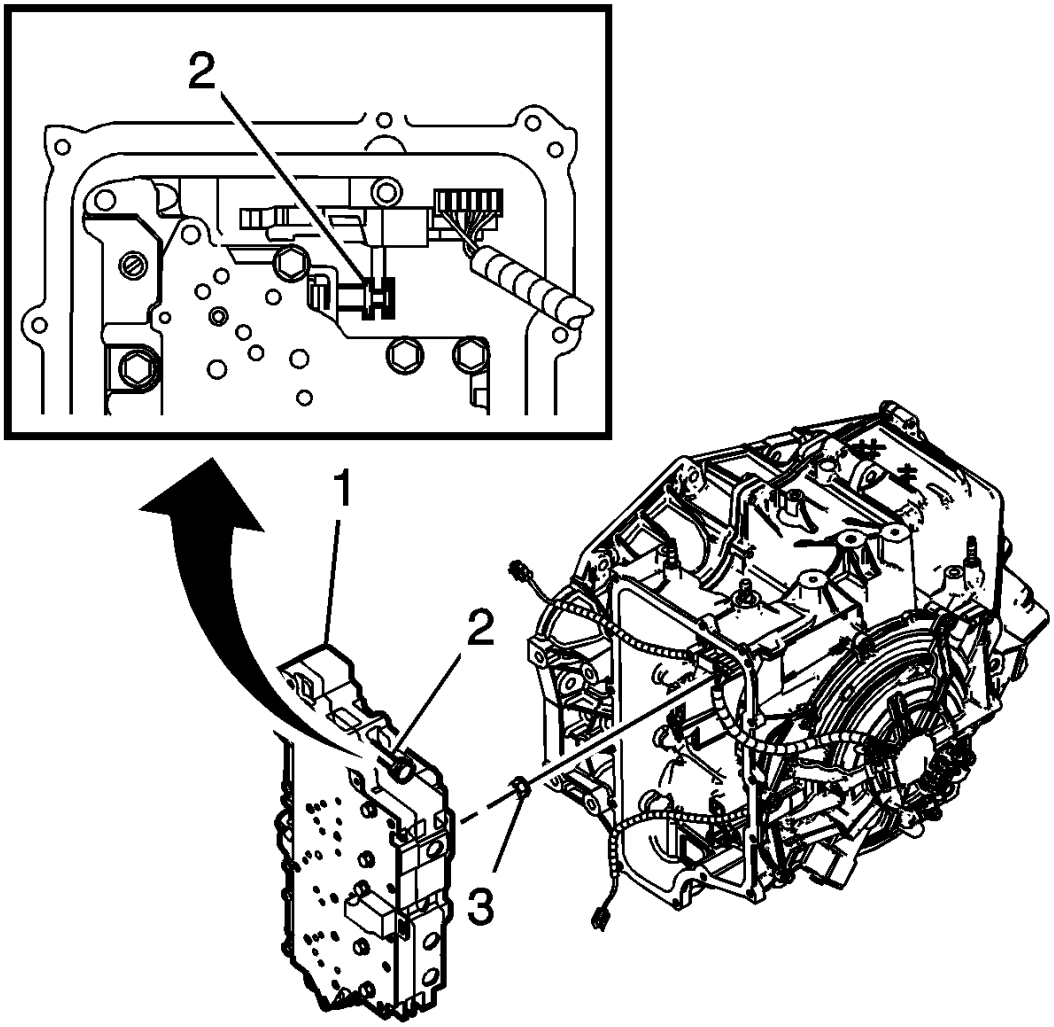

Fig. 45: Identifying Control Valve Body Components
Courtesy of GENERAL MOTORS COMPANY

NOTE: **The clutch fluid passage seal is not reusable.**

1. Install a NEW 1-2-3-4 clutch fluid passage seal (3).

NOTE: **Ensure the control solenoid valve spring is attached to the lower control valve body assembly.**

NOTE: **Align the manual valve (2) to the detent lever assembly while installing the lower control valve body assembly.**

2. Install the control valve body assembly (1).

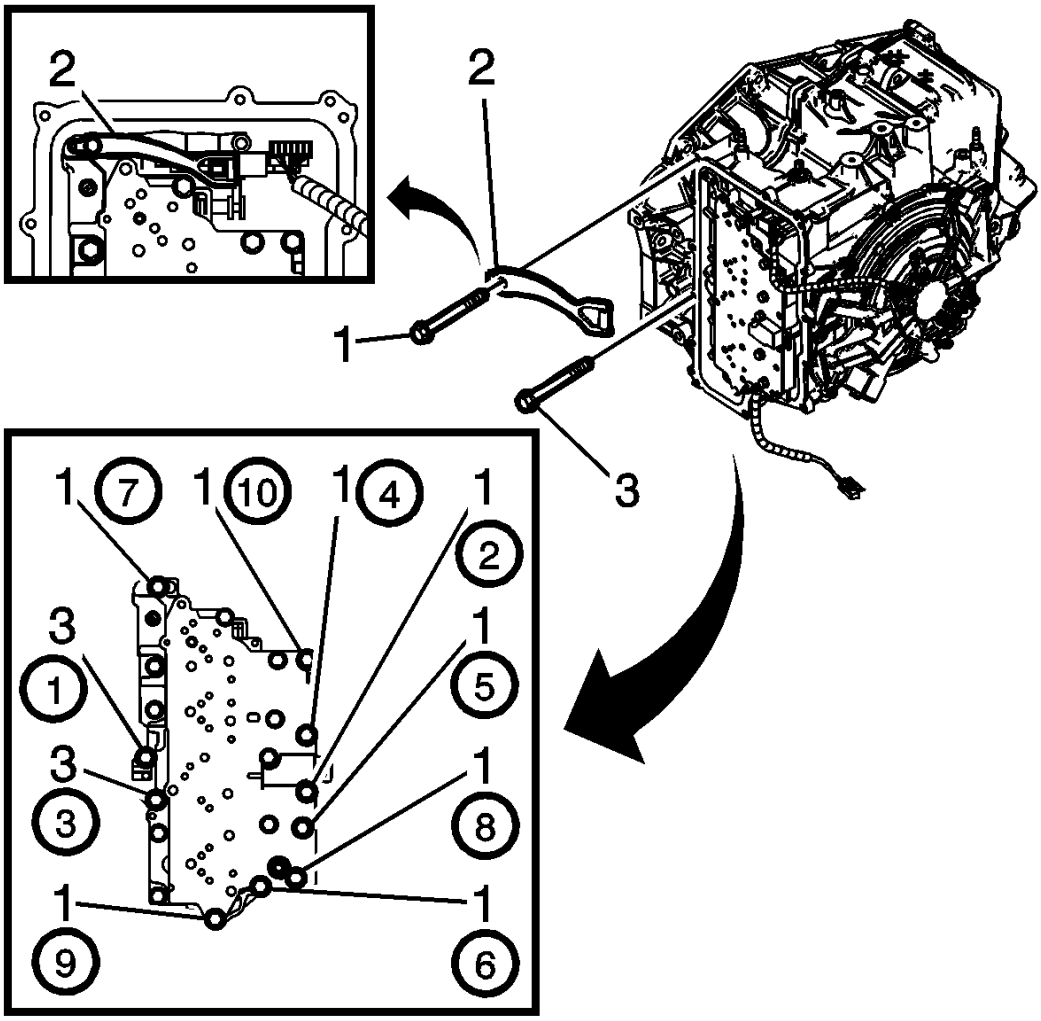

Fig. 46: Identifying Control Valve Body Bolts Torque Sequence
Courtesy of GENERAL MOTORS COMPANY

NOTE: **Ensure proper alignment of the detent assembly to the detent lever assembly with position switch while tightening the bolt. The detent assembly can move and hit the valve body assembly that could cause improper engagement with the detent lever assembly.**

3. Install the manual shaft detent assembly (2).

CAUTION: **Refer to Fastener Caution .**

NOTE: **Install all bolts before tightening, then tighten in specified sequence.**

4. Install the 8 control valve body bolts (1) M6 x 65 and tighten to 12 N.m (106 lb in).
5. Install the 2 control valve body bolts (3) M6 x 55 and tighten to 12 N.m (106 lb in).

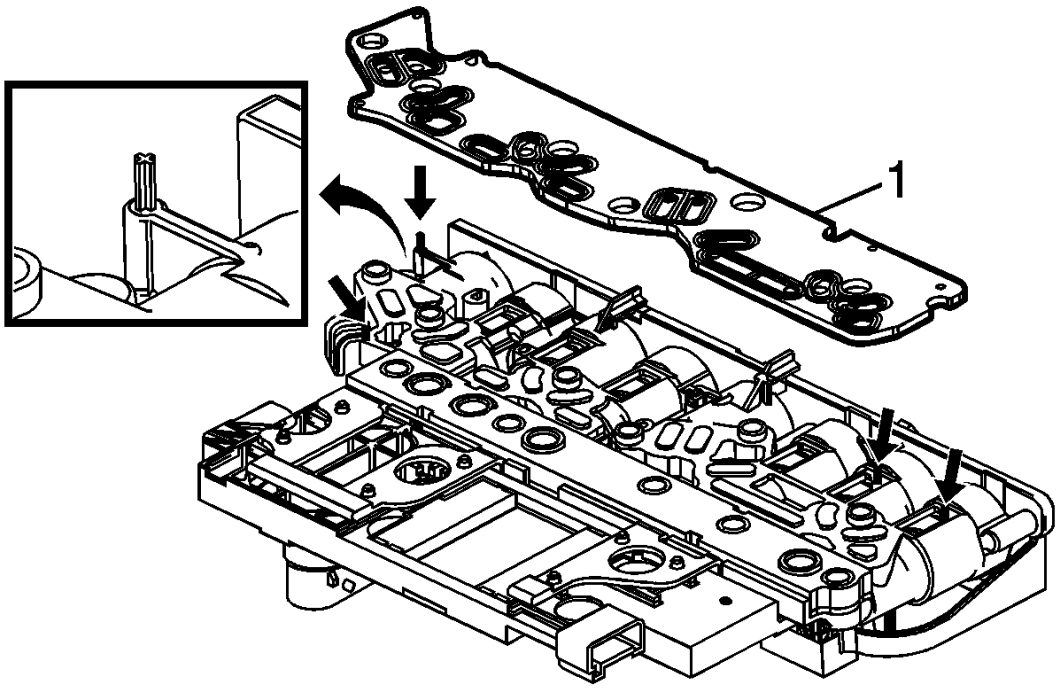

Fig. 47: Identifying Control Solenoid Valve Assembly Filter Plate
Courtesy of GENERAL MOTORS COMPANY

CAUTION: Use care when removing or installing the filter plate assembly. A broken or missing retaining tab may not adequately secure the filter plate to the control solenoid valve assembly, resulting in possible damage or contamination.

6. Install a NEW control solenoid valve assembly filter plate (1).

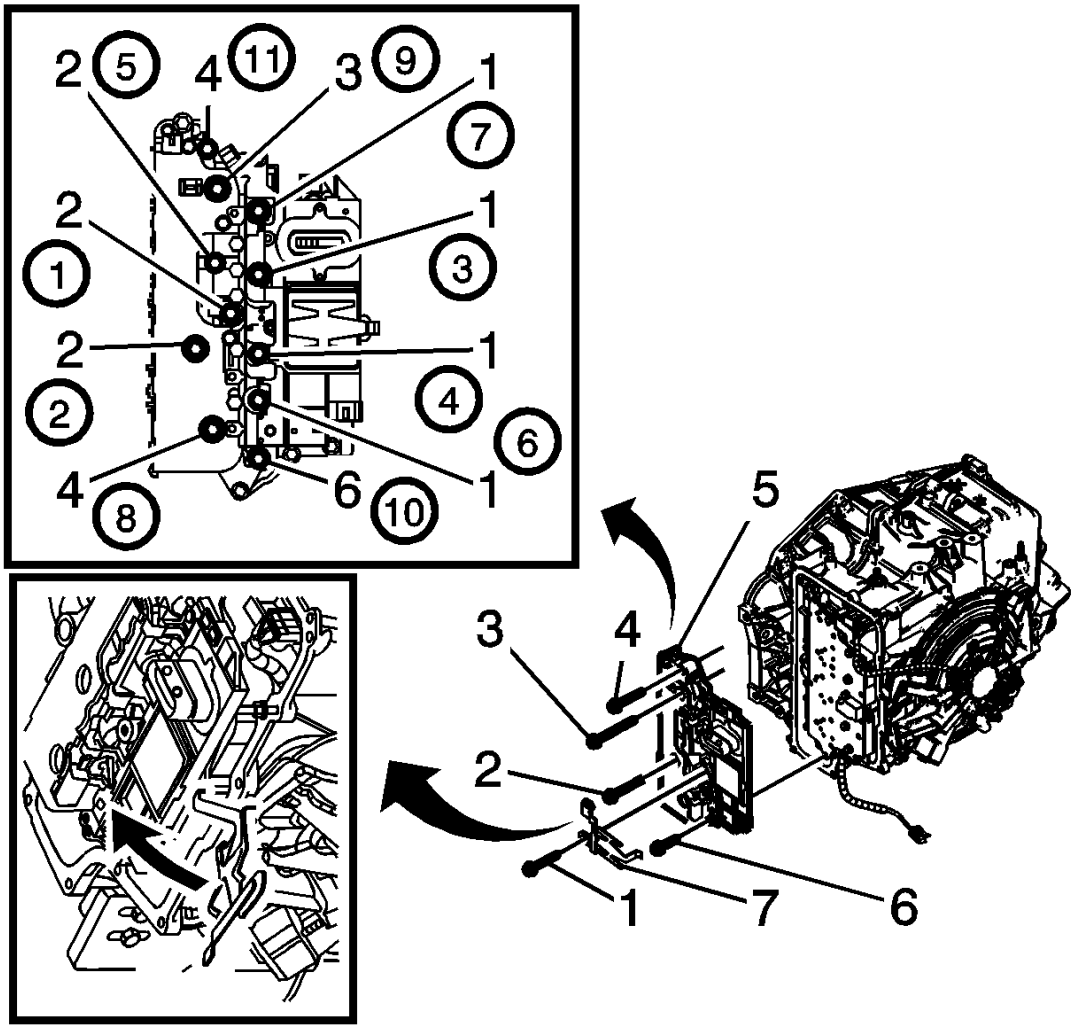

Fig. 48: Identifying Control Valve Body Bolts Torque Sequence
Courtesy of GENERAL MOTORS COMPANY

7. Install the control solenoid valve body and TCM assembly (5).
8. Rotate the control solenoid valve spring (7) into position.

NOTE: **Install all bolts before tightening, then tighten in specified sequence.**

9. Install the 4 control valve body bolts (1) M6 x 80.
10. Install the control valve body bolt (6) M6 x 55.
11. Install the 3 control valve body bolts (2) M6 x 95.
12. Install the control valve body bolt (3) M6 x 42.
13. Install the 2 control valve body bolts (4) M6 x 65.

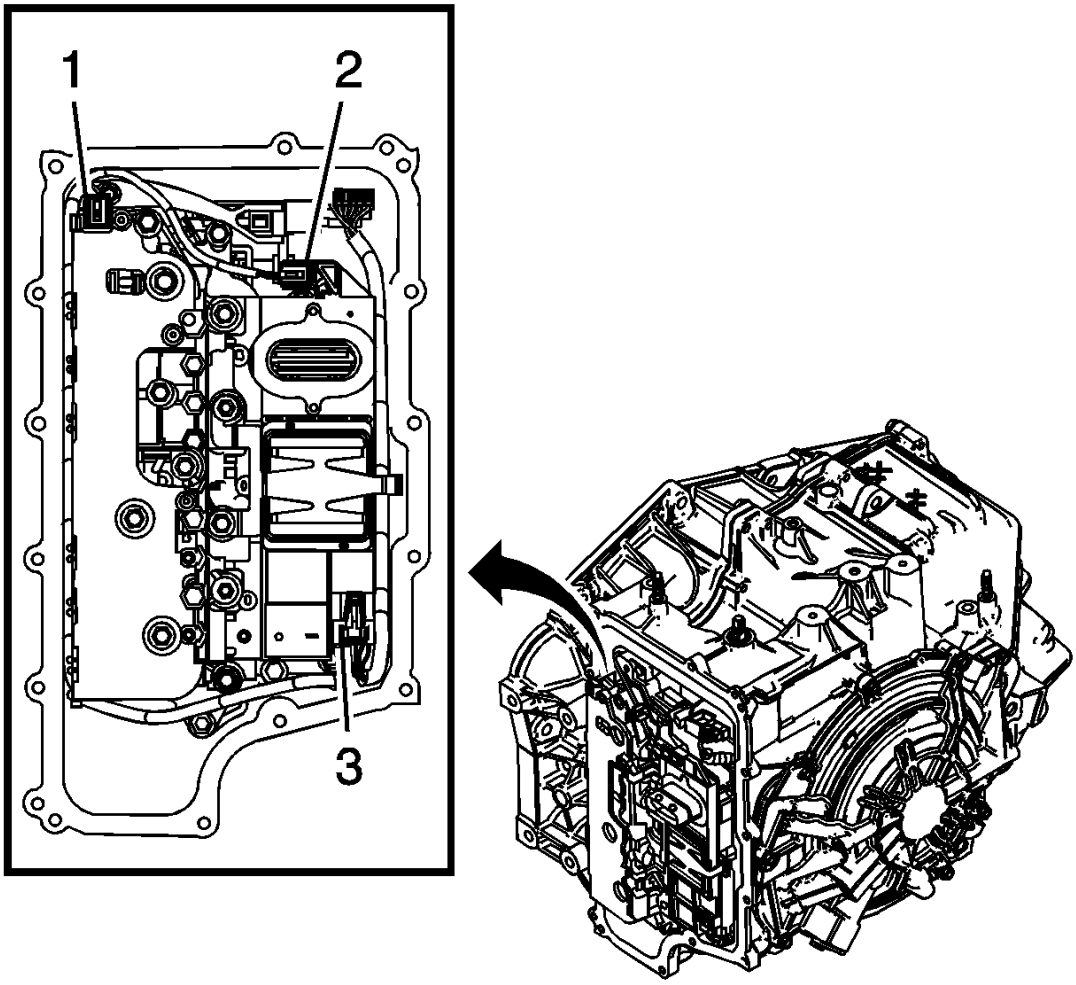

Fig. 49: Identifying Electrical Connectors
Courtesy of GENERAL MOTORS COMPANY

14. Connect the input speed sensor electrical connector (1).
15. Connect the output speed sensor electrical connector (2).
16. Connect the shift position switch electrical connector (3).
17. Install the control valve body cover. Refer to **Control Valve Body Cover Replacement**.
18. For transmission control module programming and setup. Refer to **Control Module References** .

NOTE: **After an internal transmission repair or internal part replacement the Reset Transmission Adapts procedure should be performed.**

19. Perform the Reset Transmission Adapts. Refer to **Reset Transmission Adapts** .

TORQUE CONVERTER REPLACEMENT

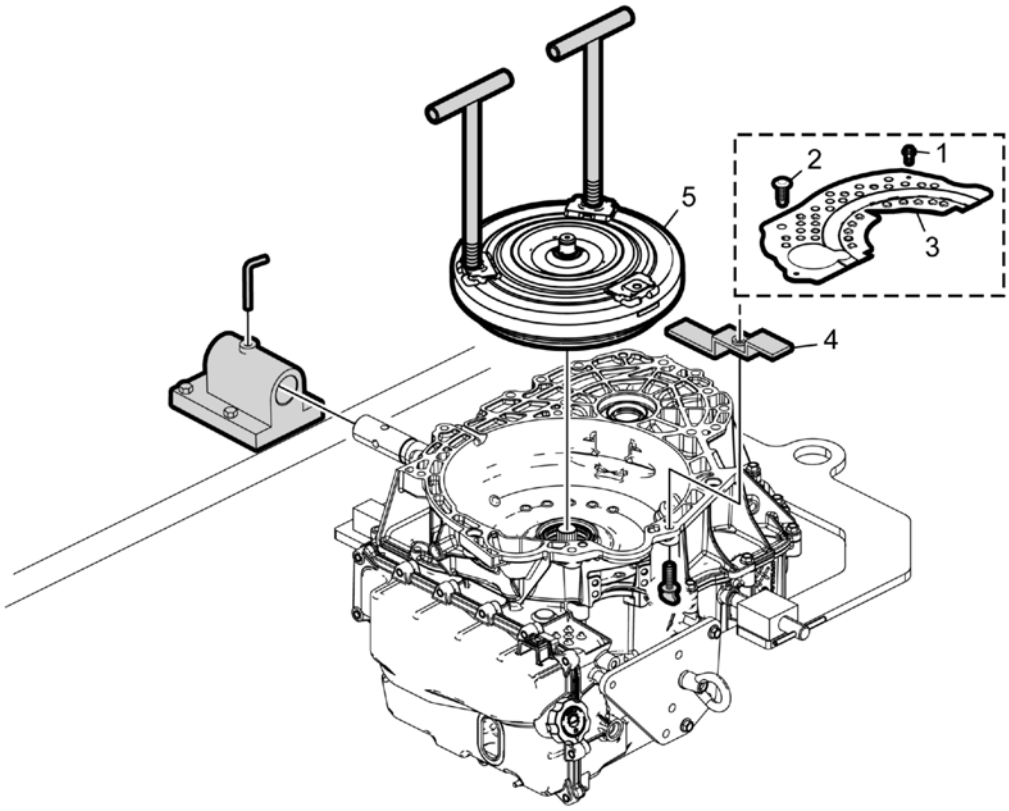

Fig. 50: Torque Converter & Mounting Components
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedures 1. Remove the transmission. Refer to **Transmission Replacement**. 2. Position the transmission assembly so the torque converter is facing up.	
1	Dust Cover Bolt M10 x 25, Model Dependent (Qty: 2)
2	Dust Cover Push Pin, Model Dependent
3	Dust Cover, Model Dependent
4	Converter Holding Strap **WARNING:** **The torque converter must be held to the torque converter housing by a retaining device such as shipping brackets. Without the**

Callout	Component Name
	retaining device, the torque converter may slide forward, disengaging the oil pump, or may fall completely out of the transmission causing personal injury and/or property damage. **Special Tools** **DT-21366** Converter Holding Strap For equivalent regional tools, refer to **Special Tools** .
5	Torque Converter Assembly **CAUTION:** **Only install the lift assist handles until it stops. Do not tighten. Over tightening the lift assist handles can cause damage to the torque converter.** **CAUTION:** **Lower the torque converter straight down. Failure to lower the**

Callout	Component Name
	torque converter straight down could damage the torque converter clutch lip seal inside the torque converter clutch assembly. **CAUTION:** **Failure to raise the torque dampener assembly straight up could damage the torque dampener clutch lip seal inside the torque dampener clutch assembly.** **Special Tools** **DT-46409** Torque Converter Lifting Handles For equivalent regional tools, refer to **Special Tools** .

TORQUE CONVERTER FLUID SEAL REPLACEMENT

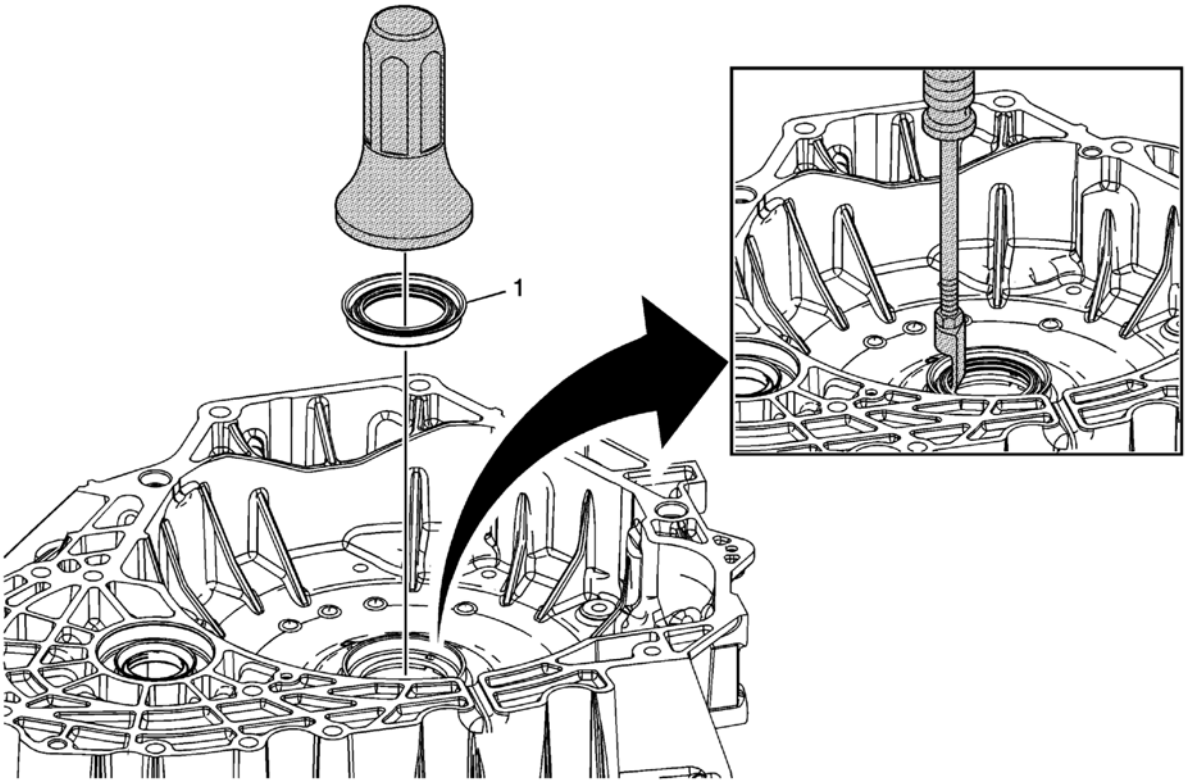

Fig. 51: Identifying Torque Converter Fluid Seal
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure Remove the transmission torque converter. Refer to **Torque Converter Replacement**.	
1	Torque Converter Fluid Seal **CAUTION:** **Support the back side of the torque converter housing while installing the seal. Install the seal until it stops moving. Applying excessive pressure to the seal once it is seated could cause**

Callout	Component Name
	damage to the torque converter housing casting. **Special Tools<!--Title-->** • **DT 23129** Universal Seal Remover • **DT 49861** Seal Installer • **GE 6125-1B** Slide Hammer with Adapter or equivalent For equivalent regional tools, refer to **Special Tools** .

OUTPUT SPEED SENSOR REPLACEMENT

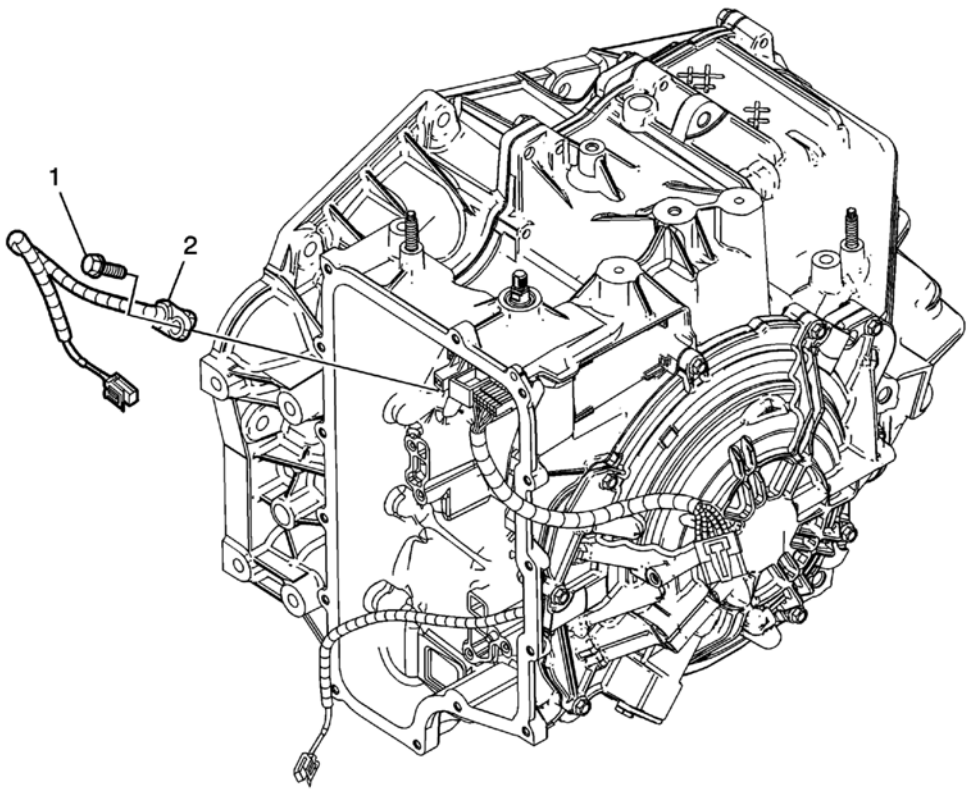

Fig. 52: View Of Output Speed Sensor
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedures 1. Raise and support the vehicle. Refer to **Lifting and Jacking the Vehicle** . 2. Remove the control valve lower body and upper body. Refer to **Control Valve Lower Body and**	

Callout	Component Name
	Upper Body Replacement.
1	Output Speed Sensor Bolt M6 x 25 **CAUTION:** **Refer to Fastener Caution .** **Tighten** 12 N.m (106 lb in)
2	Output Speed Sensor **Procedure** Perform the service programming system procedure. Refer to **Service Programming System (SPS)** . **NOTE:** **After an internal transmission repair or internal part replacement the service programming system procedure should be performed.**

INPUT SPEED SENSOR REPLACEMENT

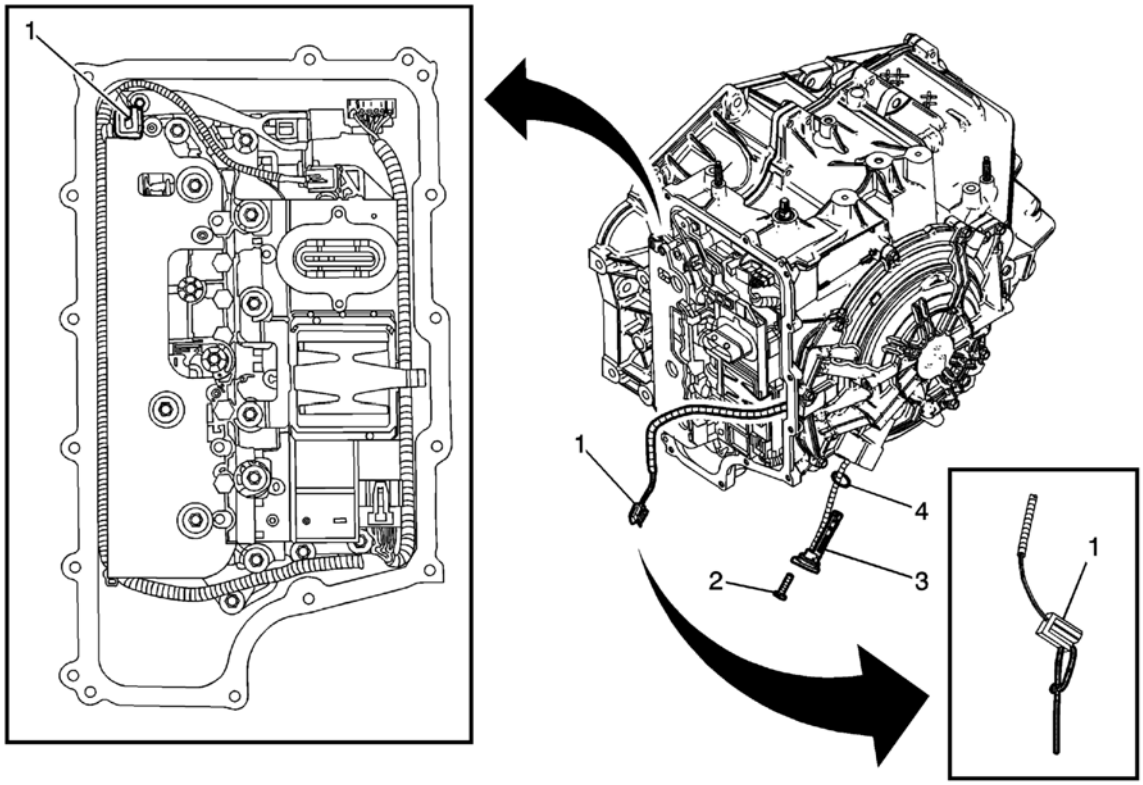

Fig. 53: View Of Input Speed Sensor
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedures 1. Raise and support the vehicle. Refer to **Lifting and Jacking the Vehicle** 2. Drain the transmission, refill when repair is completed. Refer to **Transmission Fluid Drain and Fill** 3. Remove the control valve body cover. Refer to **Control Valve Body Cover Replacement**. 4. Perform the service programming system procedure. Refer to **Service Programming System (SPS)** .	
1	Input Speed Sensor (ISS) Wire Harness **Procedure** Attach the **DT-47734** Speed Sensor Harness Tether to the ISS electrical connector locking tab before removal of old ISS to assist in installation of the new ISS. **Special Tools** **DT-47734** Speed Sensor Harness Tether.
2	Input Speed Sensor Bolt M6 x 25 **CAUTION:** **Refer to Fastener Caution .**

Callout	Component Name
	Procedure Apply threadlocker to the input speed sensor bolt. Refer to **Adhesives, Fluids, Lubricants, and Sealers** for the recommended threadlock material. **Tighten** 9 N.m (80 lb in)
3	Input Speed Sensor **TIP:** After an internal transmission repair or internal part replacement the service programming system procedure should be performed.
4	Input Speed Sensor Seal

TRANSMISSION MOUNT REPLACEMENT - LEFT SIDE

Removal Procedure

1. Install the engine support fixture. Refer to **Engine Support Fixture** .
2. Lower the frame enough to gain clearance for mount removal. Refer to **Frame Replacement** .
3. Install a transmission jack and support the transaxle.

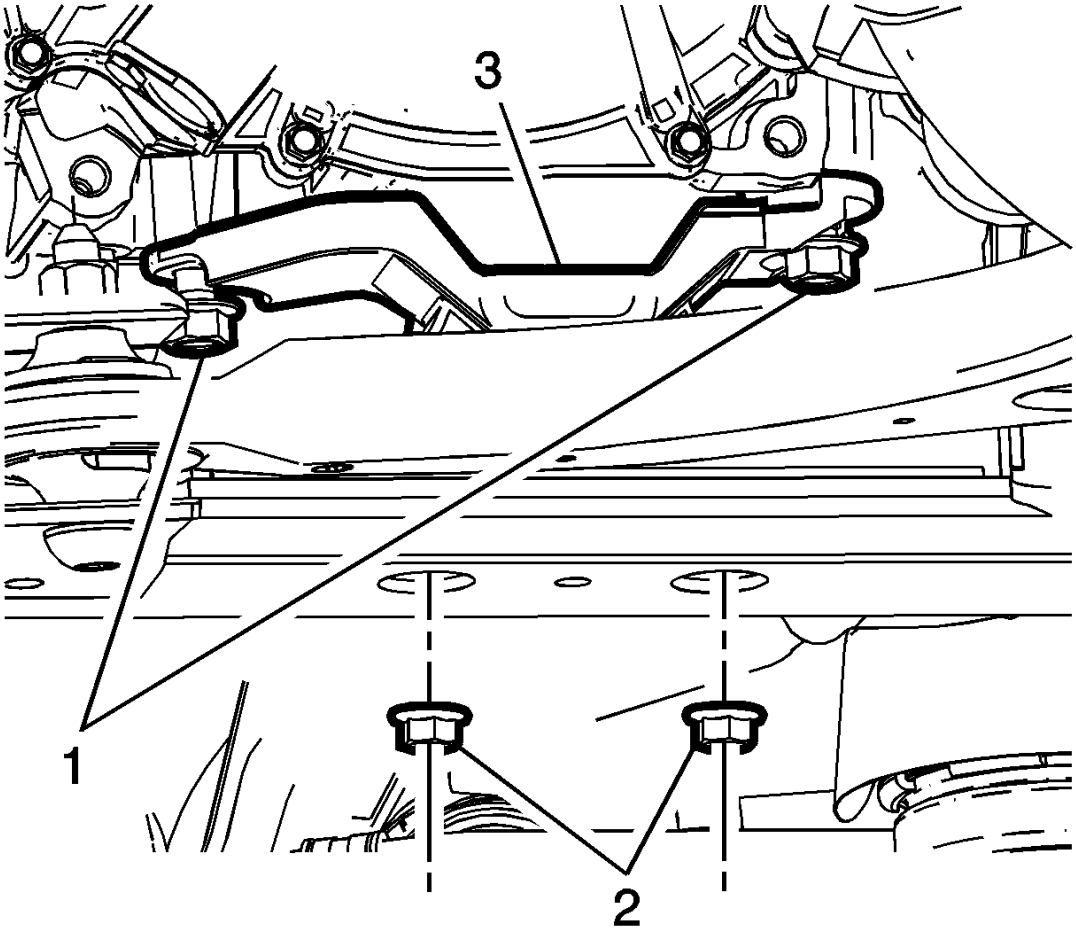

Fig. 54: Left Transmission Mount Bolts
Courtesy of GENERAL MOTORS COMPANY

4. Remove the left transmission mount bolts (1) from the transmission.
5. Remove the left transmission mount from the vehicle.

Installation Procedure

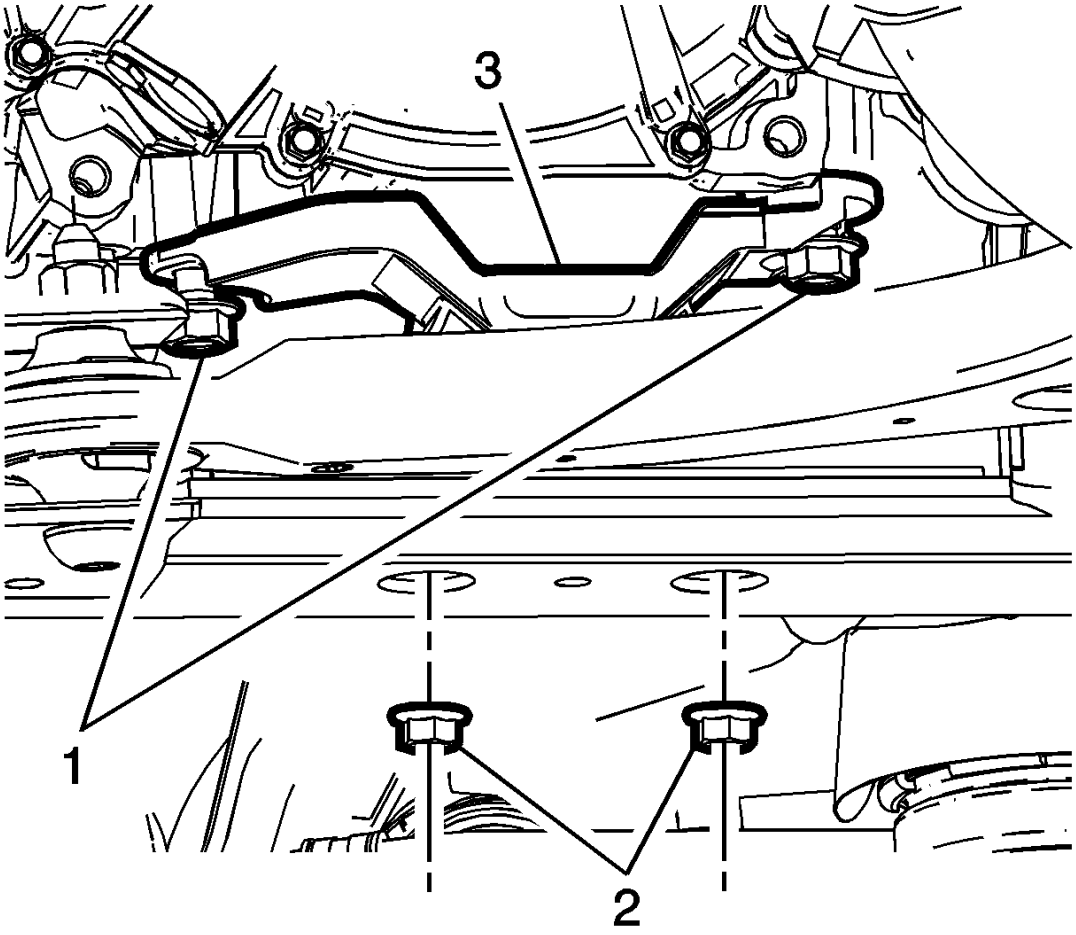

Fig. 55: Left Transmission Mount Bolts
Courtesy of GENERAL MOTORS COMPANY

1. Position the left transmission mount in the vehicle.

CAUTION: Refer to Fastener Caution .

2. Install the left transmission mount to transmission bolts (1) and tighten to 90 N.m (66 lb ft).
3. Install the frame. Refer to **Frame Replacement** .
4. Adjust the position of the transmission mount with an appropriate tool.
5. Install the left transmission mount to frame nuts (1) and tighten to 52 N.m (38 lb ft).
6. Remove the transmission jack.

7. Remove the engine support fixture.

TRANSMISSION REPLACEMENT

Removal Procedure

1. Drain the transmission fluid. Refer to **Transmission Fluid Drain and Fill**.

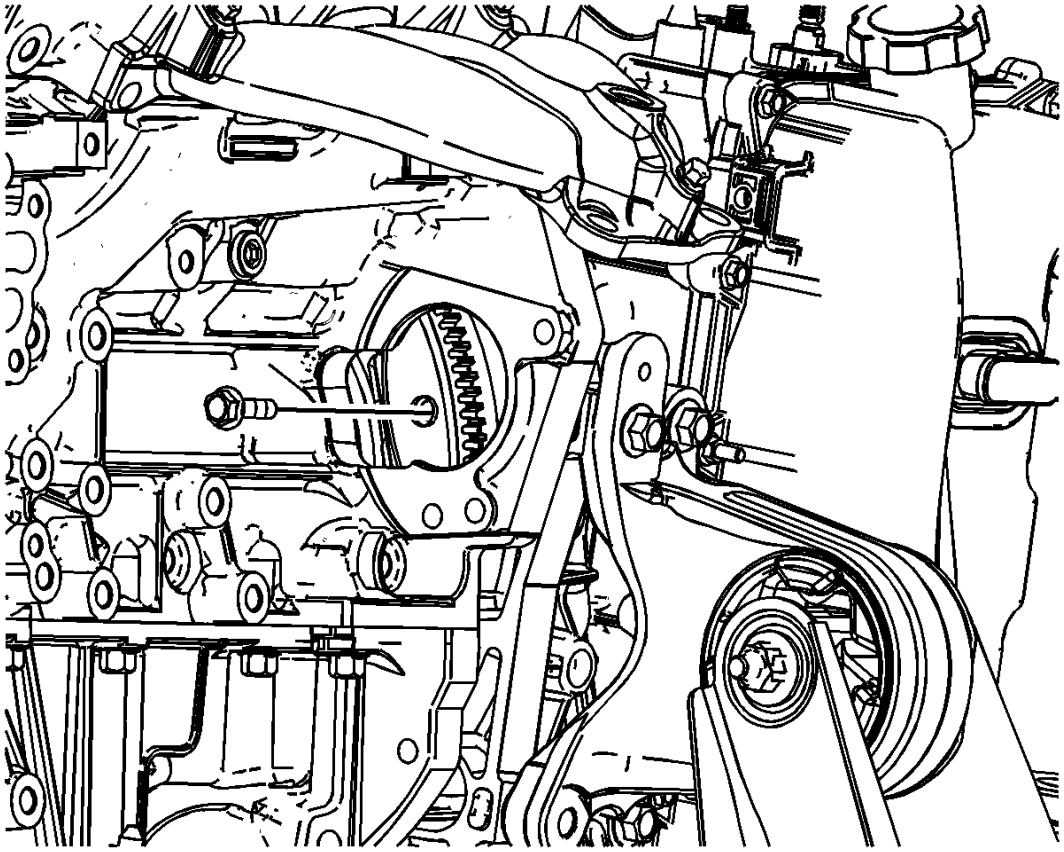

Fig. 56: Identifying Starter
Courtesy of GENERAL MOTORS COMPANY

2. Remove the starter. Refer to **Starter Replacement** .
3. Mark the relationship of the flywheel to the torque converter for reassembly.
4. Remove the four torque converter to flywheel bolts.
5. Remove the left transmission mount to frame nuts.

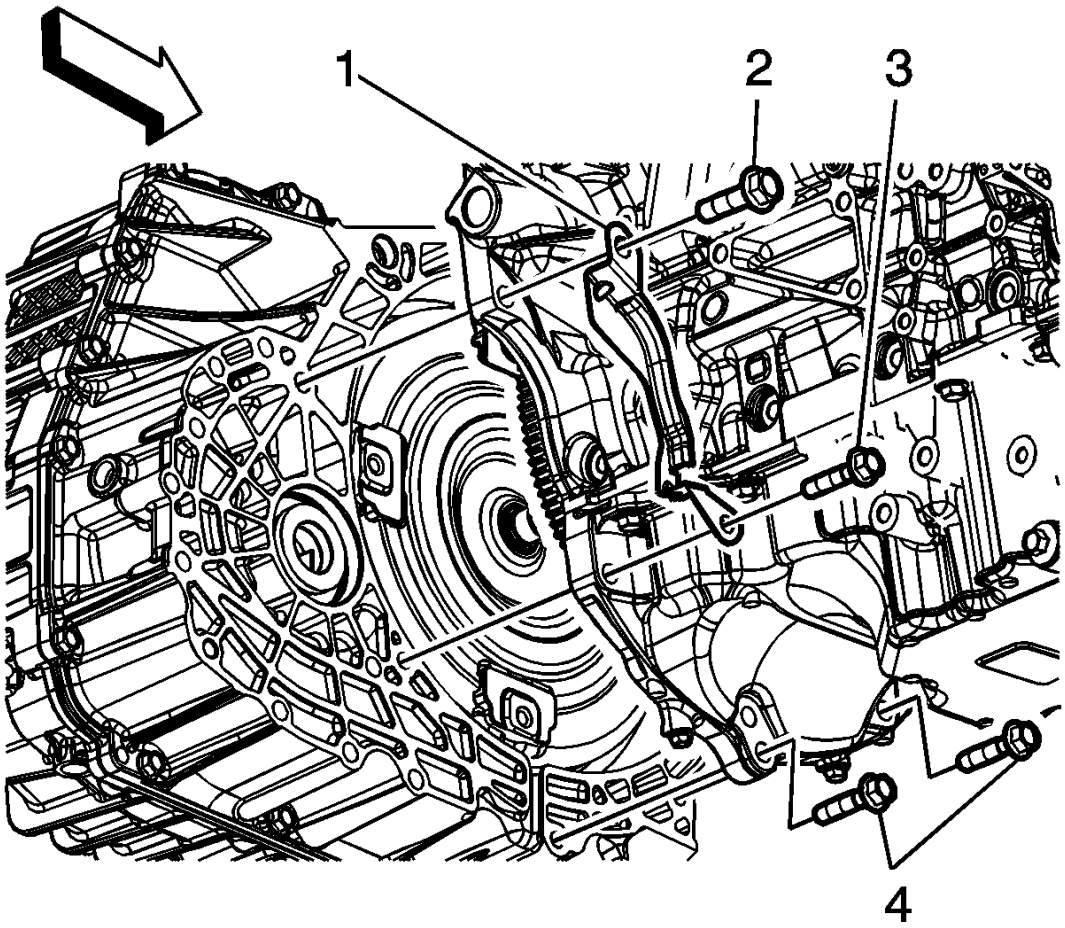

Fig. 57: Identifying Transmission Bolts
Courtesy of GENERAL MOTORS COMPANY

6. Remove the lower transmission fasteners (4).
7. Remove the engine, transmission and frame from the vehicle. Refer to **Engine Replacement** .

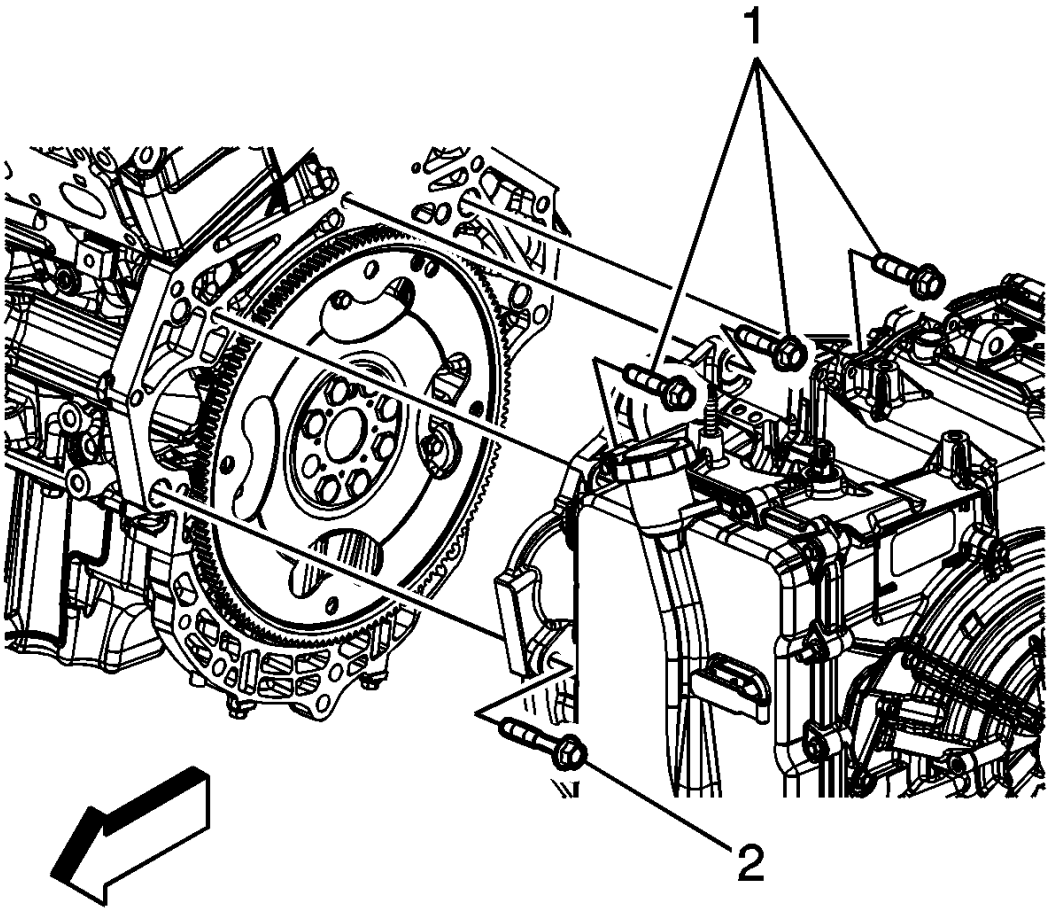

Fig. 58: Identifying Upper Transmission To Engine Bolts
Courtesy of GENERAL MOTORS COMPANY

8. Remove the upper transmission to engine fasteners (1) and (2).

NOTE: **Ensure the torque converter remains securely in place on the transmission input shaft while separating and removing the transmission.**

9. Using a suitable lifting device, separate the transmission from the engine.
10. Flush and flow test the transmission oil cooler and lines. Refer to **Transmission Fluid Cooler Flushing and Flow Test** .

Installation Procedure

1. Position the transmission the engine assembly.

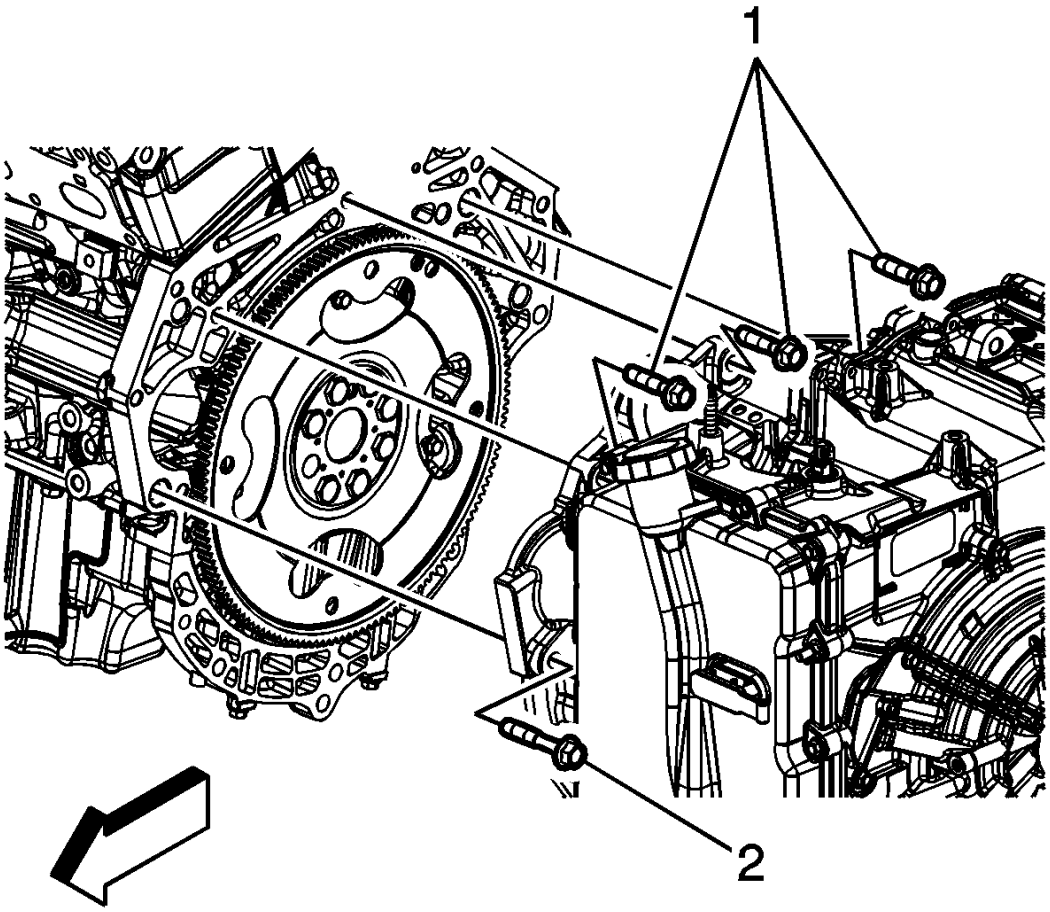

Fig. 59: Identifying Upper Transmission To Engine Bolts
Courtesy of GENERAL MOTORS COMPANY

CAUTION: Refer to Fastener Caution .

2. Install the upper transmission to engine bolt (1, 2) and tighten to 75 (55 lb ft).

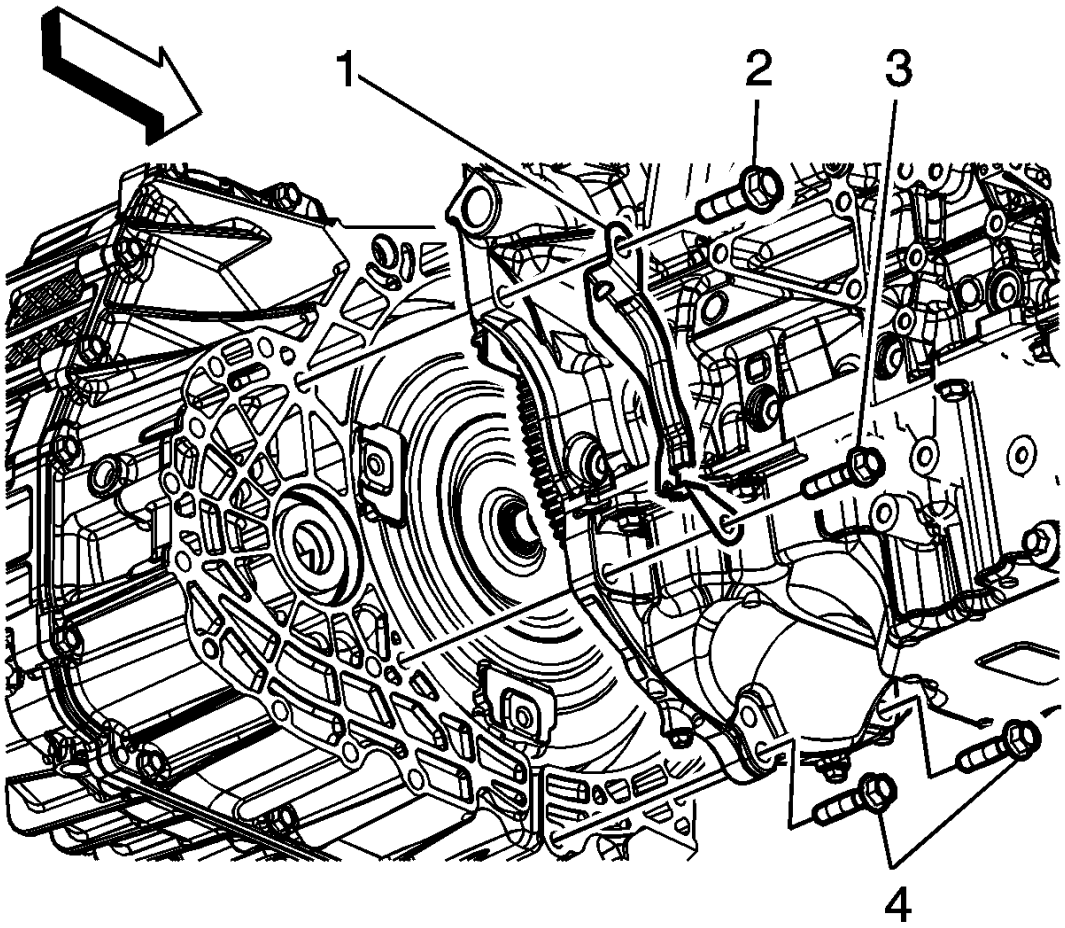

Fig. 60: Identifying Transmission Bolts
Courtesy of GENERAL MOTORS COMPANY

3. Install the lower transmission fasteners (4) and tighten to 75 (55 lb ft).

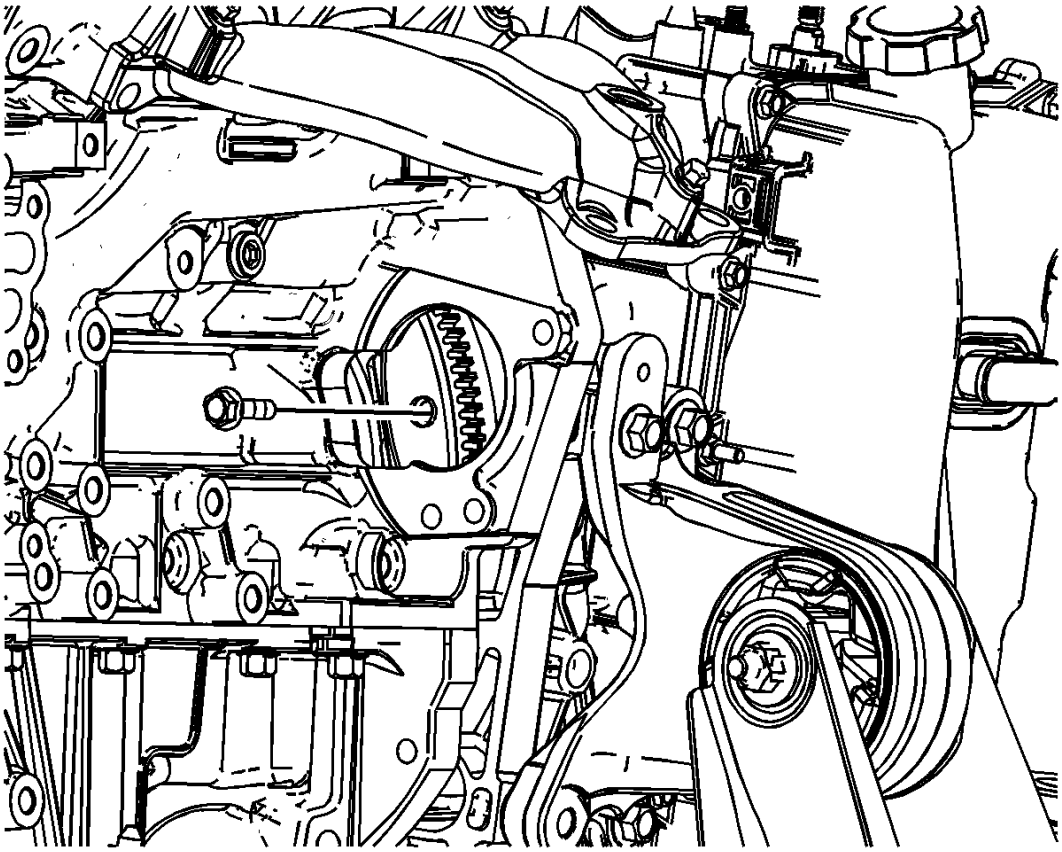

Fig. 61: Identifying Starter
Courtesy of GENERAL MOTORS COMPANY

NOTE: **If reusing the torque converter bolts, clean the threads and apply threadlocker to the threads prior to installation. Refer to Adhesives, Fluids, Lubricants, and Sealers for the recommended threadlock material.**

4. Install the torque converter to flywheel bolts and tighten to 62 (46 lb ft).
5. Install the starter. Refer to **Starter Replacement** .
6. Install the engine, transmission and frame. Refer to **Engine Replacement** .
7. Install the left transmission mount to frame nuts (1) and tighten to 66 (38 lb ft).
8. Adjust the automatic transmission range selector lever cable. Refer to **Range Selector Lever Cable Adjustment**.
9. Fill the transmission with fluid. Refer to **Transmission Fluid Drain and Fill**.
10. If a NEW TCM has been installed into the vehicle, the NEW module needs to be reprogrammed. Refer to **Service Programming System (SPS)** .

NOTE: **The Reset Transmission Adapts procedure must be performed when one**

of the following repairs have been made to the vehicle. Failure to perform the procedure after one of the following repairs may result in poor transmission performance, as well as transmission DTCs being set:

- **Transmission internal service/overhaul**
- **Valve body repair or replacement**
- **Control solenoid valve assembly replacement**
- **TCM software/calibration update**
- **Any service in response to a shift quality concern**

11. Perform the Reset Transmission Adapts. Refer to **Reset Transmission Adapts** .
12. Road test the vehicle.

Name	6T70/6T75/6T80
RPO Codes	6T70-MH2, M7W (2WD), MH4, M7U (4WD) 6T75-MY9, M7V (2WD), MH6, M7X (4WD), 6T80-MHM (2WD)
Production Location	Warren Michigan (USA), Ramos, Mexico
Transaxle Drive	Front Wheel Drive, All Wheel Drive

Name	6T70/6T75/6T80
Reverse Gear Ratio	2.88
1st Gear Ratio	4.484
2nd Gear Ratio	2.872
3rd Gear Ratio	1.842
4th Gear Ratio	1.414
5th Gear Ratio	1.000
6th Gear Ratio	0.742
Effective Final Drive Gear Ratio	2.77/3.16/3.39
Torque Converter Size- Diameter of Torque Converter Turbine	246 mm
Pressure Taps	Line Pressure
Transaxle Fluid Type	DEXRON VIÂ®
Transaxle Fluid Capacity	9.0 L/9.5 qts Quarts
Transaxle Type: 6	Six Forward Gears
Transaxle Type: T	Transverse Mount
Transaxle Type: 70/75/80	Product Series
Position Quadrant	P, R, N, D, * *(Refer to the applicable owner's manual)
Case Material	Die Cast Aluminum
Transaxle Net Weight	104 kg
Maximum Trailer Towing Capacity	N/A
Maximum Gross Vehicle Weight (GVW)	4,000 lbs

ADHESIVES, FLUIDS, LUBRICANTS, AND SEALERS

Application	Type of Material	GM Part Number	
		United States	Canada
Automatic Transmission Fluid	DEXRONÂ®VI	88861037	19264717
Input Speed Sensor	Threadlock	12345382	10953489
Torque Converter Bolts	Threadlock	12345382	10953489

NOTE: **Shift speed points are affected by many different vehicle and transmission operating conditions. The table above represents shift speed points calibrated at specific throttle angles during normal operating conditions and a temperature range between 0-130Â°C (32-266Â°F). These shift speed points are also based on an effective final drive ratio of 2.77, and assume a production-intent tire size. The table below illustrates a number of different variables that influence these shift speed points. Based on a given operating condition, these**

variables may override the normal shift speed points. To assist in monitoring the different variables, the respective scan tool data parameter is also listed.

Shift Speed Variables

Scan Tool Parameter	Shift Speed Variables
Calc. Throttle Position	Calc. Throttle Position (TP) is one of the most important inputs in the transmission shift pattern logic. A very low TP angle will impact the shift pattern by causing upshifts. A very high TP angle will impact the shift pattern by causing downshifts.
Commanded Gear	Based on numerous inputs, the transmission control module (TCM) selects the optimum gear. Once the TCM commands a gear, the pressure control solenoids are activated to hydraulically control engagement of the proper clutch.
Cruise	When cruise control is activated, the shift pattern is altered to reduce excessive shifting.
ECT	Shift speed points may be offset to enhance engine coolant temperature (ECT) warm-up. Also, operating the vehicle at higher engine speeds will reduce the time to warm the ECT and the TFT.
Engine Speed	To protect against an over speed condition, engine speed is monitored. If the engine speed becomes too high, an upshift will occur.
Engine Torque	Engine torque is used to predict vehicle operating conditions, in order to determine the optimum gear and provide for a smoother ride.
IMS	The internal mode switch (IMS) indicates the position of the transmission manual valve. The operator controls this valve by moving the gear range selector. Therefore, the possible gears may be limited by this valve position.
TCC PC Sol. Duty Cycle	The torque converter clutch (TCC) pressure control (PC) solenoid duty cycle indicates when the TCC has been engaged.
TCC Slip Speed	The TCC Slip Speed indicates the difference between engine speed and transmission input speed. The TCC is locked when slip speed is at or near zero, and may be controlling slip when at lower slip speeds.
TFP Switch 1, 3, 4 or 5	The transmission fluid pressure (TFP) switch is used to indicate if fluid pressure to a specific clutch has been applied or released.
Trans. Fluid Temp.	A lower TFT will extend shift speeds, a higher TFT, or hot mode condition, will invoke shorter shift speeds in order to establish a shift pattern required to cool the TFT.
Transmission Hot Mode	If the TFT becomes too hot, a hot mode shift pattern is used. The hot mode shift pattern will invoke lower shift speed points to establish a shift pattern necessary to cool the TFT.
Transmission OSS	The transmission output speed sensor (OSS) is one of the most important inputs into the transmission shift pattern logic. A very low transmission output speed will impact the shift pattern by causing downshifts. A very high transmission output speed will impact the shift pattern by causing upshifts.

TRANSMISSION FLUID PRESSURE SWITCH LOGIC

Gear	TFP Switch States			
	TFP SW1	*TFP SW3	TFP SW4	TFP SW5

DIAGNOSTIC INFORMATION AND PROCEDURES

DTC B2705: GEARSHIFT UNLOCK CIRCUIT

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

DTC B2705 02

Gearshift Unlock Circuit Short to Ground

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Shift Lock Control Solenoid Control Circuit	B2705 02	1	-	-
Shift Lock Control Solenoid Ground Circuit	-	1	-	-
1. Unable to move gearshift lever with brake pedal depressed				

Circuit/System Description

The body control module (BCM) controls the automatic transmission shift lock control solenoid by providing a battery positive voltage to the solenoid. The BCM utilizes a smart driver to control the voltage supply circuit to the automatic transmission shift lock control solenoid. The smart driver monitors the voltage and current flow of the control circuit.

Conditions for Running the DTC

- The ignition switch is in the ON position.
- The brake pedal is pressed.
- The transmission is in the PARK position.

Conditions for Setting the DTC

Sets if there is a short to ground in the automatic transmission shift lock control solenoid control circuit.

Action Taken When the DTC Sets

The BCM will not attempt to enable the voltage supply circuit of the automatic transmission shift lock control solenoid until the next key cycle.

Conditions for Clearing the DTC

- A current DTC will clear when the malfunction is no longer present and the ignition switch is cycled.
- All BCM history codes will clear after 100 ignition cycles with no current codes active during the 100 ignition cycles.

- **Wiring Repairs**

Scan Tool Reference

Control Module References for scan tool information

Circuit/System Verification

1. Ignition ON, clear the DTC. Observe the scan tool BCM Brake Applied Output Signal parameter. The parameter should change from ON to OFF when the brake pedal is depressed.
    - If the parameter does not change, refer to **Stop Lamps Malfunction** .
2. Ignition ON, observe the scan tool BCM Shifter Unlock Command parameter. The parameter should change from ON to OFF when the brake pedal is depressed.
    - If the parameter does not change, replace the BCM.

Circuit/System Testing

1. Ignition OFF, disconnect the harness connector at the shift lock control solenoid.
2. Ignition OFF, test for less than 30 Ω between the appropriate connector terminal listed below and ground:
    - Floor shift - terminal A
    - Column shift - terminal B
    - If greater than the specified range, test the ground circuit for an open/high resistance.
3. Install a test lamp between connector terminal A and terminal B.
4. Ignition ON, command the scan tool BCM Shift Lock Solenoid output control ON and OFF. The test lamp should turn ON and OFF as commanded.
    - If the test lamp is always ON, test the control circuit for short to voltage. If the circuit tests normal, replace the BCM.
    - If the test lamp is always OFF, test the control circuit for short to ground or an open/high resistance. If the circuit tests normal, replace the BCM.
5. If the circuit tests normal, test or replace the shift lock control solenoid.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the diagnostic procedure.

- **Transmission Control Replacement**
- **Control Module References** for BCM replacement, setup, and programming

SYMPTOMS - AUTOMATIC TRANSMISSION SHIFT LOCK CONTROL

NOTE: **The following steps must be completed before using the symptom tables.**

1. Perform the **Diagnostic System Check - Vehicle** before using the Symptom Tables in order to verify that all of the following are true:
   - There are no DTCs set.
   - The control modules can communicate via the serial data link.
2. Review the system operation in order to familiarize yourself with the system functions. Refer to **Automatic Transmission Shift Lock Control Description and Operation (Floor Shift)Automatic Transmission Shift Lock Control Description and Operation (Column Shift)**.

Visual/Physical Inspection

- Inspect for aftermarket devices which could affect the operation of the automatic transmission shift lock control. Refer to **Checking Aftermarket Accessories** .
- Inspect the easily accessible or visible system components for obvious damage or conditions which could cause the symptom.

Intermittent

Faulty electrical connections or wiring may be the cause of intermittent conditions. Refer to **Testing for Intermittent Conditions and Poor Connections**

Symptom List

Refer to a symptom diagnostic procedure in order to diagnose the symptom:

Transmission Control Lever Malfunction

TRANSMISSION CONTROL LEVER MALFUNCTION

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

Diagnostic Fault Information

Circuit/System Verification

1. Ignition ON, with the brake pedal applied, observe the scan tool Brake Applied Output Signal parameter. The reading should be ON with the brake pedal depressed.
    - If not the specified parameter, refer to **Stop Lamps Malfunction** .
2. Ignition ON, observe the scan tool BCM shift lock solenoid command parameter. The parameter should change from ON to OFF when the brake pedal is applied and released.
    - If not the specified parameter, replace the BCM.
3. Press the brake pedal, the vehicle operator should be able to move the shifter lever out of the park position.

Circuit/System Testing

1. Ignition OFF, disconnect the harness connector at the shift lock control solenoid.
2. Ignition OFF, test for less than 30 Ω between the appropriate connector terminal listed below and ground:
    - Floor shift - terminal A
    - Column shift - terminal B
    - If greater than the specified range, test the ground circuit for an open/high resistance.

3. Install a test lamp between connector terminal A and terminal B.
4. Ignition ON, command the scan tool BCM Shift Lock Solenoid output control ON and OFF. The test lamp should turn ON and OFF as commanded.
    - If the test lamp is always ON, test the control circuit for short to voltage. If the circuit tests normal, replace the BCM.
    - If the test lamp is always OFF, test the control circuit for short to ground or an open/high resistance. If the circuit tests normal, replace the BCM.
5. If the circuit tests normal, test or replace the shift lock control solenoid.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the diagnostic procedure.

- **Transmission Control Replacement**
- **Control Module References** for BCM replacement, setup and programming

DESCRIPTION AND OPERATION

AUTOMATIC TRANSMISSION SHIFT LOCK CONTROL DESCRIPTION AND OPERATION (FLOOR SHIFT)

The automatic transmission shift lock control system is a safety device that prevents an inadvertent shift out of PARK when the engine is running. The driver must press the brake pedal before moving the shift lever out of the PARK position. The system consists of the following components:

- The automatic transmission shift lock solenoid (serviced as the automatic transmission shift lock actuator), as well as the body control module (BCM) and the engine control module (ECM). The shift lock solenoid is located within the floor shift control assembly with vehicles equipped with floor shift.
- The body control module (BCM) controls the voltage supply circuit of the shift lock control solenoid. The following conditions must be before the BCM will supply voltage to the shift lock control solenoid.

The BCM controls the voltage to the shift lock control solenoid through the shift lock control solenoid controlled voltage circuit. The following conditions must be met before the BCM will supply voltage to the shift lock solenoid:

- The ignition is in the ON position.
- The engine control module (ECM) sends an input via GMLAN serial data to the BCM indicating the transmission is in the PARK position.
- The BCM determines the brake pedal is applied according the brake pedal position.

Since the shift lock control solenoid is permanently grounded, the BCM supplies voltage to the automatic transmission shift lock control solenoid, mechanically unlocking the shift lever allowing the driver to move the shift lever out of the PARK position as the solenoid energizes. When the brake pedal is not applied, the BCM turns the control voltage output of the shift lock control solenoid OFF, de-energizing the shift lock control solenoid. The de-energized solenoid mechanically locks the shift lever in the PARK position.

During remote start operation, the BCM will de-energize the shift lock control circuit, locking the shift lever in the PARK position.

AUTOMATIC TRANSMISSION SHIFT LOCK CONTROL DESCRIPTION AND OPERATION (COLUMN SHIFT)

The automatic transmission shift lock control system is a safety device that prevents an inadvertent shift out of PARK when the engine is running. The driver must press the brake pedal before moving the shift lever out of the PARK position. The system consists of the following components:

- The automatic transmission shift lock solenoid (serviced as the automatic transmission shift lock actuator), as well as the body control module (BCM) and the engine control module (ECM). The shift lock solenoid is located within the steering column assembly with vehicles equipped with column shift.
- The body control module (BCM) controls the voltage supply circuit of the shift lock control solenoid. The following conditions must be met before the BCM will supply voltage to the shift lock control solenoid.
- The ignition is in the ON position.
- The engine control module (ECM) sends an input via GMLAN serial data to the BCM indicating the transmission is in the PARK position.
- The BCM determines the brake pedal is not applied according the brake pedal position.

Since the shift lock control solenoid is permanently grounded, the BCM supplies voltage to the automatic transmission shift lock control solenoid, mechanically locking the shift lever in the PARK position as the solenoid energizes. When the brake pedal is applied, the BCM turns the control voltage output of the shift lock control solenoid OFF, de-energizing the shift lock control solenoid. The de-energized solenoid releases the mechanical lock allowing the driver to move the shift lever out of the PARK position.

During remote start operation, the BCM will energize the shift lock control circuit, locking the shift lever in the PARK position.

	Metric	English
Auxiliary Transaxle Oil Cooler To The Lower Radiator Support Bolt	10 N.m	89 lb in
Auxiliary Transaxle Oil Cooler To The Upper Radiator Support Bolt	25 N.m	18 lb ft
Transaxle Oil Cooler Fitting	38 N.m	28 lb ft

DIAGNOSTIC INFORMATION AND PROCEDURES

TRANSMISSION FLUID COOLER FLUSHING AND FLOW TEST

GM studies indicate that plugged or restricted transmission oil coolers and pipes cause insufficient transmission lubrication and elevated operating temperatures which can lead to premature transmission failure. Many repeat repair cases could have been prevented by following published procedures for transmission oil cooler flushing and flow checking. This procedure includes flow checking and flushing the auxiliary transmission oil cooler, if equipped.

NOTE: **Use the DT-45096 transmission oil cooling system flush and flow test tool or equivalent to flush and flow test the transmission oil cooler and the oil cooler pipes after the transmission is removed for repairs.**

Only use the appropriate GM automatic transmission fluid when doing a repair on a GM transmission.

If the fluid in the **DT-45096** transmission oil cooling system flush and flow test tool is different than what is used in the transmission, use compressed air to blow the residual transmission fluid out of the oil cooler and lines.

Time allowance for performing the cooler flow checking and flushing procedure has been included in the appropriate labor time guide operations since the 1987 model year. The service procedure steps for oil cooler flushing and flow testing are as follows:

Cooler Flow Check and Flushing Steps

1. Machine Set-up
2. Determine Minimum Flow Rate
3. Back Flush
4. Forward Flush
5. Flow Test

6. Code Recording Procedure
7. Clean-up

Special Tools

- **DT-45096** Transmission Oil Cooling System Flush and Flow Test Tool
- **DT-48312** Transmission Cooler Flush Adapter
- Shop air supply with water/oil filters, regulator and pressure gauge - minimum 90 psi
- Eye protection
- Rubber gloves

For equivalent regional tools, refer to **Special Tools** .

Machine Set-up

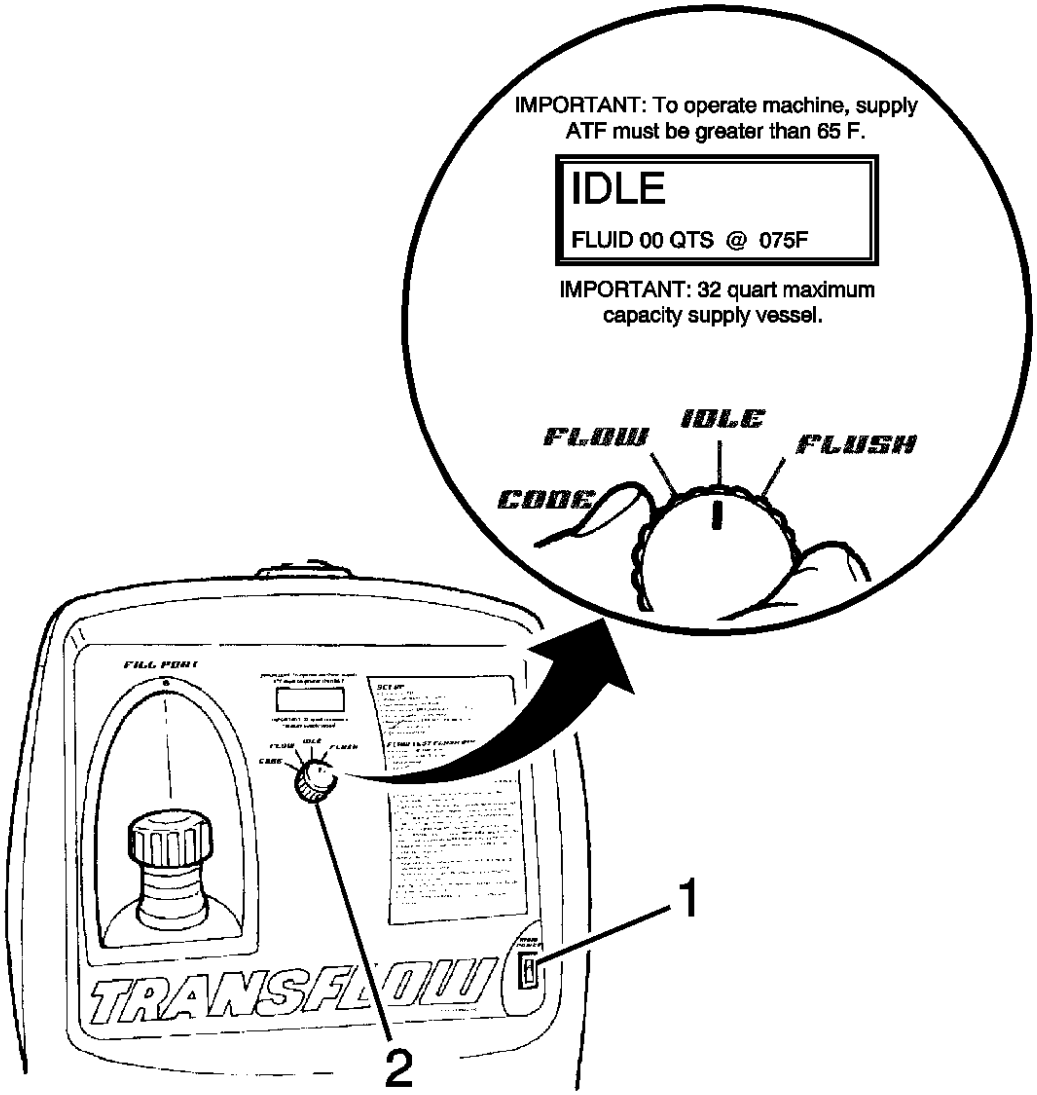

Fig. 1: View Of Main Power Switch & Main Function Switch
Courtesy of GENERAL MOTORS COMPANY

1. Verify that the main power switch (1) is in the OFF position.
2. Place the main function switch (2) in the IDLE position.

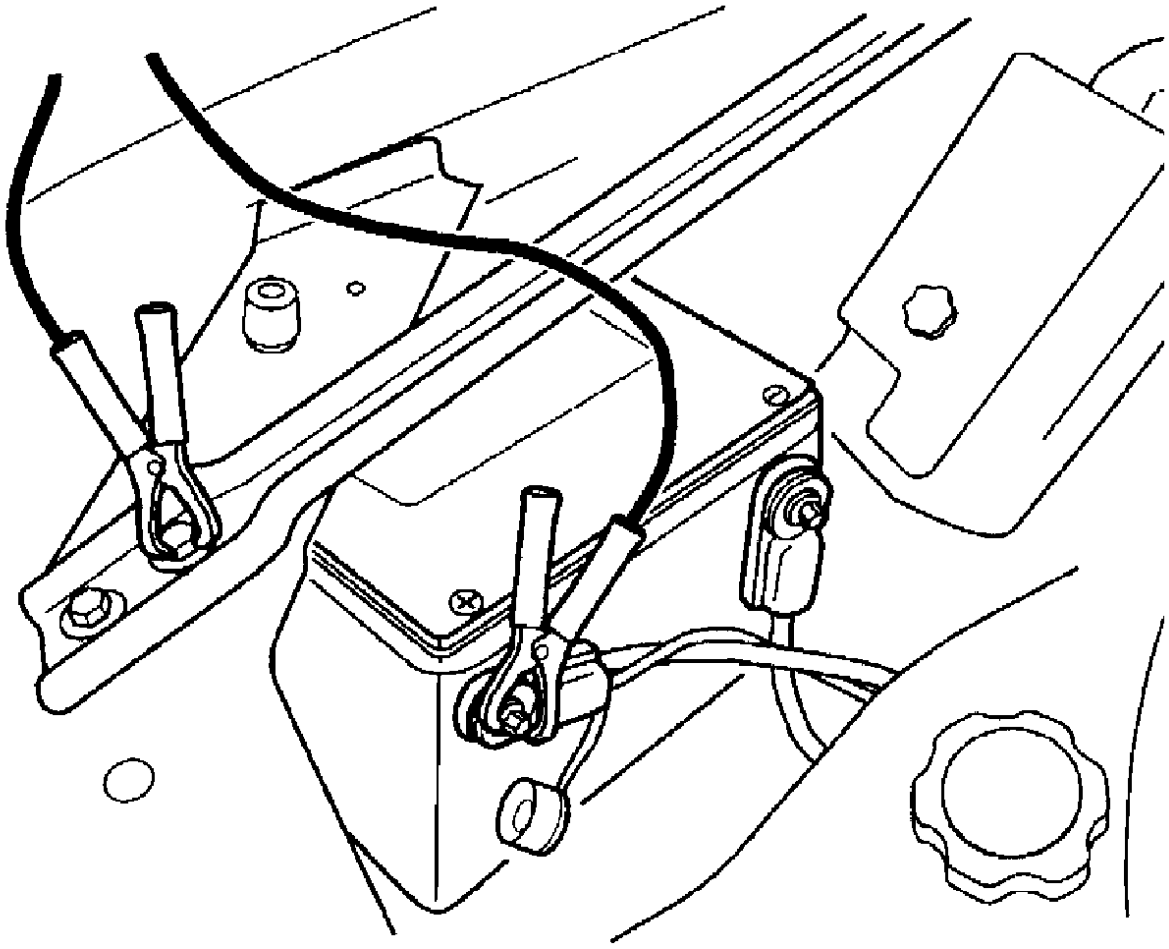

Fig. 2: Connecting To 12V DC Power Source
Courtesy of GENERAL MOTORS COMPANY

3. Connect **DT-45096** flush and flow test tool to the vehicle 12V DC power source by connecting the red battery clip to the positive, +, battery post on the vehicle and connect the negative lead to a known good chassis ground.
4. Turn the main power switch to the ON position.

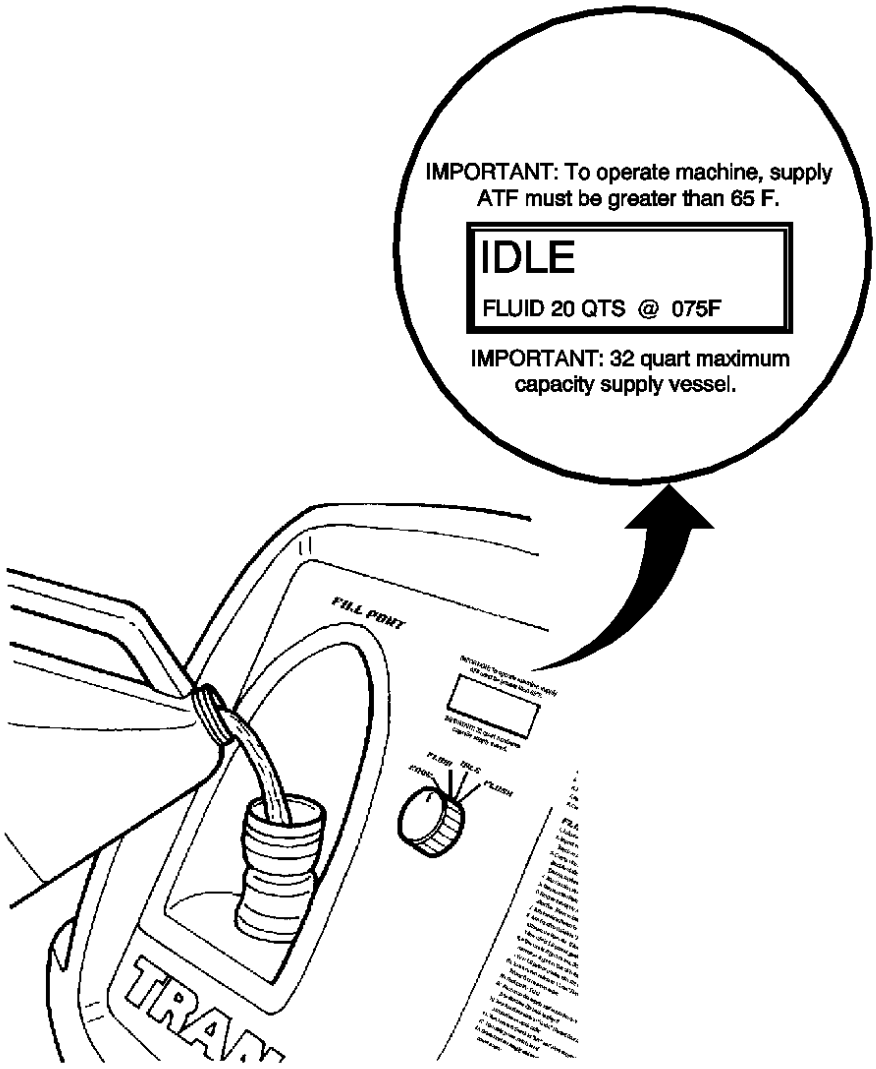

Fig. 3: Filling Supply Tank With Transmission Fluid
Courtesy of GENERAL MOTORS COMPANY

CAUTION: Do not overfill the supply vessel. Damage to the unit may result. To verify the fluid level, view the LCD screen display while filling the unit, to ensure the fluid level does not exceed 30 L (32 qt).

5. Fill the supply tank with the appropriate GM automatic transmission fluid through the fill port.
6. Reinstall and tighten the fill cap.

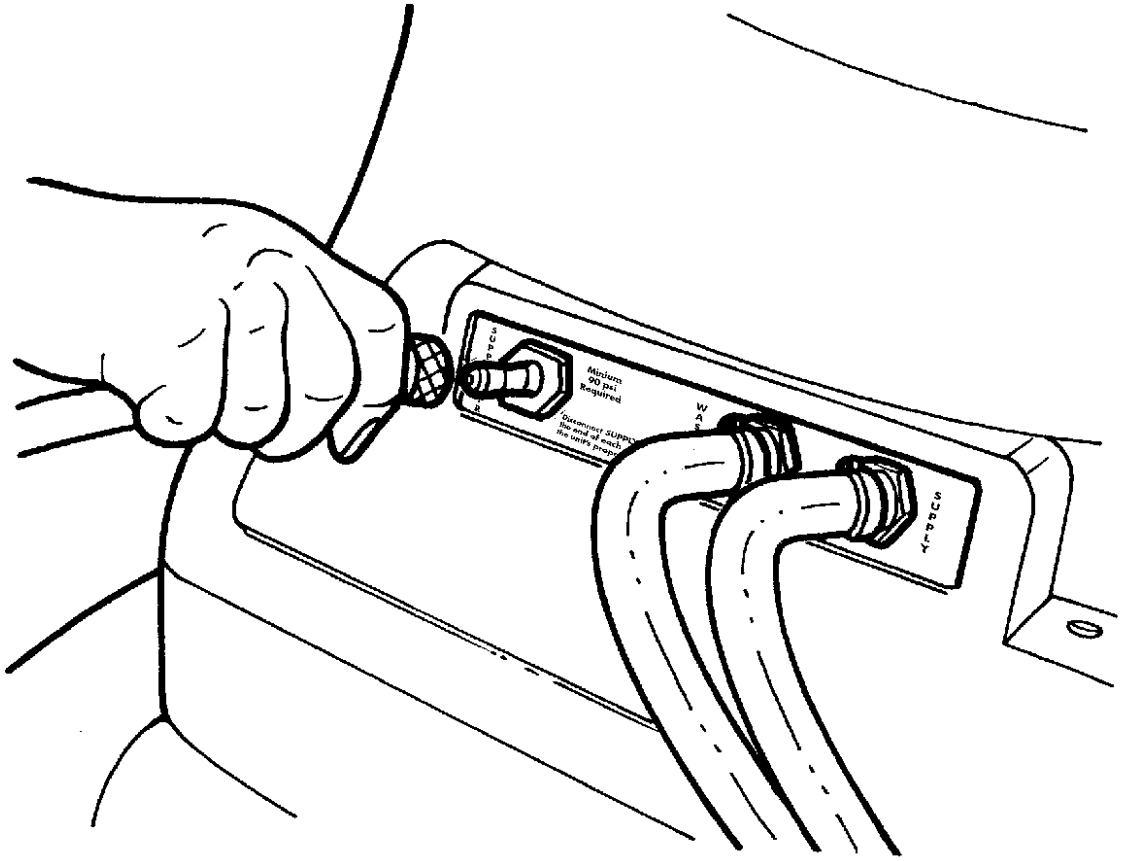

Fig. 4: Applying Shop Air Supply Hose To Quick-Disconnect
Courtesy of GENERAL MOTORS COMPANY

7. Connect a shop air supply hose to the quick-disconnect on the rear panel marked SUPPLY AIR.

Determine Minimum Flow Rate

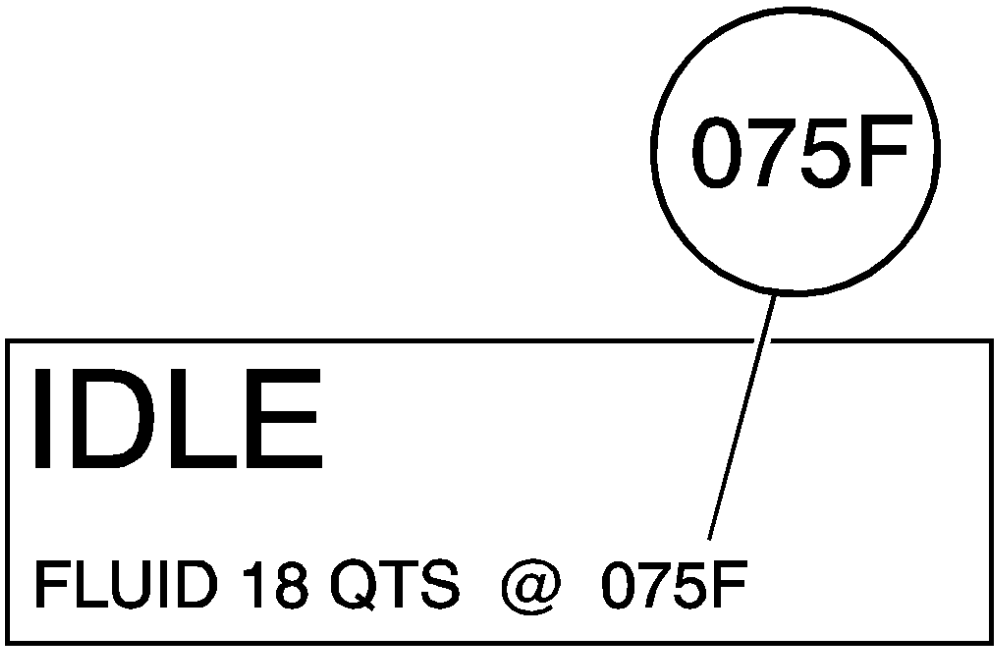

Fig. 5: Identifying Machine Display Of Automatic Transmission Fluid Temperature
Courtesy of GENERAL MOTORS COMPANY

1. From the machine display, identify the temperature of the automatic transmission fluid that is stored in the supply vessel of **DT-45096** flush and flow test tool.

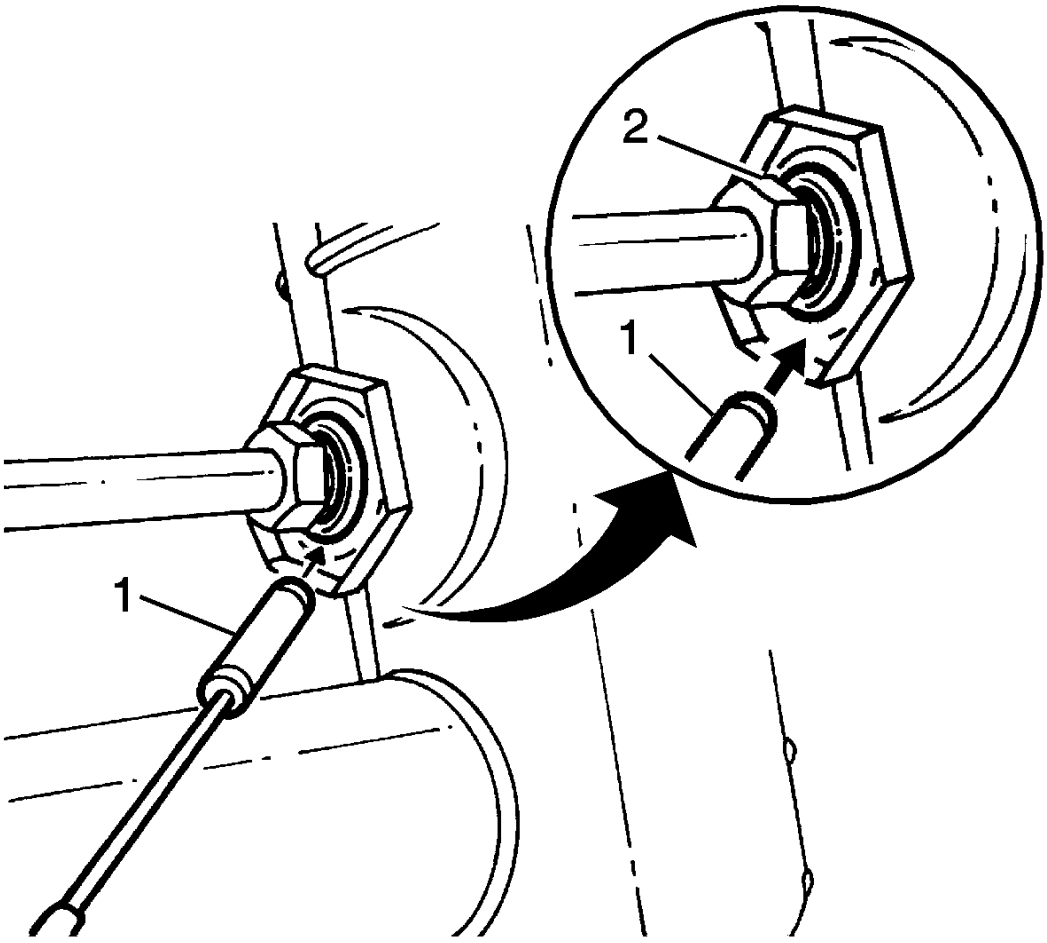

Fig. 6: Identifying Transmission Oil Cooler Metal Composition
Courtesy of GENERAL MOTORS COMPANY

2. Determine whether the transmission oil cooler is steel or aluminum by using a magnet (1) at the cooler flange (2) at the radiator.
3. Refer to the table below. Using the temperature from step 1, locate on either the Steel MINIMUM Flow Rate table or the Aluminum MINIMUM Flow Rate table the minimum flow rate in gallons per minutes (GPM). Record the minimum flow rate in GPMs and the supply fluid temperature for further reference.

   Example

   - Fluid temperature: 75Â°F
   - Cooler type: Steel

   The MINIMUM flow rate for this example would be 0.8 GPM.

4. Inspect transmission oil cooler lines for damage or kinks that could cause restricted oil flow. Repair as needed and refer to the appropriate GM service manual procedures.

Minimum Flow Rate in Gallons Per Minute (gpm)

Temperature Range	Steel	Aluminum
65 - 66Â°F	0.6 gpm	0.5 gpm
67 - 70Â°F	0.7 gpm	0.6 gpm
71 - 75Â°F	0.8 gpm	0.7 gpm
76 - 80Â°F	0.9 gpm	0.8 gpm
81 - 84Â°F	1.0 gpm	0.9 gpm
85 - 89Â°F	1.1 gpm	1.0 gpm
90 - 94Â°F	1.2 gpm	1.1 gpm
95 - 98Â°F	1.3 gpm	1.2 gpm
99 - 103Â°F	1.4 gpm	1.3 gpm
104 - 108Â°F	1.5 gpm	1.4 gpm
109 - 112Â°F	1.6 gpm	1.5 gpm
113 - 117Â°F	1.7 gpm	1.6 gpm
118 - 120Â°F	1.8 gpm	1.7 gpm

Back Flush Procedure

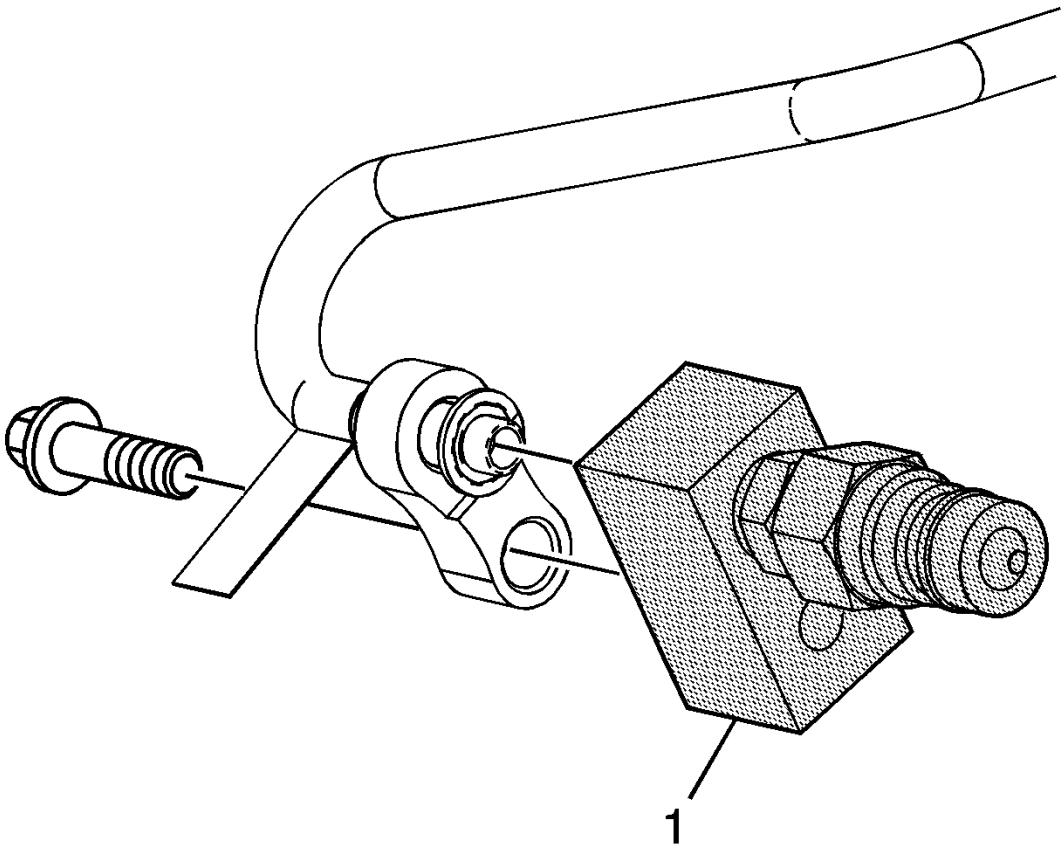

Fig. 7: Cooler Flush Adapter

Courtesy of GENERAL MOTORS COMPANY

1. Connect the **DT-45096-50** cooler flush adapter (1) to the vehicle transmission oil cooler supply and return lines at the transmission.

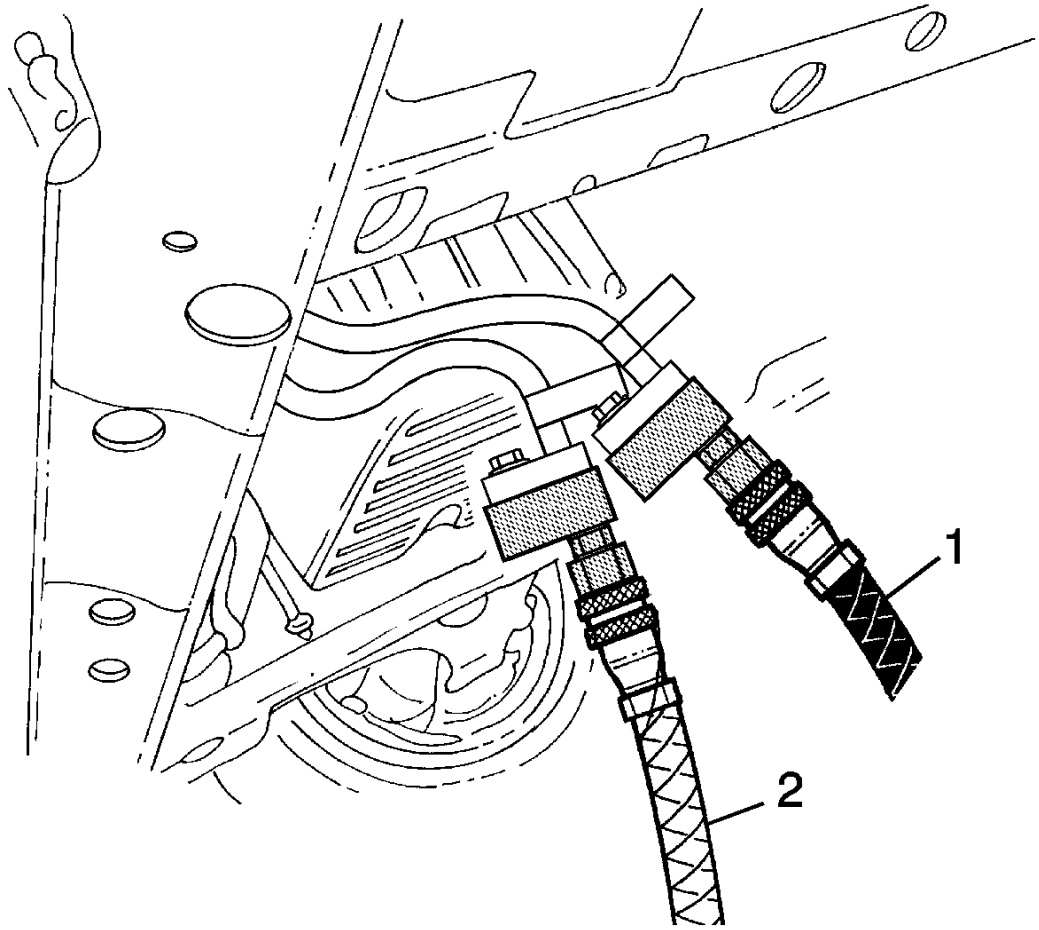

Fig. 8: View Of Black Supply Hose And Clear Waste Hose
Courtesy of GENERAL MOTORS COMPANY

2. Connect the black supply hose (1) to the return line, top connector of the transmission, and the clear waste hose (2) to the feed line, bottom connector of the transmission, to the vehicle cooler lines. This is the reverse flow - backflush direction.

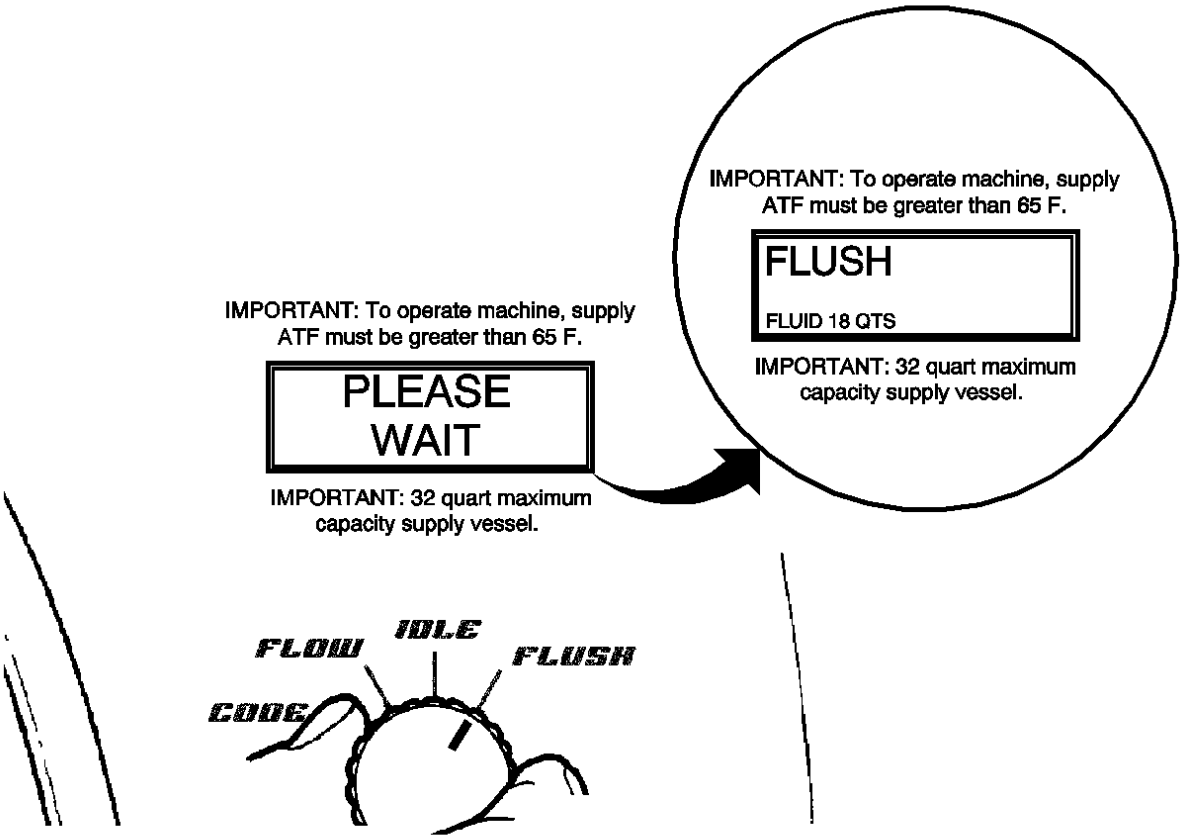

Fig. 9: View Of Main Function Switch FLUSH Position
Courtesy of GENERAL MOTORS COMPANY

3. Turn the main function switch to the FLUSH position. Allow the machine to operate for 30 seconds.

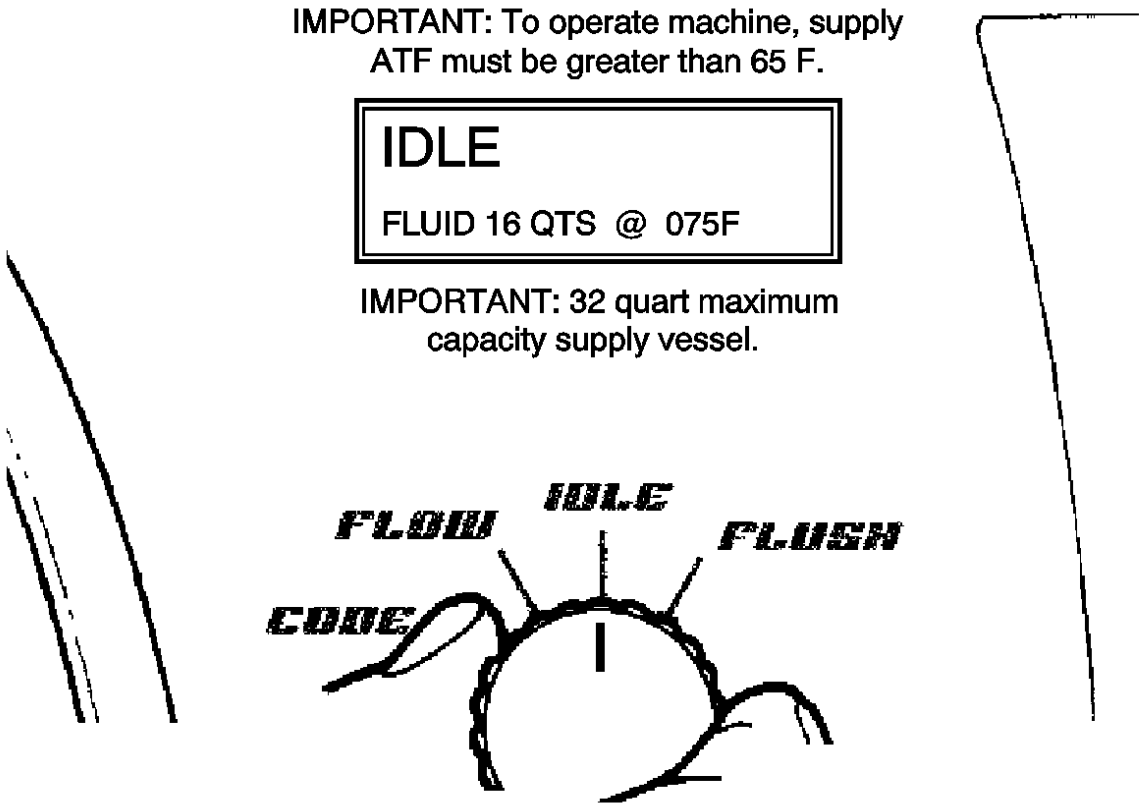

Fig. 10: View Of Main Function Switch IDLE Position
Courtesy of GENERAL MOTORS COMPANY

4. Turn the main function switch to the IDLE position and allow the supply vessel pressure to dissipate.

Forward Flush

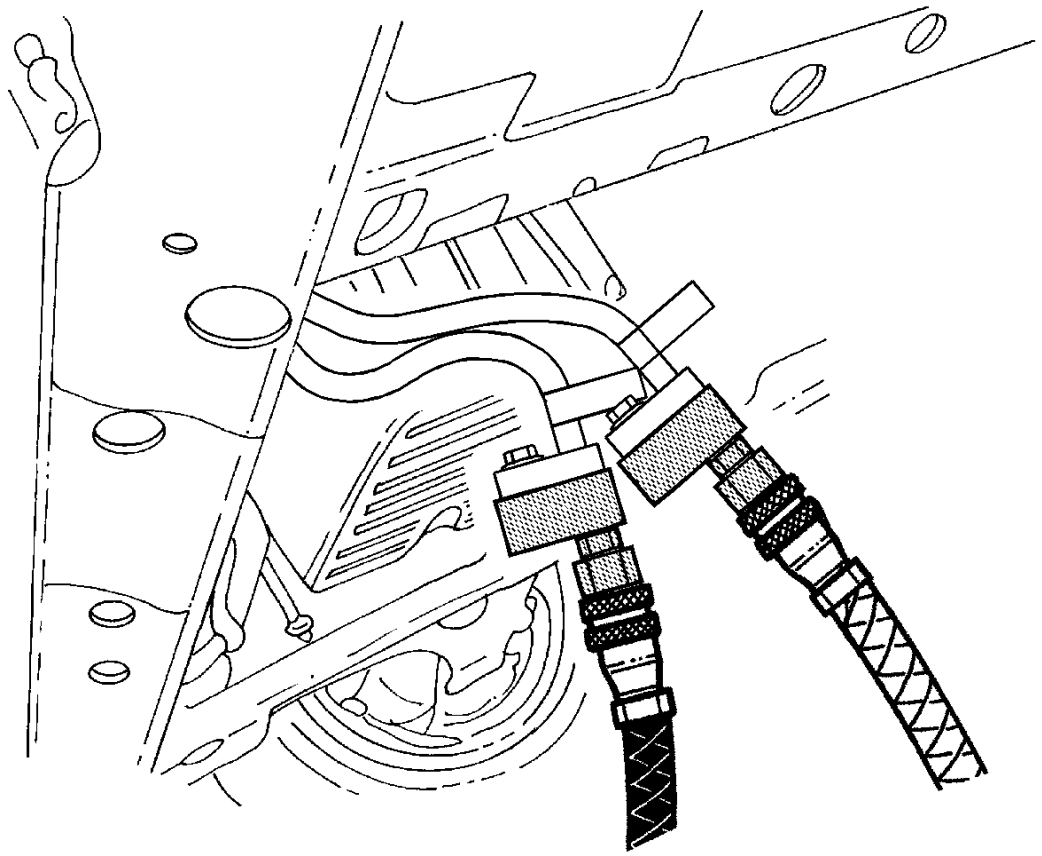

Fig. 11: Identifying Supply And Waste Hoses
Courtesy of GENERAL MOTORS COMPANY

1. Disconnect the supply and waste hoses from the vehicle cooler lines. Reverse the supply and waste hoses to provide a normal flow direction.

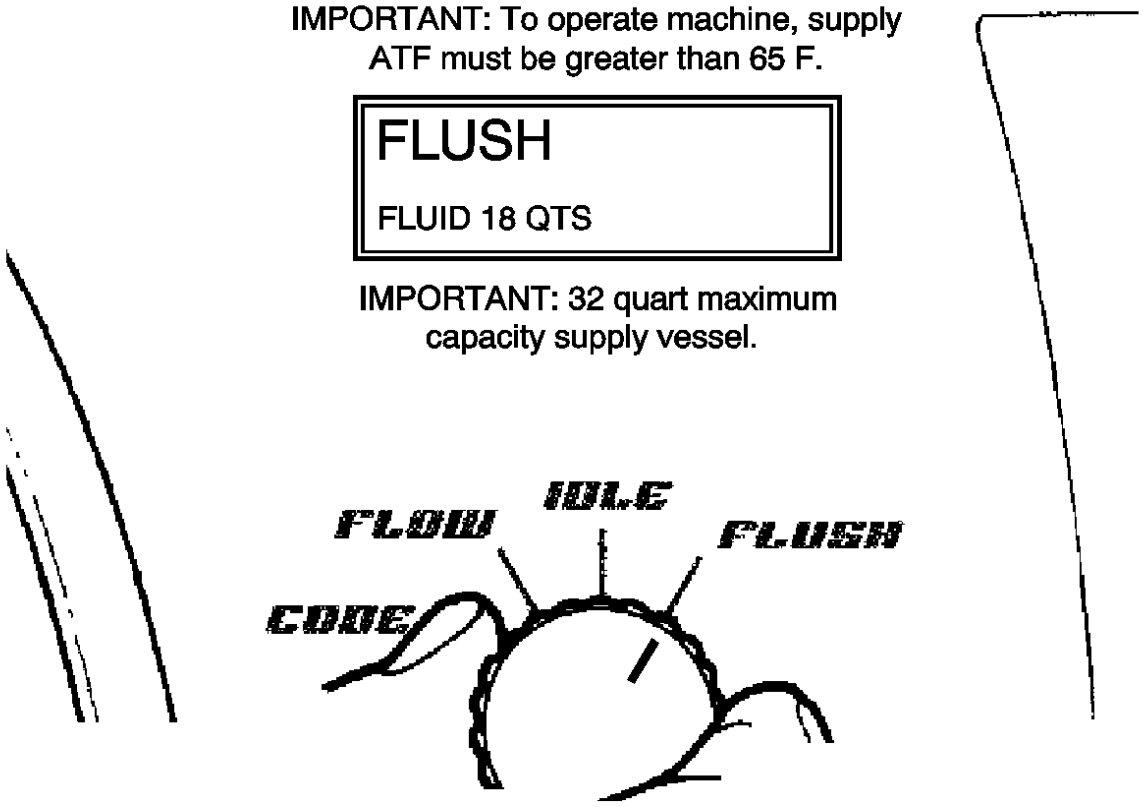

Fig. 12: View Of Main Function Switch FLUSH Position
Courtesy of GENERAL MOTORS COMPANY

2. Turn the main function switch to the FLUSH position and allow machine to operate for 30 seconds.

Flow Test

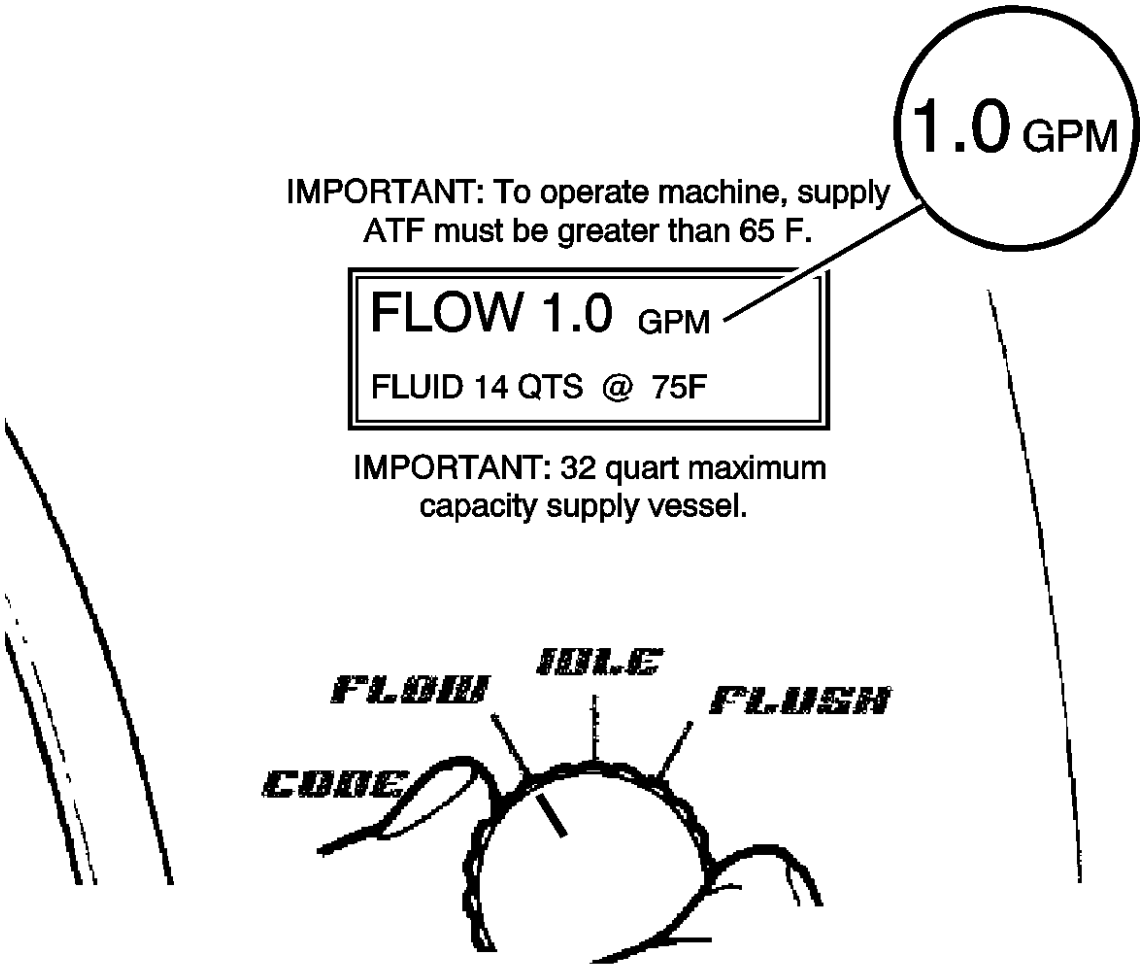

Fig. 13: View Of Main Function Switch FLOW Position
Courtesy of GENERAL MOTORS COMPANY

NOTE: **If the flow rate is less than 0.5 gpm, the LCD displays an error message. Refer to the Troubleshooting section of the operation manual.**

1. Turn the main function switch to the FLOW position and allow the oil to flow for 15 seconds. Observe and note the flow rate; this is the TESTED flow rate.
2. Compare the TESTED flow rate to the MINIMUM flow rate information previously recorded.
    - If the TESTED flow rate is equal to or greater than the MINIMUM flow rate recorded, the oil cooling system is functioning properly. Perform Code Recording Procedure.
    - If the TESTED flow rate is less than the MINIMUM flow rate previously recorded, repeat the back flush and forward flush procedures.
3. If the TESTED flow rate is less than the MINIMUM flow rate after the second test, perform Code Recording Procedure.
    1. Replace the transmission oil cooler.

2. Reconnect supply and waste hoses to the cooler lines in the normal flow direction. Perform Flow Test.
3. Perform Code Recording Procedure.

Code Recording Procedure

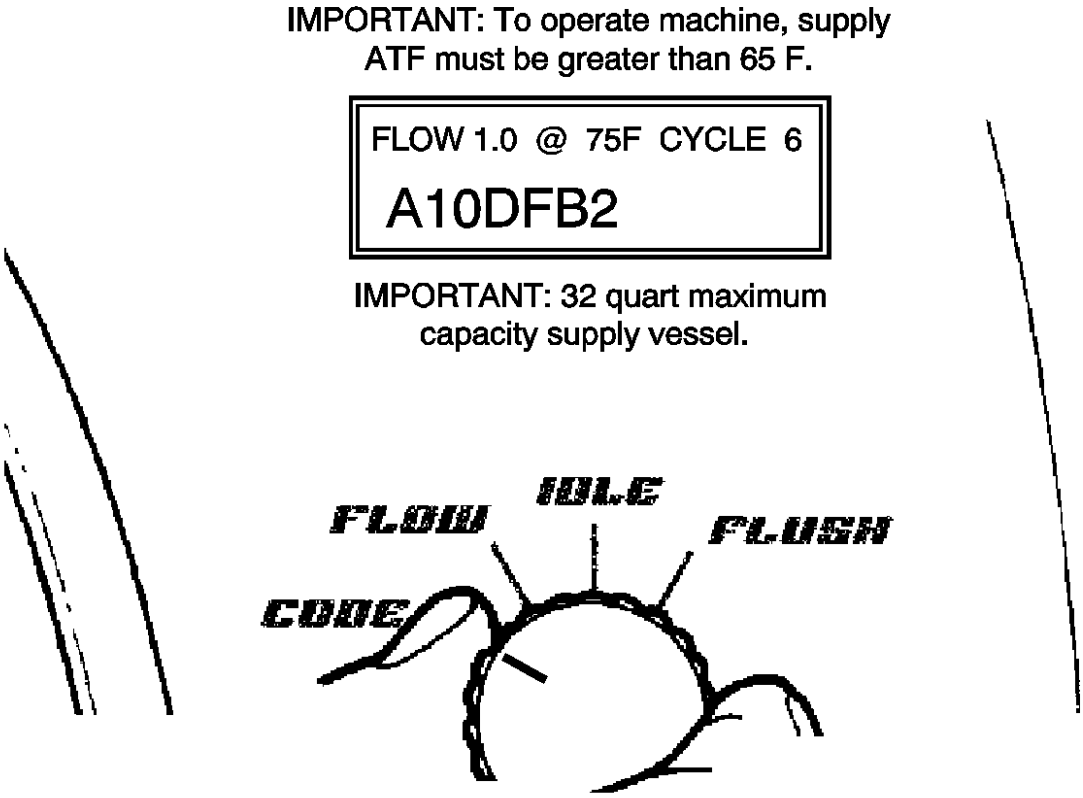

Fig. 14: View Of Main Function Switch CODE Position
Courtesy of GENERAL MOTORS COMPANY

1. Turn the main function switch to the CODE position.

NOTE:

- **If power is interrupted prior to the recording of the seven-character code, the code will be lost and the flow rate test will need to be repeated.**
- **The flow test must run for a minimum of 8-10 seconds and be above 0.5 GPM for a code to be generated.**

2. Record TESTED flow rate, temperature, cycle and seven-character flow code information on repair order.

Clean-up

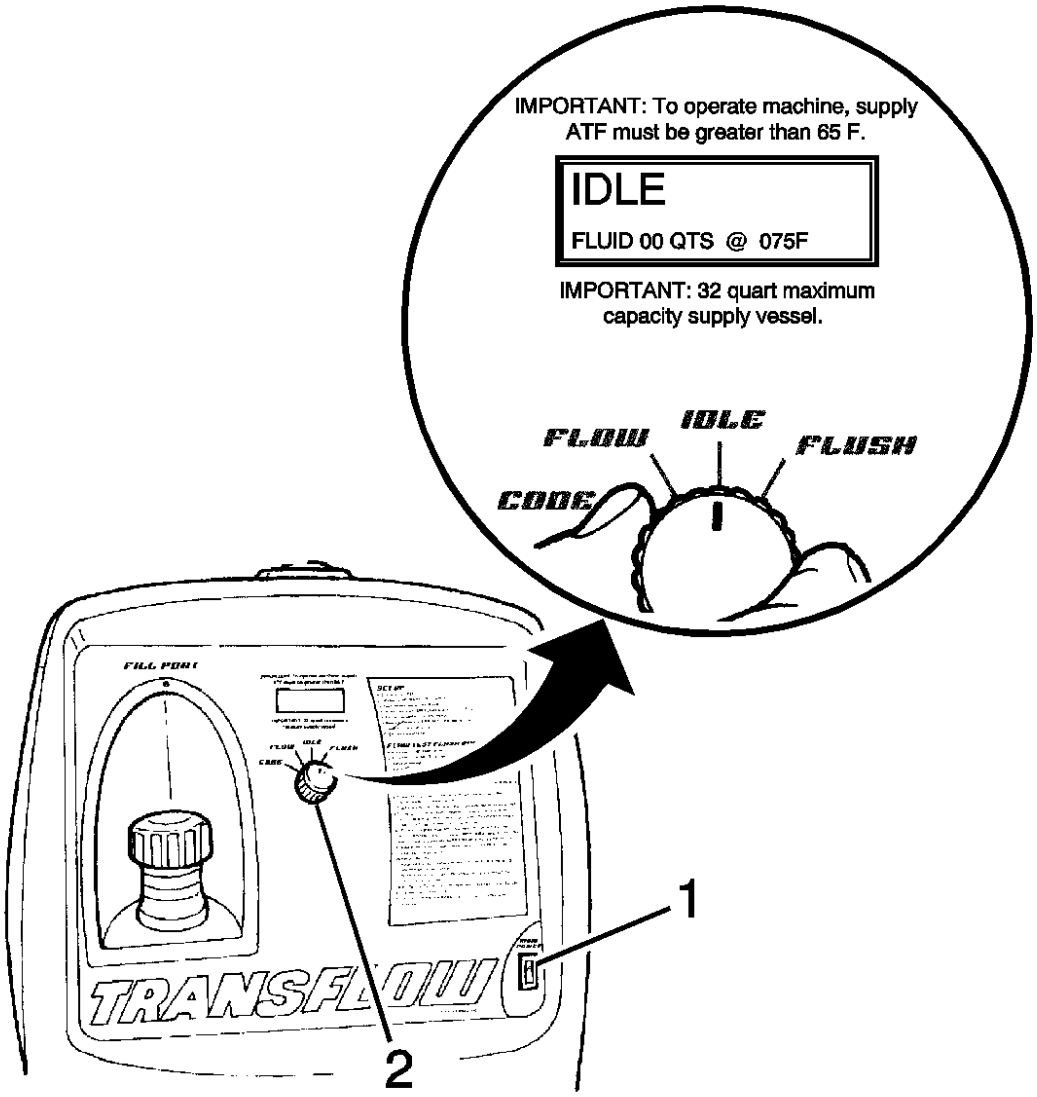

Fig. 15: View Of Main Power Switch & Main Function Switch
Courtesy of GENERAL MOTORS COMPANY

1. Turn the main function switch (2) to the IDLE position and allow the supply vessel pressure to dissipate.
2. Turn the main power switch (1) to the OFF position.

NOTE:

- **A small amount of water may drain from the bottom of the unit when the air supply is disconnected. This is a normal operation of the built-in water separator.**
- **If the fluid in the DT-45096 transmission oil cooling system flush and flow test tool is different than what is used in the transmission, use compressed air to blow the residual transmission fluid out of the oil cooler and lines.**

3. Disconnect the supply and waste hoses and the 12-volt power source from the vehicle.

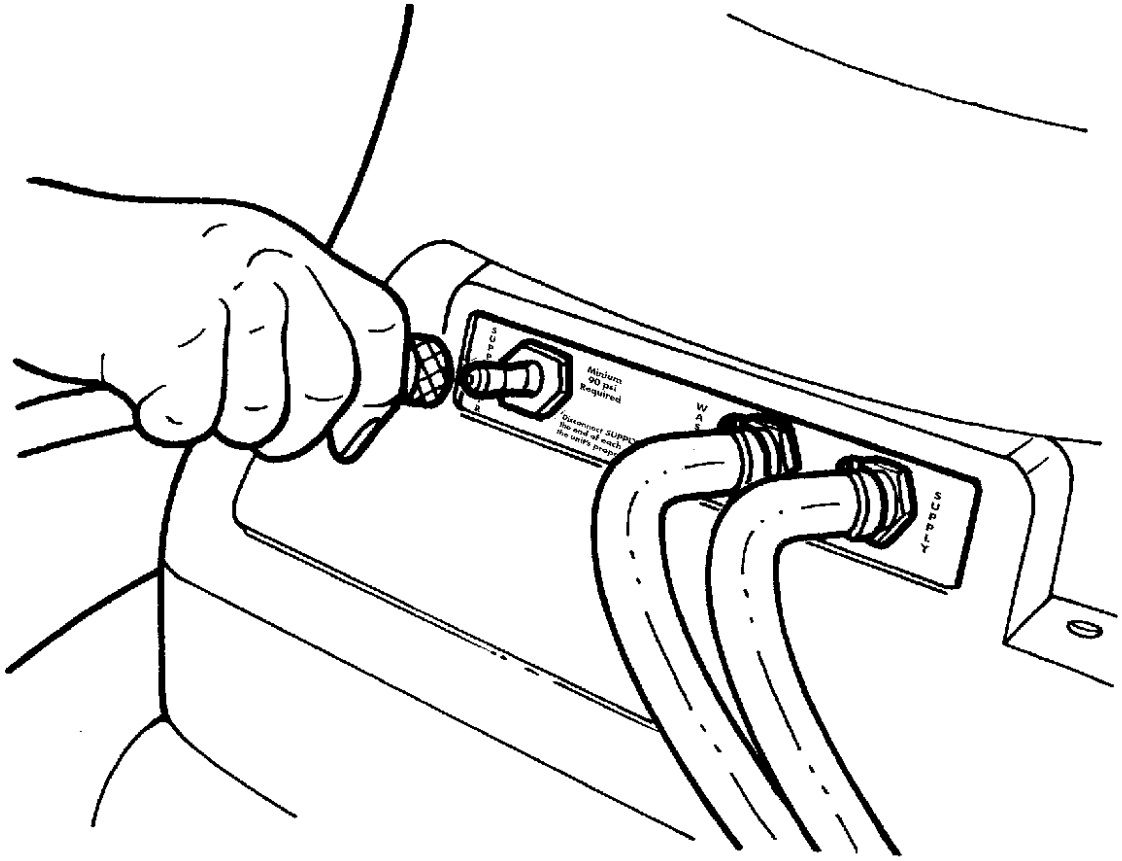

Fig. 16: Applying Shop Air Supply Hose To Quick-Disconnect
Courtesy of GENERAL MOTORS COMPANY

4. Disconnect the air supply hose from **DT-45096** flush and flow test tool.
5. Remove the **DT-48312** adapters.
6. Dispose of the waste automatic transmission fluid in accordance with all applicable federal, state, and local requirements.

REPAIR INSTRUCTIONS

TRANSMISSION FLUID AUXILIARY COOLER REPLACEMENT

Removal Procedure

CAUTION: Allow sufficient clearance around the transaxle oil cooler pipes and around the hoses to prevent damage or wear which may cause fluid loss.

1. Remove the upper radiator air baffle. Refer to **Radiator Air Upper Baffle and Deflector Replacement** .
2. Remove the auxiliary transaxle oil cooler bolt from the upper radiator support.
3. Remove the lower radiator air baffle. Refer to **Radiator Air Lower Baffle and Deflector Replacement** .

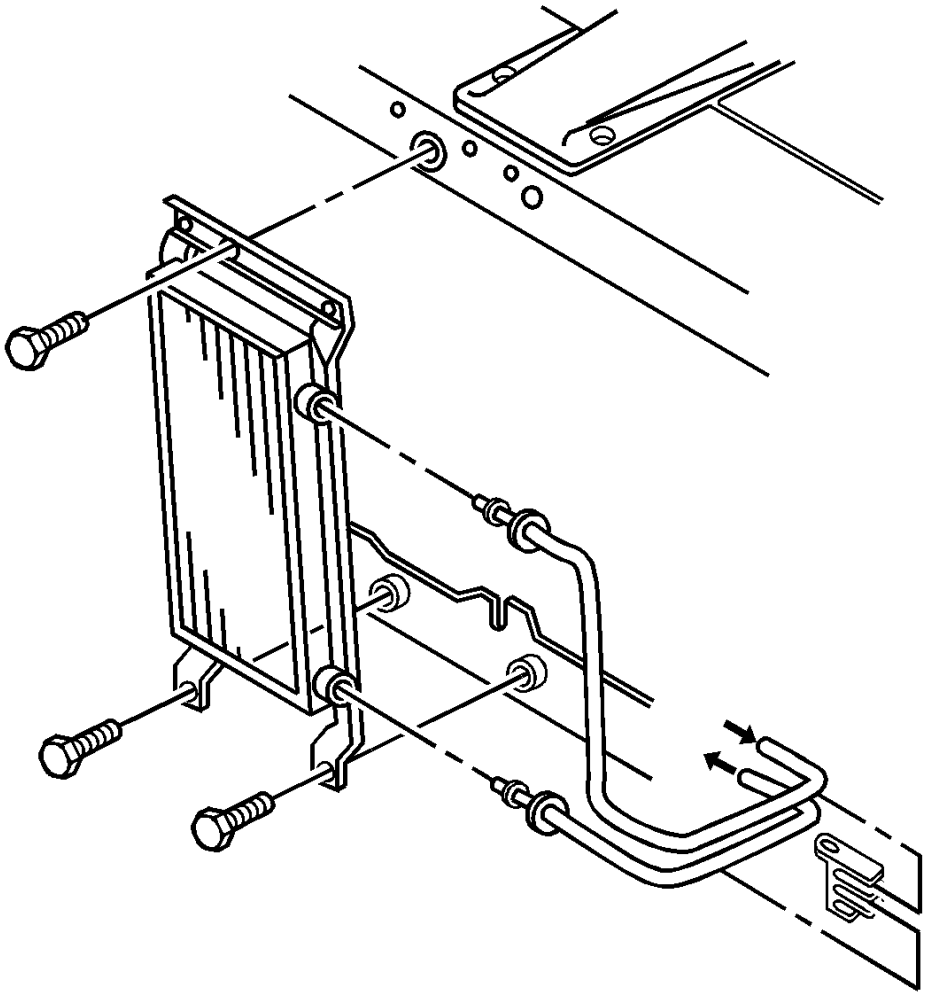

Fig. 17: Auxiliary Transaxle Oil Cooler
Courtesy of GENERAL MOTORS COMPANY

4. Remove the auxiliary transaxle oil cooler bolts from the lower radiator support.
5. Remove the inlet and outlet auxiliary transmission oil cooler lines from the support clips.
6. Lower the auxiliary transaxle oil cooler below the front bumper.
7. Remove the inlet and outlet auxiliary transaxle oil cooler hoses from the auxiliary transaxle oil cooler. Refer to **Fluid Cooler Inlet Hose Replacement**, and **Fluid Cooler Outlet Hose Replacement**.
8. Remove the auxiliary transaxle oil cooler.

Installation Procedure

1. Install the inlet and outlet auxiliary transaxle oil cooler hoses from the auxiliary transaxle oil cooler. Refer to **Fluid Cooler Inlet Hose Replacement**, and **Fluid Cooler Outlet Hose Replacement**

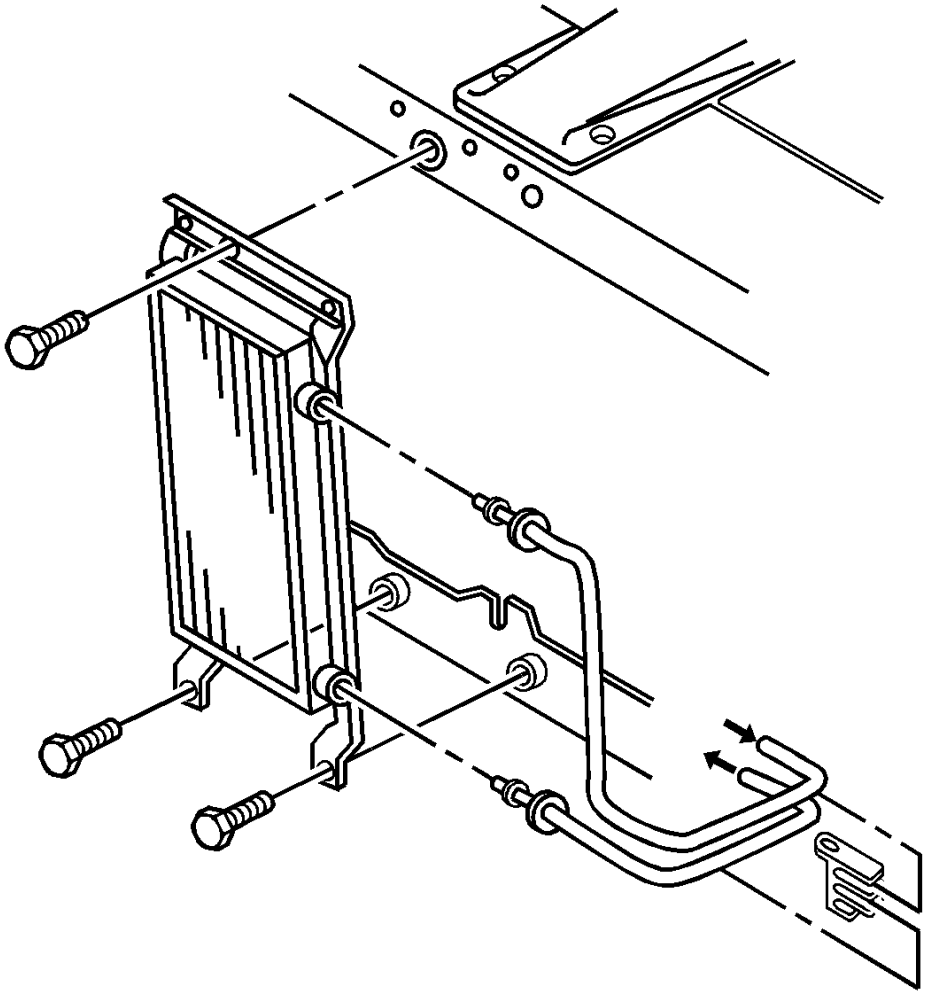

Fig. 18: Auxiliary Transaxle Oil Cooler
Courtesy of GENERAL MOTORS COMPANY

2. Install the auxiliary transaxle oil cooler to the vehicle.
3. Install the inlet and outlet auxiliary transmission oil cooler lines to the support clips.

CAUTION: Refer to Fastener Caution .

4. Install the auxiliary transaxle oil cooler bolts to the lower radiator support.

Tighten

Tighten the bolts to 10 N.m (89 lb in).

5. Install the lower radiator air baffle. Refer to **Radiator Air Lower Baffle and Deflector Replacement** .
6. Install the auxiliary transaxle oil cooler bolt to the upper radiator support.

Tighten

Tighten the bolt to 25 N.m (18 lb ft).

7. Install the upper radiator air baffle. Refer to **Radiator Air Upper Baffle and Deflector Replacement** .
8. Adjust the fluid level.

TRANSMISSION FLUID AUXILIARY COOLER INLET HOSE REPLACEMENT

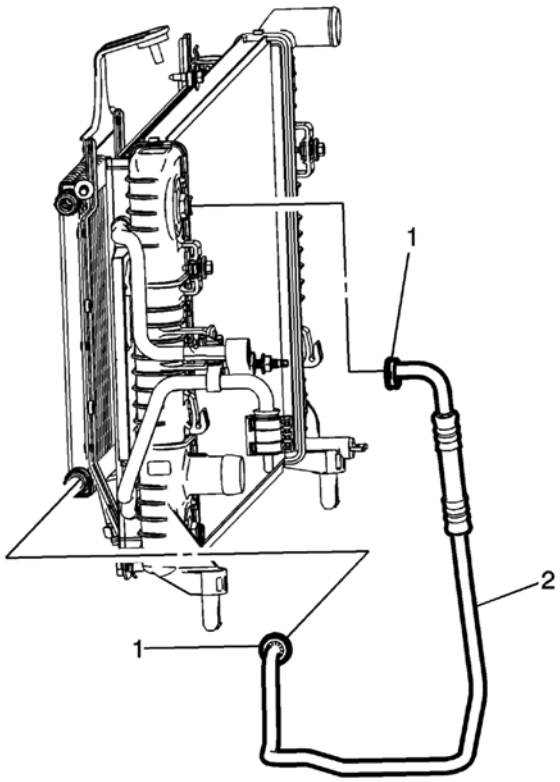

Fig. 19: Transmission Fluid Auxiliary Cooler Inlet Hose
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedures 1. Remove Radiator air and lower Baffle and deflector. Refer to **Radiator Air Lower Baffle and Deflector Replacement** . 2. Remove Upper Radiator Air Baffle. Refer to **Radiator Air Upper Baffle and Deflector Replacement** . 3. Raise and support the vehicle. Refer to **Lifting and Jacking the Vehicle** .	
1	Transmission Fluid Cooler Hose/Pipe Quick Disconnection(Qty: 2)
2	Transmission Fluid Auxiliary Cooler Inlet Hose.

TRANSMISSION FLUID COOLER PIPE CONNECTOR REPLACEMENT - RADIATOR

Removal Procedure

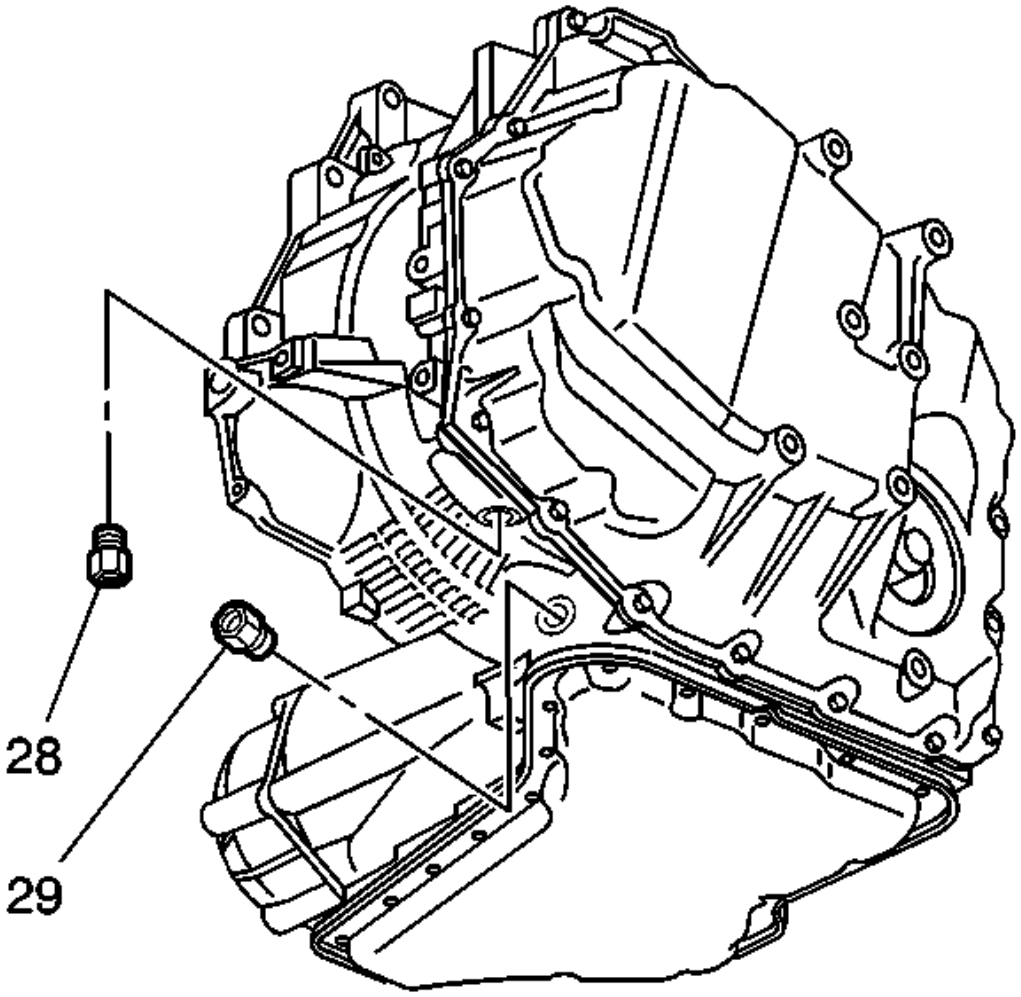

Fig. 20: View Of Transaxle Oil Cooler Fittings
Courtesy of GENERAL MOTORS COMPANY

CAUTION: Allow sufficient clearance around the transaxle oil cooler pipes and around the hoses to prevent damage or wear which may cause fluid loss.

1. Raise and support the vehicle. Refer to **Lifting and Jacking the Vehicle** .
2. Position a drain pan under the vehicle.
3. Remove the transaxle oil cooler hoses from the transaxle oil cooler fittings. Refer to **Fluid Cooler Inlet Hose Replacement**, and **Fluid Cooler Outlet Hose Replacement**.
4. Remove the transaxle oil cooler fittings (28, 29) from the transaxle.

Installation Procedure

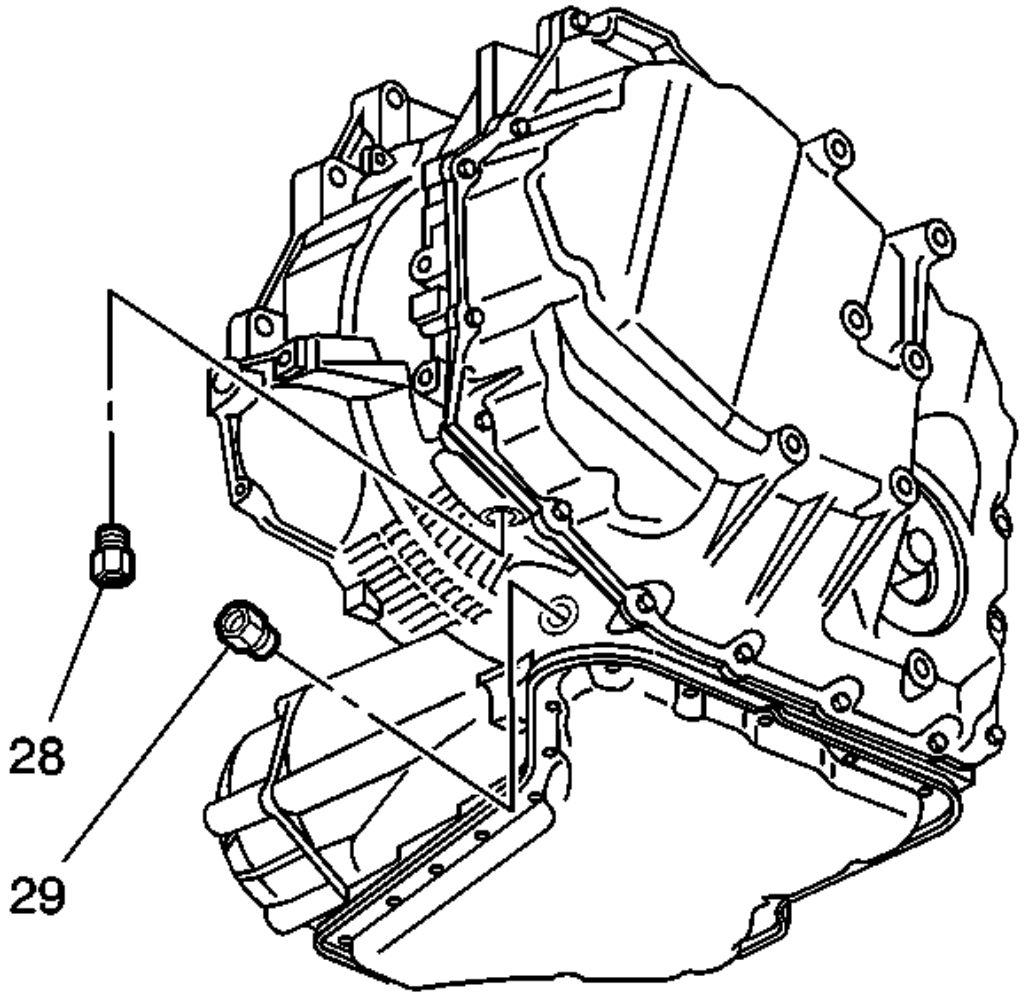

Fig. 21: View Of Transaxle Oil Cooler Fittings
Courtesy of GENERAL MOTORS COMPANY

CAUTION: **Refer to Fastener Caution .**

NOTE: **The correct thread engagement is critical. Crossthreaded fittings can achieve proper tightness and still leak.**

1. Install the transaxle oil cooler fittings (28, 29) to the transaxle.

   Tighten

   Tighten the fittings to 38 N.m (28 lb ft).

2. Install the transaxle oil cooler hoses from the transaxle oil cooler fittings. Refer to **Fluid Cooler Inlet Hose Replacement**, and **Fluid Cooler Outlet Hose Replacement**.
3. Lower the vehicle.

   CAUTION: **Refer to Transmission Overfill Caution .**

4. Adjust the fluid level.
5. Inspect for fluid leaks. Refer to **Transmission Fluid Level and Condition Check** .
6. Remove the drain pan from under the vehicle.

TRANSMISSION FLUID COOLER HOSE/PIPE QUICK-CONNECT FITTING DISCONNECTION AND CONNECTION

Removal Procedure

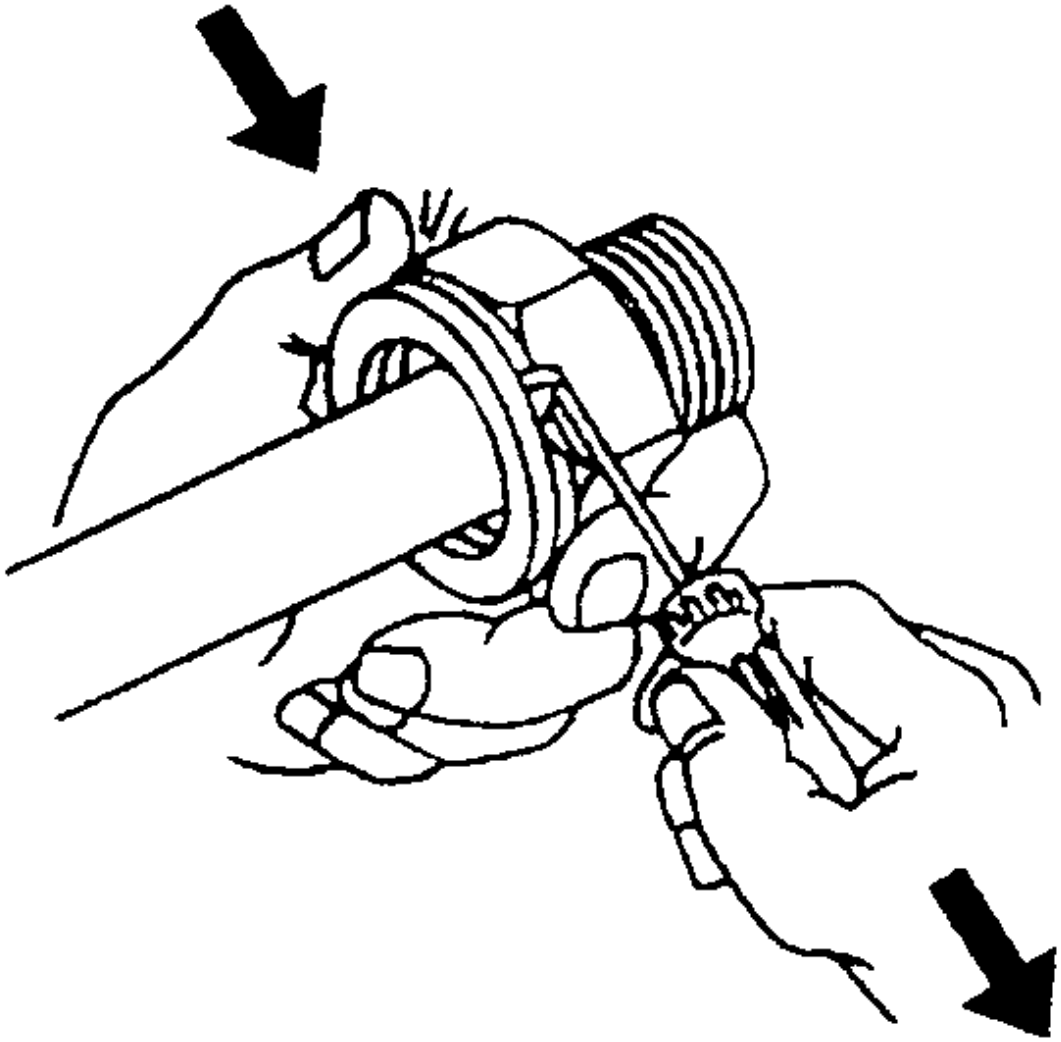

Fig. 22: Retaining Ring For Quick Connect Fitting
Courtesy of GENERAL MOTORS COMPANY

NOTE: **Perform the following procedure when removing the retaining rings and cooler lines from the quick connect fittings located on the radiator and/or the transmission.**

1. Pull the plastic cap back from the quick connect fitting and down along the cooler line about 5 cm (2 in).

2. Using a bent-tip screwdriver, pull on one of the open ends of the retaining ring in order to rotate the retaining ring around the quick connect fitting until the retaining ring is out of position and can be completely removed.
3. Remove the retaining ring from the quick connect fitting.
4. Discard the retaining ring.

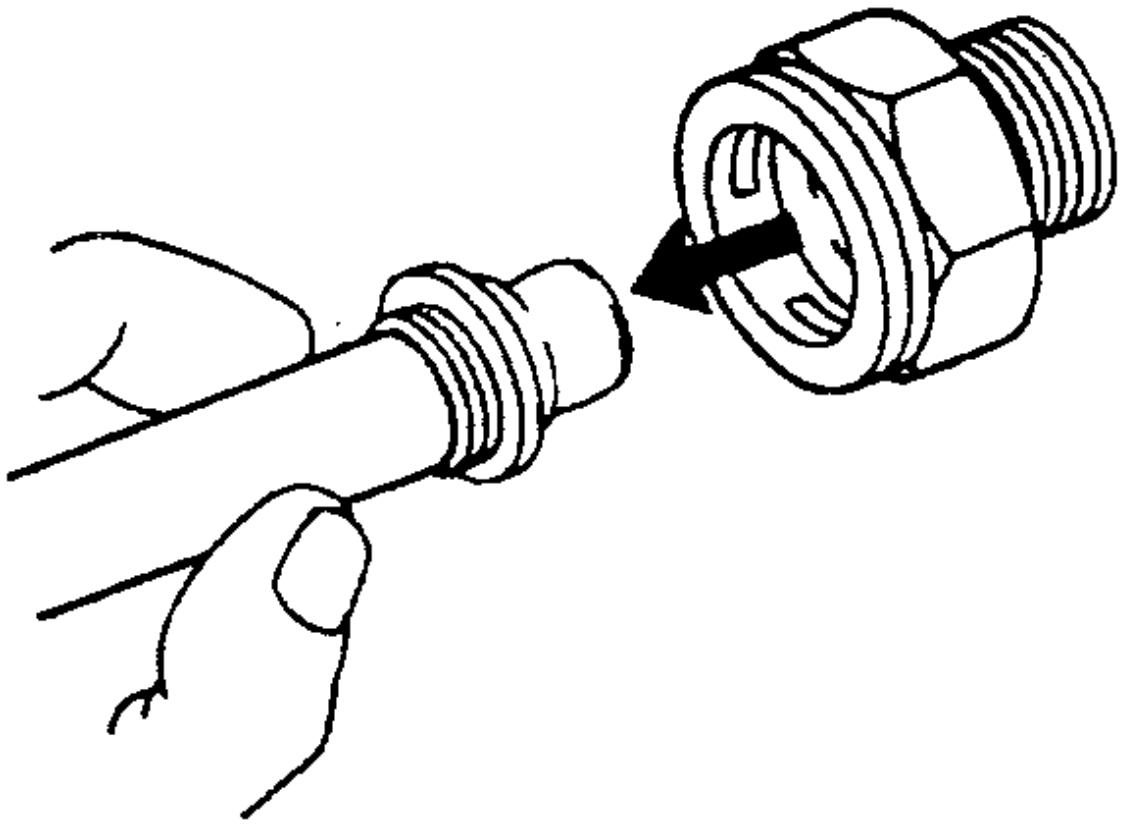

Fig. 23: Cooler Line & Quick Connect Fitting
Courtesy of GENERAL MOTORS COMPANY

5. Pull the cooler line straight out from the quick connect fitting.

Installation Procedure

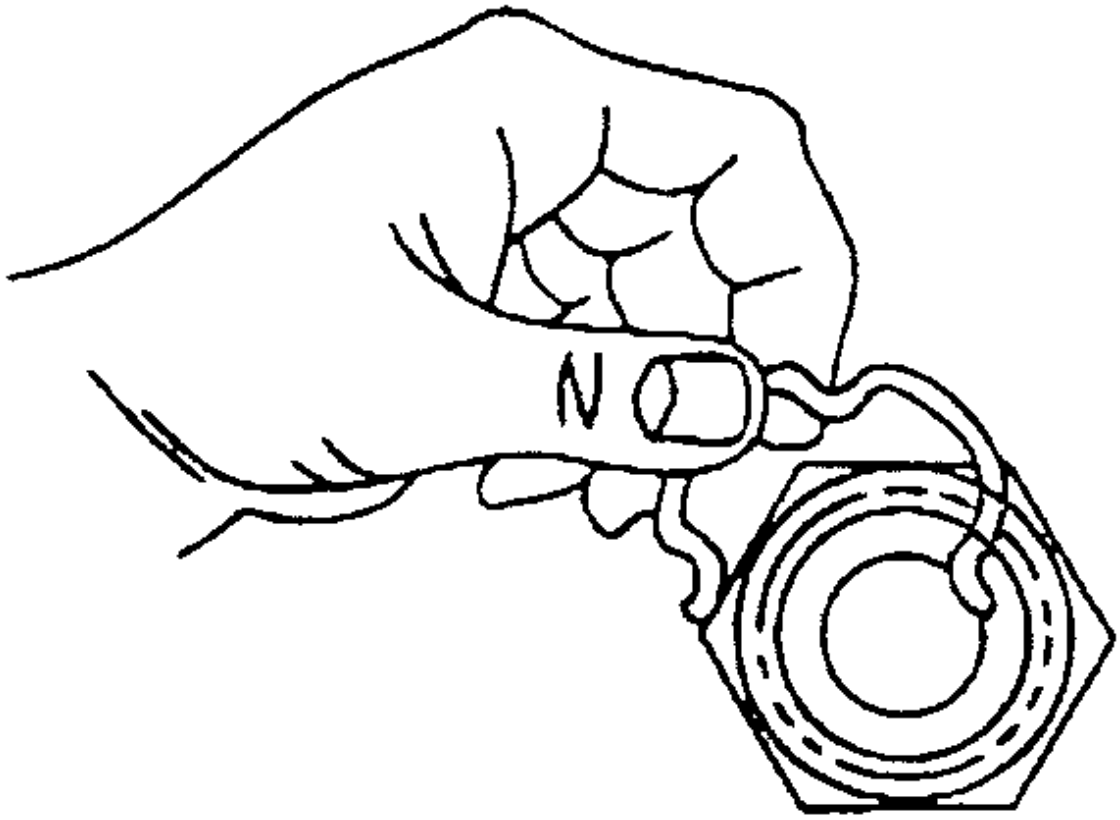

Fig. 24: Hooking Retaining Ring Into Quick Connect Fitting
Courtesy of GENERAL MOTORS COMPANY

NOTE:

- **Do not reuse any of the existing oil lines or oil line fittings if there is excessive corrosion.**
- **Do not reuse any of the existing retaining rings that were removed from the existing quick connect fittings. Install new retaining rings.**
- **Ensure the following procedures are performed when installing the new retaining rings onto the fittings.**
- **Perform the following procedure when installing the retaining rings and cooler lines to the quick connect fittings located on the radiator and/or the transmission.**

1. Hook one of the open ends of the retaining ring in one of the slots in the quick connect fitting.

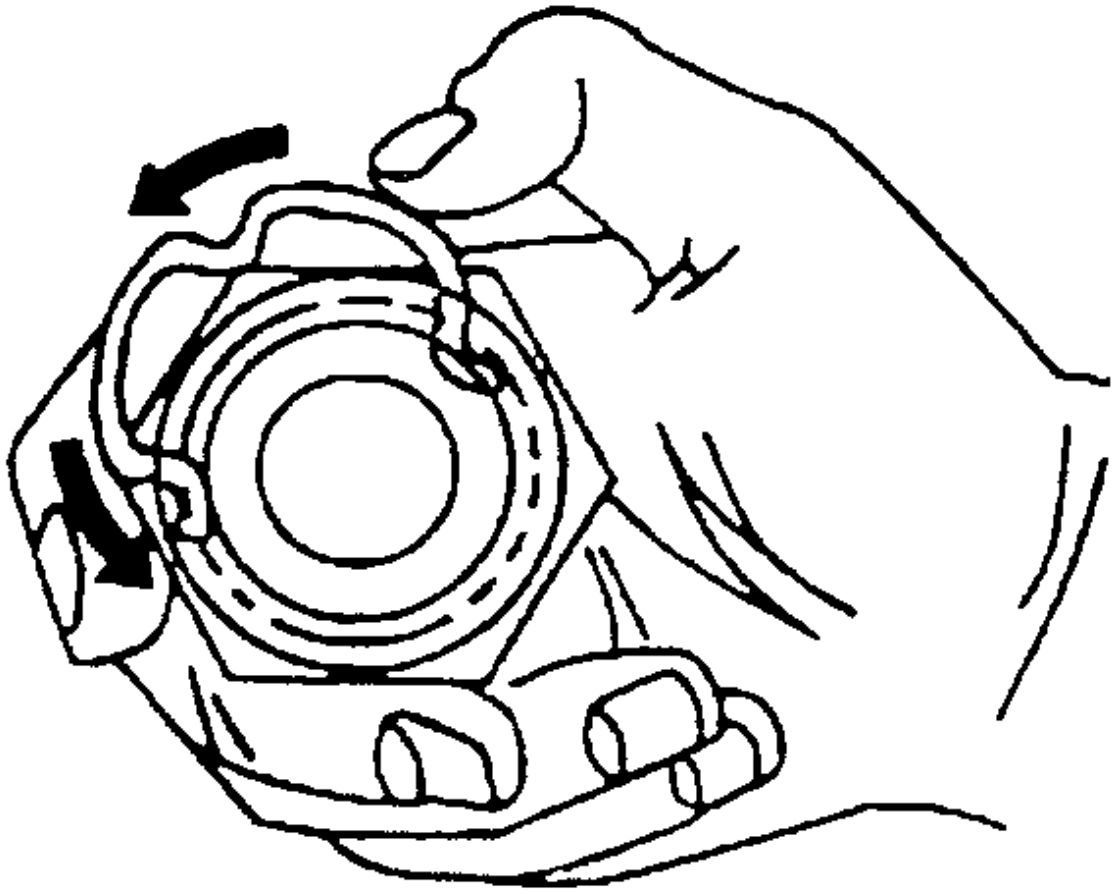

Fig. 25: Rotating Retaining Ring Around Fitting
Courtesy of GENERAL MOTORS COMPANY

2. Rotate the retaining ring around the fitting until the retaining ring is positioned with all 3 ears through the 3 slots on the fitting.

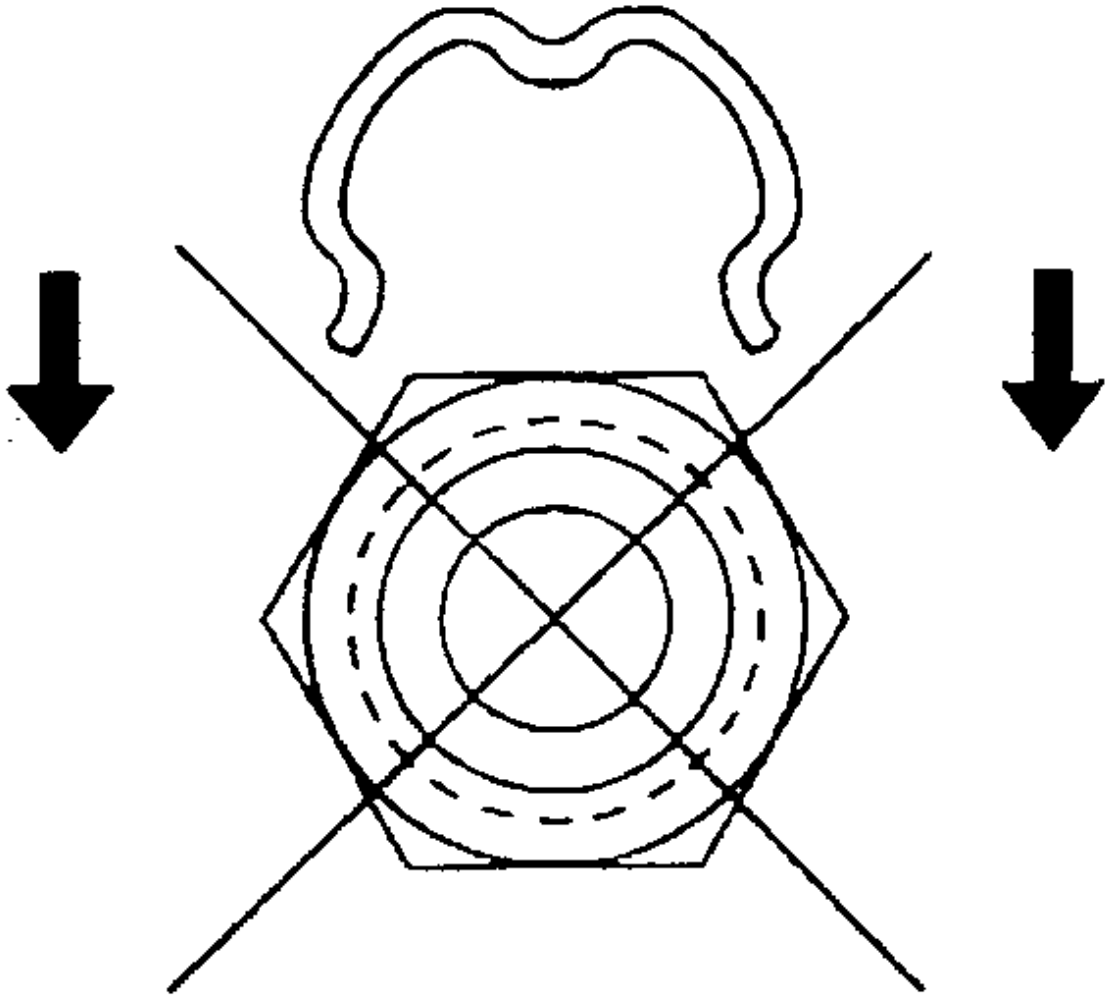

Fig. 26: Identifying Improper Engine Oil Cooler Hose/Pipe Retaining Ring Installation
Courtesy of GENERAL MOTORS COMPANY

3. Do not install the new retaining ring onto the fitting by pushing the retaining ring.

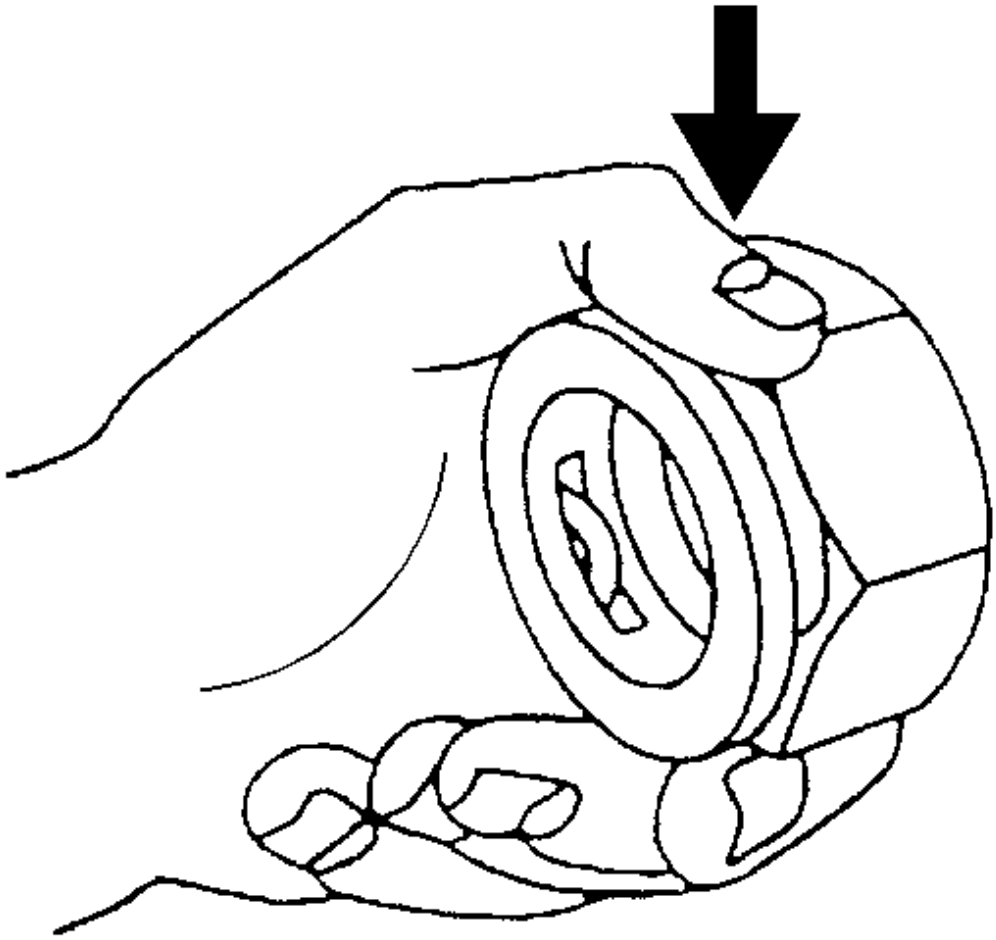

Fig. 27: Ensuring Retaining Ring Is Seated Correctly
Courtesy of GENERAL MOTORS COMPANY

4. Ensure that the 3 retaining ring ears are seen from inside the fitting and that the retaining ring moves freely in the fitting slots.

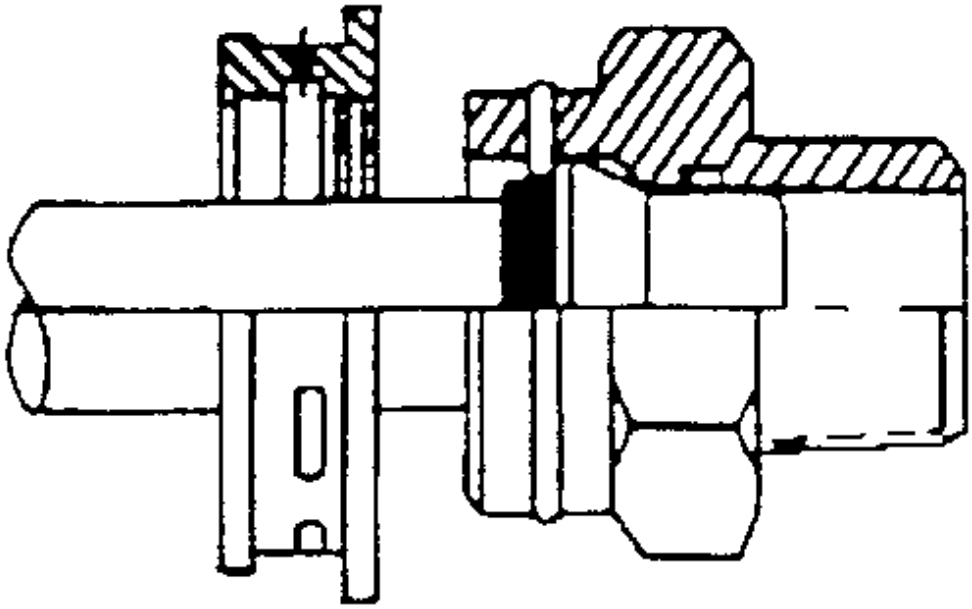

Fig. 28: View Of Cooler Line Quick Connect Fitting
Courtesy of GENERAL MOTORS COMPANY

5. Install the cooler line into the quick connect fitting.
6. Insert the cooler line end into the quick connect fitting until a click is either heard or felt.

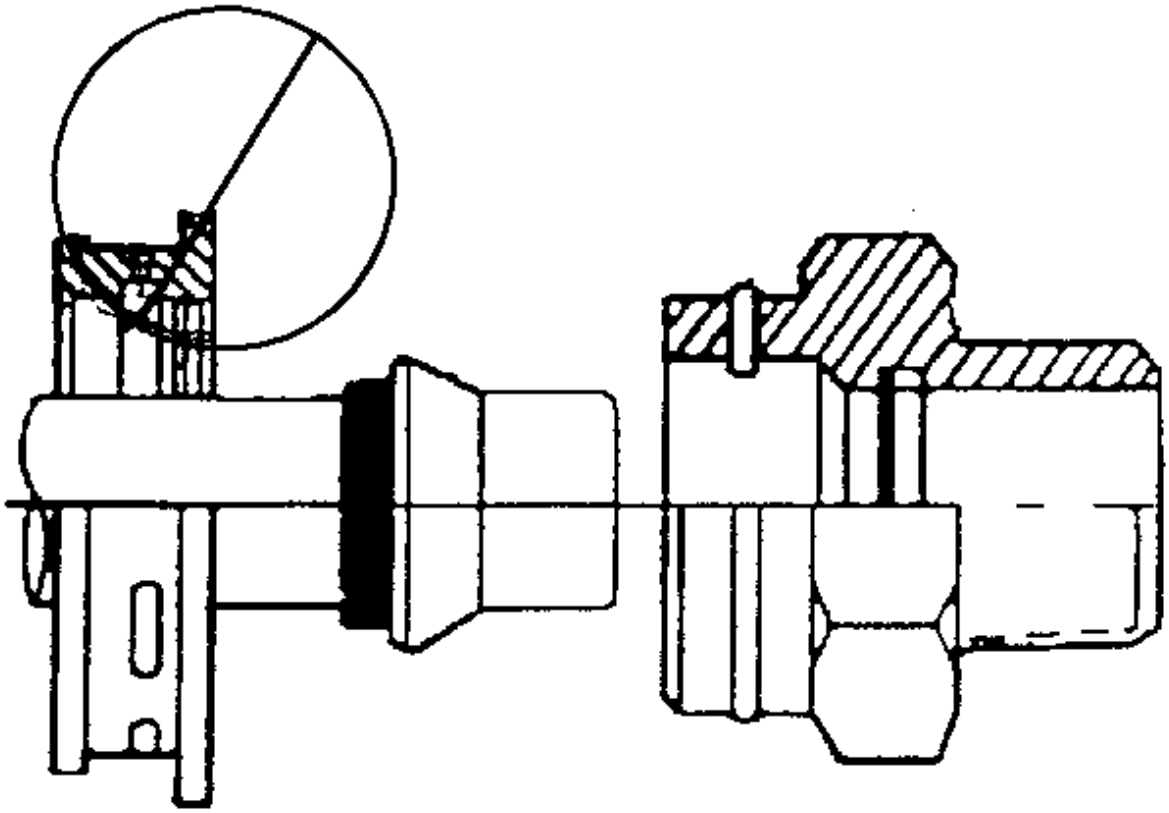

Fig. 29: Do Not Use Plastic Cap On Cooler Line In Order To Install Cooler Line Into The Fitting
Courtesy of GENERAL MOTORS COMPANY

7. Do not use the plastic cap on the cooler line in order to install the cooler line into the fitting.
8. Pull back sharply on the cooler line in order to ensure that the cooler line is fastened into the quick connect fitting.

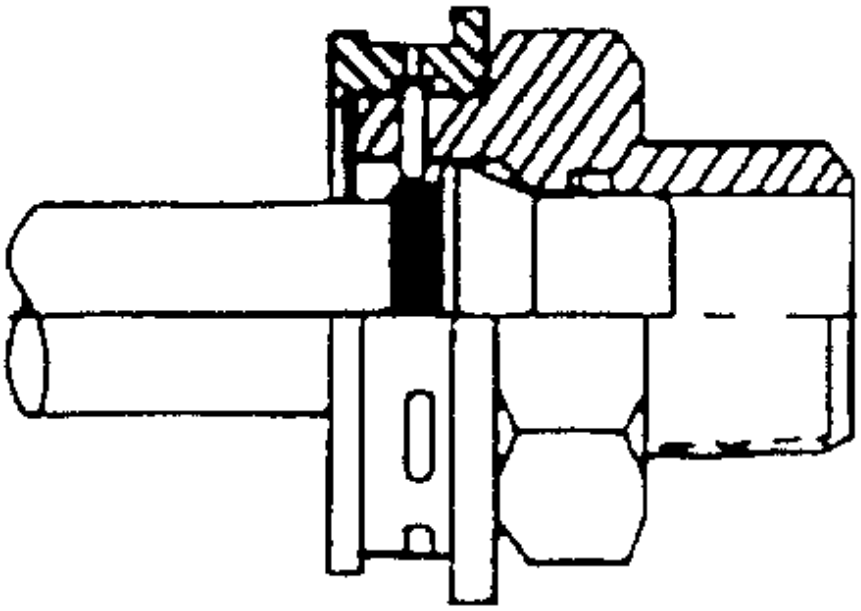

Fig. 30: View Of Cooler Line & Plastic Cap
Courtesy of GENERAL MOTORS COMPANY

NOTE: **Do not manually depress the retaining clip when installing the plastic cap.**

9. Position (snap) the plastic cap onto the fitting. Do not manually depress the retaining ring when installing the plastic cap onto the quick connect fitting.
10. Ensure that the plastic cap is fully seated against the fitting.

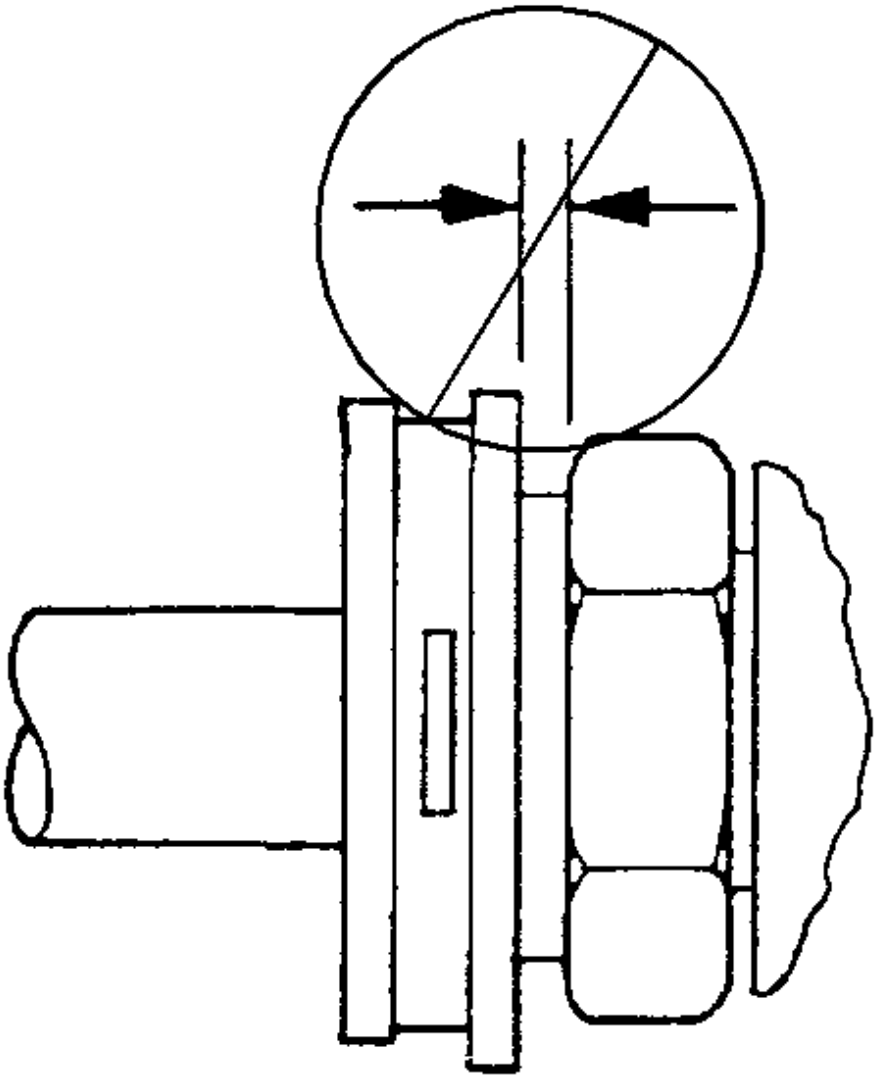

Fig. 31: Checking For Gap Between Cap & Fitting
Courtesy of GENERAL MOTORS COMPANY

11. Ensure that no gap is present between the cap and the fitting.

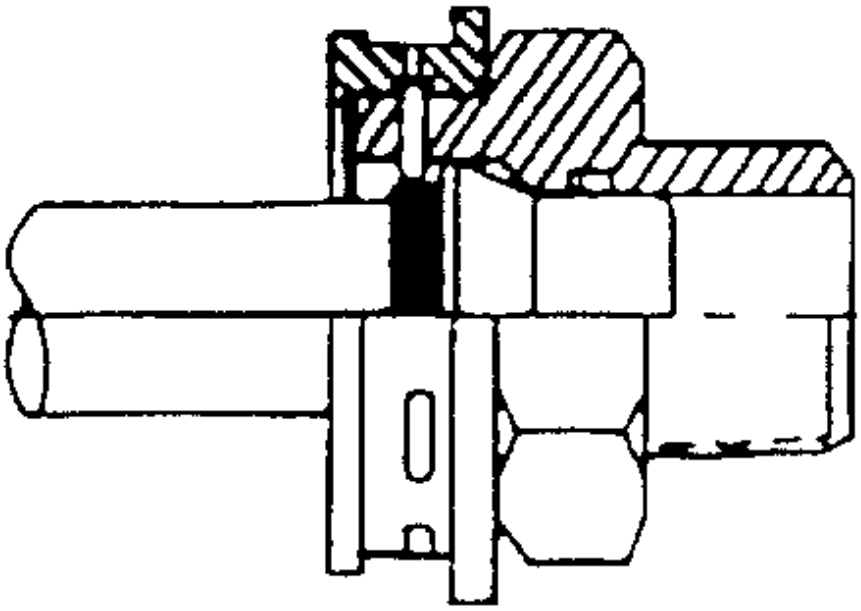

Fig. 32: View Of Cooler Line & Plastic Cap
Courtesy of GENERAL MOTORS COMPANY

12. Ensure that the yellow identification band on the tube is hidden within the quick connect fitting.

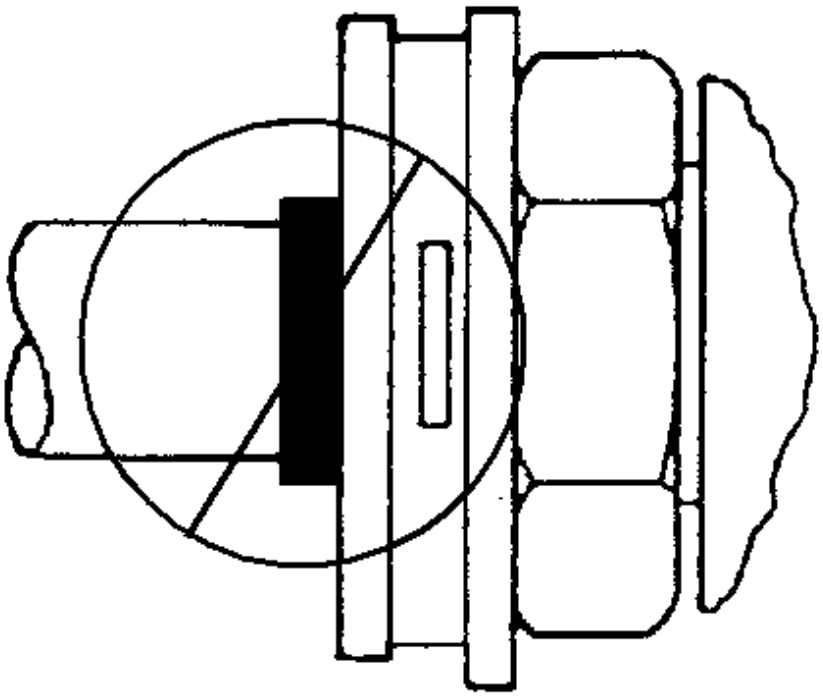

Fig. 33: Identifying Improper Joint Seating
Courtesy of GENERAL MOTORS COMPANY

13. A hidden yellow identification band indicates proper joint seating.
14. Fill the transmission to the proper level with DEXRONÂ® VI transmission fluid. Refer to **Transmission Fluid Level and Condition Check** .

FLUID COOLER INLET HOSE REPLACEMENT

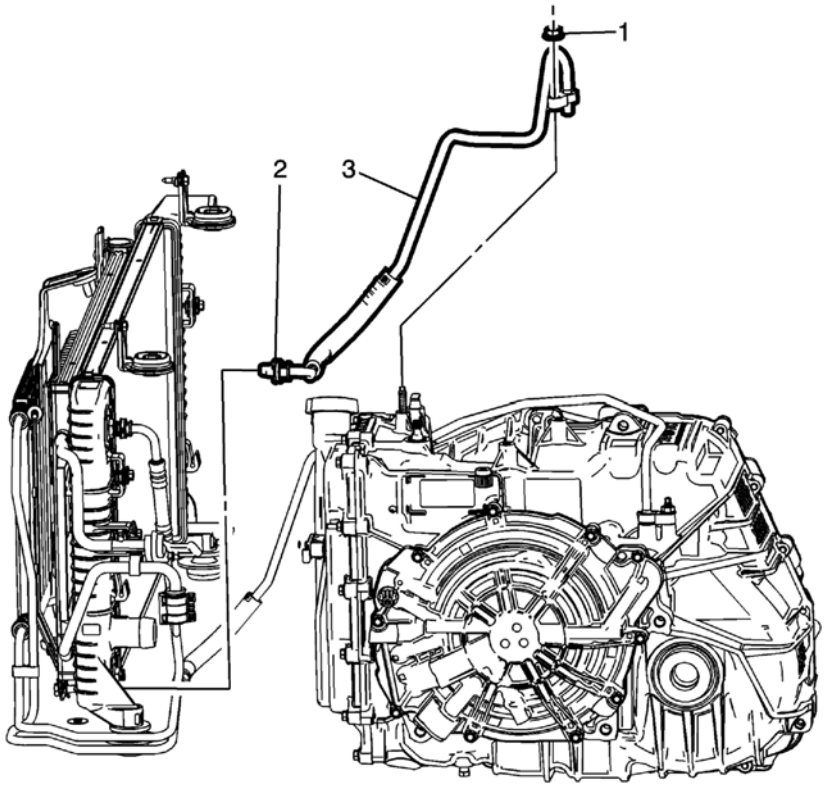

Fig. 34: Fluid Cooler Inlet Hose, Fastener & Quick Connect

9. Using the **J-42129** remover (2), separate the wheel drive shaft from the wheel hub/bearing (1).
10. Remove the **J-42129** remover (2).
11. Remove the outer tie rod end from the steering knuckle. Refer to **Steering Linkage Outer Tie Rod Replacement** .
12. Remove the stabilizer shaft link from the lower control arm. Refer to **Stabilizer Shaft Link Replacement** .
13. Separate the lower control arm from the steering knuckle. Refer to **Lower Control Arm Replacement** .

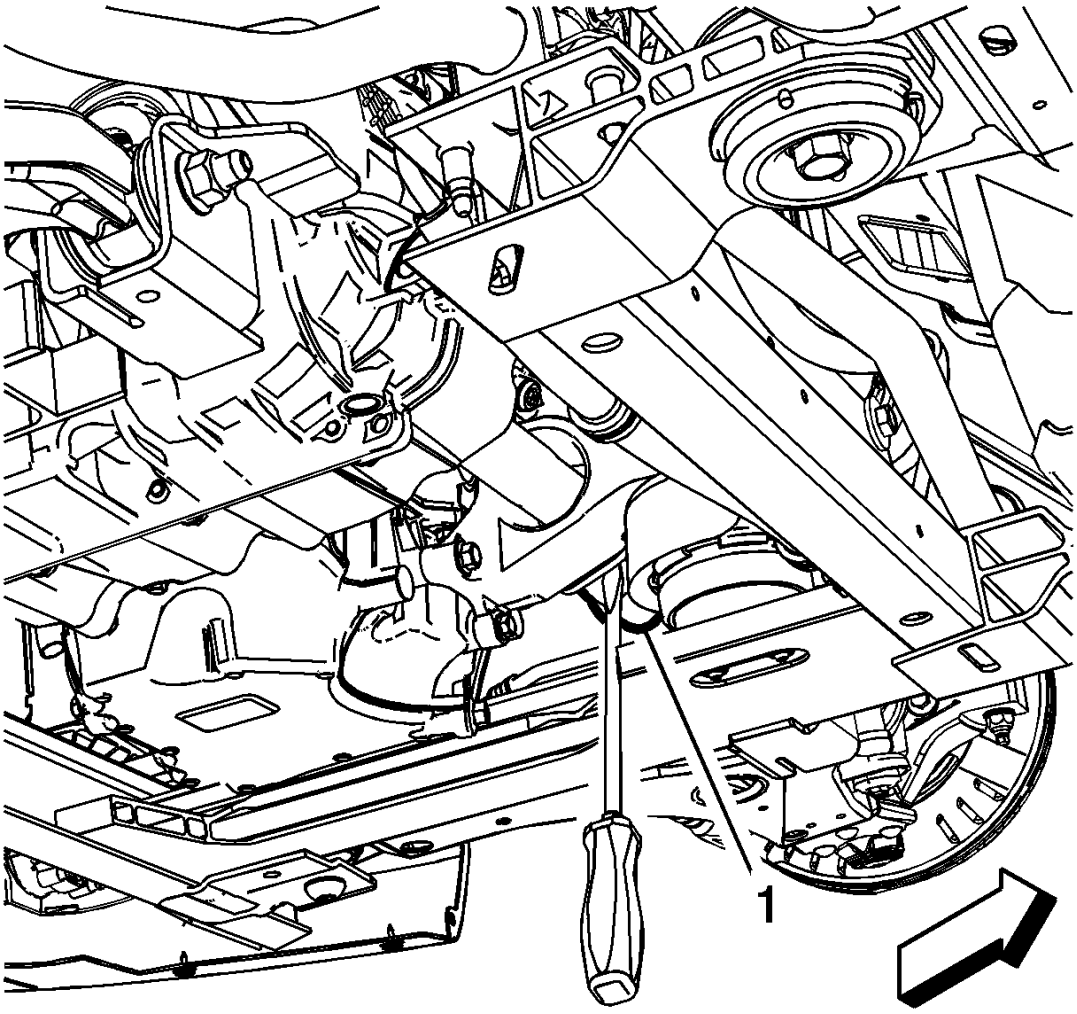

Fig. 14: Wheel Drive Shaft
Courtesy of GENERAL MOTORS COMPANY

NOTE:

- **It may be necessary to have an assistant hold the knuckle assembly while removing the wheel drive shaft.**
- **If removing the wheel drive shaft to service other suspension or drive line components, use care when removing or installing the wheel drive shaft so as not to damage the wheel drive shaft boots.**

14. Using an appropriate tool, remove the wheel drive shaft (1) from the intermediate shaft.

Installation Procedure

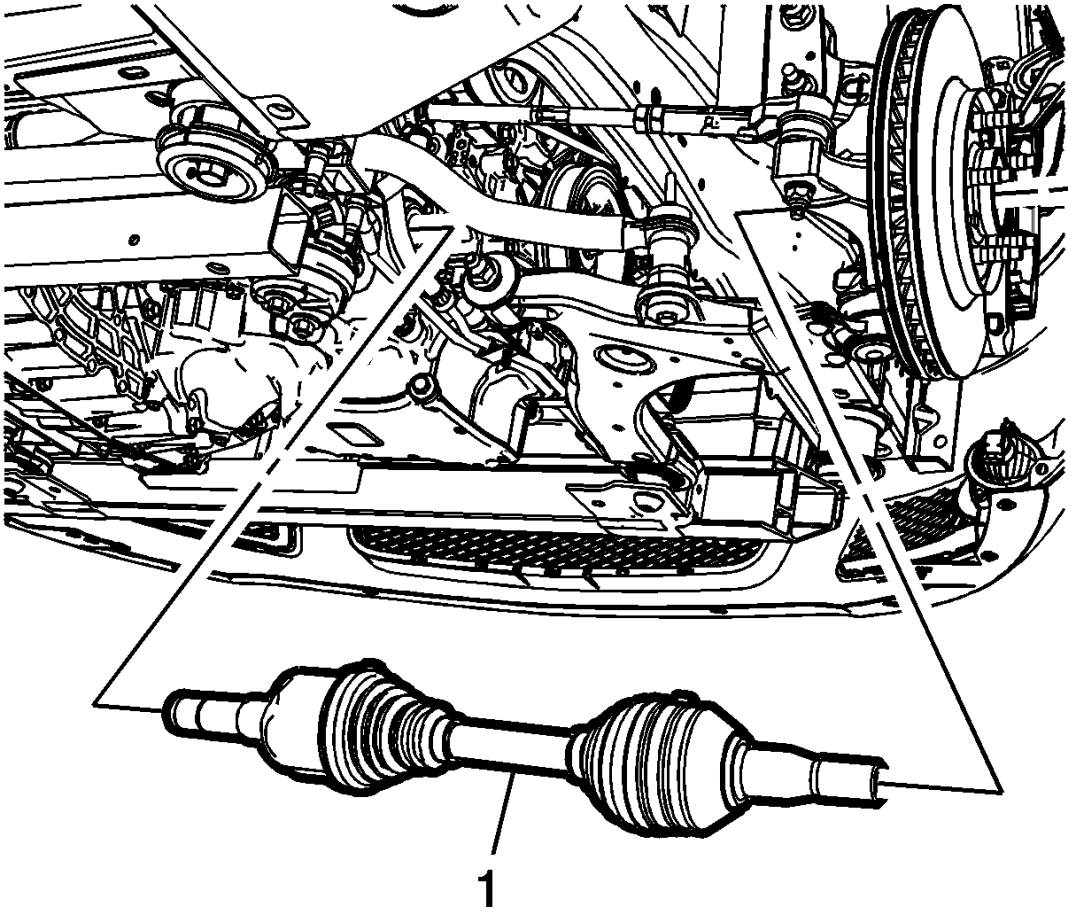

Fig. 15: Wheel Drive Shaft
Courtesy of GENERAL MOTORS COMPANY

1. Install the wheel drive shaft (1) into the intermediate shaft.
2. Install the front wheel drive shaft (1) into the front wheel hub/bearing.
3. Install the lower control arm in the steering knuckle. Refer to **Lower Control Arm Replacement** .
4. Install the stabilizer shaft link in the lower control arm. Refer to **Stabilizer Shaft Link Replacement** .
5. Install the outer tie rod end in the steering knuckle. Refer to **Steering Linkage Outer Tie Rod Replacement** .

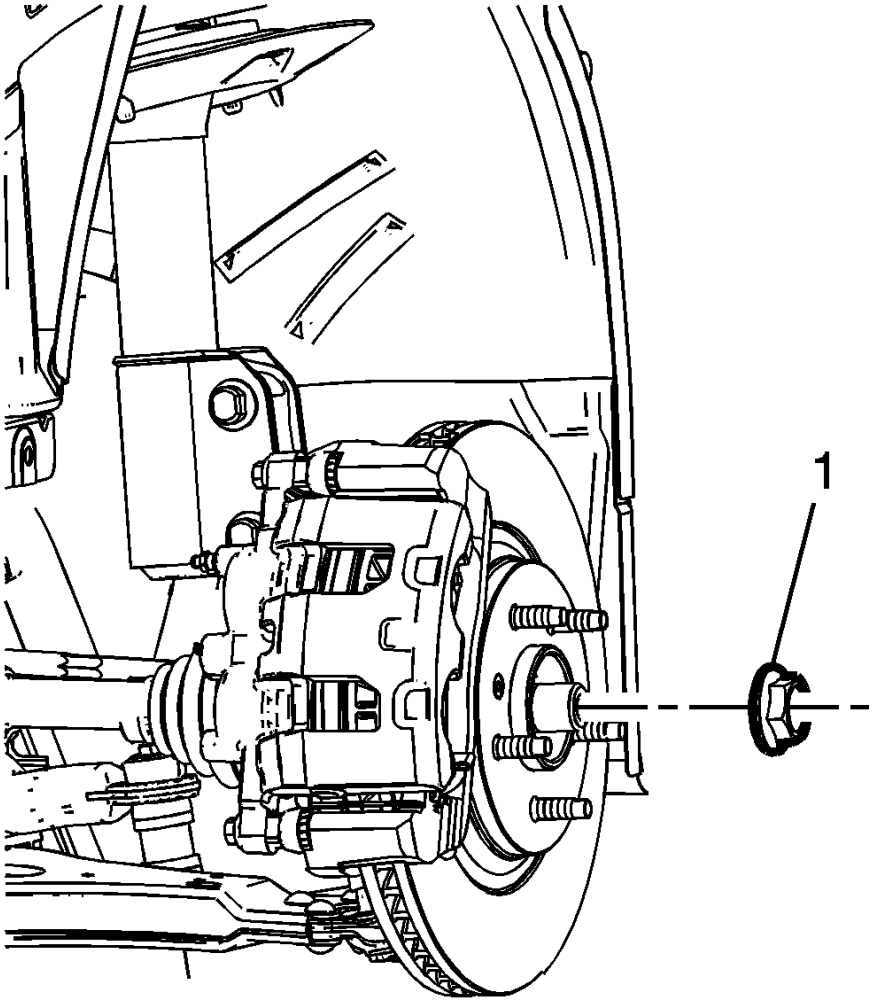

Fig. 16: Wheel Drive Shaft Nut
Courtesy of GENERAL MOTORS COMPANY

6. Hand start the NEW wheel drive shaft nut (1).

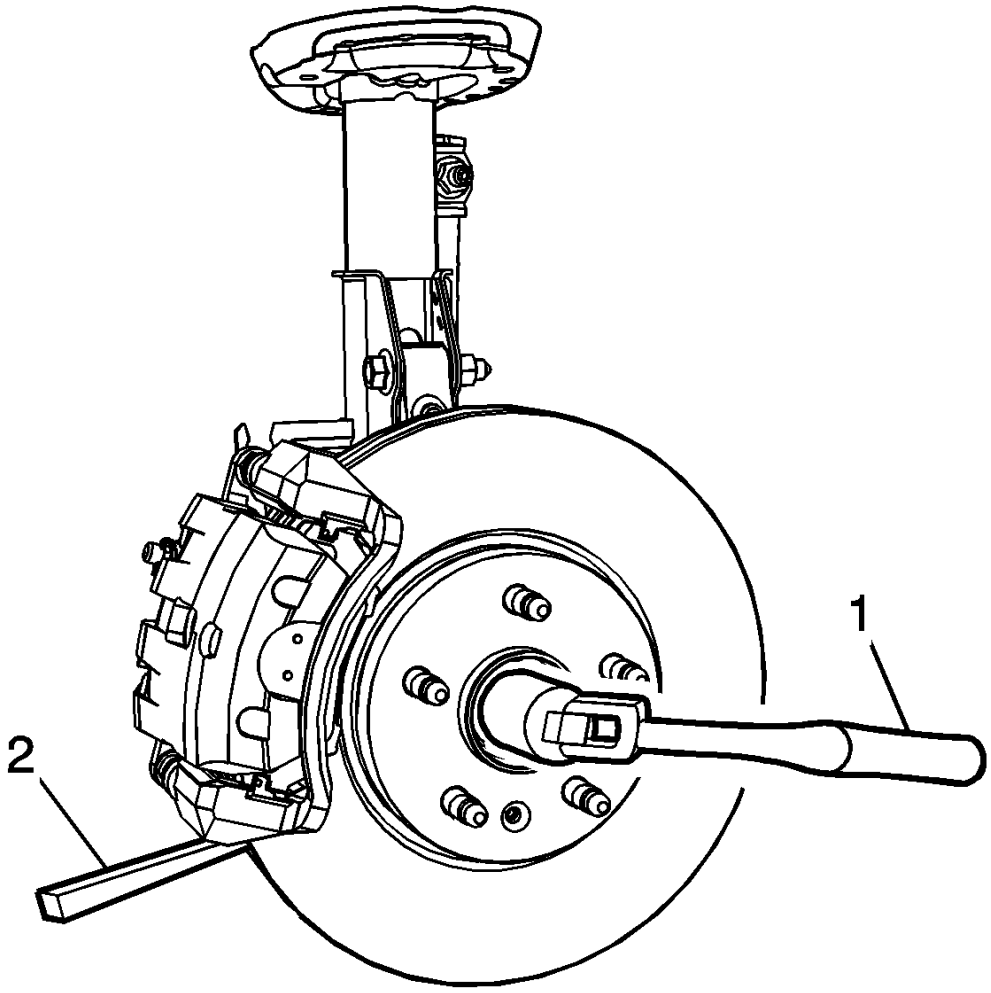

Fig. 17: Holding Brake Rotor From Rotating With Drift Or Punch
Courtesy of GENERAL MOTORS COMPANY

7. Insert a drift or punch (2) in the cooling fins of the brake rotor.
8. Rotate the brake rotor until the drift or punch (2) contacts the brake caliper mounting bracket.

CAUTION: Refer to Fastener Caution .

9. Using a torque wrench (1) and the proper size socket, tighten the wheel drive shaft nut to 210 (155 lb ft).
10. Remove the punch or drift (2) from the brake rotor.
11. Install the tire and wheel assembly. Refer to **Tire and Wheel Removal and Installation** .
12. Remove the support and lower the vehicle.

FRONT WHEEL DRIVE INTERMEDIATE SHAFT REPLACEMENT

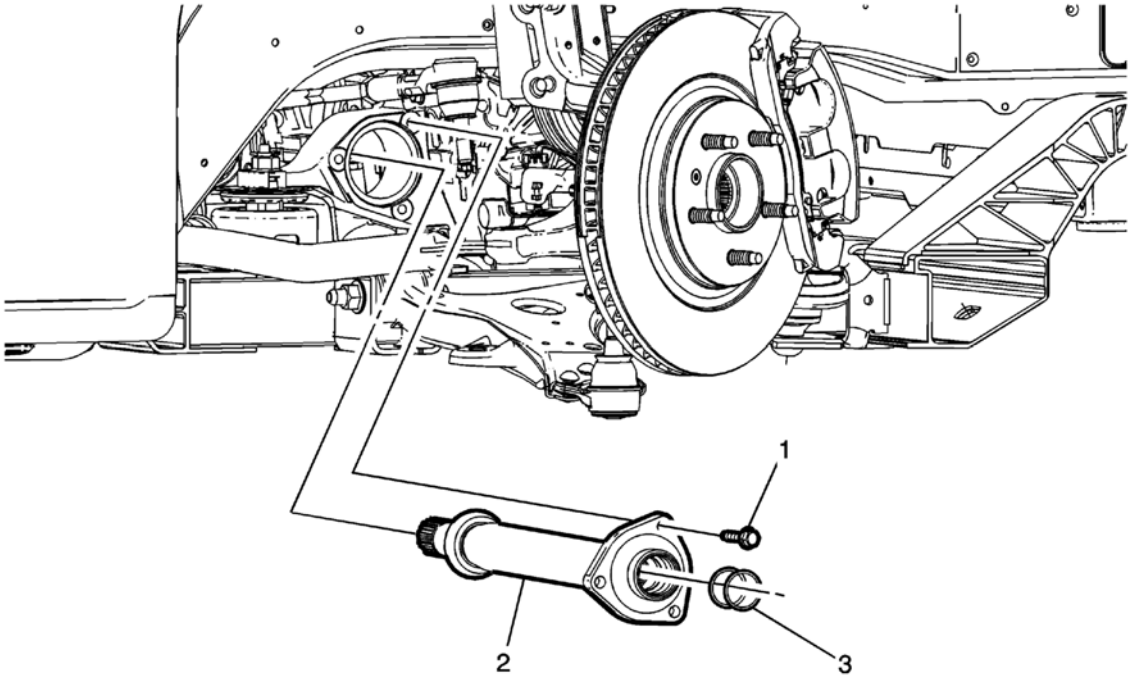

Fig. 18: Front Wheel Drive Intermediate Shaft & Mounting Components
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure 1. Raise and support the vehicle. Refer to **Lifting and Jacking the Vehicle** . 2. Remove the wheel drive shaft from the vehicle. Refer to **Wheel Drive Shaft Replacement (Left Side)Wheel Drive Shaft Replacement (Right Side)**.	
1	Front Wheel Drive Intermediate Shaft Bearing Retaining Bolt (Qty: 3) **CAUTION:** **Refer to Fastener Caution .** **Tighten** 22 (16 lb ft).
2	Front Wheel Drive Intermediate Shaft **CAUTION:** **DT-51504 must be installed into**

Callout	Component Name
	the differential output shaft seal prior to removing and installing the wheel drive shaft. Failure to install the DT-51504 as indicated may cause the splines of the wheel drive shaft to damage the differential output seal **Procedure** A small amount of grease must be applied to the wheel drive shaft and/or the internal splines of the wheel drive intermediate shaft. Refer to **Adhesives, Fluids, Lubricants, and Sealers**. **Special Tools** **DT-51504** Seal Protector For regional equivalent tools, refer to **Special Tools**.
3	Front Wheel Drive Intermediate Shaft O-Rings (Qty: 2) **NOTE:** **The front wheel drive intermediate shaft O-rings must be replaced every time the wheel drive shaft have been removed.**

WHEEL DRIVE SHAFT INNER JOINT AND BOOT REPLACEMENT

Special Tools

- **J 35910** Drive Axle Seal Clamp Pliers
- **J 41048** Drive Axle Swage Ring Clamp

Disassemble Procedure

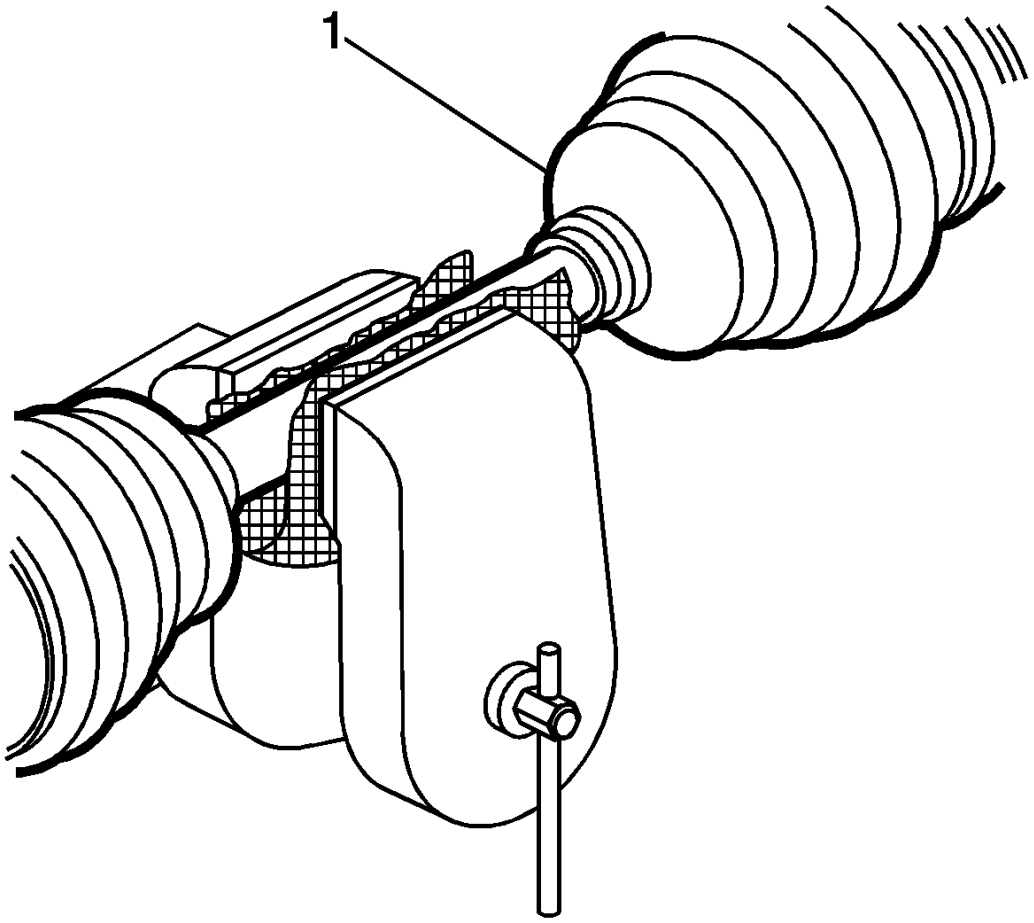

Fig. 19: View Of Front Wheel Drive Shaft Inner Joint
Courtesy of GENERAL MOTORS COMPANY

1. Install the wheel drive shaft in a soft jawed vise.

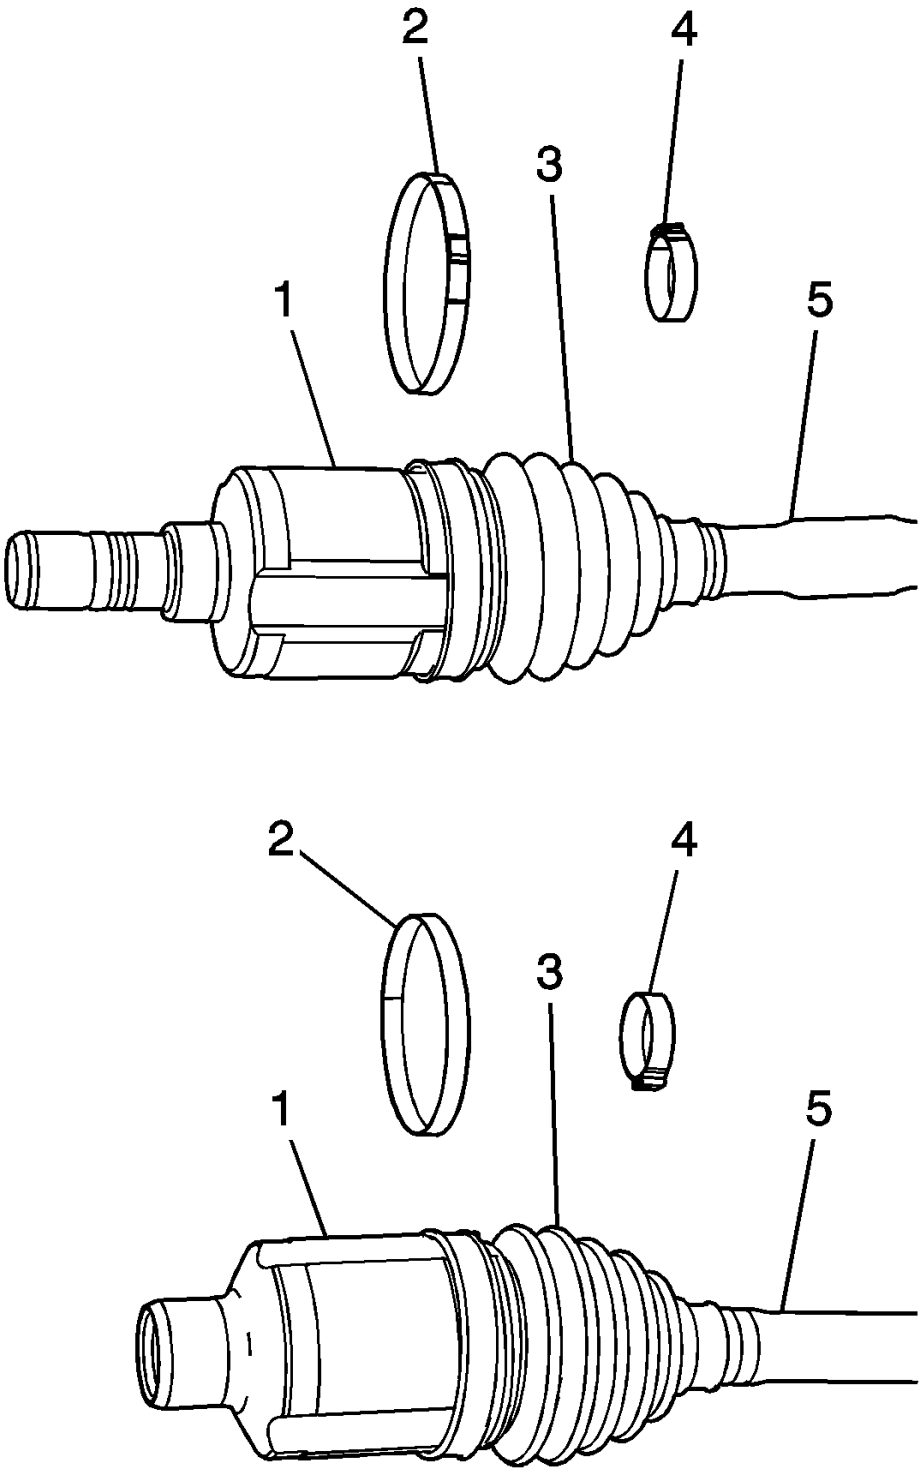

Fig. 20: View Of Wheel Drive Shaft Components
Courtesy of GENERAL MOTORS COMPANY

CAUTION: Do not cut through the wheel drive shaft inboard or outboard boot during service. Cutting through the boot may damage the sealing surface of the housing and the tripot or the constant velocity joint bushing. Damage to the sealing surface may lead to water and dirt intrusion and premature

wear of the constant velocity joint.

NOTE: **The following service procedure is for those vehicles equipped a swage style boot clamp. For all others, proceed to step 3.**

2. Using the appropriate size side cutter, remove and discard the boot retaining clamps (4) and (2).

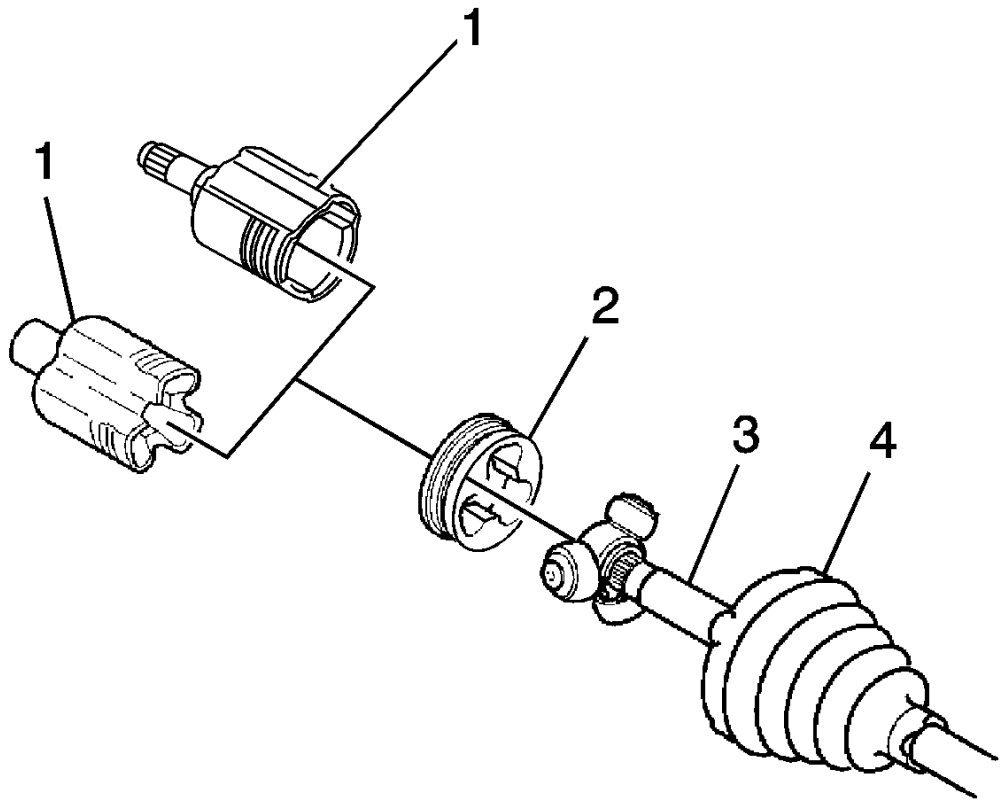

Fig. 21: View Of Tripot Housing, Bushing, Driveshaft And Boot
Courtesy of GENERAL MOTORS COMPANY

3. Remove the boot (4) from the tripod bushing (2).
4. Remove the inner tripod housing (1) and the tripod bushing (2) from the wheel drive shaft (3).

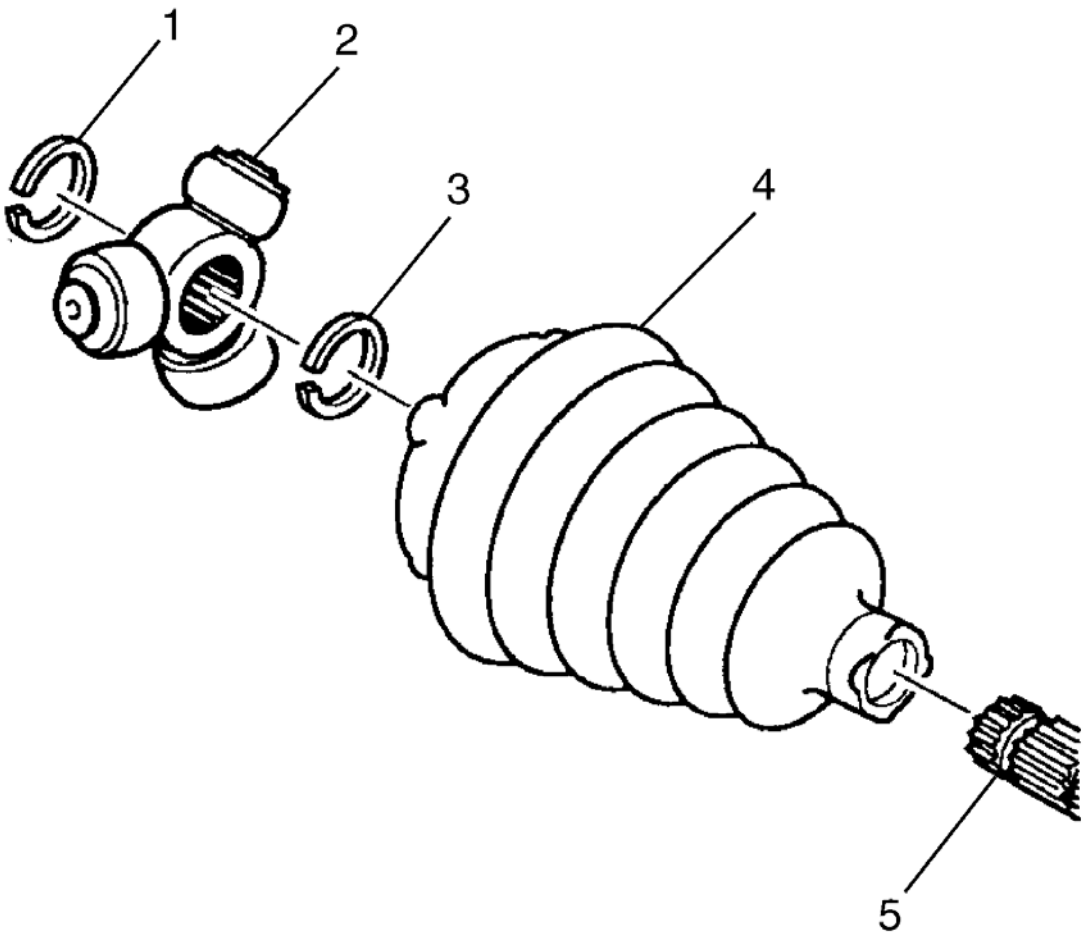

Fig. 22: View Of Spider Assembly, Rings & Tripot Boot
Courtesy of GENERAL MOTORS COMPANY

5. Using the appropriate tool, remove the outer retaining ring (1) from the wheel drive shaft (5).
6. Remove the tripod (2) from the wheel drive shaft (5).

NOTE: **If the tripod has a retaining ring located after it, proceed to step 8. If not, skip step 9 and proceed to step 9.**

7. Using the appropriate tool, remove the inner retaining ring (3) from the wheel drive shaft (5).
8. Remove the boot (4) from the wheel drive shaft (5).
9. Inspect the inner wheel drive shaft joint. Refer to **Wheel Drive Shaft Inner Joint Inspection**.

Assemble Procedure

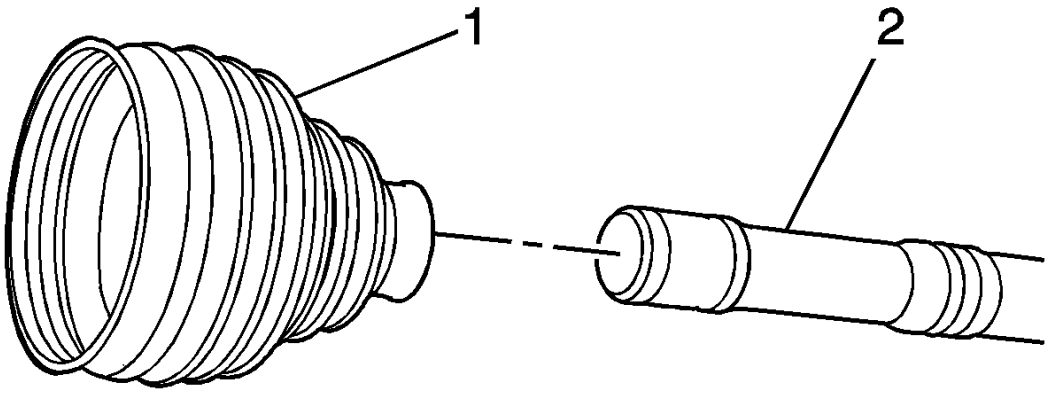

Fig. 23: Identifying Clamp & Wheel Drive Shaft
Courtesy of GENERAL MOTORS COMPANY

NOTE: **Steps 1-8 are is for those vehicles equipped a swage style boot clamp. For all others, proceed to step 9.**

1. Install the swage clamp and boot (1) on to the wheel drive shaft (2).

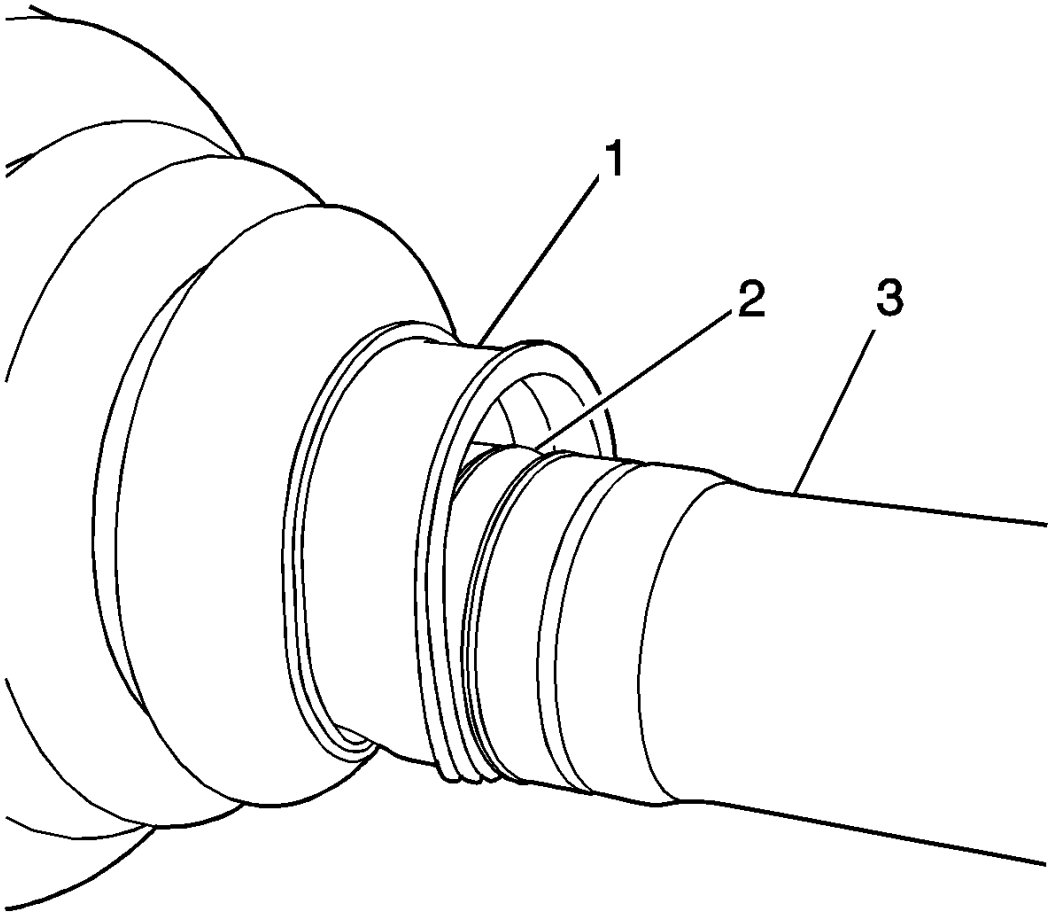

Fig. 24: Identifying Groove In Wheel Drive Shaft
Courtesy of GENERAL MOTORS COMPANY

2. Ensure that the boot (1) is properly seated in the groove (2) in the wheel drive shaft (3).

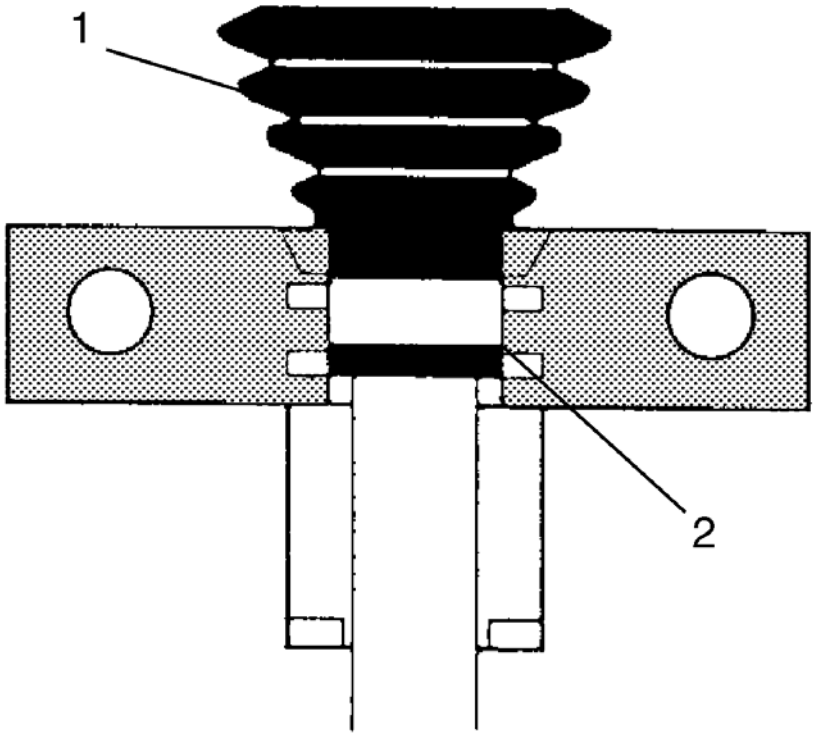

Fig. 25: Identifying Halfshaft Inboard Seal & Swage Ring
Courtesy of GENERAL MOTORS COMPANY

3. Install the **J 41048** drive axle swage ring clamp in a vise.
4. Position the swage clamp (2) so that it is properly seated on the boot (1).
5. Align the boot with the indicator on the bottom die.

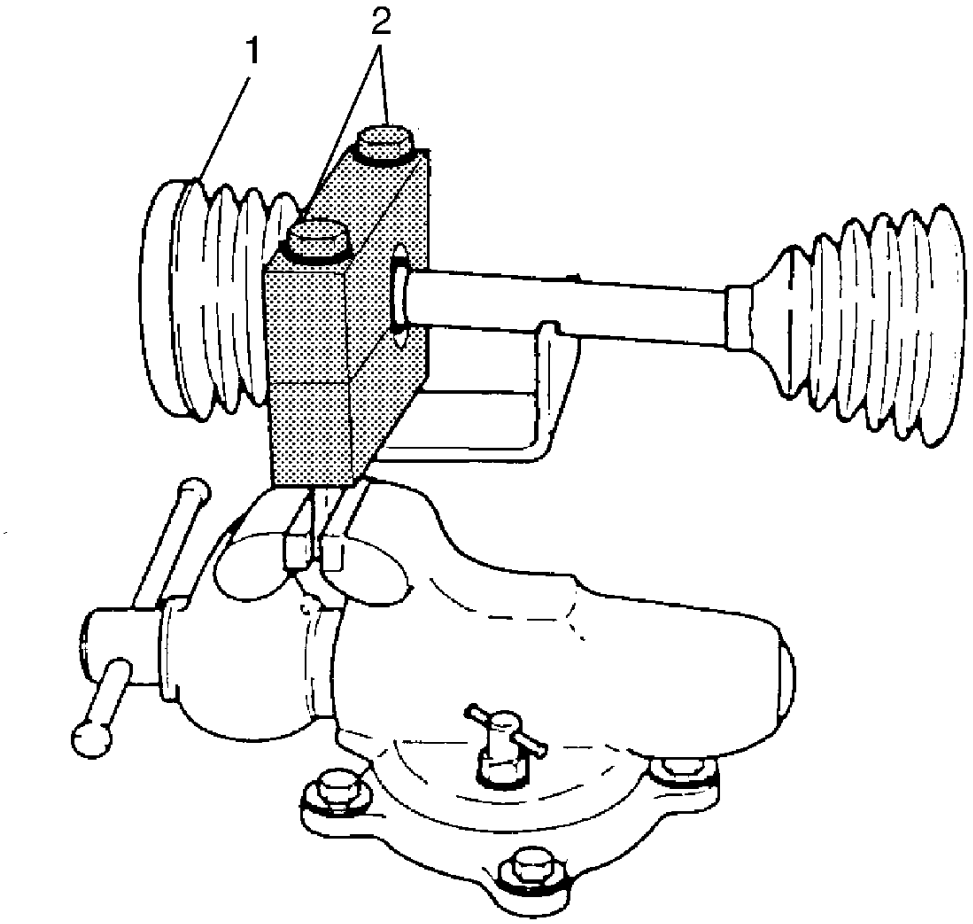

Fig. 26: Swaging Retaining Clamp Ring
Courtesy of GENERAL MOTORS COMPANY

6. Position the upper die and bolts (2) on the wheel drive shaft (1).
7. Hand tighten the bolts (2) until the gap between the upper and lower die are the same.

NOTE: **Before tightening the swage clamp, ensure that the swage clamp is seated properly so that it will not distort or damage the boot.**

8. Tighten the bolts (2) equally one at a time until both of the bolts have bottom out.

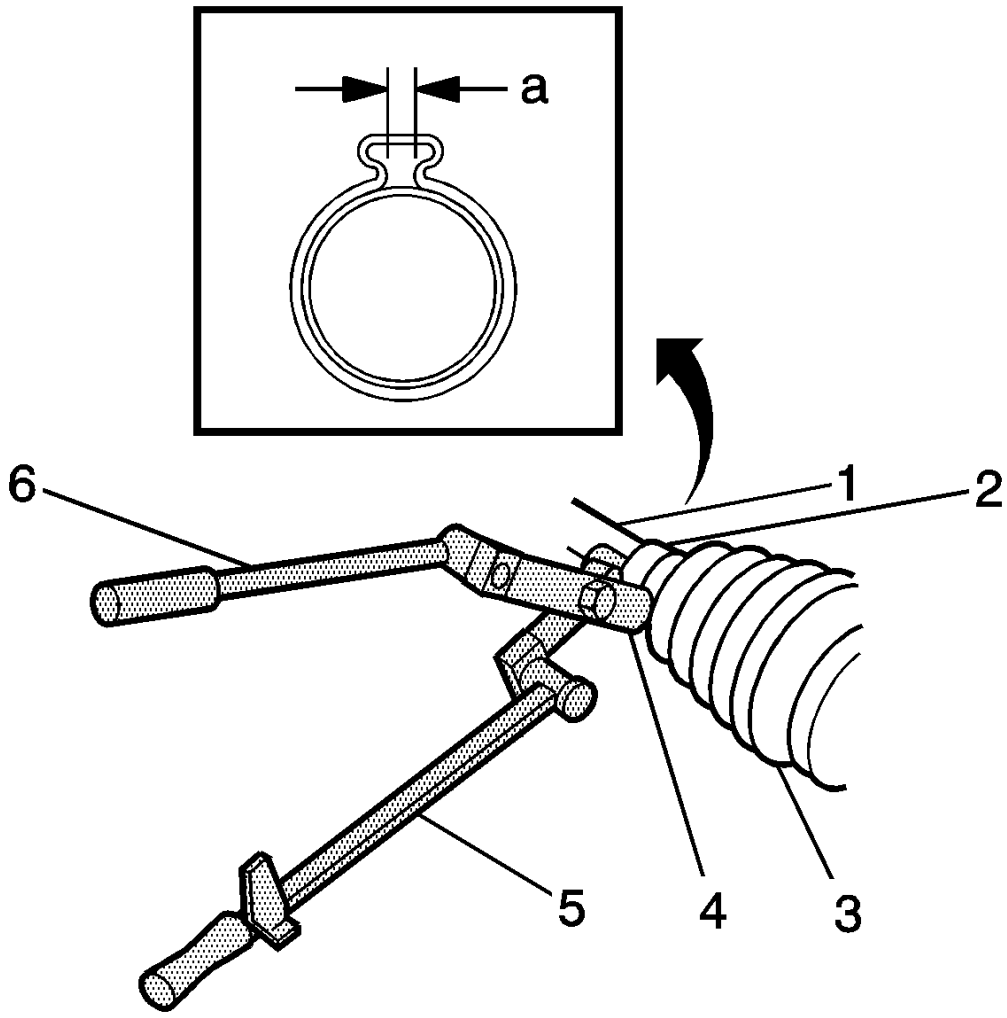

Fig. 27: Drive Axle Seal Clamp Pliers And Drive Shaft Components
Courtesy of GENERAL MOTORS COMPANY

9. Install the boot clamp on the boot.
10. Install the boot (3) and the clamp (2) on the wheel drive shaft (1).
11. Using the **J 35910** drive axle seal clamp pliers (4), torque wrench (5) and the breaker bar (6), tighten the clamp until the gap (a) in the clamp reaches 2.15 mm (0.085 inch).

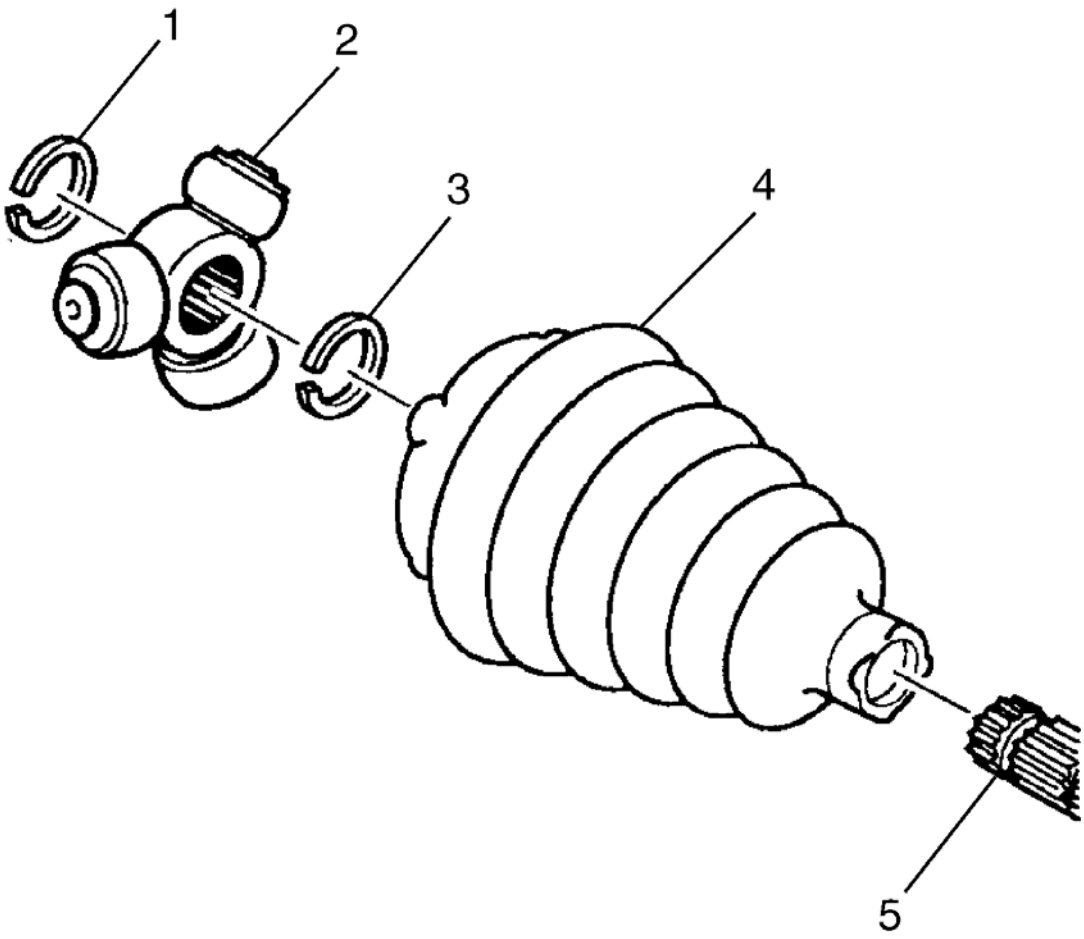

Fig. 28: View Of Spider Assembly, Rings & Tripot Boot
Courtesy of GENERAL MOTORS COMPANY

12. Using the appropriate tool, install the inner retaining ring (3), if equipped.
13. Install the tripod (2) on the wheel drive shaft (5).
14. Using the appropriate tool, install the outer retaining ring (1).

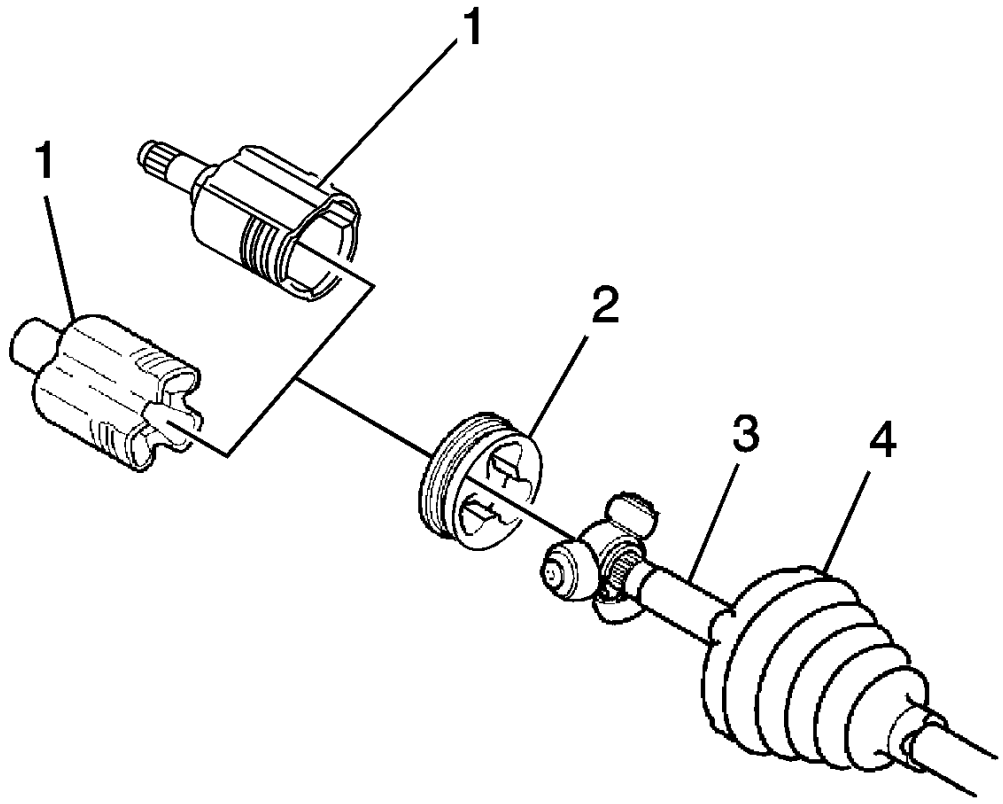

Fig. 29: View Of Tripot Housing, Bushing, Driveshaft And Boot
Courtesy of GENERAL MOTORS COMPANY

15. Install the tripod bushing (2), the tripod housing (1) on to the wheel drive shaft (3).
16. Install the tripod housing (1) on the boot (4).

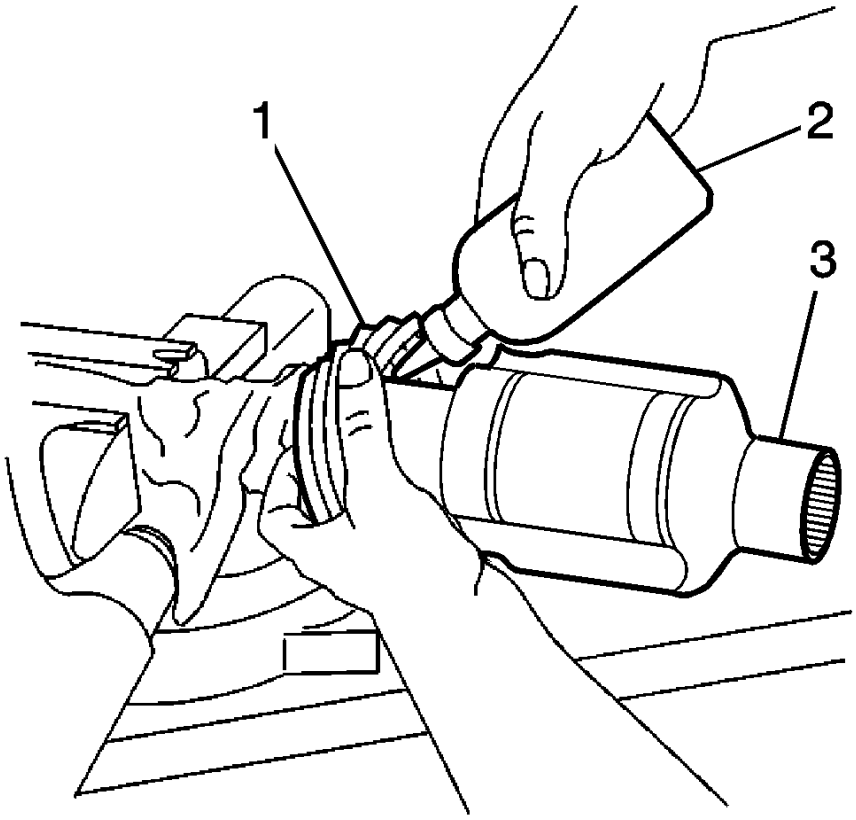

Fig. 30: Applying Lubricant Into Boot and Tripot Housing
Courtesy of GENERAL MOTORS COMPANY

17. Place approximately half the container of grease from the service kit in the boot and the half in the tripod housing.
18. Install the outer boot clamp (3) on the boot (2) and the tripod housing and the bushing (4).

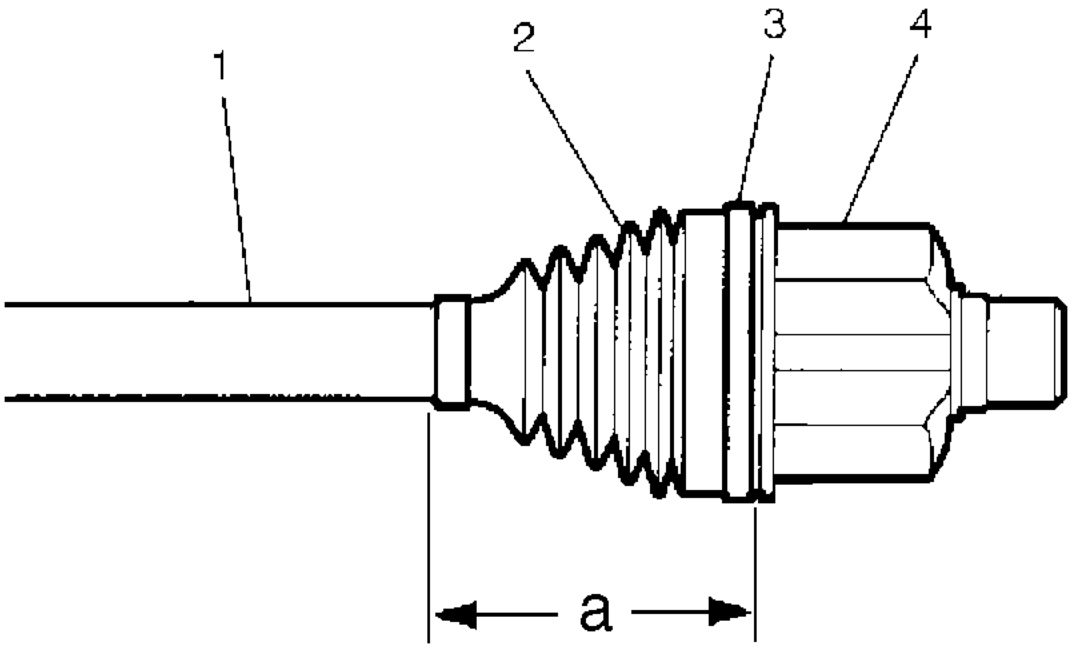

Fig. 31: Identifying Axle Shaft/CV Joint Assembly Components And Installed Boot Measurement Dimension
Courtesy of GENERAL MOTORS COMPANY

19. The measured distance from the rear of the boot to the front of the boot clamp (a) should be 95 mm (3.75 inch).

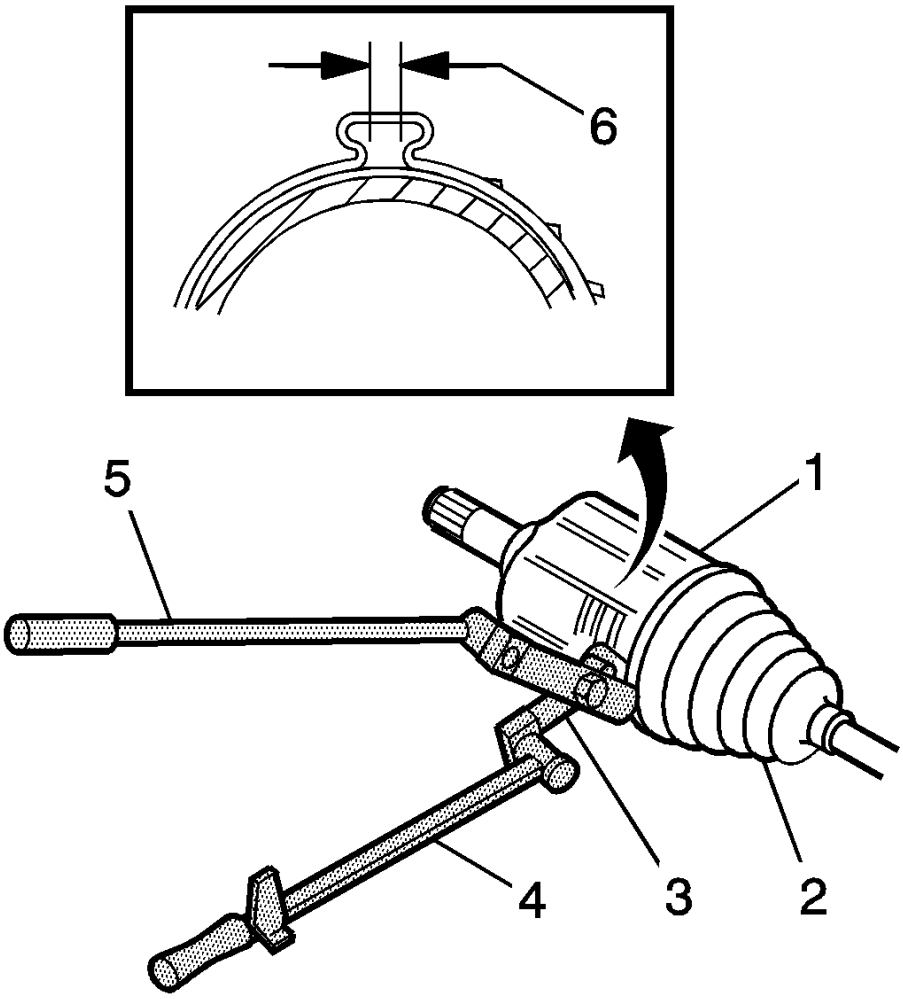

Fig. 32: Measuring Boot Clamp Gap
Courtesy of GENERAL MOTORS COMPANY

20. Using the **J 35910** drive axle seal clamp pliers (3), torque wrench (4), and the breaker bar (5), tighten the clamp (2) to 176 N.m (130 lb ft)..

NOTE: **If the gap dimension is larger than the given specification, continue to tighten the clamp until the specification is reached.**

21. The measured distance of the gap (6) should be 2.60 mm (0.102 inch).
22. Remove the wheel drive shaft from the **J 41048** drive axle swage ring clamp and rotate the tripod housing several times to distribute the grease.

WHEEL DRIVE SHAFT OUTER JOINT AND BOOT REPLACEMENT (WITHOUT WL9)

Special Tools

- **CH 48894** Wheel Drive Shaft Boot Clamp Pliers
- **DT 35910** Drive Axle Seal Clamp Pliers

For equivalent regional tools, refer to **Special Tools**.

NOTE: **The outer Constant Velocity Joint is not serviced separately. If the CV joint is found to have excessive wear or damage, replace the wheel drive shaft as an assembly.**

Disassemble Procedure

1. Remove the wheel drive shaft from the vehicle. Refer to **Wheel Drive Shaft Replacement (Left Side)Wheel Drive Shaft Replacement (Right Side)**

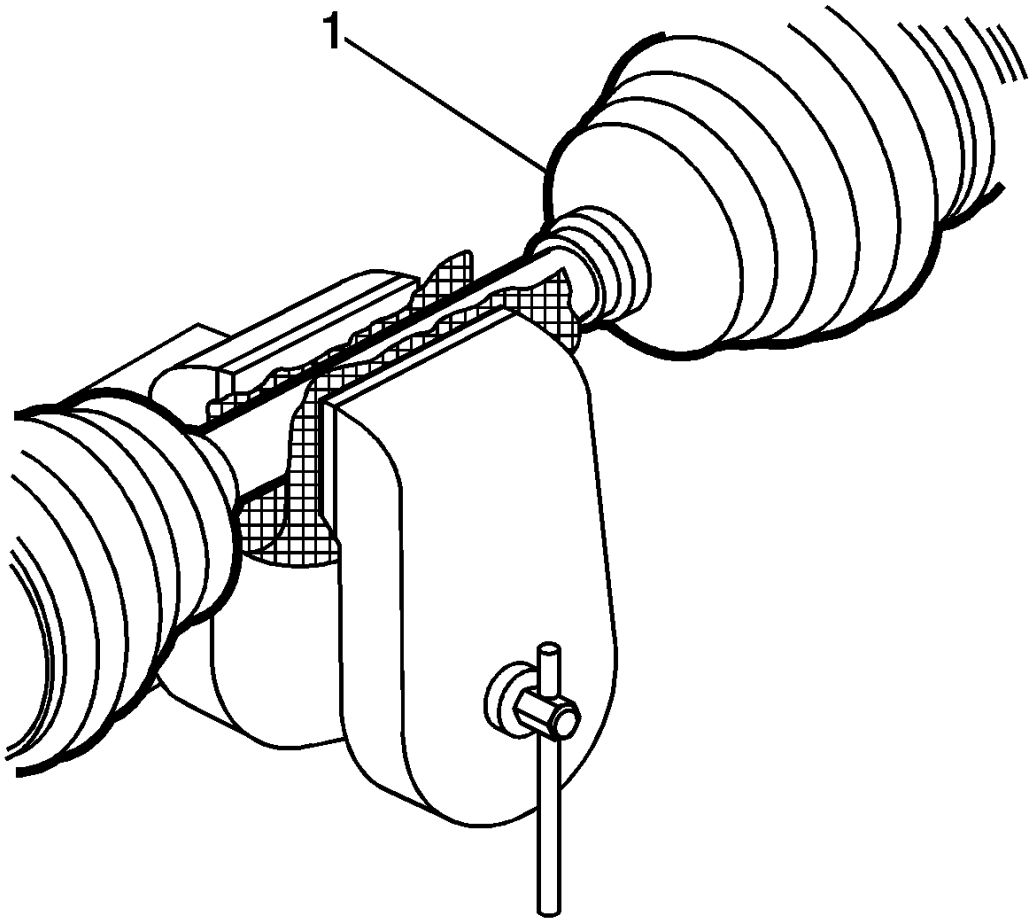

Fig. 33: View Of Front Wheel Drive Shaft Inner Joint
Courtesy of GENERAL MOTORS COMPANY

2. Clamp the drive axle shaft (1) in a soft jawed vice.

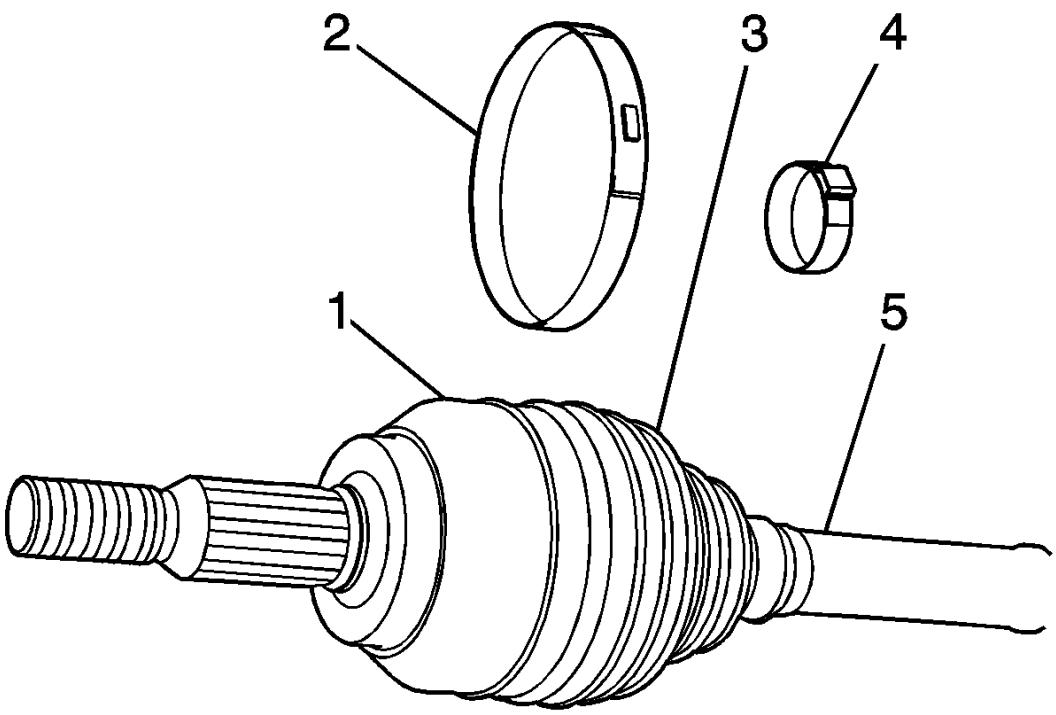

Fig. 34: Identifying Boot Clamps
Courtesy of GENERAL MOTORS COMPANY

CAUTION: Do not cut through the wheel drive shaft inboard or outboard boot during service. Cutting through the boot may damage the sealing surface of the housing and the tripot or the constant velocity joint bushing. Damage to the sealing surface may lead to water and dirt intrusion and premature wear of the constant velocity joint.

3. Using a flat-bladed tool, remove the boot clamp (2) from the constant velocity (CV) joint (1) and the boot (3).
4. Using a pair of side cutters, remove and discard the boot clamp (4) from the boot (3) and the wheel drive shaft (5). Replace with NEW clamps.

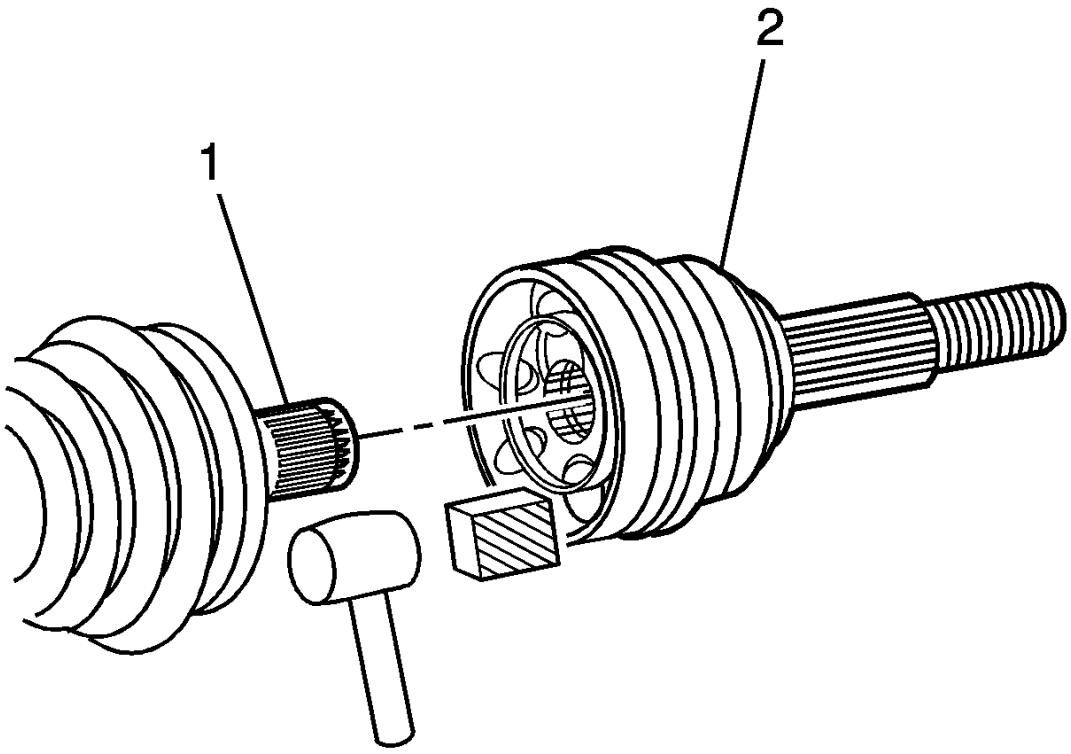

Fig. 35: Separating CV Joint From Axle Shaft
Courtesy of GENERAL MOTORS COMPANY

5. Using a block of wood and a hammer, remove the CV joint (2) from the wheel drive shaft (1).

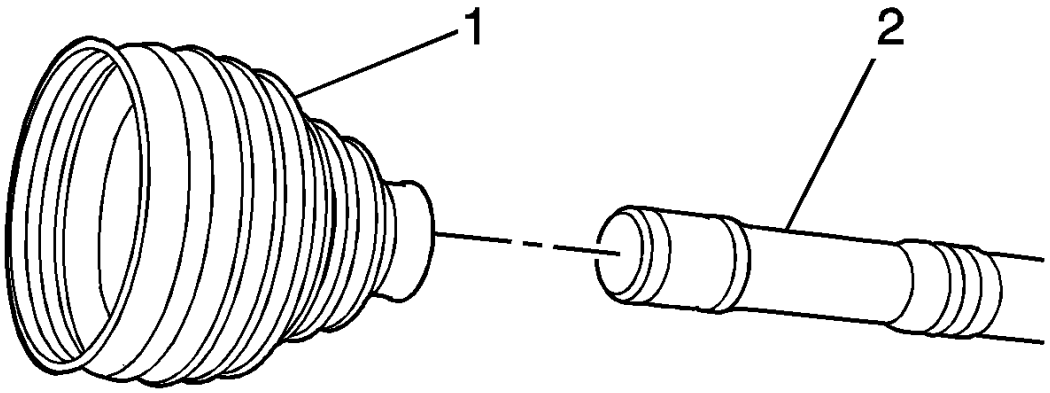

Fig. 36: Identifying Clamp & Wheel Drive Shaft
Courtesy of GENERAL MOTORS COMPANY

6. Remove the boot (1) from the wheel drive shaft (2).

Assemble Procedure

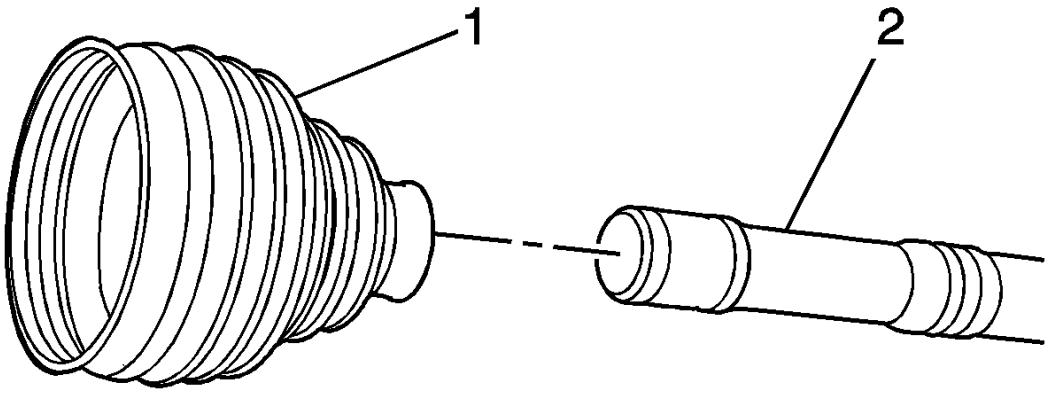

Fig. 37: Identifying Clamp & Wheel Drive Shaft
Courtesy of GENERAL MOTORS COMPANY

1. Position the boot (1) on the wheel drive shaft (2).

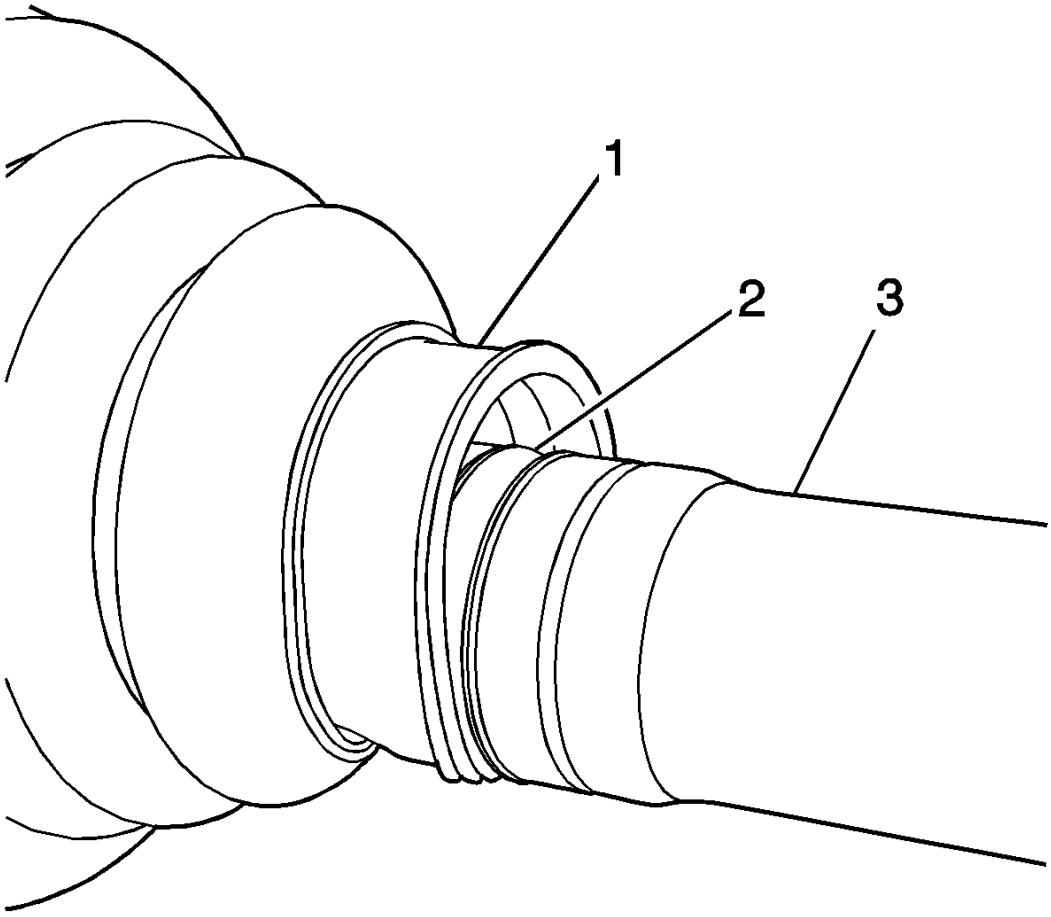

Fig. 38: Identifying Groove In Wheel Drive Shaft
Courtesy of GENERAL MOTORS COMPANY

2. Ensure that the boot (1) is properly seated in the groove (2) in the wheel drive shaft (3).

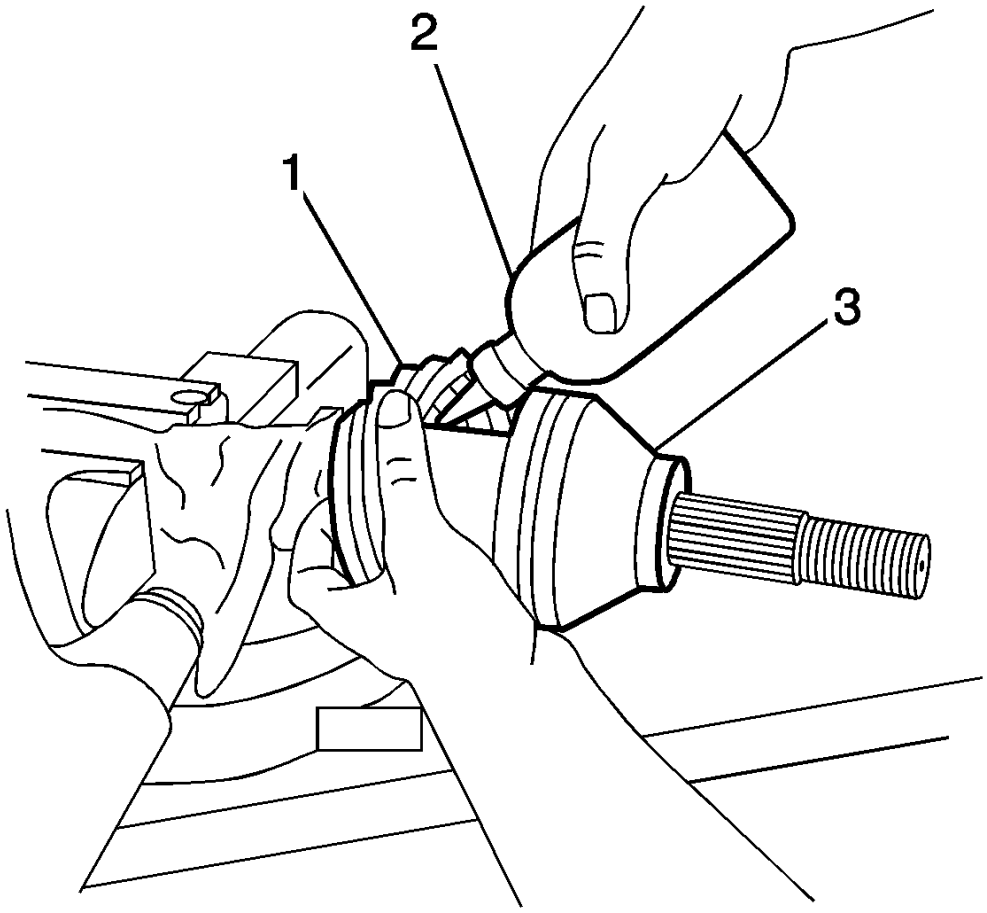

Fig. 39: Lubricating Boot Of Tripot Housing
Courtesy of GENERAL MOTORS COMPANY

3. Place approximately half the lubricant (2) inside the CV joint boot (1) and the other half in the CV joint (3).

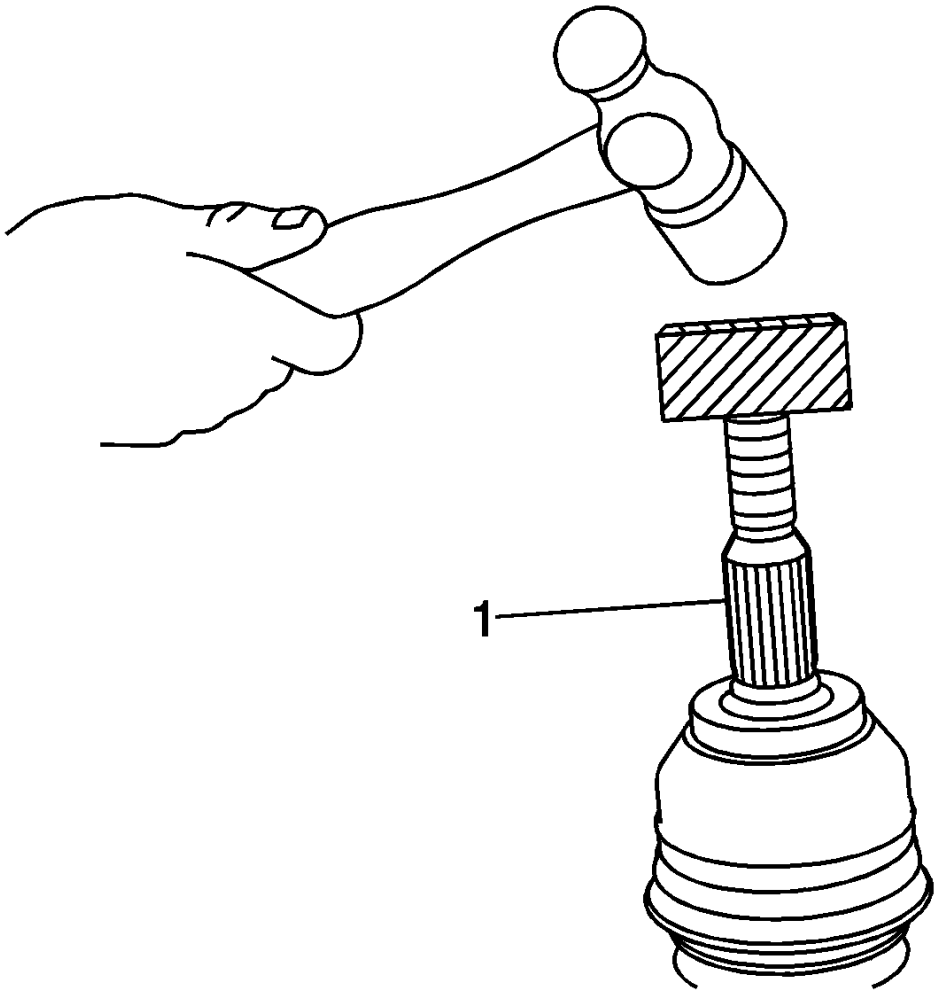

Fig. 40: Installing CV Joint
Courtesy of GENERAL MOTORS COMPANY

4. Using a block of wood and a hammer, install the CV joint on the wheel drive shaft (1).

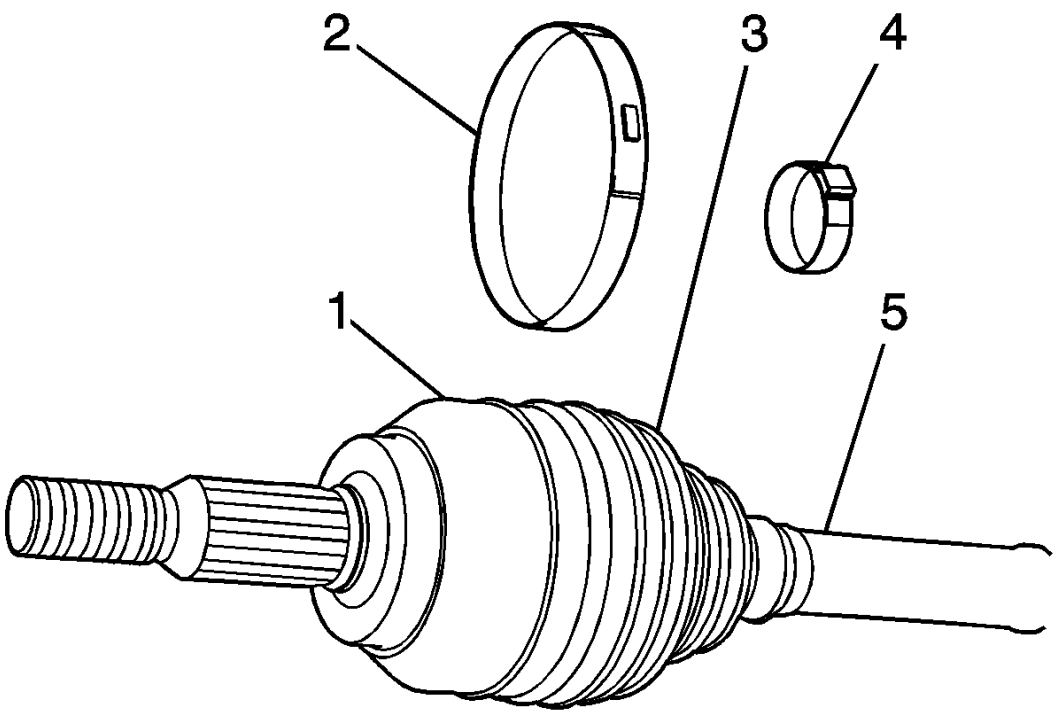

Fig. 41: Identifying Boot Clamps
Courtesy of GENERAL MOTORS COMPANY

5. Install the inboard boot clamp (4) on the boot (3) and the wheel drive shaft (5).
6. Install the outboard boot clamp (2) on the boot (3) and the CV joint housing (1).

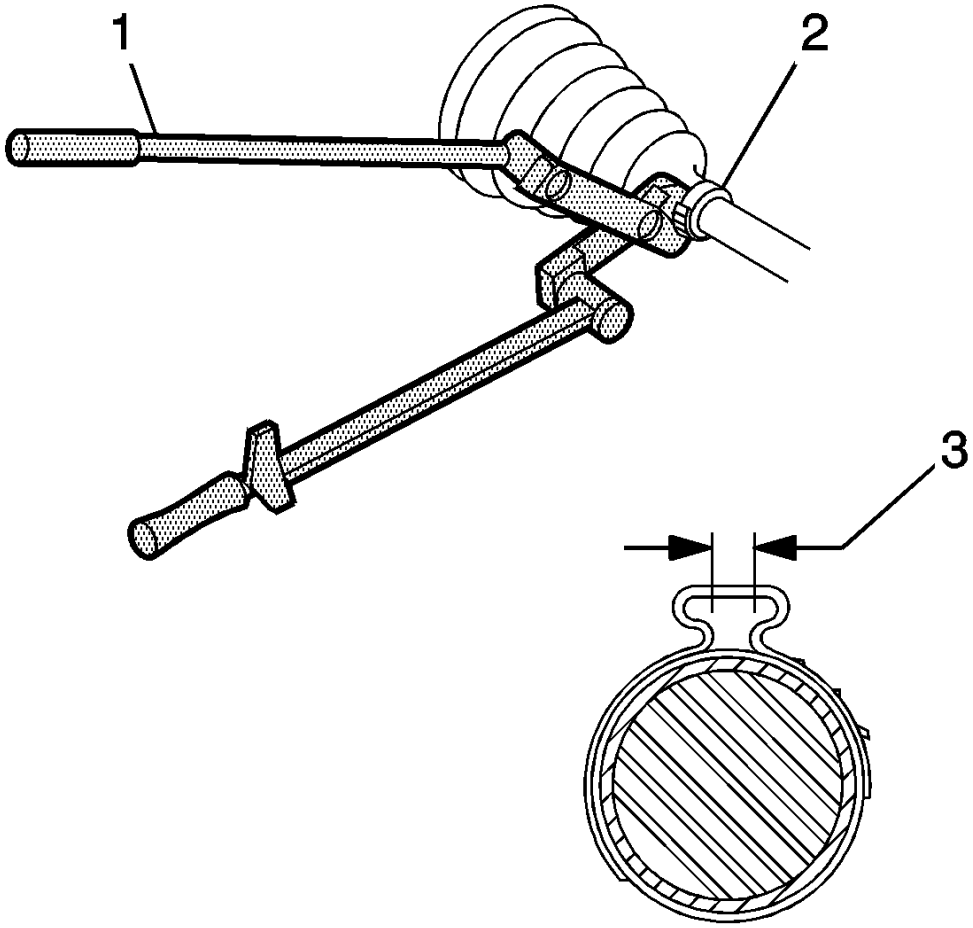

Fig. 42: Identifying Pliers Breaker Bar, Torque Wrench, Ratchet & Gap Measurement
Courtesy of GENERAL MOTORS COMPANY

NOTE: **Ensure that the boot clamp is properly positioned around the entire circumference of the boot.**

7. Using the **DT 35910** pliers (1), close the clamp (2) until the gap (3) measures 2.15 mm (0.85 in).

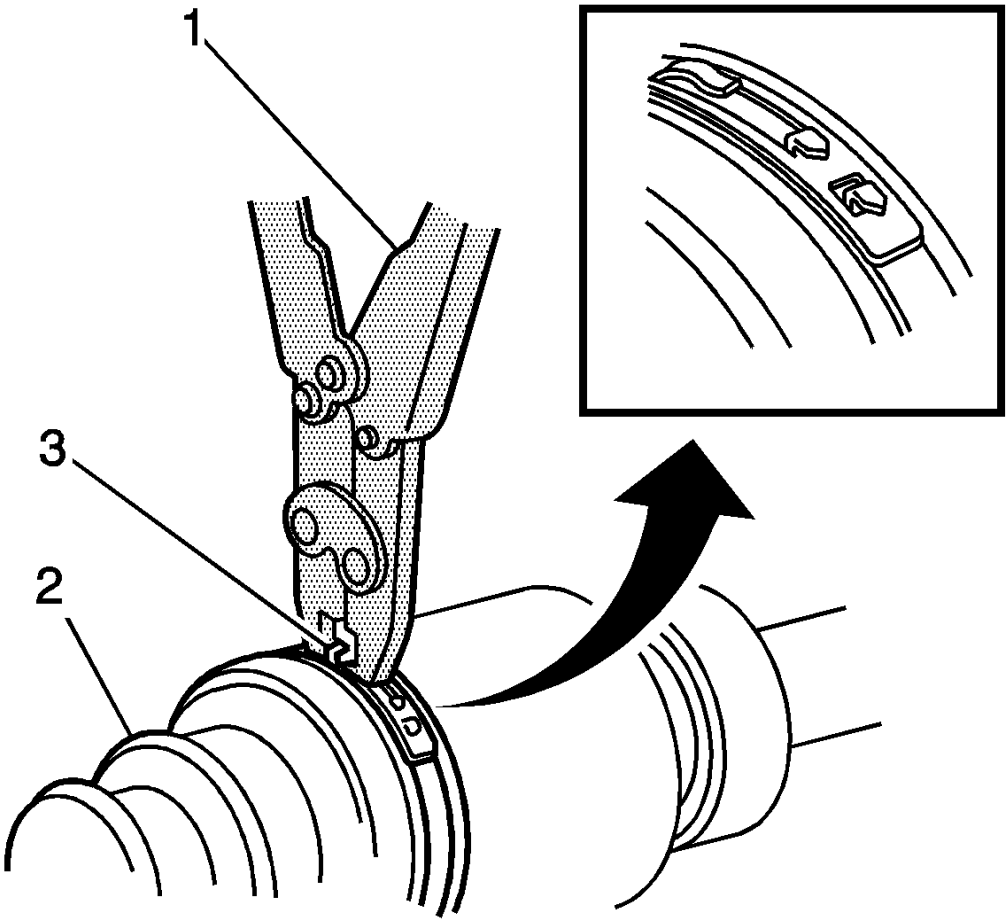

Fig. 43: Latching Large Seal Retaining Clamp
Courtesy of GENERAL MOTORS COMPANY

NOTE: **Ensure that the boot clamp is properly positioned around the entire circumference of the boot.**

8. Using the **CH 48894** pliers (1), close the boot clamp (3).
9. Remove the wheel drive shaft from the bench vise.
10. Move the CV joint in a circular motion 4 to 5 times to distribute the lubricant.
11. Install the wheel drive shaft in the vehicle. Refer to **Wheel Drive Shaft Replacement (Left Side)Wheel Drive Shaft Replacement (Right Side)**.

WHEEL DRIVE SHAFT OUTER JOINT AND BOOT REPLACEMENT (WITH WL9)

Special Tools

- **DT-48267** Drive Axle Swage Ring Clamp
- **J-8059** Snap Ring Pliers
- **J-35910** Drive Axle Seal Clamp Pliers

For equivalent regional tools, refer to **Special Tools**.

Removal Procedure

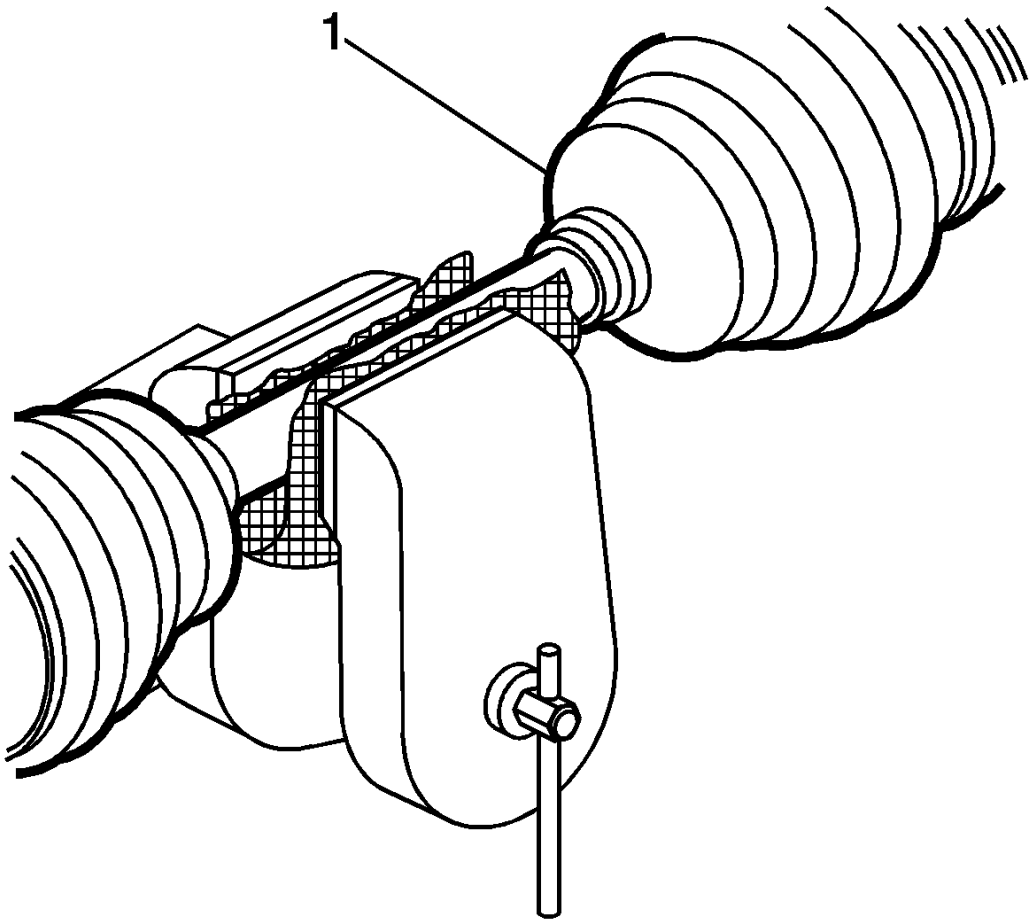

Fig. 44: View Of Front Wheel Drive Shaft Inner Joint
Courtesy of GENERAL MOTORS COMPANY

1. Clamp the wheel drive shaft (1) in a soft jawed vice.

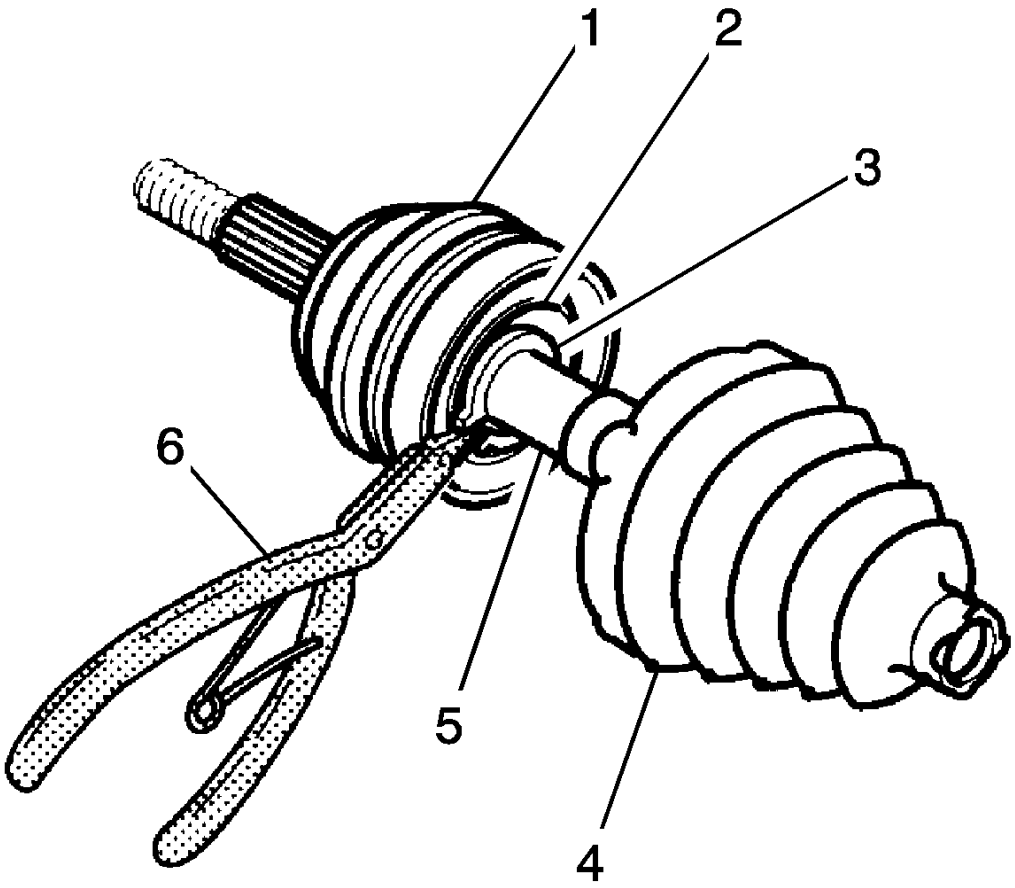

Fig. 45: Identifying CV Joint Components
Courtesy of GENERAL MOTORS COMPANY

CAUTION: Do not cut through the wheel drive shaft inboard or outboard boot during service. Cutting through the boot may damage the sealing surface of the housing and the tripot or the constant velocity joint bushing. Damage to the sealing surface may lead to water and dirt intrusion and premature wear of the constant velocity joint.

2. Remove the large seal retaining clamp from the CV joint with a side cutter. Discard the seal retaining clamp.

   Use a hand grinder to cut through the swage ring in order to remove the swage ring.

3. Remove the small eared clamp with a side cutter. Discard the eared clamp.
4. Separate the wheel drive shaft outboard seal from CV joint outer race (1) at large diameter.
5. Slide the seal (4) away from joint along wheel drive shaft (5).
6. Wipe the grease from the face of the CV joint inner race (3).
7. Spread the ears on the race retaining ring (2) using **J 8059** pliers (6).

8. Remove the CV joint assembly (1) from the wheel drive shaft (5).
9. Remove the wheel drive shaft outboard seal (4) from the wheel drive shaft (5).
10. Discard the old outboard seal (4).

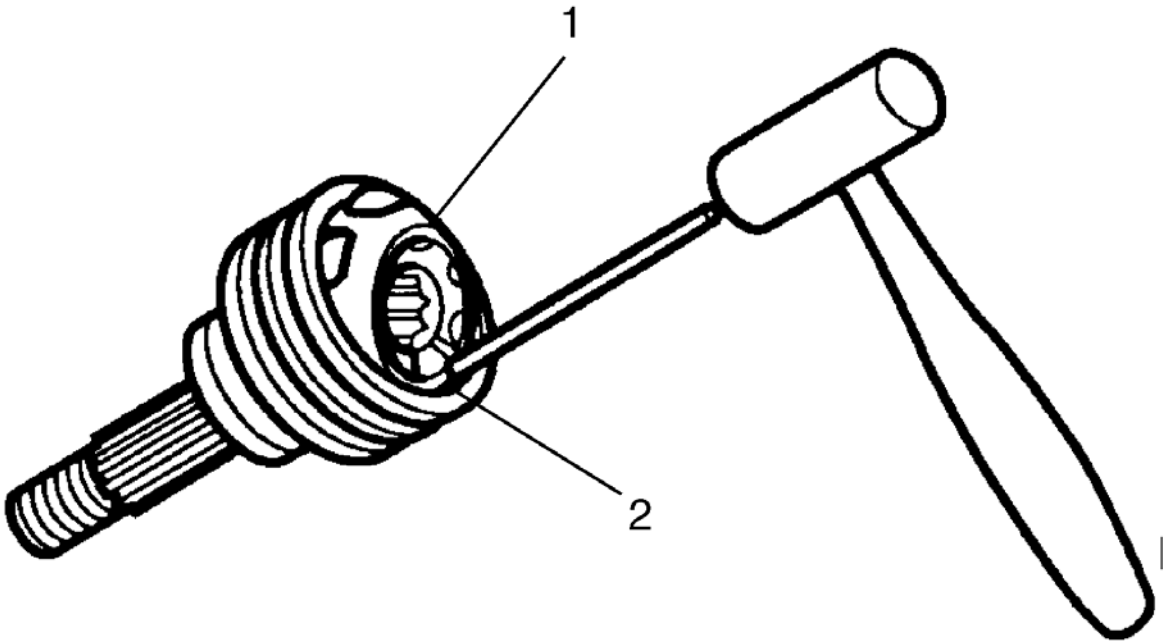

Fig. 46: Tapping Gently On Brass Drift With A Hammer In Order To Tilt Cage
Courtesy of GENERAL MOTORS COMPANY

11. Place a brass drift against the CV joint cage (1).
12. Tap gently on the brass drift with a hammer in order to tilt the cage (1).
13. Remove the first chrome alloy ball (2) when the CV joint cage (1) tilts.
14. Tilt the CV joint cage (1) in the opposite direction to remove the opposing chrome alloy ball (2).
15. Repeat this process to remove all 6 of the balls.

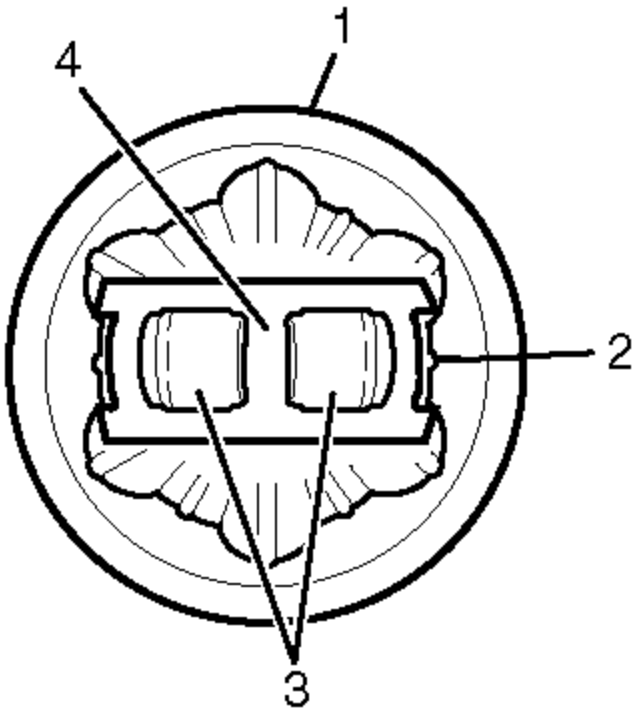

Fig. 47: View Of Outer Race, Inner Race, Cage Window & CV Joint Cage
Courtesy of GENERAL MOTORS COMPANY

16. Pivot the CV joint cage (4) and the inner race 90 degrees to the center line of the outer race (2). At the same time, align the cage windows (3) with the lands of the outer race.
17. Lift out the cage (4) and the inner race.

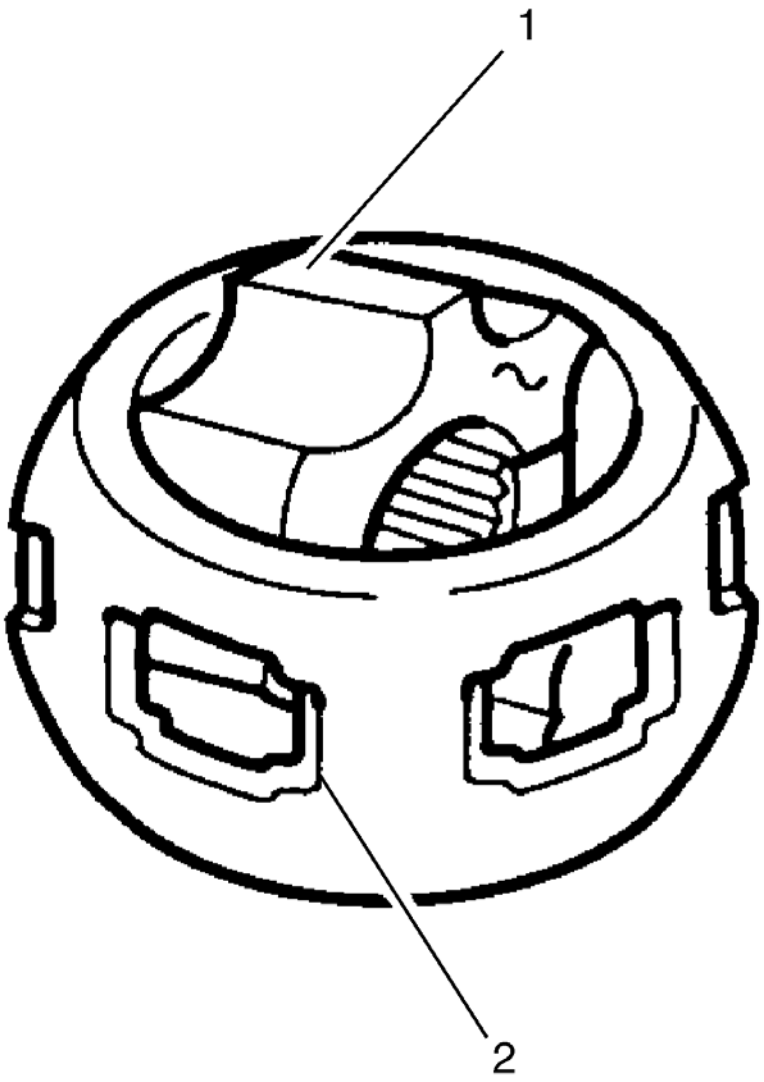

Fig. 48: View Of Inner Race & Cage
Courtesy of GENERAL MOTORS COMPANY

18. Remove the inner race (1) from the cage (2) by rotating the inner race (1) upward.

NOTE: **Remove all traces of old grease and any contaminates**

19. Clean the following items thoroughly with cleaning solvent.
    - The inner and outer race assemblies
    - The CV joint cage
    - The chrome alloy balls
20. Dry all the parts.
21. Check the CV joint assembly for the following items:
    - Unusual wear
    - Cracks

- Damage

22. Replace any damaged parts.
23. Using a wire brush, remove any rust in the seal mounting area (grooves) in the wheel drive shaft.

Installation Procedure

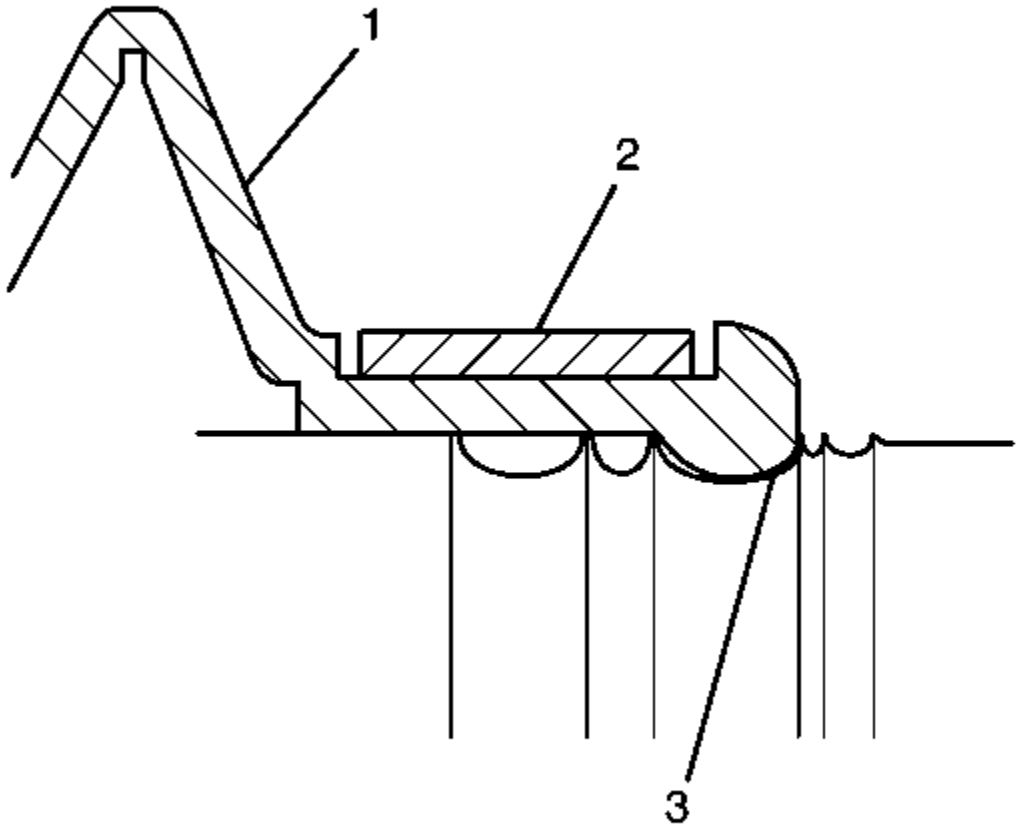

Fig. 49: View Of Outboard Seal, Seal Groove & Eared Clamp
Courtesy of GENERAL MOTORS COMPANY

NOTE: **For eared clamp, place a towel in the vise before inserting the wheel drive shaft.**

1. For eared clamp installation, mount the wheel drive shaft into a vise.

NOTE: **Do not swage or crimp.**

2. Install the new swage ring or eared clamp (2) on the neck of the outboard seal (1).

3. Slide the outboard seal (1) onto the wheel drive shaft and position the neck of the outboard seal (1) in the seal groove on the wheel drive shaft. The largest groove below the sight groove on the wheel drive shaft is the seal groove (3).

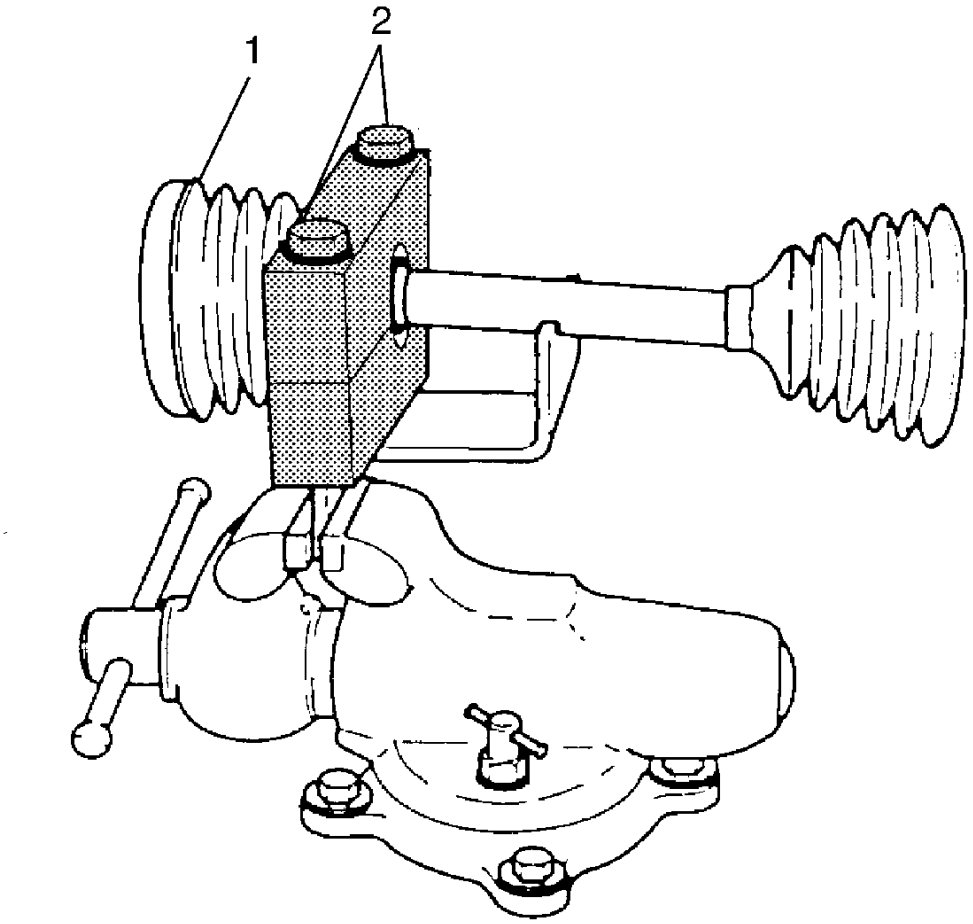

Fig. 50: Swaging Retaining Clamp Ring
Courtesy of GENERAL MOTORS COMPANY

NOTE: **For eared clamp installation, proceed to step 7.**

4. For swage ring installation use **DT-48267** clamp in the following way:
    1. Position the outboard end of the wheel drive shaft assembly (1) in **DT-48267** clamp.
    2. Align the swage ring.
    3. Place the top half of **DT-48267** clamp.

NOTE: **Align the following items during this procedure:**

- **The outboard seal (1)**
- **The wheel drive shaft**
- **The swage ring**

4. Install the bolts (2) and tighten by hand.

NOTE: **Alternate between each bolt until both sides are bottomed.**

5. Using the proper size socket and ratchet wrench, tighten the bolts (2) 180 degrees until bottom.

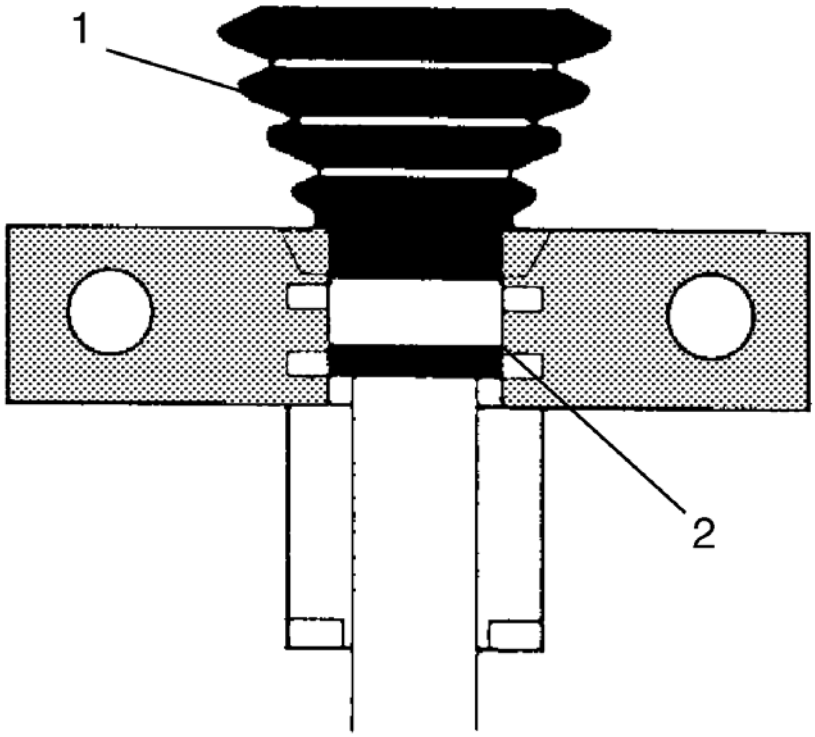

Fig. 51: Identifying Halfshaft Inboard Seal & Swage Ring
Courtesy of GENERAL MOTORS COMPANY

5. Loosen the bolts and separate the dies.
6. Check swaged ring (2) for any lip deformities. If present, place the ring (2) back into the **DT-48267** clamp making sure the ring covers the whole swaging area. If necessary, re-swage the ring.

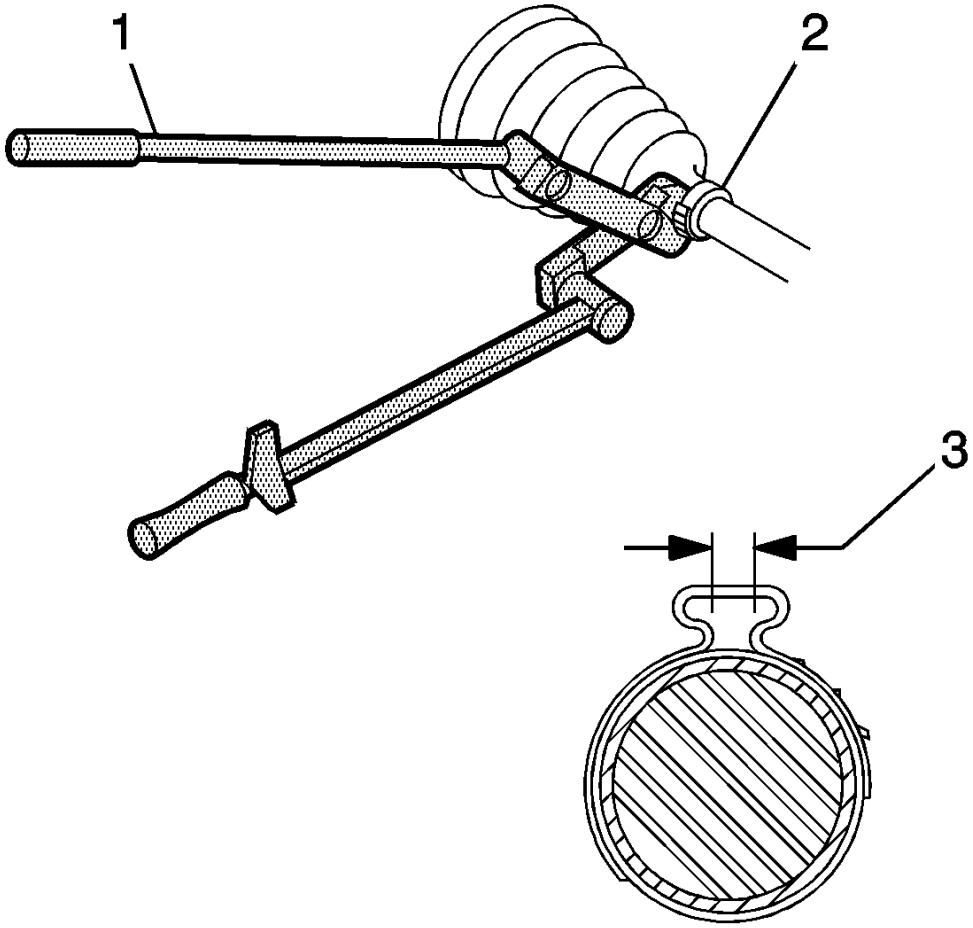

Fig. 52: Identifying Pliers Breaker Bar, Torque Wrench, Ratchet & Gap Measurement
Courtesy of GENERAL MOTORS COMPANY

CAUTION: Refer to Fastener Caution .

7. Crimp the eared clamp (1) using the **J 35910** pliers , a breaker bar, and a torque wrench.

   Tighten

   Tighten the eared clamp to 136 N.m (100 lb ft).

8. Check the gap dimension, continue tightening until the gap dimension is reached.

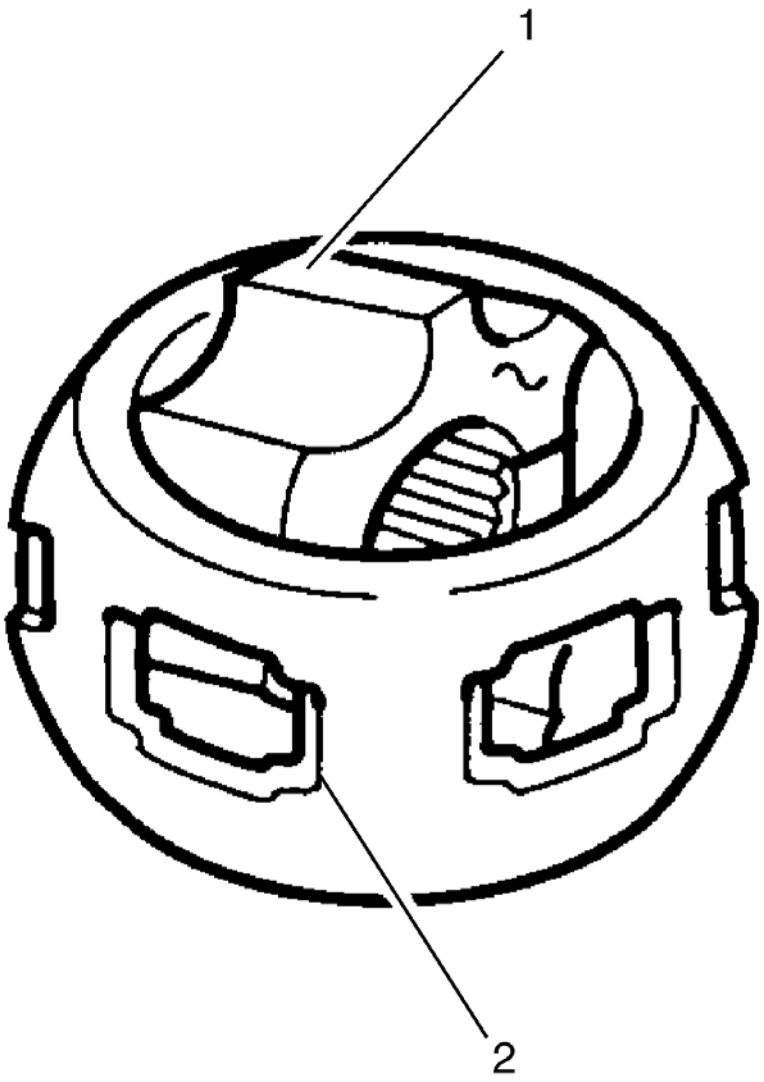

Fig. 53: View Of Inner Race & Cage
Courtesy of GENERAL MOTORS COMPANY

9. Put a light coat of grease from the service kit on the ball grooves of the inner race and the outer race.
10. Hold the inner race 90 degrees to centerline of cage with the lands of the inner race (1) aligned with the windows of the cage (2) and insert the inner race into the cage.

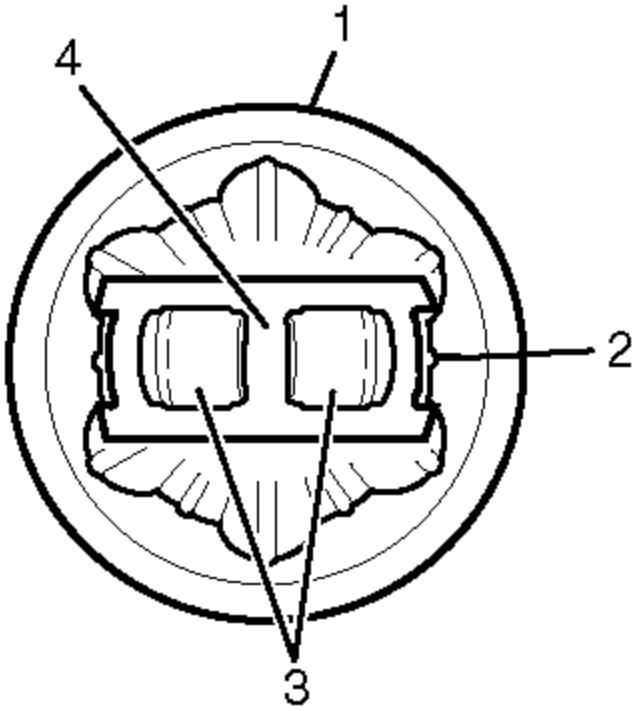

Fig. 54: View Of Outer Race, Inner Race, Cage Window & CV Joint Cage
Courtesy of GENERAL MOTORS COMPANY

11. Hold the cage and the inner race 90 degrees to centerline of the outer race (1) and align the cage windows (3) with the lands of the outer race.

NOTE: **Be sure that the retaining ring side of the inner race faces the wheel drive shaft.**

12. Place the cage and the inner race into the outer race.
13. Insert the first chrome ball then tilt the cage in the opposite direction to insert the opposing ball.
14. Repeat this process until all 6 balls are in place.
15. Place approximately half the grease from the service kit inside the outboard seal and pack the CV joint with the remaining grease.

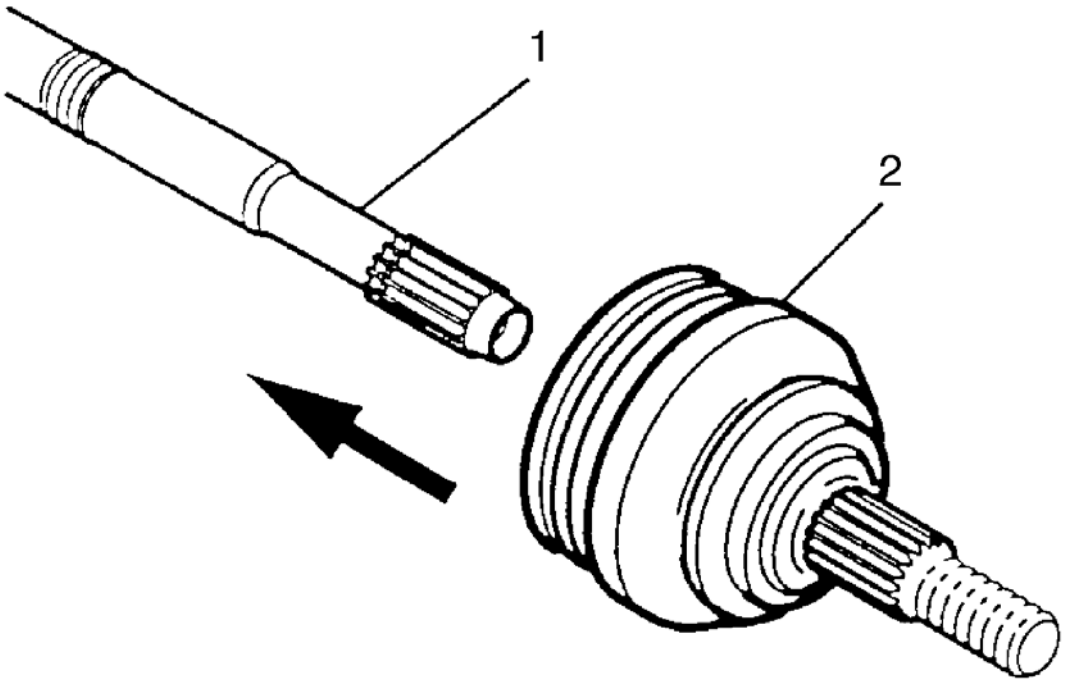

Fig. 55: Pushing CV Joint Onto Halfshaft
Courtesy of GENERAL MOTORS COMPANY

16. Push the CV joint (2) onto the wheel drive shaft (1) until the retaining ring is seated in the groove on the wheel drive shaft (1).

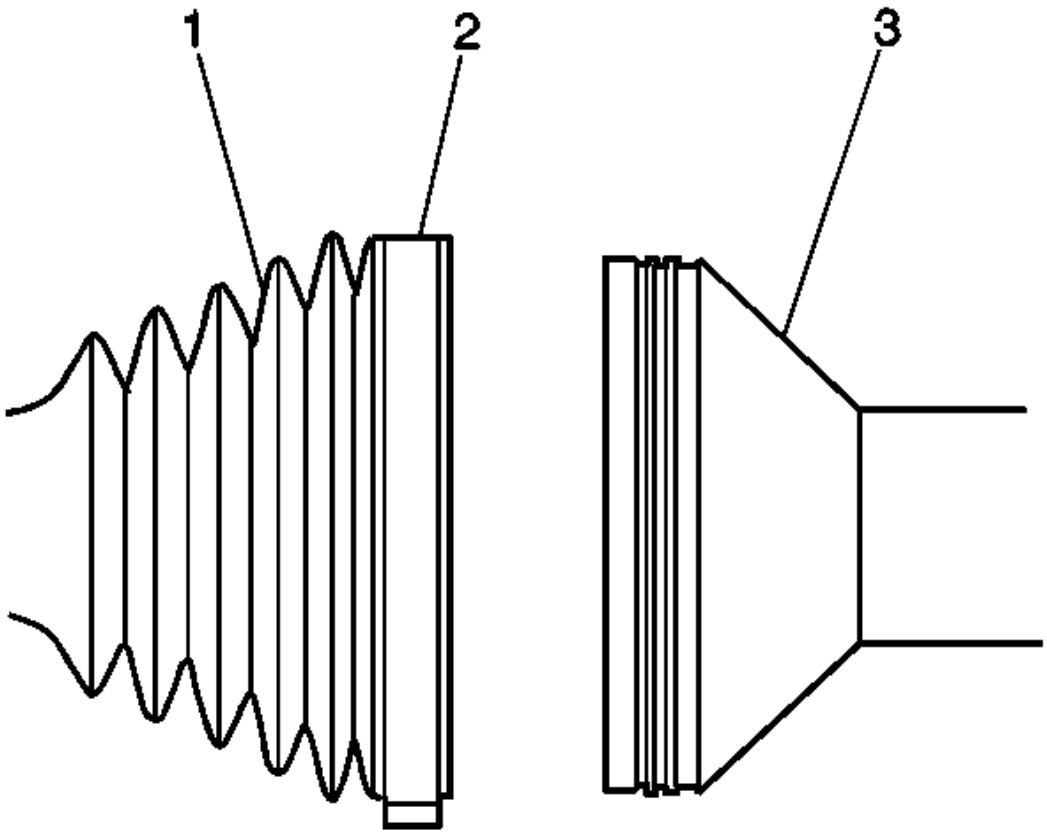

Fig. 56: View Of Boot And Large Seal Retaining Clamp
Courtesy of GENERAL MOTORS COMPANY

NOTE: **The outboard seal (1) must not be dimpled, stretched or out of shape in any way. If the outboard seal (1) is not shaped correctly, equalize the pressure in the outboard seal (1) and shape the seal properly by hand.**

17. Slide large diameter of the outboard seal (1) with the large seal retaining clamp (2) in place over the outside of the CV joint outer race (3) and locate the seal lip in the groove on the CV joint outer race.

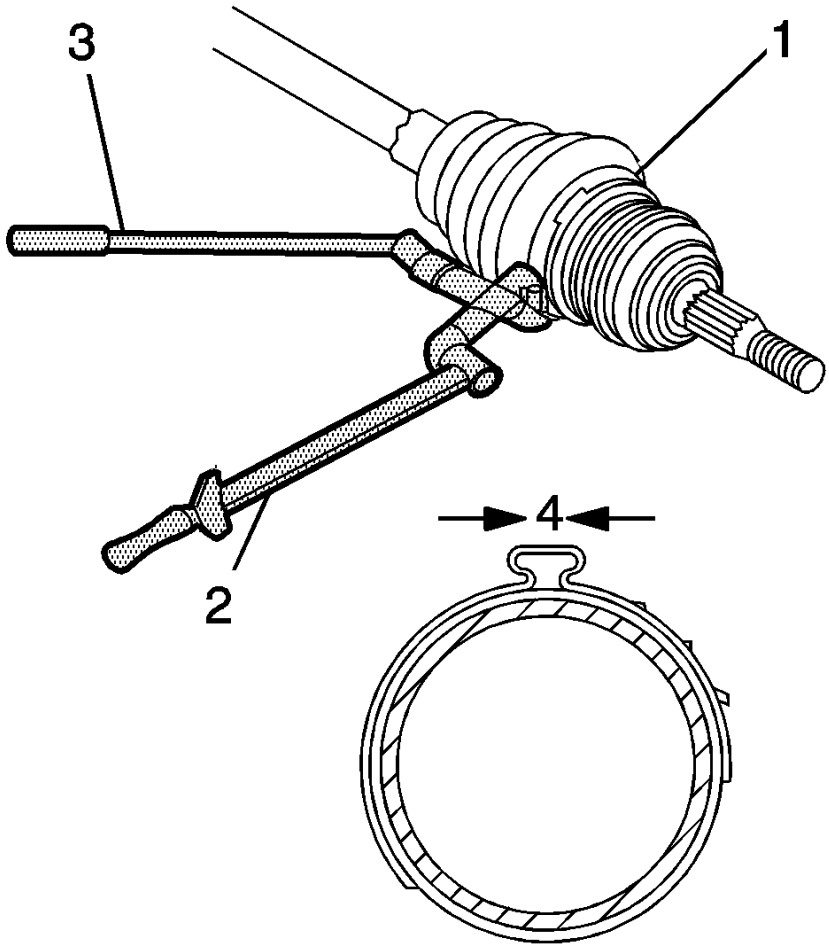

Fig. 57: Crimping Seal Retaining Clamp
Courtesy of GENERAL MOTORS COMPANY

18. Using the **J 35910** pliers (3) and the torque wrench (2), tighten the seal retaining clamp (1) to 176 N.m (130 lb ft).
19. Check the gap dimension (4) on the clamp ear. Continue tightening until the gap dimension is reached. Dimension 1.9 mm (5/64 in).

WHEEL DRIVE SHAFT OUTER JOINT INSPECTION

Special Tools

J 8059 Snap Ring Pliers

Disassembly Procedure

1. Remove the outer constant velocity (CV) joint and boot from the wheel drive shaft. Refer to **Wheel Drive Shaft Replacement (Left Side)Wheel Drive Shaft Replacement (Right Side)**.
2. Remove any grease from the CV joint.

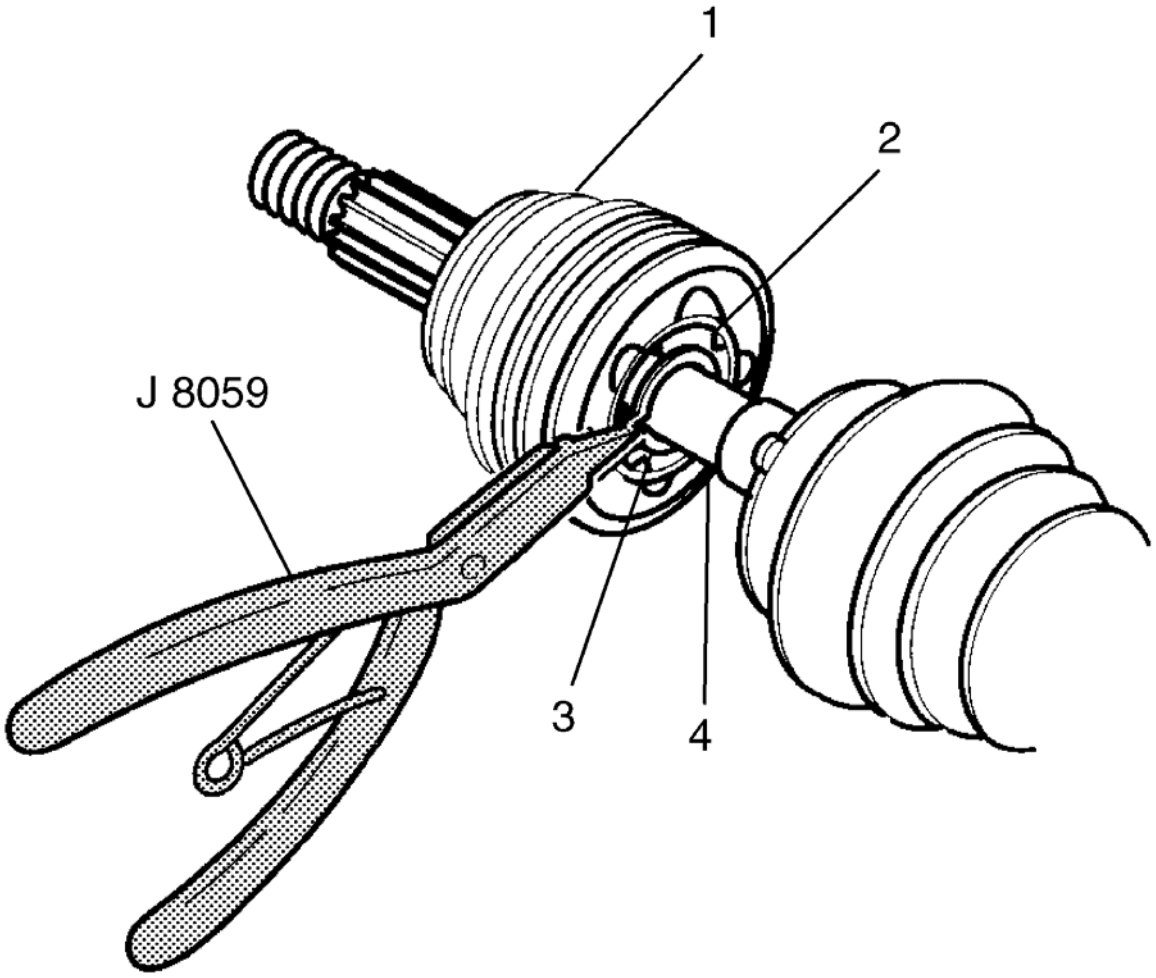

Fig. 58: Snap Ring Pliers
Courtesy of GENERAL MOTORS COMPANY

3. Using the **J 8059** snap ring pliers , remove the retaining ring (3) from the wheel drive shaft (4).

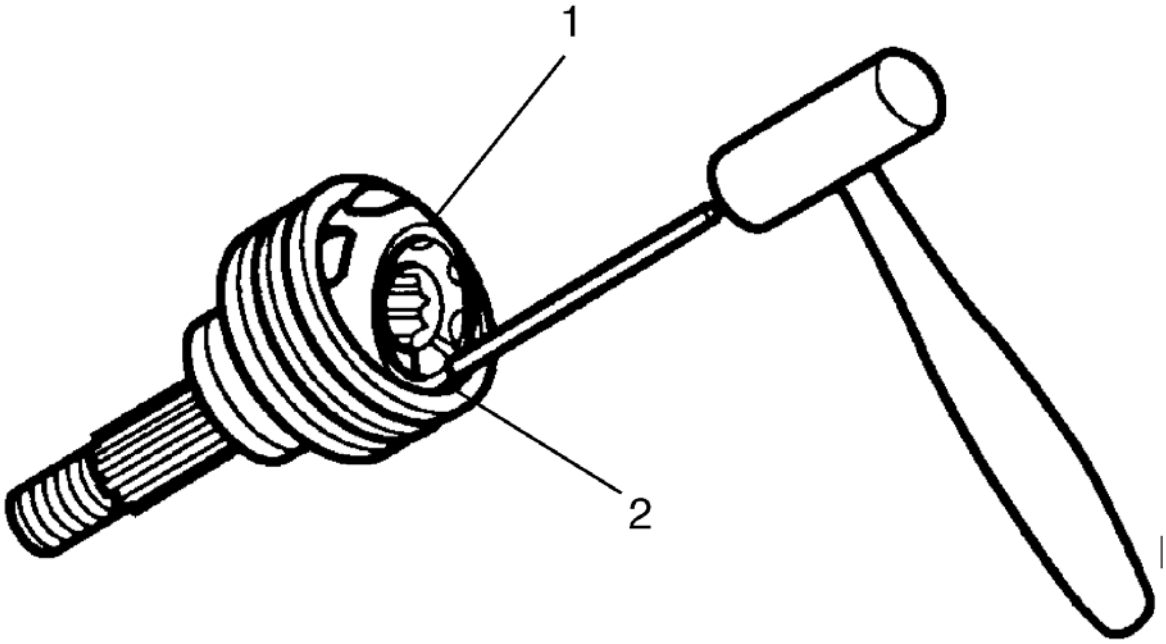

Fig. 59: Tapping Gently On Brass Drift With A Hammer In Order To Tilt Cage
Courtesy of GENERAL MOTORS COMPANY

4. Install the outer CV joint assembly in a vise.

IMPORTANT: The following procedure will have to be repeated until all the ball bearing are removed form the cage.

5. Using a brass drift (1), gentle tap the cage until the ball bearing can be removed from the cage.

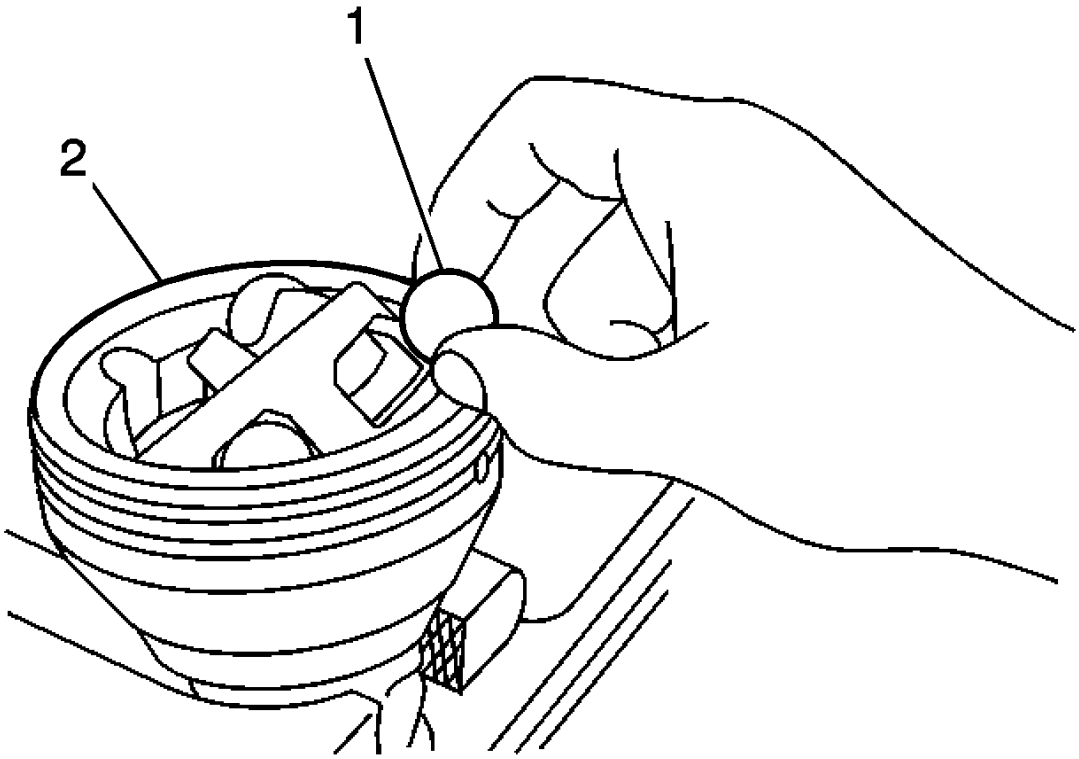

Fig. 60: Removing/Install Ball From Cage & Inner Race
Courtesy of GENERAL MOTORS COMPANY

6. Using a small screwdriver, remove the ball bearings from the CV joint.
7. Position the CV joint housing (2) so they are level.

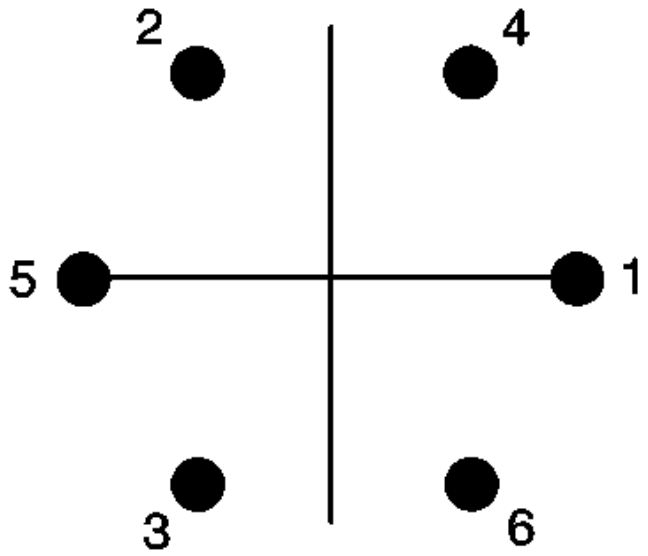

Fig. 61: View Of Ball Removal/Installation Sequence
Courtesy of GENERAL MOTORS COMPANY

8. Remove the ball bearings from the CV joint in sequence.

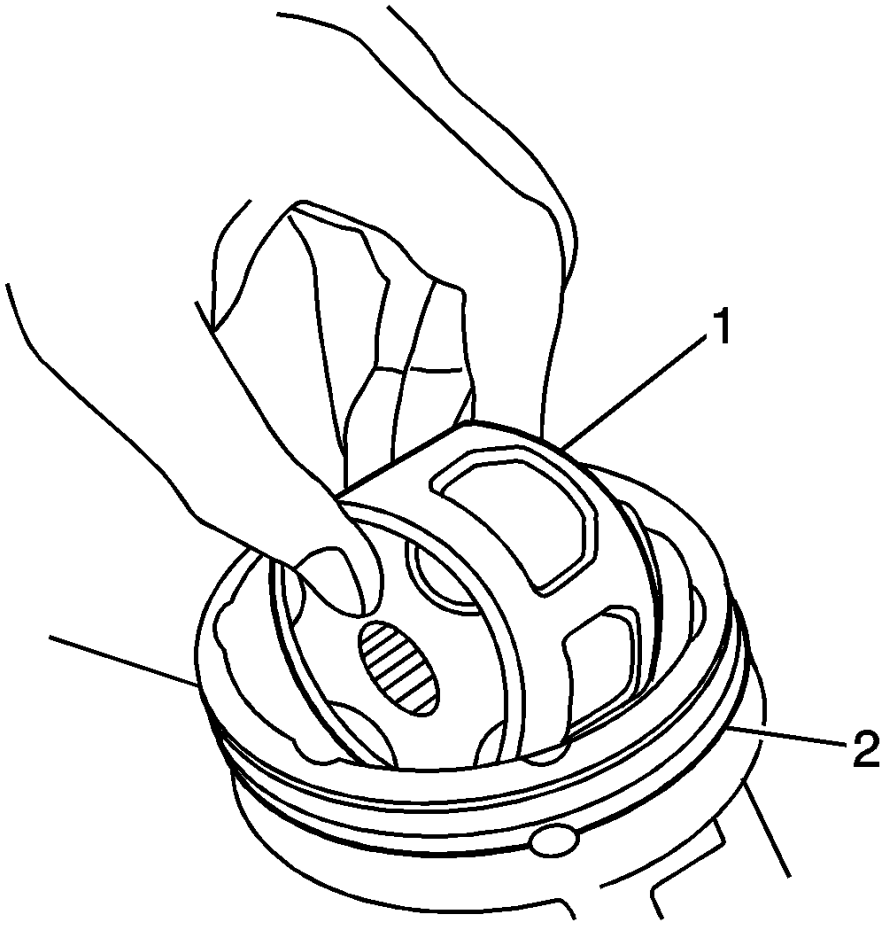

Fig. 62: Positioning Cage & Inner Race 90 Degrees To Centerline Of Outer Race
Courtesy of GENERAL MOTORS COMPANY

IMPORTANT: Position the cage so that the larger radius corners of the cage windows are facing up.

9. Position the cage (1) at 90 degrees to the centerline of the outer race.
10. Align the cage windows with the lands of the outer race.
11. Lift and remove the cage and the inner race from the outer race.

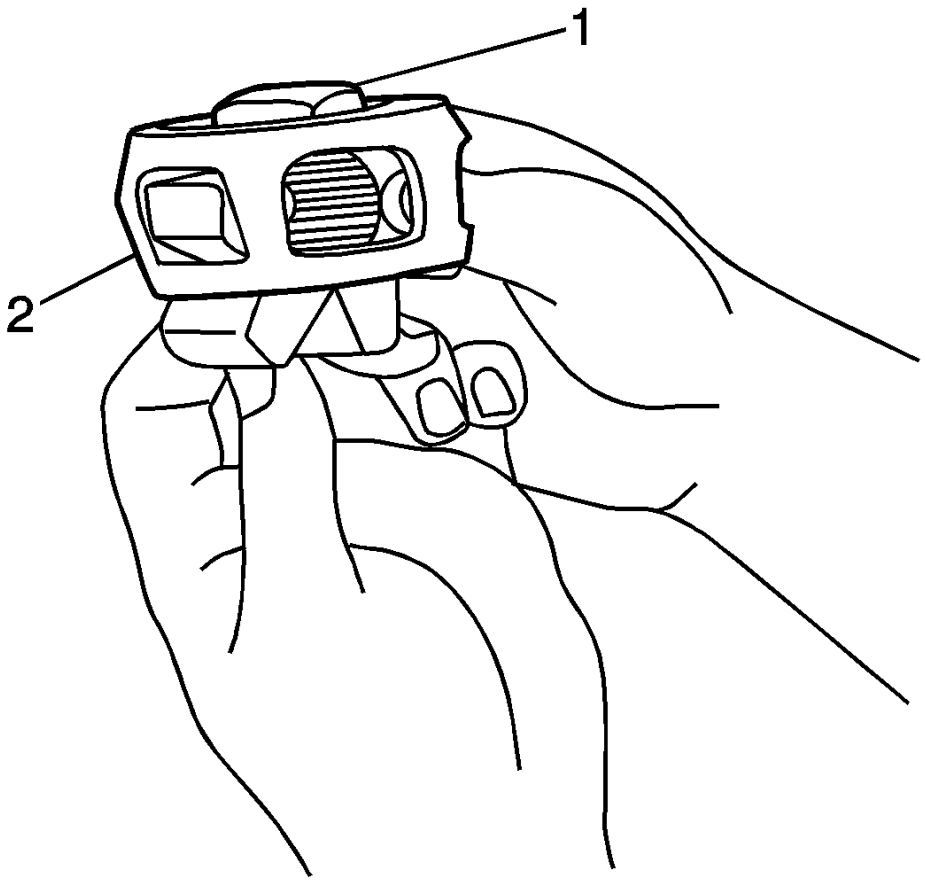

Fig. 63: Positioning Cage So Larger Radius Corners Of Cage Windows Are Up
Courtesy of GENERAL MOTORS COMPANY

12. Position the cage (2) and the inner race (1) so that the larger radius corners of the cage windows are up.
13. Rotate the inner race 90 degrees to the center line of the cage.
14. Align the lands of the inner race with the windows of the cage.
15. Move the inner race land into the cage window.
16. Rotate the inner race down and remove it from the cage.
17. Clean the following items thoroughly with the proper cleaning solvent:
    - The inner race
    - The outer race
    - The cage
    - The ball bearings
    - The exposed end of the wheel drive shaft

IMPORTANT: The internal parts of the CV joint are NOT SERVICED separately. The outer CV joint is serviced as an assembly.

18. If any of the above items are found to have excessive wear or are damaged, replace the outer CV joint as an assembly.

Assembly Procedure

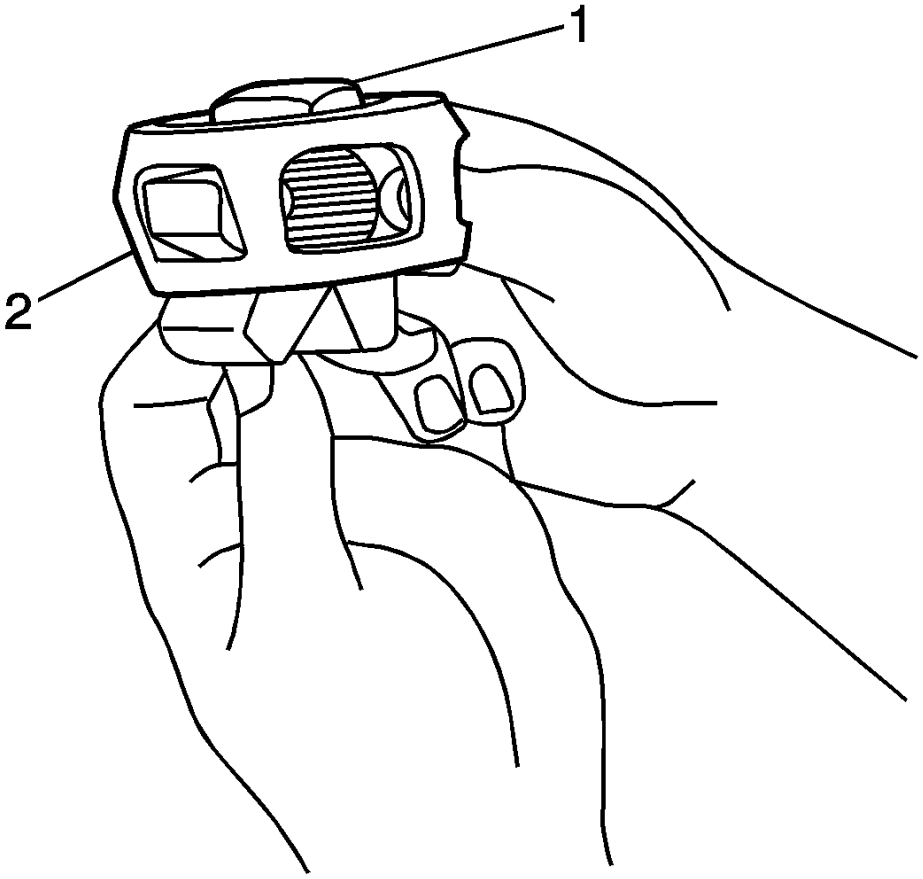

Fig. 64: Positioning Cage So Larger Radius Corners Of Cage Windows Are Up
Courtesy of GENERAL MOTORS COMPANY

1. Position the cage (2) so that the larger radius corners of the cage windows are up.
2. Position the inner race 90 degrees to the centerline of the cage.
3. Insert the inner race through the bottom of the cage.
4. Align the lands of the inner race with the windows of the cage.
5. Move the inner race land into the cage window.
6. Rotate the inner race down and remove it from the cage.
7. Rotate the inner race within the cage so that the grooved surface of the inner race is facing up.
8. Align the inner race ball bearing tracks with the cage windows.

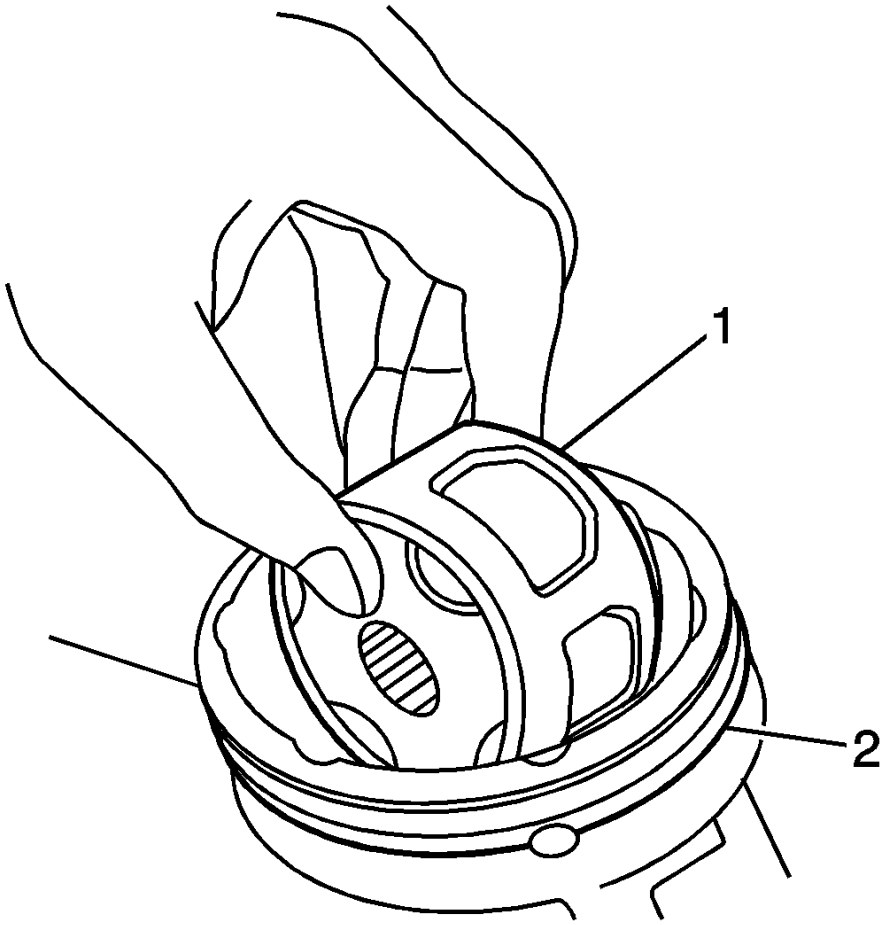

Fig. 65: Positioning Cage & Inner Race 90 Degrees To Centerline Of Outer Race
Courtesy of GENERAL MOTORS COMPANY

9. Wrap a clean shop towel around the CV joint outer race splined shaft.
10. Place the outer race vertically in a bench vise.
11. Position the cage (1) and the inner race at 90 degrees to the centerline of the outer race.
12. With the inner race and the cage assembly in a vertical position, insert the cage and the inner race into the outer race.

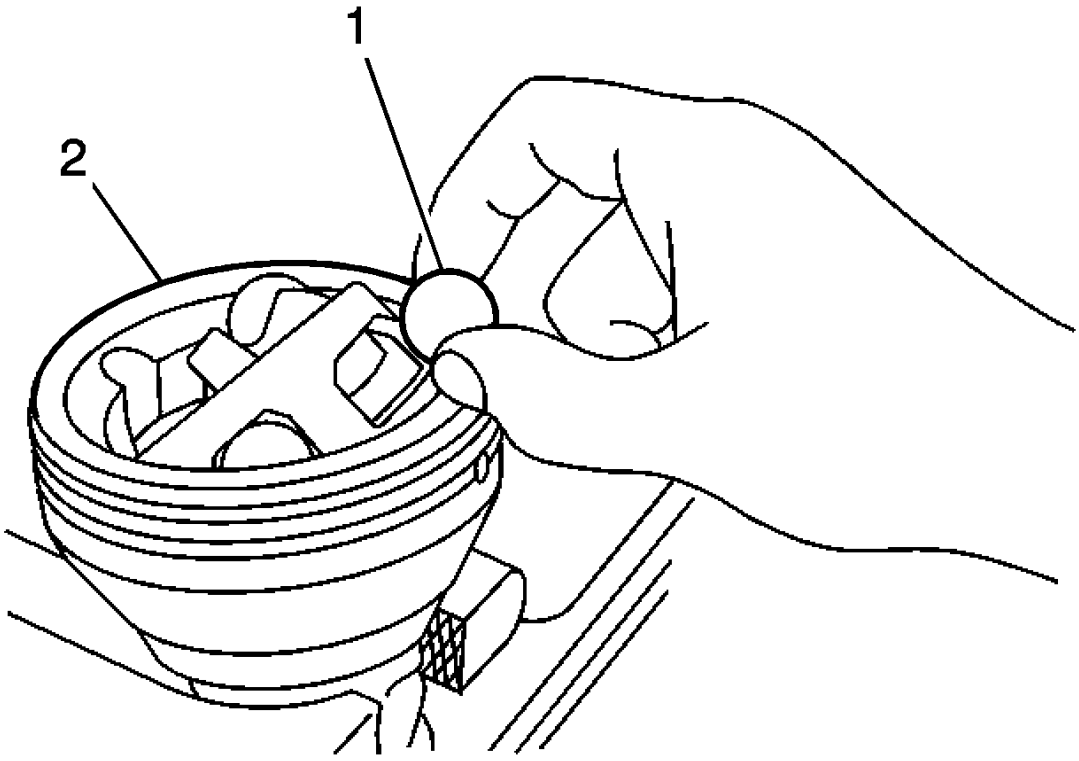

Fig. 66: Removing/Install Ball From Cage & Inner Race
Courtesy of GENERAL MOTORS COMPANY

IMPORTANT: The larger radius corners of the cage windows should be positioned up and the grooved surface of the inner race should be visible.

13. Position the housing (2) and the inner race so that they are level in the vise.
14. Rotate the appropriate components, and align the cage windows and the inner race ball bearing tracks with the outer race ball bearing (1) tracks.
15. Position a cage window and the inner race ball bearing track for the ball bearing installation.

IMPORTANT: When performing the following procedure, the opposing cage window and the inner ball bearing track will be accessible for the ball bearing installation.

16. Press down on the cage following one of the outer race ball bearing tracks.
17. Install the ball bearing through the cage window onto the inner race ball bearing track.

IMPORTANT: The following service procedure will have to be performed after each ball bearing has been installed.

18. After the first ball bearing has been installed, use a brass drift and a hammer and gently tap the cage in order to drive the cage and the inner race down completely in the outer race.

    IMPORTANT: After the ball bearing has been installed, there should be NO GAP between the ball bearing and the inner race.

19. Position the cage and the inner race so that they are level.
20. Using a plastic hammer, lightly tap the ball bearing into place.

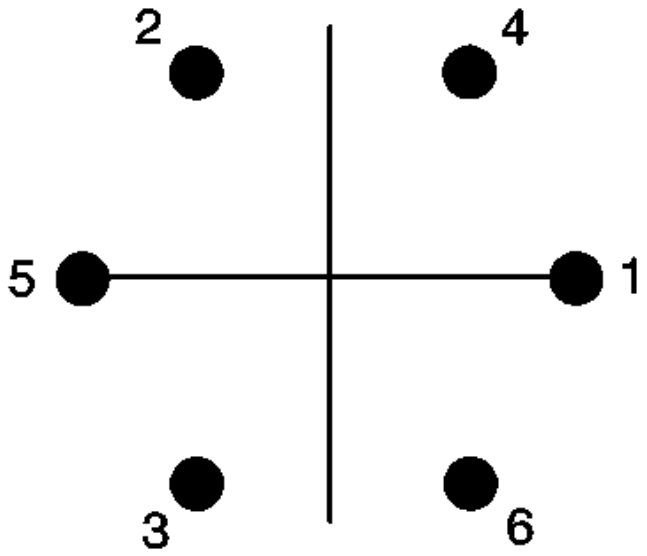

Fig. 67: View Of Ball Removal/Installation Sequence
Courtesy of GENERAL MOTORS COMPANY

21. Install the ball bearings in sequence.
22. Repeat steps 18-20 until all the ball bearings are installed.
23. If any of the internal parts are found to be defective, replace the outer joint. Refer to **Wheel Drive Shaft Outer Joint and Boot Replacement (Without WL9)Wheel Drive Shaft Outer Joint and Boot Replacement (With WL9)**.

WHEEL DRIVE SHAFT INNER JOINT INSPECTION

Inspection Procedure

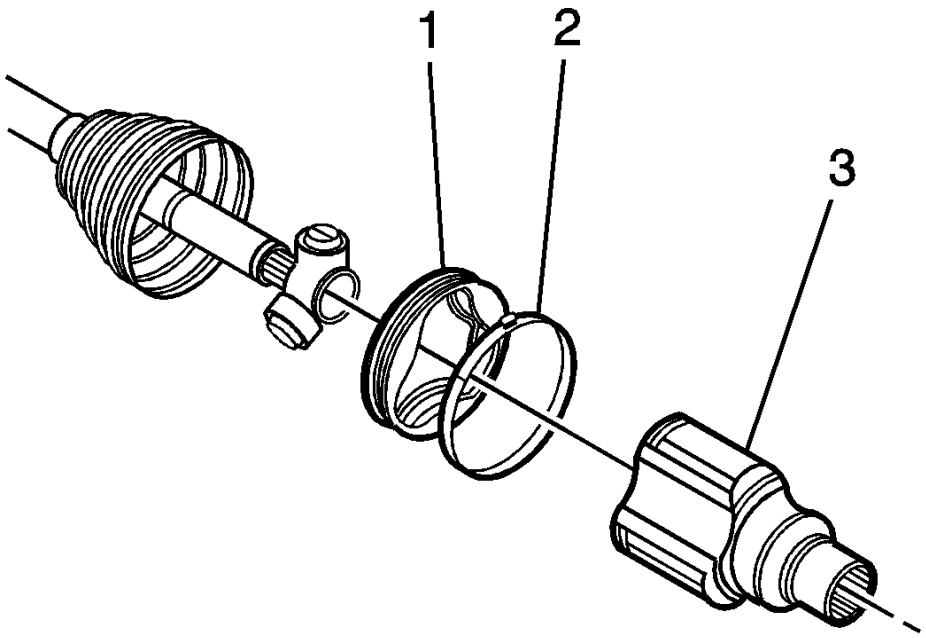

Fig. 68: Identifying Wheel Drive Shaft Inner Joint Inspection Areas
Courtesy of GENERAL MOTORS COMPANY

1. Remove the wheel drive boot clamp (2) from the tripod housing (3).
2. Remove the wheel drive shaft tripod housing (3) from the wheel drive shaft.
3. Remove the wheel drive shaft tripod joint boot bushing (1).
4. Using a suitable cleaner, remove the excess grease from the tripod assembly.
5. Inspect the following items for damage or excessive wear:
    - The wheel drive shaft tripod boot
    - The wheel drive shaft tripod assembly
    - The wheel drive shaft tripod joint housing
    - The wheel drive shaft tripod joint bushing
    - The wheel drive shaft
6. If any of the internal parts are found to be excessively worn or damaged, replace the wheel drive shaft

inner joint and boot. Refer to **Wheel Drive Shaft Inner Joint and Boot Replacement**.

DESCRIPTION AND OPERATION

WHEEL DRIVE SHAFTS DESCRIPTION AND OPERATION

Front wheel drive axles are flexible assemblies.

Front wheel drive axles consist of the following components:

- A front wheel drive shaft tri-pot joint (inner joint)
- A front wheel drive shaft constant velocity joint (outer joint)
- A front wheel drive shaft

  The front wheel drive shaft connects the front wheel drive shaft tri-pot joint and the front wheel drive shaft constant velocity joint.

The front wheel drive shaft tri-pot joint is completely flexible. The front wheel drive shaft tri-pot joint can move in and out.

The front wheel drive shaft constant velocity joint is flexible, but the front wheel drive shaft constant velocity joint cannot move in and out.

Boots (Seals) And Clamps

The front wheel drive shaft constant velocity joint and the front wheel drive shaft tri-pot joint boots (seals) in the front wheel drive axle are made of a thermoplastic material.

The clamps in front wheel drive axle are made of stainless steel.

The boot (seal) provides the following functions:

- Protection of the internal parts of the front wheel drive shaft constant velocity joint and the front wheel drive shaft tri-pot joint.

  The boot (seal) protects the grease from the following sources of damage:

  - Harmful atmospheric conditions (such as extreme temperatures or ozone gas)
  - Foreign material (such as dirt or water)
- Allows angular movement and the axial movement of the front wheel drive shaft tri-pot joint.
- Allows angular movement of the front wheel drive shaft constant velocity joint.

Protect the boots (seals) from sharp tools and from the sharp edges of the surrounding components.

IMPORTANT: Any damage to the boots (seals) or the clamps will result in leakage. Leakage will allow water to leak into the front wheel drive shaft tri-pot joint and the front wheel drive shaft constant velocity joints. Leakage will also allow grease to leak out of the front wheel drive shaft tri-pot joints and the front wheel drive shaft constant velocity joints.

Leakage may cause noisy front wheel drive axle operation and eventual failure of the internal components.

The clamps provide a leak proof connection for the front wheel drive shaft tri-pot joint and the front wheel drive shaft constant velocity joint at the following locations:

- The housing
- The front wheel drive shaft

The thermoplastic material performs well under normal conditions and normal operation. However, the material is not strong enough to withstand the following conditions:

- Abusive handling
- Damage from sharp objects (such as sharp tools or any sharp edges of the surrounding components in the vehicle).

Front Wheel Drive Shaft Tri-pot Joint (Inner Joint)

The front wheel drive shaft tri-pot joint is made with the tri-pot design without an over-extension limitation retainer.

The joint is constructed as follows for vehicles that are equipped with an automatic transmission:

- The left front wheel drive axle has a female spline. The female spline installs over a stub shaft that protrudes from the transaxle.
- The right front wheel drive axle has a male spline. The right front wheel drive axle uses barrel type snap rings in order to interlock with the transaxle gears.

Front Wheel Drive Shaft Constant Velocity Joint (Outer Joint)

The front wheel drive shaft constant velocity joint is made with the Rzeppa joint design.

The shaft end (which mates with the knuckle/hub) has a helical spline. The helical spline ensures a tight, press-type fit.

This design prevents end play between the hub bearing and the front wheel drive axle.

Using Wiring Diagrams

INTRODUCTION

Obtains wiring diagrams and technical service bulletins, containing wiring diagram changes, from the domestic and import manufacturers. These are checked for accuracy and are all redrawn into a consistent format for easy use. All system wiring diagrams are available in color format and may be viewed and or printed in color or black and white, depending on your program settings and available printer hardware.

In the past, when cars were simpler, diagrams were simpler. All components were connected by wires, and diagrams seldom exceeded 4 pages in length. Today, some wiring diagrams require more than 16 pages. It would be impractical to expect a service technician to trace a wire from page 1 across every page to page 16.

Removing some of the wiring maze reduces eyestrain and time wasted searching across several pages. Today, the majority of diagrams follow a much improved format, which permits space for internal switch details, and component and ground locations.

Components shown with a dashed line instead of a solid line indicate not all circuits are shown in this particular diagram (circuits shown in system diagrams are typically applicable to that system only). The remaining circuits connected to that component will be shown in the appropriate system that they apply to.

Today, the wiring diagram necessary to support a given repair procedure is included within that article or a link is provided to the appropriate SYSTEM WIRING DIAGRAM article. For example, the wiring diagram for a Ford EEC-IV system may be included in ENGINE PERFORMANCE and WIRING DIAGRAMS articles for Ford Motor Co. The wiring diagram for a cruise control system may be included in ACCESSORIES & EQUIPMENT section for the specific vehicle manufacturer, and the wiring diagram for an anti-lock brake system may be included in BRAKES and WIRING DIAGRAMS for the specific manufacturer.

WIRING DIAGRAMS contains all wiring diagrams not included in STARTING & CHARGING SYSTEMS and ACCESSORIES & EQUIPMENT. This includes: Data Link Connectors, Ground Distribution, Power Distribution, Engine Performance, Electric Cooling Fans, Anti-Lock Brakes, Electronic Suspension and Electronic Steering wiring diagrams. The Data Link Connectors wiring diagrams show the circuits by which the various on-board computers exchange information, and the diagnostic connectors used for diagnosis and their location. The Ground Distribution wiring diagrams show all vehicle ground points, their location, and the components common to those ground points. The Power Distribution wiring diagrams show the power feed circuits and the components common to those power feeds.

Wiring diagrams used to support the information in ACCESSORIES & EQUIPMENT are drawn in a "top-down" format. The diagrams are drawn with the power source at the top of the diagram and the ground point at the bottom of the diagram. Component locations are identified on the wiring diagrams. Any wires that do not connect directly to a component are identified on the diagram to indicate where they go.

WIRING DIAGRAM SYMBOLS

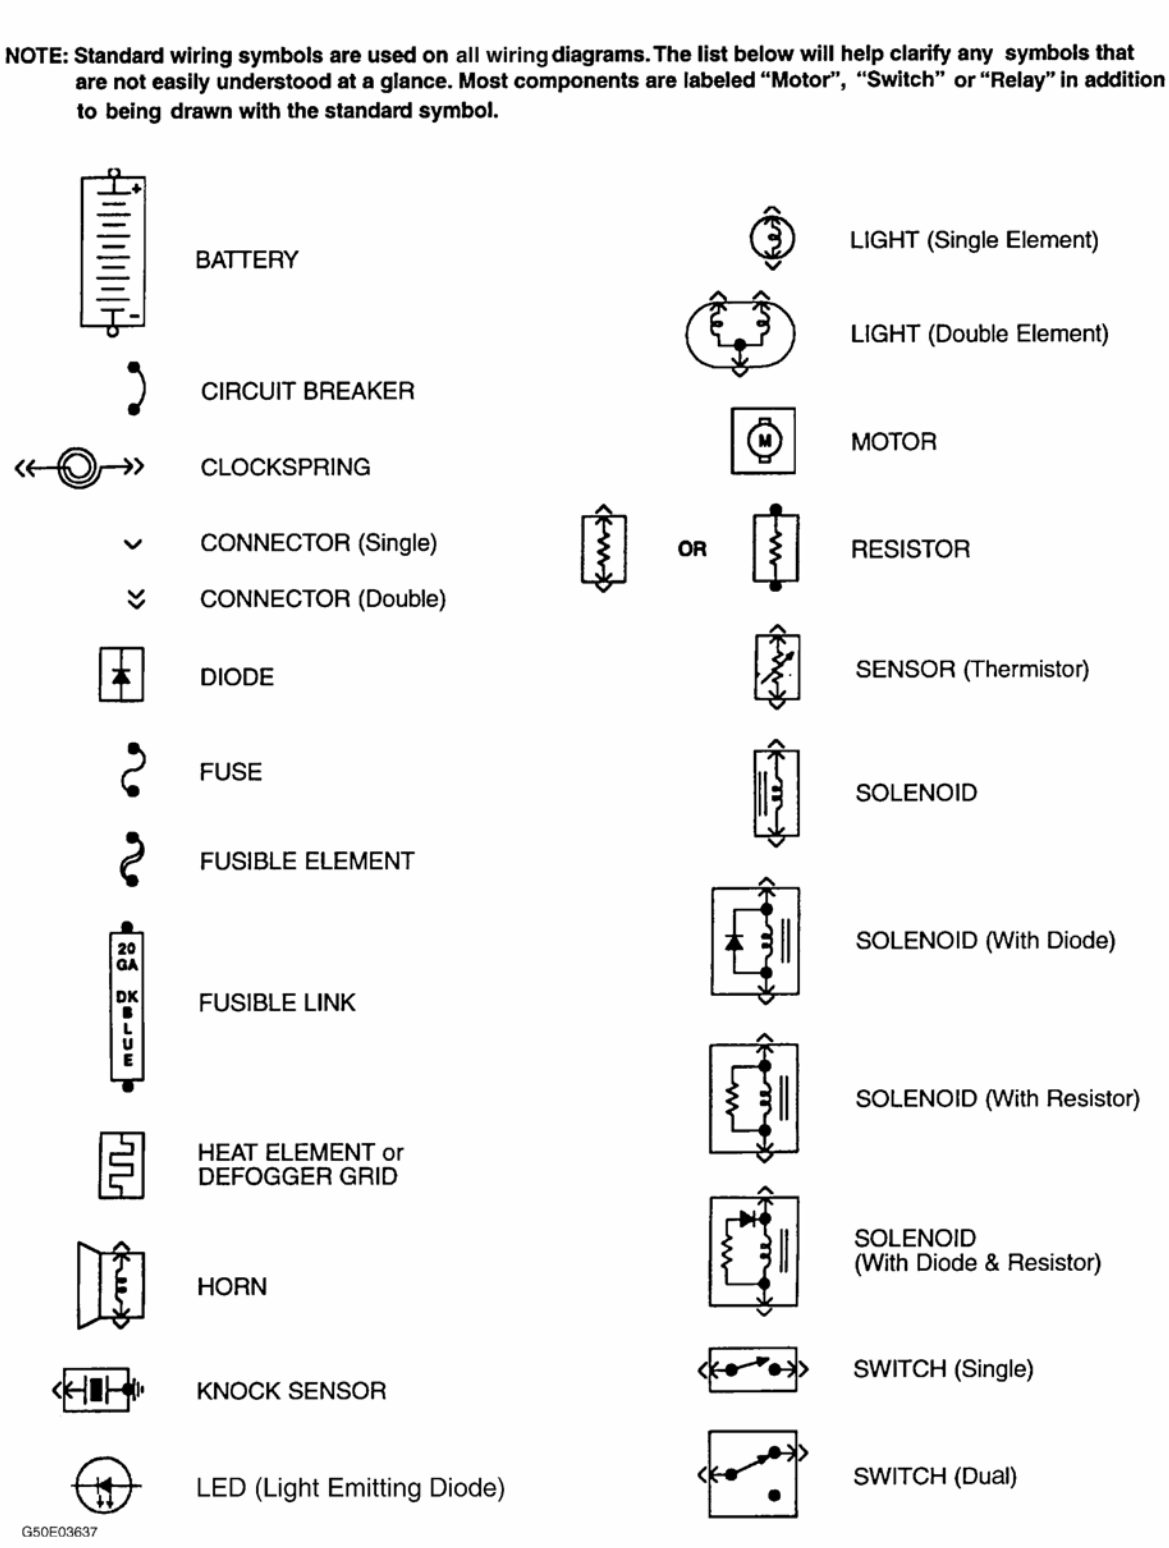

Fig. 1: Identifying Standard Wiring Diagram Symbols

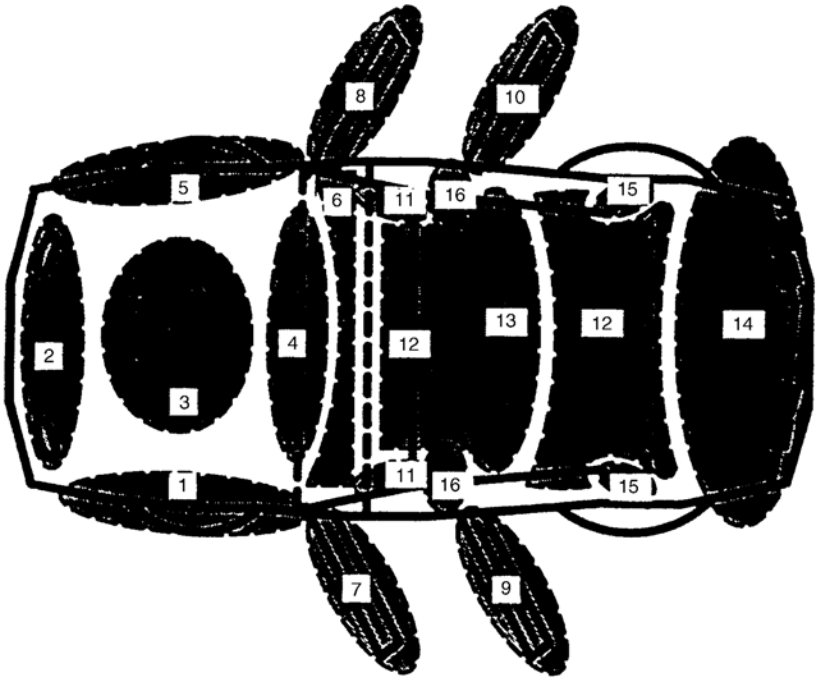
WIRING DIAGRAM GROUND NUMBER LOCATIONS

NOTE: **The following illustration depicts standardized ground numbers and locations to be used in conjunction with wiring diagrams applying to 2001 and prior model years only. See Fig. 2. Wiring diagrams applying to newer**

model years depict manufacturer-specified ground numbers and locations. Do not utilize the illustration with 2002 and newer model year wiring diagrams.



1) Left Fender
- G100 ..... Front Of Fender
- G102 ..... On Shock Tower
- G104 ..... Rear Of Fender

2) Front of Vehicle
- G106 ..... Behind Left Headlight
- G107 ..... Behind Right Headlight
- G108 ..... Left Radiator Support
- G109 ..... Right Radiator Support

3) Engine
- G110 ..... Left Front Of Engine
- G111 ..... Left Front Behind Battery
- G112 ..... Left Side Of Engine
- G114 ..... Left Rear Of Engine
- G115 ..... Rear Of Engine
- G117 ..... Right Rear Of Engine
- G119 ..... Right Front Of Engine
- G120 ..... Right Side Of Engine
- G125 ..... Front Of Engine
- G127 ..... Left Underside Of Hood
- G128 ..... Right Underside Of Hood
- G129 ..... Top Center Of Transaxle

4) Safety Wall
- G116 ..... Left Side Of Safety Wall
- G121 ..... Center Of Safety Wall
- G123 ..... Right Side Of Safety Wall

5) Right Fender
- G101 ..... Front Of Fender
- G103 ..... On Shock Tower
- G105 ..... Rear Of Fender

G00027307

6) Instrument Panel
- G200 ..... Left Kick Panel
- G201 ..... Right Side Of I/P
- G202 ..... Left Side Of I/P
- G203 ..... Right Kick Panel
- G204 ... Left Rear Of Steering Support
- G205 .. Right Rear Of Steering Support
- G206 ..... Center Of I/P
- G207 ..... Top Of Steering Column

7) Left Front Door
- G500 ..... Left Front Door

8) Right Front Door
- G600 ..... Right Front Door

9) Left Rear Door
- G700 ..... Left Rear Door

10) Right Rear Door
- G800 ..... Right Rear Door

11) "A" Pillars
- G900 ..... Left "A" Pillar
- G901 ..... Right "A" Pillar

12) Passenger Compartment
- G300 ..... Below Left Front Seat
- G301 ..... Below Right Front Seat
- G302 ..... Below Center Console
- G303 ..... Below Right Rear Seat
- G304 ..... Below Left Rear Seat
- G306 ..... Below Center Of Rear Seat
- G307 ..... Below Right Rear Window
- G309 ..... Left Front Door Sill
- G310 ..... Behind Right Rear Seat
- G311 ..... Center Of Rear Shelf
- G312 ..... Behind Left Rear Seat

13) Roof
- G902 ..... Left Front Of Roof
- G903 ..... Right Front Of Roof
- G906 ..... Left Rear Of Roof
- G907 ..... Right Rear Of Roof
- G908 ..... Center Front Of Roof
- G909 ..... Center Rear Of Roof

14) Rear Of Vehicle
- G400 ..... Left Front Side Of Trunk
- G401 ..... Right Front Side Of Trunk
- G402 ..... Left Rear Wheelwell
- G403 ..... Right Rear Wheelwell
- G404 ..... Left Rear Side Of Trunk
- G405 ..... Right Rear Side Of Trunk
- G406 ..... Center Rear Of Trunk Lid
- G407 ..... Center Rear Of Trunk
- G408 ..... Center Front Of Trunk
- G409 ..... Rear Of Cargo Bed

15) "C" Pillars
- G904 ..... Left "C" Pillar
- G905 ..... Right "C" Pillar

16) "B" Pillars
- G305 ..... Right "B" Pillar
- G308 ..... Left "B" Pillar

Fig. 2: Ground Numbers & Locations (2001 & Prior Model Years)

WIRING DIAGRAM COMPONENT LOCATIONS

When trying to locate a component in a wiring diagram and you don't know the specific system where it is located, use this handy component locator to find the system wiring diagram in which the component is located.

Then, go to that system and locate the component within the wiring diagram.

For example, if you don't know the specific system in which the ignition switch is located, look up ignition switch in the wiring diagram component location tables and go to the appropriate wiring diagram(s) which contain either full or partial views of the ignition switch. The full view of the ignition switch is located in Power Distribution.

The first listing for the component will be the full or most complete view of the component. Additional listings will be partial views of the component. Not all components are used on all models.

All components will have a partial view in Ground Distribution and Power Distribution. Data Link Connectors show connecting circuits between modules. Alternate names for components may be listed in wiring diagram component locations tables.

WIRING DIAGRAM COMPONENT LOCATIONS

Component	Wiring Diagram
ABS Electronic Control Unit	Anti-Lock Brakes; Data Link Connectors
ABS Hydraulic Unit	Anti-Lock Brakes
Acceleration Sensor	Anti-Lock Brakes
Accessory Delay Relay	Power Windows
A/C Compressor Clutch Relay	Engine Performance
A/C Sensor	Engine Performance
A/C Pressure Switch	Engine Performance
Adaptive Lamp Control Module	Exterior Lights
Air Bag(s)	Air Bag Restraint System
Air Bag Module	Air Bag Restraint System
Air Bag Sensor(s)	Air Bag Restraint System
Air Injection Pump Relay	Engine Performance
Air Temperature Sensor	Overhead Console
Alternator (Generator)	Generators & Regulators
Anti-Theft Control Module	Anti-Theft System; Starters
Autolamp Control Relay	Headlight Systems; Daytime Running Lights
Automatic Shutdown (ASD) Relay	Engine Performance; Generators & Regulators
Autostick Switch	Engine Performance
Auxiliary Battery Relay	Generators & Regulators
Back-Up Lights	Back-Up Lights; Exterior Lights
Barometric (BARO) Pressure Sensor	Engine Performance
Battery	Power Distribution
Battery Temperature Sensor	Engine Performance
Body Control Module	Body Control Computer; Anti-Theft System; Daytime Running Lights; Engine Performance; Headlight Systems; Warning Systems
Boost Control Solenoid	Engine Performance
Boost Sensor	Engine Performance

Component	Wiring Diagram
Brake Fluid Level Switch	Analog Instrument Panels
Brake On/Off (BOO) Switch	Cruise Control Systems; Engine Performance; Shift Interlock Systems
Buzzer Module	Warning Systems
Camshaft Position (CMP) Sensor	Engine Performance
Central Control Module	Anti-Theft System
Clockspring	Air Bag Restraint System; Cruise Control Systems; Steering Column Switches
Clutch Pedal Position Switch	Starters
Clutch Start Switch	Starters
Combination Meter	Analog Instrument Panels
Constant Control Relay Module (CCRM)	Engine Performance; Electric Cooling Fans
Convenience Center	Power Distribution; Illumination/Interior Lights
Convertible Top Motor	Power Convertible Top
Convertible Top Switch	Power Convertible Top
Crankshaft Position (CKP) Sensor	Engine Performance
Cruise Control Module	Cruise Control Systems
Cruise Control Switch	Cruise Control Systems
Condenser Fan Relay(s)	Electric Cooling Fans
Data Link Connector (DLC)	Engine Performance
Daytime Running Lights Module	Daytime Running Lights; Exterior Lights
Defogger Relay	Rear Window Defogger
Diagnostic Energy Reserve Module (DERM)	Air Bag Restraint System
Discriminating Sensor (Air Bag)	Air Bag Restraint System
Distributor	Engine Performance
Door Lock Actuators	Power Door Locks; Remote Keyless Entry
Door Lock Relay(s)	Power Door Locks
Electrochromic Mirror	Power Mirrors
Electronic Level Control (ELC) Height Sensor	Electronic Suspension
Electronic Level Control (ELC) Module	Electronic Suspension
Engine Coolant Temperature (ECT) Sending Unit	Analog Instrument Panels
Engine Coolant Temperature (ECT) Sensor	Engine Performance
Engine Control Module	Engine Performance; Generators & Regulators; Starters
ETACS ECU	Warning Systems; Power Windows; Remote Keyless Entry
Evaporative (EVAP) Emissions Canister	Engine Performance
EVAP Canister Purge Solenoid	Engine Performance
EVAP Canister Vent Solenoid	Engine Performance
Exhaust Gas Recirculation (EGR) Valve	Engine Performance
Fuel Tank Vacuum Sensor	Engine Performance

Component	Wiring Diagram
Fog Lights	Headlight Systems; Daytime Running Lights
Fog Light Relay	Headlight Systems; Daytime Running Lights
Fuel Door Release Solenoid	Power Fuel Door Release
Fuel Gauge Sending Unit	Analog Instrument Panels
Fuel Injectors	Engine Performance
Fuel Pump	Engine Performance
Fuel Pump Relay	Engine Performance; Power Distribution
Fuse/Relay Block	Power Distribution
Fusible Links	Power Distribution; Generators & Regulators; Starters
Generator	Generators & Regulators; Engine Performance; Power Distribution
Generic Electronic Module (GEM)	Body Control Modules; Electronic Suspension
Glow Plug Relay	Engine Performance
Glow Plugs	Engine Performance
Grounds	Ground Distribution
Headlight Door Module	Headlight Doors
Headlight Relay	Headlight Systems; Daytime Running Lights
Headlights	Headlight Systems; Daytime Running Lights
Heated Oxygen Sensor(s) (HO2S)	Engine Performance
Heated Windshield Control Module	Heated Windshields
Height Sensor	Electronic Suspension
Horns	Steering Column Switches
Horn Relay	Steering Column Switches
Idle Air Control (IAC) Motor/Valve	Engine Performance
Ignition Coil(s)	Engine Performance
Ignition Key Lock Cylinder	Anti-Theft System
Ignition Module	Engine Performance
Ignition Switch	Power Distribution; Engine Performance; Generators & Regulators; Starters
Illuminated Entry Module	Illumination/Interior Lights
Illumination Lights	Illumination/Interior Lights
Impact Sensor	Air Bag Restraint System
Inertia Fuel Shutoff Switch	Engine Performance
Inhibit Relay	Starters
Instrument Cluster	Analog Instrument Panels
Intake Air Temperature (IAT) Sensor	Engine Performance
Interior Lights	Illumination/Interior Lights
Interlock Switch	Starters
Junction Block	Power Distribution
Keyless Entry Receiver	Remote Keyless Entry

Component	Wiring Diagram
Key Reminder Switch	Starters
Knock Sensor	Engine Performance
Lamp Control Module	Exterior Lights
License Plate Lamp	Exterior Lights
Lighting Control Module	Lighting Control Modules; Anti-Theft System; Daytime Running Lights; Headlight Systems
Lower Relay	Power Convertible Top
Malfunction Indicator Light (MIL)	Engine Performance; Instrument Panels
Manifold Absolute Pressure (MAP) Sensor	Engine Performance
Mass Airflow (MAF) Sensor	Engine Performance
Mega Fuse	Generators & Regulators
Memory Seat/Mirror Module	Memory Systems
Mirror Defogger	Rear Window Defogger
Moon Roof Motor	Power Moon Roof
Moon Roof Relay	Power Moon Roof
Multi-Function Control Module	Warning Systems
Neutral Safety Switch	Starters
Oil Level Switch	Engine Performance
Oil Pressure Switch/Sending Unit	Analog Instrument Panels; Engine Performance
Overhead Console	Overhead Console
Oxygen Sensor(s) (O2S)	Engine Performance
Parking Brake Switch	Analog Instrument Panels
Park Lights	Exterior Lights
Park/Neutral Position Switch	Starters; Engine Performance; Anti-Theft System; Body Control Module
Perimeter Lighting Control Relay	Exterior Lights
Power Amplifier	Power Antennas
Power Antenna Module	Power Antennas
Power Antenna Motor	Power Antennas
Power Distribution Center	Power Distribution; Generators & Regulators; Starters
Power Door Lock Motors	Power Door Locks
Power Mirror Motors	Power Mirrors; Memory Systems
Power Sliding Door Controller	Power Sliding Side Door
Power Seat Motors	Power Seats; Memory Systems
Power Steering Pressure Switch	Engine Performance
Power Top Motor	Power Convertible Top
Power Top Relay(s)	Power Convertible Top
Powertrain Control Module	Engine Performance; Analog Instrument Panels; Cruise Control Systems; Data Link Connectors; Generators & Regulators; Starters

Component	Wiring Diagram
Power Window Motors	Power Windows
Power Window Relay(s)	Power Windows
Radiator Fan Motor(s)	Electric Cooling Fans
Radiator Fan Relay(s)	Engine Performance; Electric Cooling Fans;
Rainsense Module	Wiper/Washer Systems
Raise Relay	Power Convertible Top
Remote Anti-Theft Personality (RAP) Module	Anti-Theft System; Starters; Warning Systems
Seat Belt Pretensioners	Air Bag Restraint System
Seat Belt Retractor Solenoid	Passive Restraints
Seat Belt Switch	Air Bag Restraint System; Passive Restraints
Shift Interlock Solenoid	Shift Interlock Systems
Shift Lock Actuator	Shift Interlock Systems
Side Marker Lights	Exterior Lights
SIR Coil Assembly (Clockspring)	Air Bag Restraint System
Slip Ring (Clockspring)	Air Bag Restraint System; Steering Column Switches
SRS Control Module	Air Bag Restraint System
Starter Motor	Starters
Starter Interrupt Relay	Starters
Starter Solenoid	Starters
Starter Relay	Starters
Steering Wheel Position Sensor	Anti-Lock Brakes
Stoplights	Exterior Lights
Stoplight Switch	Engine Performance; Cruise Control Systems; Anti-Lock Brakes
Sun Roof ECU	Power Sun Roof
Sun Roof Motor	Power Sun Roof
Sun Roof Position Sensor	Power Sun Roof
Taillights	Exterior Lights
Throttle Position (TP) Sensor	Engine Performance
Torque Converter Clutch Solenoid/Switch	Engine Performance
Traction Control Switch	Anti-Lock Brakes
Trailer Tow Connector	Exterior Lights
Trailer Tow Relay	Exterior Lights
Transmission/Transaxle	Engine Performance
Transmission Control Module (TCM)	Engine Performance; Starters
Transmission Range Sensor	Starters; Back-Up Lights; Engine Performance
Transmission Range Switch	Back-Up Lights; Engine Performance; Anti-Theft System
Turn Signal Flasher	Exterior Lights
Turn Signal Lights	Exterior Lights

Component	Wiring Diagram
Twilight Sentinel Switch	Headlight Systems; Daytime Running Lights
Vapor Canister Leak Detection Pump	Engine Performance
Vehicle Control Module (VCM)	Engine Performance
Vehicle Dynamic Module	Electronic Suspension
Vehicle Speed Control Servo	Cruise Control Systems
Vehicle Speed Sensor	Data Link Connectors; Analog Instrument Panels; Cruise Control Systems; Electronic Suspension
Voltage Regulator	Generators & Regulators
Water-In-Fuel Sensor	Engine Performance; Analog Instrument Panels
Wheel Speed Sensors	Anti-Lock Brakes
Window Timer Module	Power Convertible Top
Windshield Intermittent Wiper Relay	Wiper/Washer Systems
Windshield Washer Motor	Wiper/Washer Systems
Wiper Motor	Wiper/Washer Systems

	Previous Schematic Page Icon This icon is used on the schematic to navigate to the previous schematic in the subsystem.

Symbol	Description
	Supplemental Inflatable Restraint (SIR) or Supplemental Restraint System (SRS) Icon This icon is used to alert the technician that the system contains SIR/SRS components that require certain precautions before servicing.

Symbol	Description
	Information Icon This icon is used to alert the technician that there is additional information that will aid in servicing a system.

Symbol	Description
	Danger Icon This icon is intended to alert the technician that a component within the system contains labeling with the same icon. This icon is used when a source component has potential for 60 volts DC or greater or has potential for 42 volts AC or greater.

Symbol	Description
	High Voltage Icon This icon is intended to alert the technician that a component within the system contains labeling with the same icon. This icon is used when a component/circuit has potential for 60 volts DC or greater or has potential for 42 volts AC or greater.

Symbol	Description
	Caution Icon This icon is used to advise the technician to use caution when servicing this component. This icon may be used when a component/circuit has a voltage range potential between 30-60 volts DC or 15-42 volts AC.

Symbol	Description
	Functional Serial Data Communication This icon is used to show the technician that the serial data circuit detail is shown incomplete. It also provides an active link to the Data Communication Schematics were the circuit is shown complete.

Vehicle Zoning Strategy

All grounds, in-line connectors, and splices have identifying numbers that correspond to where they are located in the vehicle. The following table explains the numbering system.

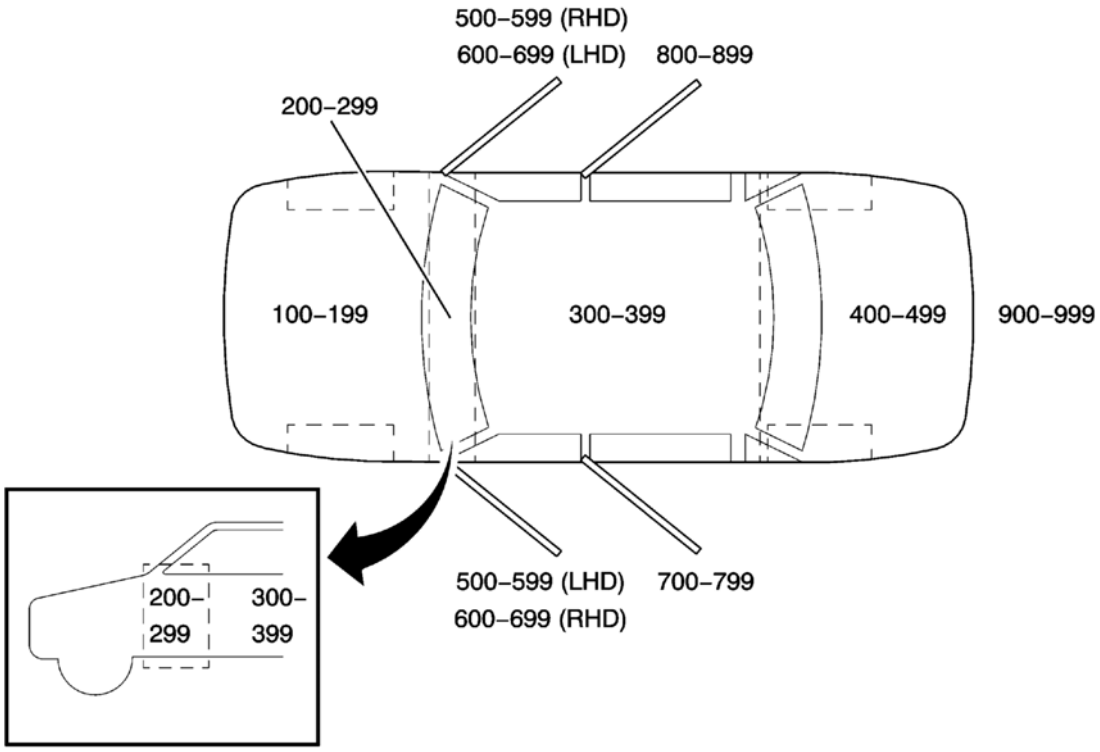

Fig. 23: Passenger Car Zoning View
Courtesy of GENERAL MOTORS COMPANY

Callout Numbers	Zone Description
100-199	Engine compartment (all forward of the instrument panel)
200-299	Within the instrument panel area (between the bulkhead and the front plane of the instrument panel)
300-399	Passenger compartment (from instrument panel to the back of the rear seats)
400-499	Luggage compartment (from the back of the rear seats to the rear of the vehicle)
500-599	Inline harness connectors to or within the driver door
600-699	Inline harness connectors to or within the front passenger door
700-799	Inline harness connectors to or within the left rear door
800-899	Inline harness connectors to or within the right rear door
900-999	Inline harness connectors to or within the luggage compartment lid or hatch

	WARNING: **When performing service on or near the SIR components or the SIR wiring, the SIR system must be disabled. Refer to SIR Disabling and Enabling . Failure to observe the correct procedure could cause deployment of the SIR components, personal injury, or unnecessary SIR system repairs.**
	NOTE: **Twisted-pair wires provide an effective shield that helps protect sensitive electronic components from electrical interference.** **In order to prevent electrical interference from degrading the performance of the connected components, you must maintain the proper specification**

Icon	Icon Definition
	when making any repairs to the twisted-pair wires shown : • **The wires must be twisted a minimum of 9 turns per 31 cm (12 in) as measured anywhere along the length of the wires.** • **The outside diameter of the twisted wires must not exceed 6.0 mm (0.25 in).**

Icon	Icon Definition
	**NOTE:** **The following component has pin numbers that are known to have been changed during production by the wiring harness supplier.** • **JX206 The following lists what cavities are bussed to battery positive voltage and ignition 1 voltage: Pins A, B, C, D, E, and F are all attached to the ignition 1 voltage bus while pins G, H, J, K, and L are all attached to the battery positive**
